Introduction

This document describes Blocked Requests in the App Discovery Report: App Grid (percentage of total) and App Details (count per identity).

App Grid

The Blocked % shows the percentage of DNS requests **blocked for your Umbrella organization** over the time period. The default time period is 90 days.

Application ▾	Vendor ▾	Weighted Risk ▾	Identities ⓘ ▾	DNS Requests ▾	Blocked ▾	Label ⓘ
 Discordapp Collaboration	Discord	Very High	13	1,541	12%	 Not Approved ▾ Block this app ⓘ

360015971991

App Details

The Blocked column shows a count of blocked DNS requests for each identity in your Umbrella organization (for this specific app). The default time period is 90 days.

This data can be accessed in two ways:

- Clicking on the count of Identities in the main App Grid report
- Clicking on an App name and then selecting the "Identities" tab

Risk Details		Identities (13)			
Search for Identities 		Date 			
Identities		DNS Requests 	Blocked Requests 	First Detected (UTC) 	Last Detected (UTC) 
 Test		374	252	Nov 19, 2018	Dec 1, 2018

360018187812

Filtering by Date

To get more recent data on the % of blocked traffic, the report can be filtered by date. This gives a better insight as to the effect of recent policy changes. This filter is available in both the App Grid and App Details.

For example, the main Apps Grid can be filtered to show blocked requests from yesterday:

Date

Today

Yesterday

November 2018

: The default time period is 90 days but can be filtered to a single day. Other date ranges are not currently available but are on the product roadmap.

More Information

It is important to remember these:

- Each block represents an individual DNS request that was filtered by Umbrella.
- Some apps naturally generate more DNS requests than others. Some apps generate little DNS traffic even when in use, whereas others generate frequent requests even when idle. Umbrella counts the hits but is not aware of the intent of the user.
- All types of Umbrella DNS blocks are counted. This includes Security, Content, Destination List, Application and other blocks.
- Blocking an application is not expected to have any immediate impact on the App Discovery report...
 - App Discovery data is only aggregated once per day
 - The default view shows 90 days of data, so it can take some time to reflect 100% blocking.

FAQ

I have marked an App as "Not Approved", why is it not being blocked?

"Not Approved" is a label to help with your workflow but does not physically block the App. You must block the app via other means, such as the "Application Settings" page:

Labels do not affect policy settings

When you set an app to Not Approved, it is *not* automatically blocked from use. Labels within the App Discovery report are used to help review apps in your environment.

You must configure [Application settings](#) within a policy to block apps.

Is it possible to see a log of each individual blocked request?

The App Discovery report is not able to perform this level of "forensic" investigation currently. However, you can search for blocked Applications using the Umbrella Activity Search. The Application filter is shown on the Advanced Search dialog.
