Introduction

This document describes how to configure the Cisco IOS router in a site–to–site IPsec VPN with overlapping private network addresses behind VPN gateways.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on Cisco IOS 3640 routers that run software version 12.4.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.
Network Diagram

This document uses this network setup:

![Network Diagram]

**Note:** The IP addressing schemes used in this configuration are not legally routable on the Internet. They are RFC 1918 addresses which have been used in a lab environment.

Both Private_LAN1 and Private_LAN2 have an IP subnet of 192.168.1.0/24. This simulates the overlapping address space behind each side of the IPsec tunnel.

In this example, the Site_A router performs a bi-directional translation so that the two private LANs can communicate over the IPsec tunnel. The translation means that Private_LAN1 "sees" Private_LAN2 as 10.10.0.0/24 through the IPsec tunnel, and Private_LAN2 "sees" Private_LAN1 as 10.5.5.0/24 through the IPsec tunnel.

**Configurations**

This document uses these configurations:

- Site_A Router SDM Configuration
- Site_A Router CLI Configuration
- Site_B Router Configuration

**Site_A Router SDM Configuration**

**Note:** This document assumes that the router is configured with basic settings like interface configuration, etc. Refer to Basic Router Configuration using SDM for more information.

**NAT Configuration**

Complete these steps in order to use NAT to configure SDM on the Site_A router:

1. Choose **Configure > NAT > Edit NAT Configuration**, and click **Designate NAT Interfaces** in order to define trusted and untrusted interfaces as shown.
2. Click **OK**.
3. Click **Add** in order to configure the NAT translation from inside to outside direction as shown.
4. Click **OK**.

5. Once again, click **Add** in order to configure the NAT translation from outside to inside direction as shown.
6. Click OK.

<table>
<thead>
<tr>
<th>Network Address Translation Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inside Interface(s): Loopback0</td>
</tr>
<tr>
<td>Outside Interface(s): Ethernet0/0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Original address</th>
<th>Translated address</th>
<th>Rule Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.1.0-192.168.1.255</td>
<td>10.5.5.0-10.5.5.255</td>
<td>Static</td>
</tr>
<tr>
<td>192.168.1.0-192.168.1.255</td>
<td>10.10.10.0-10.10.10.255</td>
<td>Static</td>
</tr>
</tbody>
</table>

**Note:** Here is the equivalent CLI configuration:

```bash
interface Loopback0
  ip nat inside
interface Ethernet0/0
  ip nat inside
ip nat inside source static network 192.168.1.0 10.5.5.0 /24
ip nat outside source static network 192.168.1.0 10.10.10.0 /24
```

**VPN Configuration**

Complete these steps in order to use VPN to configure SDM on the Site_A router:
1. Choose **Configure > VPN > VPN Components >IKE > IKE Policies > Add** in order to define the IKE policies as shown in this image.

![IKE Policy Configuration](image)

2. Click **OK**.

![IKE Policies Configuration](image)

**Note:** Here is the equivalent CLI configuration:

```
crypto isakmp policy 10
encr des
hash md5
authentication pre-share
group1
```

3. Choose **Configure > VPN > VPN Components >IKE > Pre-shared Keys > Add** in order to set the pre-shared key value with peer IP address.

![Pre-shared Keys Configuration](image)

4. Click **OK**.
Note: Here is the equivalent CLI configuration:

```
Equivalent CLI Configuration

crypto isakmp key 6 L2L12345 address 172.16.1.2 255.255.255.0
```

5. Choose Configure > VPN > VPN Components > IPSec > Transform Sets > Add in order to create a transform set `myset` as shown in this image.

```
Add Transform Set

Name: myset

Data integrity with encryption (ESP)

Integrity Algorithm: ESP_MD5_HMAC

Encryption Algorithm: ESP_DES
```

6. Click OK.

```
Transform Set

<table>
<thead>
<tr>
<th>Name</th>
<th>ESP Encryption</th>
<th>ESP Integrity</th>
<th>AH Integrity</th>
</tr>
</thead>
<tbody>
<tr>
<td>myset</td>
<td>ESP_DES</td>
<td>ESP_MD5_HMAC</td>
<td></td>
</tr>
</tbody>
</table>
```

Note: Here is the equivalent CLI configuration:

```
Equivalent CLI Configuration

crypto ipsec transform-set myset esp-des esp-md5-hmac
```

7. Choose Configure > VPN > VPN Components > IPSec > IPSec Rules(ACLs) > Add in order to create a crypto Access Control List(ACL) 101.
8. Click OK.

Note: Here is the equivalent CLI configuration:

<table>
<thead>
<tr>
<th>Equivalent CLI Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-list 101 permit ip 10.5.5.0 0.0.0.255 192.168.1.0 0.0.0.255</td>
</tr>
</tbody>
</table>
9. Choose **Configure > VPN > VPN Components > IPSec > IPSec Policies > Add** in order to create crypto map *mymap* as shown in this image.

10. Click **Add**.

   a. Click the **General** tab and retain the default settings.

   b. Click the **Peer Information** tab in order to add the peer IP address 172.16.1.2.
c. Click the **Transform Sets** tab in order to select the desired transform set *myset*.

![Add Crypto Map Transform Sets Tab]

---

d. Click the **IPSec Rule** tab in order to select the existing crypto ACL 101.

![Add Crypto Map IPSec Rule Tab]
e. Click **OK**.

**Note:** Here is the equivalent CLI configuration:

```
Equivalent CLI Configuration

crypto map mymap 10 ipsec-isakmp
set peer 172.16.1.2
set transform-set myset
match address 101
```

11. Choose **Configure > VPN > Site-to-Site VPN > Edit Site-to-Site VPN > Add** in order to apply crypto map *mymap* to the interface Ethernet0/0.
12. Click OK.

**Note:** Here is the equivalent CLI configuration:

```
Equivalent CLI Configuration

interface Ethernet0/0
crypto map mymap
```

**Site_A Router CLI Configuration**

```

Complete these steps in order to verify the connection:

1. In SDM, choose **Tools > Ping** in order to establish the IPsec VPN tunnel with source IP as 192.168.1.1 and destination IP as 10.10.10.1.

2. Click **Test Tunnel** in order to check the IPsec VPN tunnel is established as shown in this image.

3. Click **Start**.
Troubleshoot

This section provides information you can use to troubleshoot your configuration.
