Introduction

This document describes how to troubleshoot Multicast VPN (mVPN) profile 14 within the Cisco IOS® XR.

Prerequisites

You must have knowledge of Multicast profile14 and its behaviour.

Requirements

Cisco recommends that MVPN BGP auto-discovery must be configured.

Also, it is recommended that you know these topics:

- Profiles “ 14
- Core Tree “ mLDP
- Service “ IPv4 VPN
- C-Overlay Signaling “ BGP
- Auto-Discovery “ BGP
- Model “ Partition MDT P2MP with BGP AD
- Encapsulation/forwarding “ MPLS

Components Used

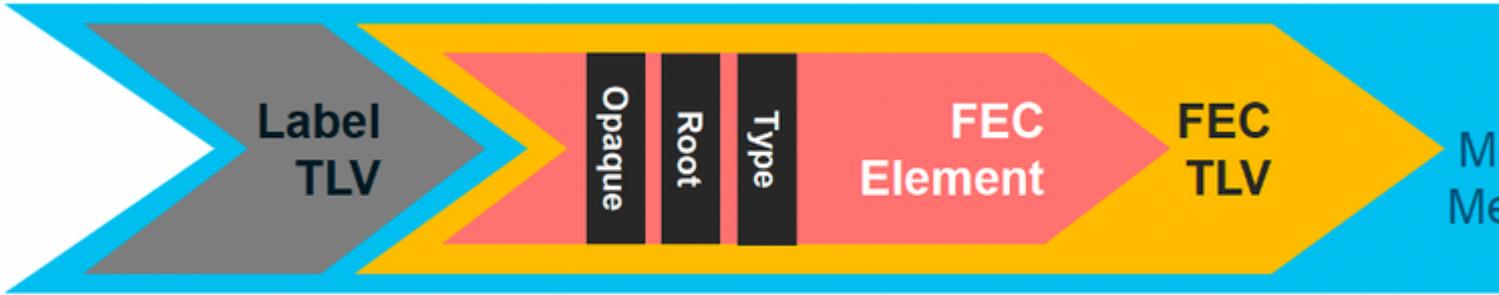

This document is not restricted to specific software and hardware versions.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

mLDP Concepts

Core Tree - mLDP

- Multipoint LDP = LDP + extensions
- P2MP tree -Receiver driven “Root learned from routing
- MP2MP tree “Configuration driven “Root configured
- Protection by MPLS TE or Loop-Free Alternate (LFA)
- No PHP “Top label identifies the tree
- Replication of mcast on the core routers
- FEC elements hold: Type of tree + Root + Opaque value: (S, G), MDT number, LSP ID

mLDP

MP2MP LSP vs P2MP LSP

We have two ways to send traffic between the PEs.

