## Introduction

This document describes how to use Firepower Threat Defense (FTD) captures and Packet Tracer utilities.

# Prerequisites

## Requirements

There are no specific requirements for this document.

## Components Used

The information in this document is based on these software versions:

- ASA5515-X that runs FTD software 6.1.0
- FPR4110 that runs FTD software 6.2.2
- FS4000 that runs Firepower Management Center (FMC) software 6.2.2

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

## Background Information

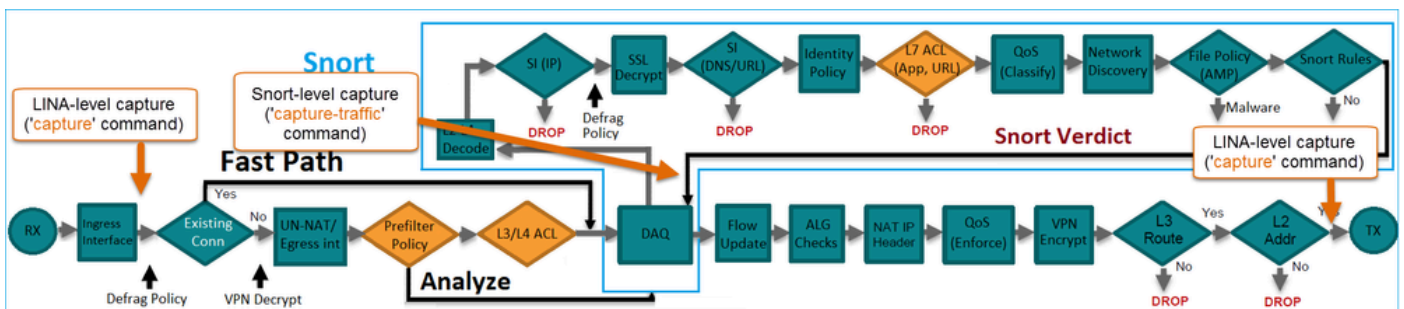

### FTD Packet Processing

The FTD packet processing is visualized as follows:

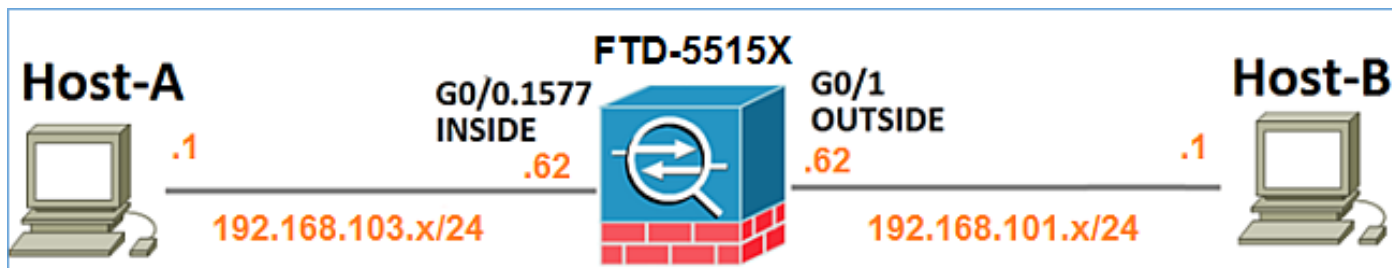

1. A packet enters the ingress interface, and it is handled by the LINA engine.
2. If the policy requires the packet to be inspected by the Snort engine.
3. The Snort engine returns a verdict for the packet.
4. The LINA engine drops or forwards the packet based on Snort's verdict.

Based on the architecture, the FTD captures can be taken in these places:

## Configure

## Network Diagram

## Work with Snort Engine Captures

### Prerequisites

There is an Access Control Policy (ACP) applied on FTD that allows Internet Control Message Protocol (ICMP) traffic to go through. The policy also has an Intrusion Policy applied:

The screenshot shows the FTD5515 Policies configuration page. The 'Policies' tab is selected, and the 'Access Control' sub-tab is active. The page displays the configuration for the 'Mandatory - FTD5515- (1-1)' policy. The policy is configured to allow ICMP traffic from the source network 192.168.103.0/24 to the destination network 192.168.101.0/24. The action is set to 'Allow'. The 'Intrusion Policy' is also applied to this rule.

#	Name	S... Z...	D... Z...	Source Networks	Dest Networks	V...	U...	A...	Sr...	Dest P...	U...	IS...	Action	Shield	Folder	Count	Tools
1	Allow ICMP	any	any	192.168.103.0/24	192.168.101.0/24	any	any	any	any	ICMP (1)	any	any	Allow	Shield	Folder	1	Tools

### Requirements

1. Enable capture on FTD CLISH mode without a filter.
2. Ping through the FTD and check the captured output.

### Solution

**Step 1.** Log in to the FTD console or SSH to the br1 interface and enable capture on FTD CLISH mode without a filter.

```
<#root>
```

```
>
```

```
capture-traffic
```

Please choose domain to capture traffic from:

```
0 - br1
```

1 - Router

Selection?

