Introduction

This sample configuration initially blocks traffic from a host device (at 10.31.1.47) on the internal network to all devices on the Internet until you perform browser authentication with the use of authentication proxy. The access list passed down from the server (**permit tcp ip1 icmp any any**) adds dynamic entries post-authentication to access list 116 that temporarily allow access from that device to the Internet.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco IOS® Software Release 12.2.23
- Cisco 3640 router

Note: The **ip auth-proxy** command was introduced in Cisco IOS Software Release 12.0.5.T. This configuration was tested with Cisco IOS Software Release 12.0.7.T.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.

```

Verify

There is currently no verification procedure available for this configuration.

Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

For **debug** commands, along with other troubleshooting information, refer to Troubleshooting Authentication Proxy.

Note: Refer to Important Information on Debug Commands before you issue **debug** commands.