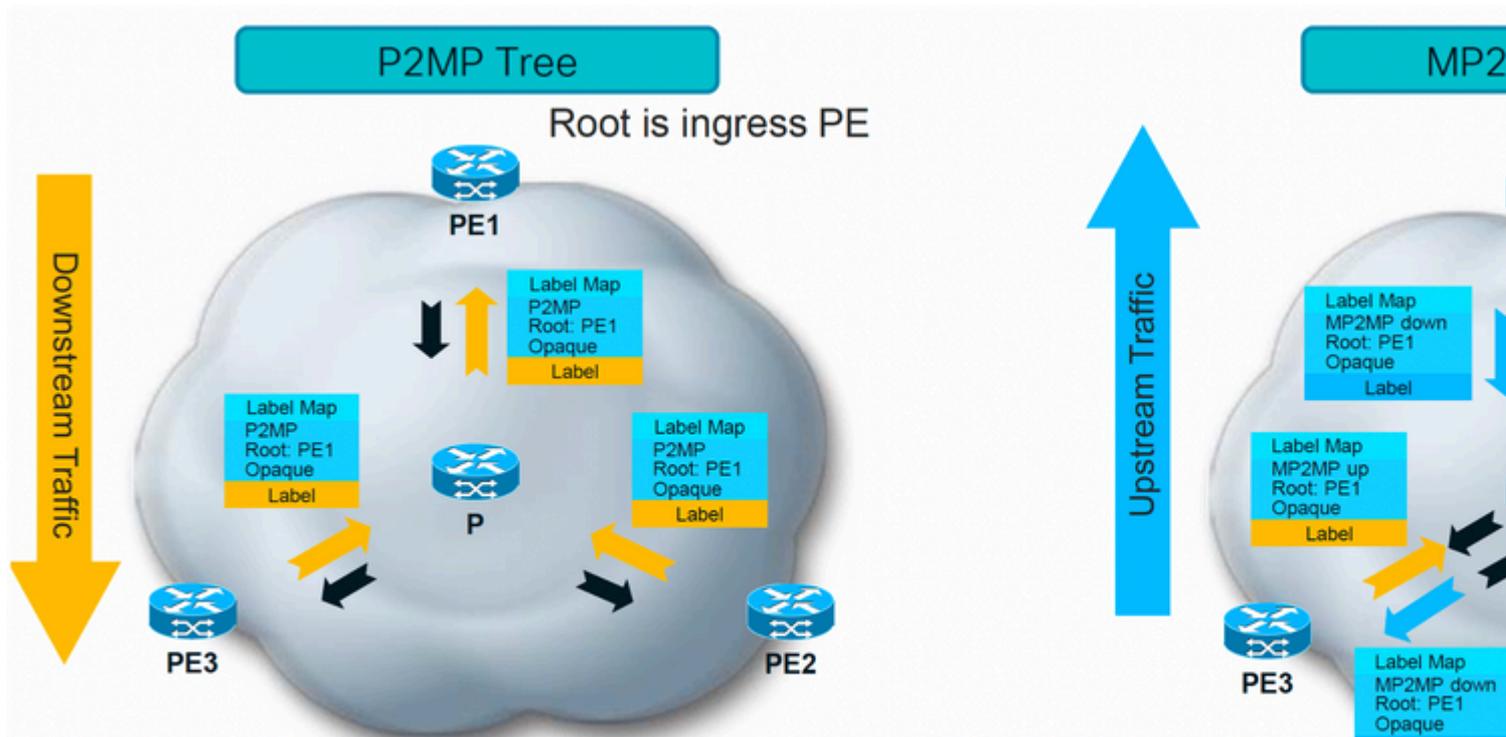

1. MP2MP - a static default MDT is created among all PEs for that particular user, this works as if all PEs for that user were connected in the same LAN segment.
2. P2MP - when a configurable threshold value is reached, the sender PE can create a new LSP so only the PEs that are involved in that communication see the traffic, this LSP is created to avoid unnecessary waste of bandwidth sending traffic to PEs that did not join the stream. This LSP only creates for an (S, G) entry in the user network, if you send traffic that exceeds the configured threshold through an (*, G) entry, no new P2MP is created (the concept of PHP can not be used in this scenario when the leaf acts as a root, otherwise it does not know which user that traffic belongs to).

mLDP work with a concept as root, it is somewhat similar to a Rendezvous Point in the PIM-SM scenario, but remember, in mLDP, a PIM-free MPLS core is mentioned, and PIM is only enabled in the user-facing interfaces.

In the MP2MP tree, the roots are responsible to receive the traffic from a leaf and replicate it to all directly connected neighbors.

Every PE can have more than one root configured, they choose its active root based on metric, if the metric is the same the highest IP address is elected as the root for that particular PE.

In the P2MP tree, the root is always the device sending the traffic (In this document the term root is used more to reference the MP2MP tree unless specified).

```
log
hello-adjacency
neighbor
nsr
graceful-restart
!
igmp sync delay on-session-up 25
mldp
address-family ipv4
make-before-break delay 60 60
forwarding recursive
recursive-fec
```

This concept is explained in the troubleshoot section. This configuration is required in the MID and BUD router.