1

Please specify tcpdump options desired.  
(or enter '?' for a list of supported options)  
Options:

On FTD 6.0.x, the command is:

<#root>

>

**system support**

**capture-traffic**

**Step 2.** Ping through FTD and check the captured output.

<#root>

>

**capture-traffic**

Please choose domain to capture traffic from:

0 - br1

1 - Router

Selection?

1

Please specify tcpdump options desired.  
(or enter '?' for a list of supported options)  
Options:

```
12:52:34.749945 IP olab-vl603-gw.cisco.com > olab-vl647-gw.cisco.com: ICMP echo request, id 0, seq 1, len 60
12:52:34.749945 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 0, seq 1, len 60
12:52:34.759955 IP olab-vl603-gw.cisco.com > olab-vl647-gw.cisco.com: ICMP echo request, id 0, seq 2, len 60
12:52:34.759955 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 0, seq 2, len 60
12:52:34.759955 IP olab-vl603-gw.cisco.com > olab-vl647-gw.cisco.com: ICMP echo request, id 0, seq 3, len 60
12:52:34.759955 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 0, seq 3, len 60
12:52:34.759955 IP olab-vl603-gw.cisco.com > olab-vl647-gw.cisco.com: ICMP echo request, id 0, seq 4, len 60
12:52:34.759955 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 0, seq 4, len 60
^C    <- to exit press CTRL + C
```

## Work with Snort Engine Captures

## Requirements

1. Enable capture on FTD CLISH mode with the use of a filter for IP 192.168.101.1.
2. Ping through FTD and check the captured output.

## Solution

**Step 1.** Enable capture on FTD CLISH mode with the use of a filter for IP 192.168.101.1.

```
<#root>
```

```
>
```

```
capture-traffic
```

```
Please choose domain to capture traffic from:
```

```
0 - br1
```

```
1 - Router
```

```
Selection?
```

```
1
```

```
Please specify tcpdump options desired.
```

```
(or enter '?' for a list of supported options)
```

```
Options:
```

```
host 192.168.101.1
```

**Step 2.** Ping through the FTD and check the captured output:

```
13:28:36.079982 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 3, seq 0, len 60
```

```
13:28:36.079982 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 3, seq 1, len 60
```

```
13:28:36.079982 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 3, seq 2, len 60
```

```
13:28:36.079982 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 3, seq 3, len 60
```

```
13:28:36.079982 IP olab-vl647-gw.cisco.com > olab-vl603-gw.cisco.com: ICMP echo reply, id 3, seq 4, len 60
```

You can use the **-n** option to see the hosts and port numbers in numeric format. For example, the earlier capture is shown as:

```
<#root>
```

```
>
```

```
capture-traffic
```

```
Please choose domain to capture traffic from:
```

```
0 - br1
```

```
1 - Router
```

Selection?

1

Please specify tcpdump options desired.  
(or enter '?' for a list of supported options)  
Options:

```
-n host 192.168.101.1
```

```
13:29:59.599959 IP 192.168.101.1 > 192.168.103.1: ICMP echo reply, id 5, seq 0, length 80
13:29:59.599959 IP 192.168.101.1 > 192.168.103.1: ICMP echo reply, id 5, seq 1, length 80
13:29:59.599959 IP 192.168.101.1 > 192.168.103.1: ICMP echo reply, id 5, seq 2, length 80
13:29:59.599959 IP 192.168.101.1 > 192.168.103.1: ICMP echo reply, id 5, seq 3, length 80
13:29:59.599959 IP 192.168.101.1 > 192.168.103.1: ICMP echo reply, id 5, seq 4, length 80
```

## Tcpdump Filter Examples

### Example 1:

In order to capture Src IP or Dst IP = 192.168.101.1 and Src port or Dst port = TCP/UDP 23, enter this command:

```
<#root>
```

Options:

```
-n host 192.168.101.1 and port 23
```

### Example 2:

In order to capture Src IP = 192.168.101.1 and Src port = TCP/UDP 23, enter this command:

```
<#root>
```

Options:

```
-n src 192.168.101.1 and src port 23
```

### Example 3:

In order to capture Src IP = 192.168.101.1 and Src port = TCP 23, enter this command:

```
<#root>
```

Options:

```
-n src 192.168.101.1 and tcp and src port 23
```

#### Example 4:

In order to capture Src IP = 192.168.101.1 and see the MAC address of the packets add the 'e' option, and enter this command:

```
<#root>
```

