[Related Information](#)

## [Introduction](#)

This document provides a sample configuration for synchronizing the PIX/ASA Security Appliance clock with a network time server using Network Time Protocol (NTP). ASA1 communicates directly with the network time server. ASA2 passes NTP traffic through an IPsec tunnel to ASA1, which in turn forwards the packets to the network time server.

Refer to [ASA 8.3 and Later: NTP with and without an IPsec Tunnel Configuration Example](#) for more information on the identical configuration on Cisco ASA with versions 8.3 and later.

**Note:** A Router can also be used as an NTP server for synchronizing the PIX/ASA Security Appliance clock.

## [Prerequisites](#)

## [Requirements](#)

Ensure that you meet these requirements before you attempt this configuration:

- End-to-end IPsec connectivity must be established before starting this NTP configuration.

- The Security Appliance license must be enabled for Data Encryption Standard (DES) encryption (at a minimum encryption level).

## Components Used

The information in this document is based on the software and hardware versions below.

- Cisco Adaptive Security Appliance(ASA) with version 7.x and later
- ASDM version 5.x.and later

**Note:** Refer to [Allowing HTTPS Access for ASDM](#) in order to allow the ASA to be configured by the ASDM.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Related Products

This configuration can also be used with the Cisco PIX 500 Series Security Appliance, which runs version 7.x and later.

**Note:** NTP support was added in PIX version 6.2. Refer to [PIX 6.2: NTP with and without an IPsec Tunnel Configuration Example](#) in order to configure NTP on the Cisco PIX Firewall.

## Conventions

Refer to the [Cisco Technical Tips Conventions](#) for more information on document conventions.

## Configuration

### Network Diagram

This document uses the network setup shown in this diagram.

**Note:** The IP addressing schemes used in this configuration are not legally routable on the

Internet. They are [RFC 1918](#) addresses, which have been used in a lab environment.

- [VPN Tunnel ASDM Configuration](#)
- [NTP ASDM Configuration](#)
- [ASA1 CLI Configuration](#)
- [ASA2 CLI Configuration](#)

## VPN Tunnel ASDM Configuration

Complete these steps to create the VPN tunnel:

1. Open your browser and type **https://<Inside\_IP\_Address\_of\_ASA>** to access the ASDM on the ASA. Be sure to authorize any warnings your browser gives you related to SSL certificate authenticity. The default username and password are both blank. The ASA presents this window to allow the download of the ASDM application. This example loads the application onto the local computer and does not run in a Java applet.

2. Click **Download ASDM Launcher and Start ASDM** in order to download the installer for the ASDM application.
3. Once the ASDM Launcher downloads, complete the steps directed by the prompts in order to install the software and run the Cisco ASDM Launcher.
4. Enter the IP address for the interface you configured with the **http -** command and a username and password if you specified one. This example uses the default blank username

and password.

5. Run the VPN Wizard once the ASDM application connects to the ASA.

6. Choose the **Site-to-Site** IPsec VPN tunnel

type.

7. Specify the outside IP address of the remote peer. Enter the authentication information to use, which is the pre-shared key in this example.

8. Specify the attributes to use for IKE, also known as Phase 1. These attributes must be the

same on both sides of the

tunnel.

9. Specify the attributes to use for IPsec, also known as Phase 2. These attributes must match on both

sides.

10. Specify the hosts whose traffic should be allowed to pass through the VPN tunnel. In this

step, the hosts local to ASA1 are specified.

11. The hosts and networks on the remote side of the tunnel are specified.

12. The attributes defined by the VPN Wizard are displayed in this summary. Double check the configuration and click **Finish** when you are satisfied the settings are correct.

## [NTP ASDM Configuration](#)

Complete these steps to configure NTP on the Cisco Security Appliance:

1. Choose **Configuration** in the ASDM home page as shown

here:

2. Now choose **Properties > Device Management > NTP** in order to open the **NTP** configuration page of ASDM as shown

here:

3. Click the **ADD** button in order to add a NTP server and provide the required attributes such as IP address, Interface name (Inside or Outside), key number and key value for Authentication in the new window that comes up after you have clicked on the **ADD** button as shown in the screen shot. Then click on

The screenshot shows a dialog box titled "Add NTP Server Configuration". It has a blue title bar with a close button. The main area is light gray with a grid pattern. It contains the following fields and controls:

- IP Address: 172.22.1.161 (text box)
- Interface: inside (dropdown menu)
- Authentication Key section (bordered box):
  - Key Number: 1 (dropdown menu)
  - Key Value: \*\*\*\*\* (text box)
  - Reenter Key Value: \*\*\*\*\* (text box)
  - Trusted:  (checkbox)
- Preferred:  (checkbox)
- Buttons: OK, Cancel, Help (at the bottom)

The "OK" button is circled in red.

OK.

**Note:** The interface name should be chosen as inside for ASA1 and outside for ASA2. **Note:** The ntp authentication key should be the same in ASA and the NTP server. The Authentication attribute configuration in cli for ASA1 and ASA2 are shown

below: ASA1#ntp authentication-key 1 md5 cisco ntp trusted-key 1 ntp server 172.22.1.161 key 1 source inside  
ASA2#ntp authentication-key 1 md5 cisco ntp trusted-key 1 ntp server 172.22.1.161 key 1 source outside

4. Now click the checkbox **Enable NTP Authentication** and click **Apply**, which completes the NTP configuration task.

## ASA1 CLI Configuration

### ASA1

```
ASA#show run : Saved ASA Version 7.1(1) ! hostname ASA1
domain-name default.domain.invalid enable password