Head/Root = This router has a Multicast source connected

Tail/Leaf = This router has Multicast receivers

Bud = This router is in transit and has some receivers connected

Mid = This router is in transit

Label Switch Multicast (LSM)/NG mVPN

- Leverage MPLS encapsulation > Share control and data plane with unicast
- Leverage new core tree protocols > mLDP, P2MP TE, BIER
- Fast ReRoute (FRR)
- Leverage proven functionality: Default and Data MDT
- More flexible designs per VPN
- Manageability: no need to track Multicast Groups per VPN/Default/Data MDT

BGP

AF IPv4 mVPN

AF IPv4 mVPN is added to be able to support the NG profiles. It is referred to as the MCAST-VPN NLRI. There are two main functions of this address family:

- Auto-Discovery (AD)
- Customer Signaling in overlay

Auto-Discovery means that the PE routers learn of each other in an automatic manner. PE routers learn which other PE routers are enabled for multicast for a VPN. This avoids the need to manually configure this on every PE router.

The user signaling in overlay is the signaling of (*, G) or (S, G) information, but now in BGP instead of PIM.

Look at Figure A to see the overview of BGP AD IPv4 MVPN.

BGP Auto Discovery + C-Signalling

BGP update

PMSI Tunnel Attribute (PTA)

mcast vprn

Flags (1 octet)	0-6 – Reserved 7 – L – Leaf information required
Tunnel type (1 octet)	0 No tunnel information present 1 RSVP-TE P2MP LSP 2 mLDP P2MP LSP 3 PIM-SSM Tree 4 PIM-SM Tree 5 PIM-Bidir Tree 6 Ingress Replication 7 mLDP MP2MP LSP
MPLS label (3 octets)	MPLS label
Tunnel Identifier (variable)	1 RSVP-TE P2MP LSP - <Extended Tunnel ID, Reserved, Tunnel ID, P2MP ID> 2 mLDP P2MP LSP - <P2MP FEC Element> 3 PIM-SSM Tree - <P- Root Node Address, P-Multicast Group> 4 PIM-SM Tree - <Sender Address, P-Multicast Group> 5 PIM-Bidir Tree - <Sender Address, P-Multicast Group> 6 Ingress replication - <unicast tunnel endpoint IP address of the local PE that is to be this PE's receiving endpoint address for the tunnel> 7 mLDP MP2MP LSP - <MP2MP FEC Element>

Route type (1 octet)	1 Intra-AS 2 Inter-AS 3 S-PMSI 4 Leaf A-D 5 Source 6 Shared 7 Source
Length (1 octet)	Length in field of MC
Route type specific (variable length)	One or mo RD (8 octe MCAST se MCAST se MCAST g MCAST g Originating

Figure A - BGP IPv4 AD MVPN

There are two important pieces of information carried out by BGP in the AF IPv4 MVPN. The first part of information sits in the NLRI itself. There is a number from 1-7 that represents the Route Type. Each Route Type has a specific function. The first 5 are used for BGP-AD. Note that Route Type 3 is actually also used for Data MDT (S-PMSI) signaling.

The last two types, 6 and 7, are used for C-multicast signaling. Next to the Route Type, there is also specific Route Type information embedded which pertains to the RD (if VPN context is used), specific C-multicast info (Source, Group) and the IP address (PE) of the originator.

The second part is the PMSI Tunnel Attribute (PTA). This PTA holds information that pertains to the core tree tunnels that are used. The tunnel type indicates a number of which core tree protocol is used to build the tunnel. The tunnel identifier is a set of fields which uniquely describes the tunnel by specific core tree protocol fields.