Options:

```
-ne
```

```
src 192.168.101.1
```

```
17:57:48.709954
```

```
6c:41:6a:a1:2b:f6 > a8:9d:21:93:22:90,
```

```
ethertype IPv4 (0x0800), length 58: 192.168.101.1.23 > 192.168.103.1.25420:
```

```
Flags [S.], seq 3694888749, ack 1562083610, win 8192, options [mss 1380], length 0
```

#### Example 5:

In order to exit after you capture 10 packets, enter this command:

```
<#root>
```

Options:

```
-n -c 10 src 192.168.101.1
```

```
18:03:12.749945 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [.], ack 3758037348, win 32768, length
```

```
18:03:12.749945 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [P.], ack 1, win 32768, length 2
```

```
18:03:12.949932 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [P.], ack 1, win 32768, length 10
```

```
18:03:13.249971 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [.], ack 3, win 32768, length 0
```

```
18:03:13.249971 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [P.], ack 3, win 32768, length 2
```

```
18:03:13.279969 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [.], ack 5, win 32768, length 0
```

```
18:03:13.279969 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [P.], ack 5, win 32768, length 10
```

```
18:03:13.309966 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [.], ack 7, win 32768, length 0
```

```
18:03:13.309966 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [P.], ack 7, win 32768, length 12
```

```
18:03:13.349972 IP 192.168.101.1.23 > 192.168.103.1.27287: Flags [.], ack 9, win 32768, length 0
```

#### Example 6:

In order to write a capture to a file with the name **capture.pcap** and copy it via FTP to a remote server, enter this command:

```
<#root>
```

Options:

```
-w capture.pcap host 192.168.101.1
```

```
CTRL + C <- to stop the capture
```

```
> file copy 10.229.22.136 ftp / capture.pcap
```

Enter password for ftp@10.229.22.136:  
Copying capture.pcap

Copy successful.

>

## Work with FTD LINA Engine Captures

### Requirements

1. Enable two captures on FTD with the use of these filters:

Source IP	192.168.103.1
Destination IP	192.168.101.1
Protocol	ICMP
Interface	INSIDE
Source IP	192.168.103.1
Destination IP	192.168.101.1
Protocol	ICMP
Interface	OUTSIDE

2. Ping from Host-A (192.168.103.1) to Host-B (192.168.101.1) and check the captures.

### Solution

**Step 1.** Enable the captures:

<#root>

```
> capture CAPI interface INSIDE match icmp host 192.168.103.1 host 192.168.101.1  
> capture CAPO interface OUTSIDE match icmp host 192.168.101.1 host 192.168.103.1
```

**Step 2.** Check the captures in the CLI.

Ping from Host-A to Host-B:

```
C:\Users\cisco>ping 192.168.101.1

Pinging 192.168.101.1 with 32 bytes of data:
Reply from 192.168.101.1: bytes=32 time=4ms TTL=255
Reply from 192.168.101.1: bytes=32 time=5ms TTL=255
Reply from 192.168.101.1: bytes=32 time=1ms TTL=255
Reply from 192.168.101.1: bytes=32 time=1ms TTL=255
```

<#root>

> show capture

capture CAPI type raw-data interface INSIDE [Capturing

- 752 bytes

]

match icmp host 192.168.103.1 host 192.168.101.1

capture CAPO type raw-data interface OUTSIDE [Capturing

- 720 bytes

]

match icmp host 192.168.101.1 host 192.168.103.1

The two captures have different sizes due to the Dot1Q header on the INSIDE interface, as shown in this output example:

<#root>

> show capture CAPI

8 packets captured

1: 17:24:09.122338

802.1Q vlan#1577

P0 192.168.103.1 > 192.168.101.1: icmp: echo request

2: 17:24:09.123071 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply

3: 17:24:10.121392 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request

4: 17:24:10.122018 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply

5: 17:24:11.119714 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request

6: 17:24:11.120324 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply

7: 17:24:12.133660 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request

8: 17:24:12.134239 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply

8 packets shown

<#root>

> show capture CAPO

8 packets captured

1: 17:24:09.122765 192.168.103.1 > 192.168.101.1: icmp: echo request

2: 17:24:09.122994 192.168.101.1 > 192.168.103.1: icmp: echo reply

```

3: 17:24:10.121728 192.168.103.1 > 192.168.101.1: icmp: echo request
4: 17:24:10.121957 192.168.101.1 > 192.168.103.1: icmp: echo reply
5: 17:24:11.120034 192.168.103.1 > 192.168.101.1: icmp: echo request
6: 17:24:11.120263 192.168.101.1 > 192.168.103.1: icmp: echo reply
7: 17:24:12.133980 192.168.103.1 > 192.168.101.1: icmp: echo request
8: 17:24:12.134194 192.168.101.1 > 192.168.103.1: icmp: echo reply
8 packets shown

```

## Work with FTD LINA Engine Captures – Export a Capture via HTTP

### Requirements

Export the captures taken in the earlier scenario with a browser.

