

Modify Application Risk Scores and View Community Risk Insights

Contents

Introduction

This document describes how to modify application risk scores and view the Community Risk Score for better application risk management.

Overview

The Application Risk Score Override allows you to change an application's risk score instantly. This feature also introduces the Community Risk Score, which represents the median of all customized risk scores set by customers for each application. The Community Risk Score offers insight into how other organizations rate application risk, providing another perspective as you manage your own risk assessments.

Modify an Application Risk Score

You can change the risk score of any application through the App Discovery workflow:

- In the Umbrella dashboard, use the **grid view of apps** or the **individual app details page**.
- Select the application and choose **Change Risk Score** to adjust its score as needed.

View the Community Risk Score

You can view the Community Risk Score in these locations:

- **Risk Summary view**
- **Change Risk Score** dialog box (shown after selecting the Change Risk Score option)

Undo a Risk Score Override

You can revert to the default Cisco composite application risk score at any time:

- In the Change Risk Score selection list, select **default weighted risk** to undo your override.
