Umbrella Edge Data Center Now Available in Querétaro, Mexico

Contents

Introduction

Starting October 22nd, 2021, Umbrella customers can now connect to our newest edge data center in Querétaro, Mexico for full SIG services, including DNS, Secure Web Gateway, and Cloud Delivered Firewall.

Information

A new region was created for IPsec tunnel connections: [LA-1](#). The initial members of this region are Querétaro and Miami, Florida. Miami will be replaced by a second Latin America DC in the future with its own IP address. Customers can use Atlanta for automatic failover, or manually configure another data center for backup tunnels.

This new edge data center expands our rapidly growing [global network](#). Due to our innovative [global cloud architecture](#) and [anycast](#) routing, most customers in the region will automatically connect to this new data center.

Also, while we strive to maintain high uptime for all of our data centers, our augmented routing solution seamlessly and automatically routes traffic to the next nearest data center if for any reason a data center is unavailable.