### Solution

In order to export the captures with a browser, you need to:

1. Enable the HTTPS server.
2. Allow HTTPS access.

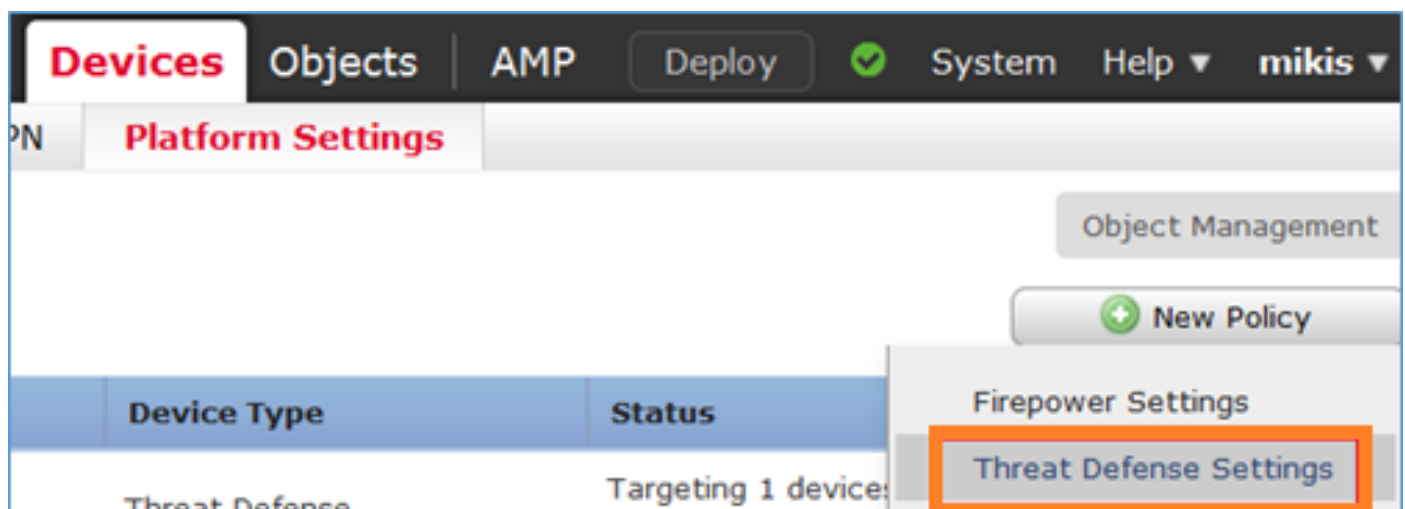

By default, the HTTPS server is disabled, and no access is allowed:

```

<#root>
>
show running-config http
>

```

**Step 1.** Navigate to **Devices > Platform Settings**, click **New Policy**, and choose **Threat Defense Settings**:

Specify the Policy name and Device Target:

## New Policy

Name:

Description:

**Targeted Devices**

Select devices to which you want to apply this policy.

**Available Devices**

**Selected Devices**

FTD5515

**Step 2.** Enable the HTTPS server and add the network that you want to be allowed to access the FTD device over HTTPS:

Overview Analysis Policies **Devices** Objects AMP

Device Management NAT VPN **Platform Settings**

### FTD5515-System\_Policy

Enter a description

- ARP Inspection
- Banner
- External Authentication
- Fragment Settings
- HTTP 1**
- ICMP
- Secure Shell
- SMTP Server

Enable HTTP Server ☒ 2

Port  (Please don't use 80 or 1443)

3

Interface	Network
INSIDE	Net_192.168.103.0_24bits

**Save and Deploy.**

At the time of the policy deployment, you can enable **debug http** in order to see the start of the HTTP service:

```
<#root>
```

```
> debug http 255
```

```
debug http enabled at level 255.
```

```
http_enable: Enabling HTTP server
HTTP server starting.
```

The result on FTD CLI is:

