## Introduction

This document describes the release details of the AMP Private Cloud 2.4 release.

## AMP Private Cloud 2.4 Release Details

AMP Private Cloud v2.4 includes a new AMP Cloud protocol allowing us to bring more features to the AMP platform. New installs of AMP Private Cloud v2.4 and later will automatically use the new protocol. Existing installs upgraded to AMP Private Cloud v2.4 will continue to use the old protocol but a migration wizard is provided in the administration console that allows you to migrate to the new AMP Cloud protocol.

We recommend that all AMP Private Cloud administrators migrate to the new AMP Cloud protocol. The newly added AMP for Endpoints Linux Connector and latest versions of the AMP for Endpoints Windows and Mac Connectors with new features are only supported on AMP Private Cloud servers running the new AMP Cloud protocol.

Older versions of the AMP for Endpoints Windows and Mac Connectors do not support the new AMP Cloud protocol. You must upgrade any existing AMP for Endpoints Mac Connector v1.3 and AMP for Endpoints Windows Connector v5.0 or greater after running the migration wizard. We always recommend upgrading to the latest available version of all AMP for Endpoint Connectors.

**Note:** To continue using the TETRA engine you must migrate to the new AMP Cloud protocol and upgrade to AMP for Endpoints Windows Connector v5.1.11 by October 31, 2017.
