Introduction

Ping packet test is commonly used test to troubleshoot connectivity issues. This document will illustrate a systematic approach for using ping test to check the Network Convergence System 6000 (NCS6K) slow forwarding packet.

Prerequisites

Requirements

Readers of this document should have knowledge of these topics:

- Basic IP routing.
- XR operating system.

Components Used

This document is created for NCS6K platform.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Background Information

There is a key difference between NCS6K and traditional IOS-XR platform: NCS6K utilizes virtualization technology to build up the system. Each node, Routing Processor (RP) or Line Card (LC), may run several Virtual Machines (VM) like system admin VM, IOS-XR VM1, IOS-XR VM2 etc, which combined to together create a fully functional XR node. Following figure shows an example where RP and LC run one IOS-XR VM:

Figure 1
There is a control ethernet network to connect RPs and LCs. The control plane traffic between RPs and LCs will pass through this control ethernet network. Since this is a virtualization environment, questions like how these packet are delivered to specific VM and how the Nicantic (NIC) in RP or LC knows a packet is destined to them?

In a nutshell, VLANs are used to differentiate traffic of different VMs and this process is done by NIC. Figure 2 shows how NIC will deliver VLAN 3074 traffic to IOS-XR VM, and VLAN 3073 traffic to Admin VM.

**Figure 2**

Putting these forwarding component together, you get a simplified forwarding path for ping test scenario as shown in figure 3.

When doing a ping test from RP, packets take the following forwarding path inside the box:

RP_PING $\rightarrow$ RP_NETIO $\rightarrow$ RP_SPP $\rightarrow$ RP_Linux_Kernel_Socket $\rightarrow$ Switch $\rightarrow$ LC_FIA $\rightarrow$ LC_NPU (Include PSE, PLIM_ASIC) $\rightarrow$ Line

**Figure 3**
Verify

For rest of the document, a scenario where a ping would be initiated from the RP will be taken as an example. The ping would be initiated to a directly connected host on Te0/0/0/2/0. Following steps will show a step by step approach to verify the path of this ping packet.

```

1. "show IPv4 traffic" counter on RP node, will show how many Internet Control Message Protocol (ICMP) echos have been sent out and how many ICMP reply have returned.

2. Check Network Input Output (NETIO) component. Next step is to check RP FINT NETIO chain counter. You have to see the "OUT" counter of IPv4 node in netio chain. If it increments, it means packets have reached NETIO component and are being sent out from NETIO component.

Check initial NETIO counter value.

```
RP/0/RP0/CPU0:NCS6k-Deploy#sh netio chains FINT loc 0/rp0/cpu0 | in Stats
<Protocol number> (name)  Stats
<6> (fint_n2n)   Stats IN: 0 pkts, 0 bytes; OUT: 0 pkts, 0 bytes
<10> (clns)   Stats IN: 0 pkts, 0 bytes; OUT: 0 pkts, 0 bytes
<12> (ipv4)   Stats IN: 2788 pkts, 115373 bytes; OUT: 2816 pkts, 117933 bytes
<13> (mpls)   Stats IN: 16482 pkts, 2467508 bytes; OUT: 0 pkts, 0 bytes

<36> (l2transport)   Stats IN: 0 pkts, 0 bytes; OUT: 0 pkts, 0 bytes
```

Initiate 10 ping packets.
```
RP/0/RP0/CPU0:NCS6k-Deploy#ping 10.67.1.1 coun 10
Type escape sequence to abort.
Sending 10, 100-byte ICMP Echos to 10.67.1.1, timeout is 2 seconds:
!!!!!!!!!!
Success rate is 100 percent (10/10), round-trip min/avg/max = 4/7/8 ms
```

Check NETIO counter again. You would see increment of 10 packets.
```
RP/0/RP0/CPU0:NCS6k-Deploy#sh netio chains FINT loc 0/rp0/cpu0 | in Stats
<Protocol number> (name)  Stats
<6> (fint_n2n)   Stats IN: 0 pkts, 0 bytes; OUT: 0 pkts, 0 bytes

```

You can also use KornShell (ksh) command "show_netio_fwder_stats -g" to check if inject/punt counter increments or not. Note: In production environment, there may be other background traffic which makes it hard to check if ping packets reached this component or not. As a workaround, you can use large number of packets with timeout 0 : "ping x.x.x.x count 10000 time 0" and check if the counter increments suddenly or has a spike.

```
RP/0/RP0/CPU0:NCS6k-Deploy#run show_netio_fwder_stats -g
RECEIVE STATISTICS SUMMARY:
rx_pkts: 2224455
```
Initiate 10 ping packets.
RP/0/RP0/CPU0:NCS6k-Deploy#ping 10.67.1.1 coun 10
Type escape sequence to abort.
Sending 10, 100-byte ICMP Echos to 10.67.1.1, timeout is 2 seconds:
!!!!!!!!!!!
Success rate is 100 percent (10/10), round-trip min/avg/max = 3/4/7 ms

Check counter again to check to see increment of 10 packets.

eth-vf1.514 is used for communication with Mgmtether interface but you cannot see IPv4 address. Mgmtether interface in XR VM relies on IP stack of IOS-XR instead of IP stack in Linux.
ether-vf1.3073 is used for communication with Admin VM.
ether-vf1.3074 is used for XR VM related control plane traffic. Ping test packet will pass through this sub-interface (using Linux network protocol stack). Tcpdump associated with Linux has lot of options on how to dump interesting traffic. In addition, you can use tcpdump tools to sniff Secure Domain Router (SDR) control plane traffic (vlan 3074) or sniff other traffic like Inter Process Communication (IPC) communication in vlan 3073.xr

Note: Since it is VM scenario, the traffic sent to VM may be encapsulated with VM interface address in the outer header so that this traffic can reach the VM interface. The above packet dump is actually was encapsulated with UDP packet header with source/destination 172.0.16.1, which is eth-vf1.3074 ip address in IOS-XR VM. Note: The captures taken are to demonstrate the approach and do not have Internet Control Message Protocol (ICMP) traffic.

8. **Check "show interface" counters.** It is good idea to check this in first step but in sequence of packet flow this would be last. It helps to identify if the packet has been sent to the line, and if the packet has been returned from the line. It can help narrow down whether the problem is inside the box or outside of this box.  
Check initial counter values.