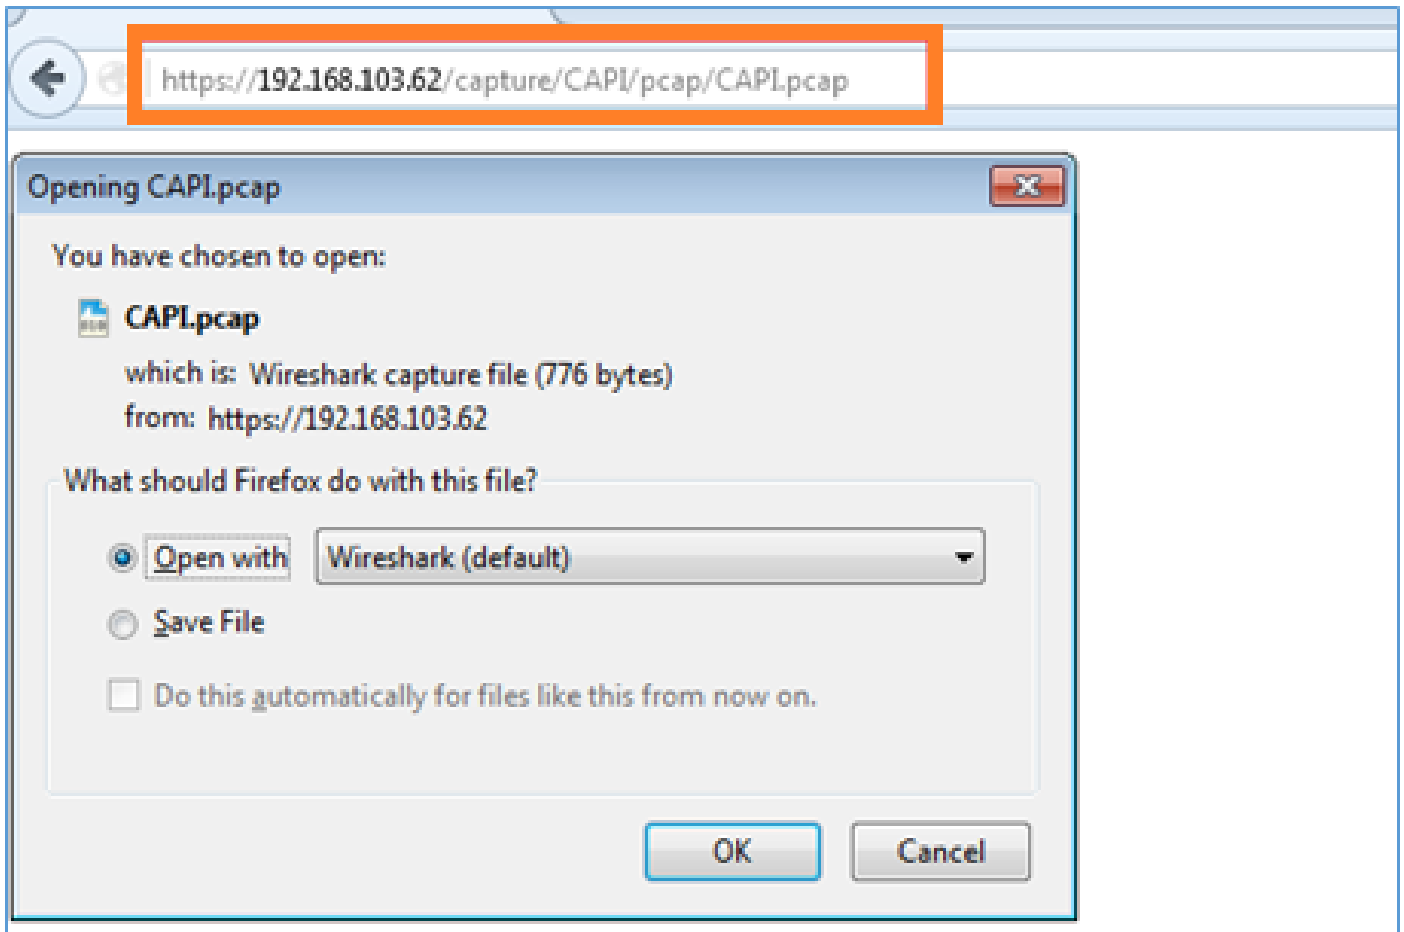

```
<#root>
```

```
> undebug all
```

```
> show run http
http server enable
```