BGP mVPN Route Types

Route Type	Name	AD or C-mcast	Usage
1	Intra-AS I-PMSI A-D route	AD	AD Advertise member PE

2	Inter-AS I-PMSI A-D route	AD	Same as type 1, but for inter-AS
3	S-PMSI A-D route	AD	Advertised by Source PE to signal Data MDT
4	Leaf A-D route	AD	Advertised by Receiver-PE as a response to type 3 route with leaf info required flag set
5	Source Active A-D route	AD	Advertised by Source PE with an active source to facilitate SPT switchover
6	Shared Tree Join route	C-mcast	Advertise (*, G) by Receiver PE
7	Source Tree Join route	C-mcast	Advertise (S, G) by Receiver PE

Route Types in AF IPv4 MVPN

This section provides an overview of the different route types and their purpose.

Intra-AS I-PMSI A-D Route (Type 1)

Purpose: To advertise the PE as to participate in MVPN for a certain VPN. This is BGP-AD.

Encoding:

```

+-----+
|   RD   (8 octets)   |
+-----+
| Originating Router's IP Addr |
+-----+

```

Inter-AS I-PMSI A-D Route (Type 2)

Purpose

Advertised by an ASBR, so that Inter-Autonomous mVPN can be signaled.

Encoding

```

+-----+
|      RD      (8 octets)      |
+-----+
|      Source AS (4 octets)    |
+-----+

```

S-PMSI A-D Route (Type 3)

Purpose

1. Advertised by the PE router, in order for it to signal to other PE routers that it is the Ingress PE for a certain C-(S, G) and that it switches over to a Data MDT. The core tree information needed to receive PE routers joins this stream is encoded in the PTA.
2. Advertised by a PE router, it indicates that it wants to participate in a Partitioned MDT model. In that case, the Source and Group fields are wildcard (*,*) elements.

Encoding

```

+-----+
|      RD      (8 octets)      |
+-----+
| Multicast Source Length (1 octet) |
+-----+
| Multicast Source (variable)      |
+-----+
| Multicast Group Length (1 octet) |
+-----+
| Multicast Group (variable)       |
+-----+
| Originating Router's IP Addr     |
+-----+

```

The Source and Group fields relate to C-multicast state.

Leaf A-D Route (Type 4)

Purpose

This message is sent in response to obtain an Inter-AS I-PMSI A-D route or a S-PMSI A-D route, only if the Leaf Information (LI) Required bit is set.

Encoding

```
+-----+
|   Route Key (variable)   |
+-----+
| Originating Router's IP Addr |
+-----+
```

The Route Key is set to the NLRI of the received route with the Leaf Information Required bit set.

If the Leaf A-D is generated that corresponds to inter-as I-PMSI route, then its NLRI looks like this:

```
+-----+
|   Type (1 octet): 4      |
+-----+
|   Length (1 octet)      |
+-----+
|   Type (1 octet): 2      |
+-----+
|   Length (1 octet)      |
+-----+
|   RD (8 octet)          |
+-----+
| Source AS (4 octet)      |
+-----+
| Originating Router's IP Addr |
+-----+
```

If the Leaf A-D route is generated that corresponds to the S-PMSI route, then its NLRI looks like this:

```
+-----+
|   Type (1 octet): 4      |
```

```

+-----+
| Length (1 octet) |
+-----+
| Type (1 octet): 3 |
+-----+
| Length (1 octet) |
+-----+
| RD (8 octet) |
+-----+
| Multicast Source Length (1 octet) |
+-----+
| Multicast Source (Variable) |
+-----+
| Multicast Group Length (1 octet) |
+-----+
| Multicast Group (Variable) |
+-----+
| Origin Routers IP addr for SPMSI |
+-----+
|Origin Router's IP Addr for Leaf-ad|
+-----+

```

Source Active A-D Route (Type 5)

Purpose

The usage of the Source Active Route is related to PIM Sparse Mode in overlay signaling. Refer to that section for more information.

