

Prior to integrate MSE with ISE, MSE has to be up and running, that means:

1. MSE needs to be added to Prime Infrastructure, and services synchronized
2. CAS Service needs to be enabled and Wireless client tracking needs to be enabled
3. Maps have to be configured in Prime
4. NMSP Should be successful between MSE and WLCs ("show nmosp status" on the WLC command line)

In this setup, there will be only one Building with 2 floors:

Site Maps Edit View		-- Select a command --		Go		Total Entries 5				
Show:	Type	All	Status	All	<input type="checkbox"/> Incomplete	Go				
<input type="checkbox"/>	Name	Type	Incomplete	Total APs	a/n/ac Radios	b/g/n Radios	Radios with Critical Alarms	Wireless Clients	Status	
<input type="checkbox"/>	System Campus	Campus/Site		2	2	2	0	1	<input checked="" type="checkbox"/>	
<input type="checkbox"/>	Unassigned	Campus/Site		0	0	0	0	0	<input checked="" type="checkbox"/>	
<input type="checkbox"/>	System Campus > Pegasus3	Building		2	2	2	0	1	<input checked="" type="checkbox"/>	
<input type="checkbox"/>	System Campus > Pegasus3 > Floor1	Floor Area		2	2	2	0	1	<input checked="" type="checkbox"/>	
<input type="checkbox"/>	System Campus > Pegasus3 > Floor2	Floor Area		0	0	0	0	0	<input checked="" type="checkbox"/>	

Total Entries 5

Components used

- MSE version 8.0.110
- ISE version 2.0

Integrating MSE with ISE

Go to Network Resources, Location Services, and click add to add MSE.

Parameters are self explanatory, and you can test connection, and also client location lookup by mac address:

[Location Servers list](#) > [New Location Server](#)

Location Server

* Name	<input type="text" value="mse"/>
Description	<input type="text"/>
* Hostname/IP	<input type="text" value="10.48.39.241"/> <small>(i)</small>
* User Name	<input type="text" value="admin"/>
* Password	<input type="password" value="....."/>
* Timeout	<input type="text" value="5"/> Seconds (range 1-60)

Troubleshooting

Test Server Working

Find Location by MAC Address  Found in : System Campus#Pegasus3#Floor1

Next thing to do, is to go to Location tree, and click Get Update. This will allow ISE to fetch Buildings and Floor from MSE, and make them available in ISE, Similar to when you add AD Groups.

Location Tree

Checked locations will be available for ISE access policy. Unchecked locations will be hidden.
It is recommended to update the tree before hiding locations.
Hidden locations will remain hidden even when the tree is updated.

Update tree from location servers

<input type="checkbox"/>	Name	Description	MSE Data Source	
<input checked="" type="checkbox"/>	Unassigned		mse	🔗
<input checked="" type="checkbox"/>	System Campus		mse	🔗
<input checked="" type="checkbox"/>	Pegasus3		mse	🔗

Setting Up Authorization

The attributes MSE:Map Location can now be used in authorization policies.

Configure the 2 below rules:

Status	Rule Name	Conditions (identity groups and other conditions)	Permissions	
<input checked="" type="checkbox"/>	Wireless_Floor1	if (Wireless_802.1X AND MSE:MapLocation EQUALS System Campus#Pegasus3#Floor1)	then PermitAccess	Edit
<input checked="" type="checkbox"/>	Wireless	if Wireless_802.1X	then DenyAccess	Edit

Users in Floor1 should be able to authenticate.

We see in the authentication details the correct profile, as well as MAP Location attribute

Overview

Event	5200 Authentication succeeded
Username	bastien-96
Endpoint Id	94:DB:C9:01:49:13
Endpoint Profile	Unknown
Authentication Policy	Default >> Dot1X >> Default
Authorization Policy	Default >> Wireless_Floor1
Authorization Result	PermitAccess

With the above configuration, if the endpoint is moving from one zone to another, it will not be

deauthenticated. If you want to track user movement, and send a CoA if Authorization change, you can enable the tracking option in the authorization profile, which will check for location changing every 5 minutes. Note that this can be disruptive to normal fast roaming operations.

Track Movement

Troubleshooting

For this feature, ISE configuration is straightforward, however, most issues might happen if MSE is not able to locate the device.

A few things to check to make sure MSE is setup properly:

1- Make sure that the WLC where user connected has valid NMSP connection to the MSE ISE is integrated with:

If not, this document will help

http://www.cisco.com/c/en/us/td/docs/solutions/Enterprise/Borderless_Networks/Unified_Access/CMX/CMX_Troubleshooting.pdf

2- Check if MSE is able to track devices