http 192.168.103.0 255.255.255.0 INSIDE

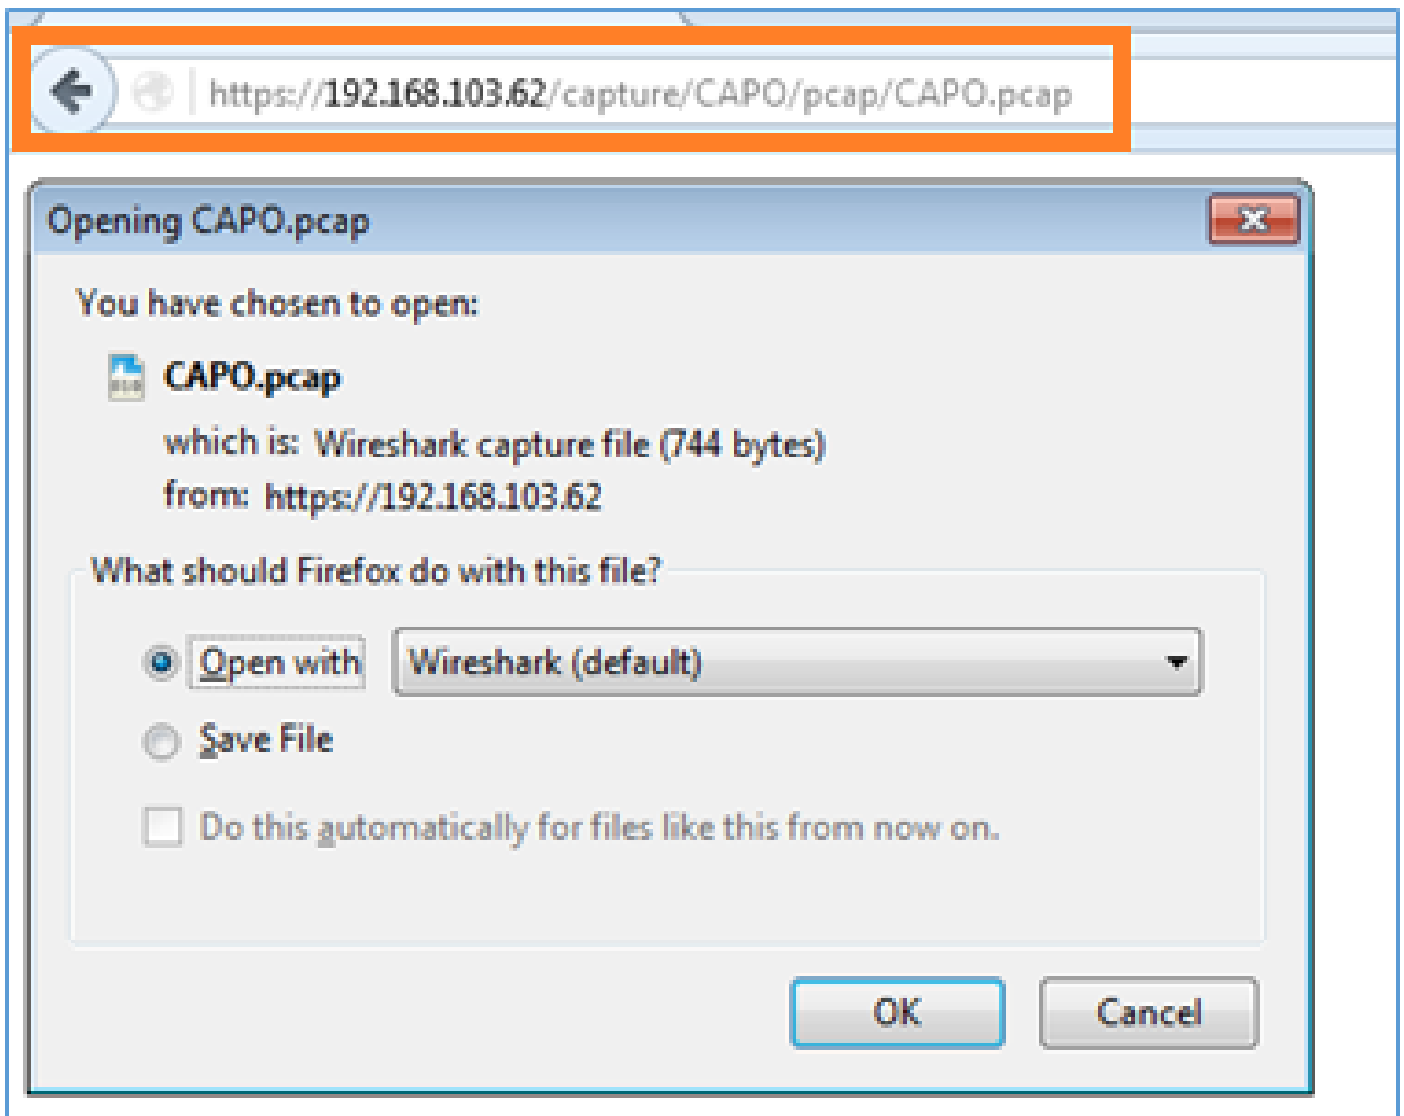

Open a browser on Host-A (192.168.103.1) and use this URL in order to download the first capture: <https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap>.

For reference:

<a href="https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap">https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap</a>	IP of the FTD data interface where HTTP server is enabled
<a href="https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap">https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap</a>	The name of the FTD capture
<a href="https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap">https://192.168.103.62/capture/CAPI/pcap/CAPI.pcap</a>	The name of the file that is downloaded

For the second capture, use <https://192.168.103.62/capture/CAPO/pcap/CAPO.pcap>.

## Work with FTD LINA Engine Captures - Export a Capture via FTP/TFTP/SCP

### Requirements

Export the captures taken in the earlier scenarios with Cisco IOS® protocols.