Encoding

```

+-----+
| RD (8 octets) |
+-----+

```

```

| Multicast Source Length (1 octet) |
+-----+
| Multicast Source (variable)      |
+-----+
| Multicast Group Length (1 octet) |
+-----+
| Multicast Group (variable)       |
+-----+

```

Shared Tree Join Route (Type 6)

Purpose

The BGP Update or Withdraw message is the equivalent of a PIM (*, G) Join or Prune message.

Encoding

Type 6 & 7 Routes have the same NLRI encoding.

```

+-----+
| RD (8 octets)                    |
+-----+
| Source AS (4 octets)             |
+-----+
| Multicast Source Length (1 octet) |
+-----+
| Multicast Source (variable)       |
+-----+
| Multicast Group Length (1 octet) |
+-----+
| Multicast Group (variable)        |
+-----+

```

Source Tree Join Route (Type 7)

Purpose

The BGP Update or Withdraw message is the equivalent of a PIM (S,G) Join or Prune message.

Encoding

Type 6 & 7 Routes have the same NLRI encoding.

```

+-----+
| RD (8 octets)                    |
+-----+
| Source AS (4 octets)             |
+-----+
| Multicast Source Length (1 octet) |
+-----+

```

```

+-----+
| Multicast Source (variable) |
+-----+
| Multicast Group Length (1 octet) |
+-----+
| Multicast Group (variable) |
+-----+

```

AF IPv4 MVPN NLRI Encoding

This section lists the encoding of the network part for IPv4 MVPN routes per Route Type. Note that the RD is not included for Route Types 1, 2, and 3. The network part is listed with the number in () and it represents the number of octets for each part. The first number is always the Route Type (1-7). The Prefix-length part is listed in the number of bits.

Intra-AS A_D Route

```

Network:          [1] [PE address (4)]
Prefix-length:    40

```

Inter-as A-D route

```

Network:          [2] [AS (4)]
Prefix-length:    40

```

S-PMSI A-D route

```

Network:          [3] [srclen (1)] [src (4)] [1 grplen] [grp (4)] [PE address (4)]
Prefix-length:    120

```

Leaf A-D route

```

Network:          [4] [2] [RD] (8)] [AS (4)] [ PE address (4)]
Prefix-length:    144

```

or

Network: [4] [3] [RD (8)] [srclen (1)] [src (4)] [grplen (1)] [grp (4)] [PE address (4)]
Prefix-length: 224

Source-Active A-D route

Network: [5] [srclen (1)] [src (4)] [grplen (1)] [grp (4)]
Prefix-length: 88

C-Multicast Route - Shared-tree Join

Network: [6] [RD (8)] [AS (4)] [srclen (1)] [src (4)] [grplen (1)] [grp (4)]
Prefix-length: 184

C-Multicast Route Source-tree Join

Network: [7] [RD (8)] [AS (4)] [srclen (1)] [src (4)] [grplen (1)] [4 grp]
Prefix-length: 184

