Configuring Cisco Secure VPN Client 1.1 for Windows to IOS Using Local Extended Authentication

Document ID: 14119

Cisco has announced the End−of−Life (EoL) for the Cisco Secure VPN Client. Refer to Product Bulletin No. 2224 for more information.

Introduction

This document shows sample configurations for local Extended Authentication (Xauth) with the VPN Client. This feature provides authentication to a user who has the Cisco Secure VPN Client 1.1 installed on their PC by prompting the user for a username and a password. Refer to Configuring Cisco VPN Client 3.x for Windows to IOS Using Local Extended Authentication for information on the same configuration using Cisco VPN Client 3.x (recommended).

Prerequisites

Requirements

Xauth can also be configured for TACACS+ and RADIUS with VPN Client.

Xauth includes *authentication* only, not *authorization* (where users can go once the connection is established). *Accounting* (where users went) is not implemented.

The configuration must work without Xauth before you implement Xauth. The example in this document demonstrates Mode Configuration (Mode Config) and Network Address Translation (NAT) in addition to Xauth, but the assumption is that IPsec connectivity is present before the Xauth commands are added.

Components Used

The information in this document is based on these software and hardware versions:

- VPN Client Version 1.1 (or later)
- Cisco IOS® Software Releases 12.1.2.2.T, 12.1.2.2.P (or later)
- Local authentication was tested with a Cisco 3660 that runs c3660−jo3s56i−mz.121−2.3.T

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

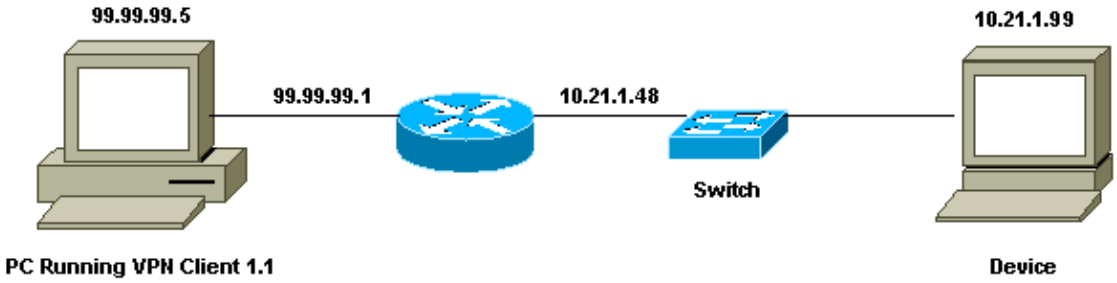
Configure

In this section, you are presented with the information to configure the features described in this document.

Note: Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.

Network Diagram

This document uses this network setup.



VPN Client 1.1 Setup

```
Network Security policy:
 1− Myconn
         My Identity = ip address
                 Connection security: Secure
                 Remote Party Identity and addressing
                         ID Type: IP subnet
                         10.21.1.0 (range of inside network)
                         Port all Protocol all

                 Connect using secure tunnel
                         ID Type: IP address
                         99.99.99.1
                         Pre−shared key = cisco1234

         Authentication (Phase 1)
         Proposal 1
                 Authentication method: pre−shared key
```

```
                    Encryp Alg: DES
                    Hash Alg: MD5
                    SA life: Unspecified
                    Key Group: DH 1

            Key exchange (Phase 2)
            Proposal 1
                    Encapsulation ESP
                    Encrypt Alg: DES
                    Hash Alg: MD5
                    Encap: tunnel
                    SA life: Unspecified
                    no AH

    2- Other Connections
                Connection security: Non-secure
                Local Network Interface
                    Name: Any
                    IP Addr: Any
                    Port: All
```

With Xauth enabled on the router, when the user tries to connect to a device inside the router (here a **ping -t #.#.#.#** was performed), a gray screen appears:

```
User Authentication for 3660
Username:
Password:
```

Configurations

Router Configuration for Local Xauth

```
Current configuration:

Verify

There is currently no verification procedure available for this configuration.

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Troubleshooting Commands

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

Note: Refer to Important Information on Debug Commands before you use **debug** commands.

- **debug aaa authentication** Displays information on AAA/TACACS+ authentication.
- **debug crypto isakmp** Displays messages about IKE events.
- **debug crypto ipsec** Displays IPsec events.
- **debug crypto key-exchange** Shows Digital Signature Standard (DSS) public key exchange messages.
- **clear crypto isakmp** Specifies which connection to clear.
- **clear crypto sa** Deletes IPsec security associations.

Sample Debug Output

```
goss-e4-3660#show debug
General OS:
  AAA Authentication debugging is on
Cryptographic Subsystem:
```

```
  Crypto ISAKMP debugging is on
  Crypto Engine debugging is on
  Crypto IPSEC debugging is on