### Solution

Export a capture to an FTP server:

```
<#root>
```

```
firepower
```

```
# copy /pcap capture:CAPI ftp://ftp_username:ftp_password@192.168.78.73/CAPI.pcap
```

```
Source capture name [CAPI]?
```

```
Address or name of remote host [192.168.78.73]?
```

```
Destination username [ftp_username]?
```

```
Destination password [ftp_password]?
```

Destination filename [CAPI.pcap]?  
!!!!!!

114 packets copied in 0.170 secs

firepower#

Export a capture to a TFTP server:

<#root>

firepower

# copy /pcap capture:CAPI tftp://192.168.78.73

Source capture name [CAPI]?

Address or name of remote host [192.168.78.73]?

Destination filename [CAPI]?  
!!!!!!!!!!!!!!!!!!!!

346 packets copied in 0.90 secs

firepower#

Export a capture to an SCP server:

<#root>

firepower#

copy /pcap capture:CAPI scp://scp\_username:scp\_password@192.168.78.55

Source capture name [CAPI]?

Address or name of remote host [192.168.78.55]?

Destination username [scp\_username]?

Destination filename [CAPI]?

The authenticity of host '192.168.78.55 (192.168.78.55)' can't be established.

RSA key fingerprint is <cb:ca:9f:e9:3c:ef:e2:4f:20:f5:60:21:81:0a:85:f9:02:0d:0e:98:d0:9b:6c:dc:f9:af:4

Are you sure you want to continue connecting (yes/no)? yes

Warning: Permanently added '192.168.78.55' (SHA256) to the list of known hosts.

!!

454 packets copied in 3.950 secs (151 packets/sec)

firepower#

Offload captures from FTD. Currently, when you need to offload captures from FTD, the easiest method is to perform these steps:

1. From Lina - copy /pcap capture:<cap\_name> disk0:
2. From FPR root - mv /ngfw/mnt/disk0/<cap\_name> /ngfw/var/common/
3. From FMC UI - **System > Health > Monitor > Device > Advanced Troubleshooting** and enter the <cap\_name> in field and download.

## Work with FTD LINA Engine Captures – Trace a Real Traffic Packet

### Requirements

Enable a capture on FTD with these filters:

Source IP	192.168.103.1
Destination IP	192.168.101.1
Protocol	ICMP
Interface	INSIDE
Packet tracing	yes
Number of tracing packets	100

Ping from Host-A (192.168.103.1) the Host-B (192.168.101.1) and check the captures.

### Solution

To trace a real packet is very useful to troubleshoot connectivity issues. It allows you to see all the internal checks that a packet goes through. Add the **trace detail** keywords and specify the number of packets that you want to be traced. By default, the FTD traces the first 50 ingress packets.

In this case, enable capture with trace detail for the first 100 packets that FTD receives on the INSIDE interface:

```
<#root>
```

```
> capture CAPI2 interface INSIDE trace detail trace-count 100 match icmp host 192.168.103.1 host 192.168.101.1
```

Ping from Host-A to Host-B and check the result:

```
C:\Users\cisco>ping 192.168.101.1

Pinging 192.168.101.1 with 32 bytes of data:
Reply from 192.168.101.1: bytes=32 time=2ms TTL=255
Reply from 192.168.101.1: bytes=32 time=2ms TTL=255
Reply from 192.168.101.1: bytes=32 time=2ms TTL=255
Reply from 192.168.101.1: bytes=32 time=8ms TTL=255
```

The captured packets are:

<#root>

> show capture CAPI2

8 packets captured

```
1: 18:08:04.232989 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request
2: 18:08:04.234622 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply
3: 18:08:05.223941 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request
4: 18:08:05.224872 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply
5: 18:08:06.222309 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request
6: 18:08:06.223148 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply
7: 18:08:07.220752 802.1Q vlan#1577 P0 192.168.103.1 > 192.168.101.1: icmp: echo request
8: 18:08:07.221561 802.1Q vlan#1577 P0 192.168.101.1 > 192.168.103.1: icmp: echo reply
```

8 packets shown

This output shows a trace of the first packet. The parts that are of interest:

- Phase 12 is where the 'forward flow' is seen. This is the LINA engine Dispatch Array (effectively the internal order of operations).
- Phase 13 is where FTD sends the packet to the Snort instance.
- Phase 14 is where the Snort Verdict is seen.