The network and prefix length for each route type can be found in the output of `show bgp ipv4 mvpn` command in Cisco IOS or Cisco IOS XR. Here is an example of the output for this command from Cisco IOS XR:

```
DRP/0/3/CPU1:Router#show bgp ipv4 mvpn vrf one
Route Distinguisher: 1:2 (default for vrf one)

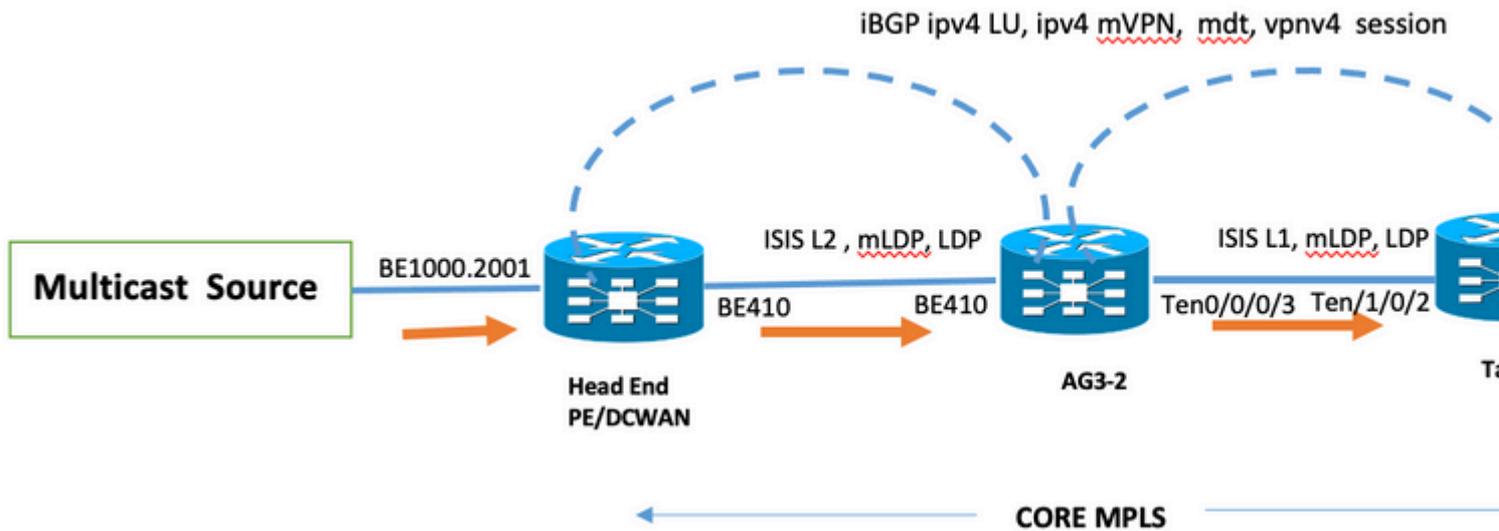

*>i[1][10.1.100.1]/40 10.1.100.1 100 0 i
*>i [3][1:1][*][*][10.100.1.1]/14
10.100.1.1 0 100 0 ?
*>i[3][3][1:2][32][10.2.2.9][32][225.1.1.1][10.1.100.2][10.1.100.5]/224
10.1.100.5 100 0 i
*>i[4][3][1:2][32][10.2.100.9][32][225.1.1.1][10.1.100.2][10.1.100.1]/224
10.1.100.1 100 0 i
*>i[5][32][10.2.2.9][32][225.1.1.1]/88
10.1.100.2 100 0 i
*>i[6][1:5][1][32][10.2.100.12][32][225.1.1.1]/184
10.1.100.1 100 0 i
*>i[7][1:2][1][32][10.2.2.9][32][232.1.1.1]/184
10.1.100.1 100 0 i
```

Configuration

Refer to this [document](#) to know how to configure mVPN with Cisco IOS XR.

Topology

Partitioned MDT - mLDP P2MP - BGP-AD - BGP C-Mcast Signaling - SSM

Multicast Profile 14 topology

Platform: ASR9K

Steps to Troubleshoot

1. Check if there are any system-level alarms on the reported node (Source PE/Receiver PE/MID Router).

```
Show pfm location all
```

```
Show logging (Check for critical or major logs)
```

```
admin show alarm
```

2. Check the MPLS core connectivity between the Headend router and Tail End Router.

3. Check the local connectivity of the Multicast Source/Receiver to connected PE routers.

4. Check the End-to-End connectivity between Multicast Source and receiver.

5. Check the configuration as per the configuration guide mentioned in the previously mentioned document.

6. Basic verification from system health check:

- Check if any system alarm (**show pfm location all**)
- Check memory and CPU

```
show memory summary location all
```

```
show shmwin summary location all
```

```
show processes memory detail location all
```

```
show process cpu location <>
```

- Check interface and QoS Stats
- Check show logging, if there is any critical notification or errors
- Check for any configuration changes due to which impact or issue observed
- Platform drops

Towards Core

Verify MLDP status:

```
RP/0/RSP0/CPU0:AG2-1#sh mpls mldp status
```

```
Fri Mar 12 02:56:00.727 EST
```

```
mLDP statistics
```

```
Process status : Active, Running and Ready
```

```
Logging notifications : Disabled
```

```
Label release scan in : never
```

```
LSM ID scan in : never
```

```
RIB connection status : Connected
```

```
RIB connection open : Yes
```

Check the MLDP database with Global-id:

The behaviour of recursive-fec.

Here for Tail/leaf end to reach root/Head end, there is next-hop change.

On Tail End, Head end loopback is learned via AG3-2 (MID Router). So here recursive-fec plays an important role

Configuration:

```
<#root>
```

```
mldp
```

```
address-family ipv4
```

```
recursive-fec
```

```
!
```

- Enable mLDP recursive fec makea Leaf (Ingress PE) to build Partitioned MDT towards the upstream router and insert the inline-RR (AG3-2) (that is, next-hop for Ingress PE/Original Root prefix) as the root.

```
<#root>
```

```
RP/0/RSP0/CPU0:AG2-1#sh mpls mldp database root 10.44.0.10 opaquetype global-id 4 details
```

Fri Mar 12 03:42:20.594 EST

[np:NP 3 TM 0] drop paks: +5909 >>> Check TM drops if it increasing rapidly check the QOS stats & RFD bu

[np:NP 5 TM 0] drop paks: +909

[np:NP 6 TM 0] drop paks: +8925

[np:NP 7 TM 0] drop paks: +5491

If you observe that TM drops increase more rapidly, then collect these logs:

Show policy-map interface <> out >>>> egress stats >>>>Check if there is any drops in queue

Collect np datalogs

Get into LC shell (run attach 0/x/cpu0)

Execute **show_np** "e <np_id> -d npdatalog

Also, collect multiple(4-5) iterations of the pipeline from the LC shell.

<#root>

```
show_np -e <np_id> -d -pipeline >>>>
```

Only applicable for Tomhawk LC

Since Multicast traffic uses TM loopback, check if there are any drops in qshal (example NP4 Location 4).

Sample o/p:

```
Tailend#show qshal loopback-queue np 4 location 0/0/CPU0
Tue Jun 9 10:51:12.908 IST
TY Options argc:6
nphal_show_chk -p 2049loopback-queue-n 0x4

```

To catch any bursty traffic:

```
np_perf -e 0 -R -o 4 -D 10 -n 5000
```

R is for rfd

O is for special ports (loopback comes under that)

D is duration; in the above example it is 10 secs; max you can specify is 2 days or something like that

Log Collection

Collect these show techs related to multicast:

```
show tech-support multicast address-family ipv4
show tech-support multicast address-family ipv4 hardware
show tech-support multicast vrf <> address-family ipv4
show tech-support multicast vrf <> address-family ipv4 hardware
```

If you observe any NP for fabric issues or drops, capture this CLI:

```
show tech np
show tech fabric
```

Collect np datalogs:

1. Get into LC shell (run `attach 0/x/cpu0`)
2. Execute this command: `show_np <np_id> -d npdatalog`

If you observe any process crash:

1. Upload core dump for that process file end with `core.tgz` and `core.txt` . The default file generated gets saved in `harddisk:/`

2. Upload show tech for that process. The Default file generated gets saved in `harddisk:/showtech`

If you observe any process blocked through CLI, use this command: `show process blocked location all`

Take:

- Follow process `<JID>` iteration 5 location `<>`
- Dumpcore running `<JID/Process name>` location `<>`
 - This CLI generates dump core and uploads core dump for that process, files end with `core.tgz` and `core.txt`.
 - The default file generated gets saved in `harddisk:/`
- Upload show tech for that process.