<#root>

> show capture CAPI2 packet-number 1 trace detail

8 packets captured

```
1: 18:08:04.232989 000c.2998.3fec a89d.2193.2293 0x8100 Length: 78

## Capture Tool in Post-6.2 FMC Software Versions

In FMC Version 6.2.x, a new packet capture wizard was introduced. Navigate to **Devices > Device Management** and click the **Troubleshoot** icon. Then choose **Advanced Troubleshooting** and finally **Capture w/Trace**.

Choose **Add Capture** to create an FTD capture:

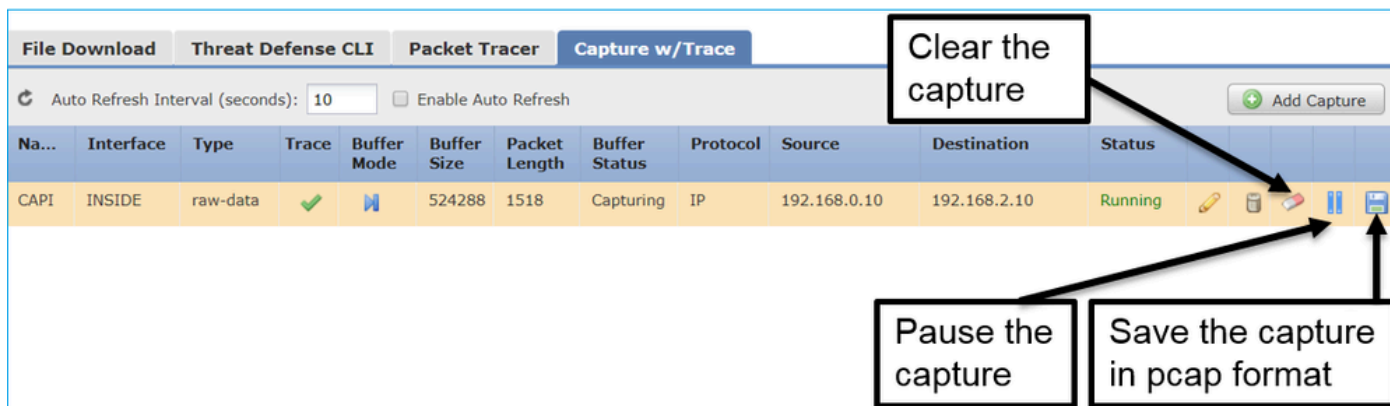

The current FMC UI limitations are:

- Cannot specify Src and Dst ports
- Only basic IP Protocols can be matched
- Cannot enable capture for LINA engine ASP Drops

### Workaround – Use the FTD CLI

As soon as you apply a capture from the FMC UI the capture runs:

The capture on FTD CLI:

```
<#root>
```

```
> show capture
```

```
capture CAPI%intf=INSIDE% type raw-data trace interface INSIDE [Capturing - 0 bytes]
  match ip host 192.168.0.10 host 192.168.2.10
>
```

## Trace a Real Packet on Post-6.2 FMC

On FMC 6.2.x, the **Capture w/Trace** wizard allows you to capture and trace real packets on FTD:

The screenshot shows the 'Add Capture' wizard. Fields include Name (CAPI), Interface (INSIDE), Match Criteria (Protocol: IP, Source Host: 192.168.16.111, Destination Host: 192.168.17.1), Buffer (Packet Size: 1518, Buffer Size: 524288), and options for Continuous Capture, Stop when full, Trace (checked), and Trace Count (50). A callout box labeled 'Trace ingress packets' has arrows pointing to the 'Trace' checkbox and the 'Trace Count' field.

You can check the traced packet in the FMC UI:

The Snort verdict

## FTD Packet Tracer Utility

### Requirements

Use the Packet Tracer utility for this flow and check how the packet is handled internally:

Ingress interface	INSIDE
Protocol	ICMP echo request
Source IP	192.168.103.1
Destination IP	192.168.101.1

### Solution

Packet Tracer generates a **virtual packet**. As shown in this example, the packet is subject to Snort inspection. A capture taken at the same time at Snort-level (**capture-traffic**) shows the ICMP echo request:

<#root>

> packet-tracer input INSIDE icmp 192.168.103.1 8 0 192.168.101.1

Phase: 1  
Type: CAPTURE  
Subtype:  
Result: ALLOW  
Config:  
Additional Information:  
MAC Access list

Phase: 2  
Type: ACCESS-LIST

```

The Snort-level capture at the time of the packet-tracer test shows the virtual packet:

```
<#root>
```

```
>
```

```
capture-traffic
```

Please choose domain to capture traffic from:

- 0 - management0
- 1 - Router

Selection? 1

Please specify tcpdump options desired.

(or enter '?' for a list of supported options)

Options:

```
-n
13:27:11.939755 IP 192.168.103.1 > 192.168.101.1: ICMP echo request, id 0, seq 0, length 8
```

## Packet Tracer UI Tool in Post-6.2 FMC Software Versions

In FMC Version 6.2.x, the **Packet Tracer** UI tool was introduced. The tool is accessible in the same way as the capture tool and allows you to run Packet Tracer on FTD from the FMC UI:

ConfigurationUsersDomainsIntegrationUpdatesLicenses▼Health ► Monitor
