Introduction

This document describes how to troubleshoot memory modules and related issues in the Cisco Unified Computing System (UCS) solution.

Prerequisites

Requirements

Cisco recommends knowledge of Cisco Unified Computing System (UCS).

Components Used

This document is not restricted to specific software and hardware versions.

However, this document addresses:

- Cisco UCS B-Series Blade Servers
- UCS Manager
- UCS uses Dual In-line Memory Module (DIMM) as RAM modules.
Troubleshoot Methodology

This section covers several parts of UCS memory issues.

- Memory placement
- Troubleshoot DIMMs via UCSM and CLI
- Logs to check in technical support

Terms and Acronyms

<table>

Memory Placement

Memory placement is one of the most notable physical aspects of the UCS solution.

Typically, the server comes with memory pre-populated with a requested amount.

However, when in doubt, refer to the hardware installation guide.

For memory population rules, refer to B-series technical specifications for the specific platform.

B-series technical specifications link:

Data Sheets

Memory Errors

- DIMM Error
  - Multibit = Uncorrectable
    - POST is mapped by BIOS; OS does not see DIMM.
    - Runtime usually causes OS reboot.
  - Singlebit = Correctable
    - OS continues to see the DIMM.
- Error Correcting Code (ECC) Error
- Parity Error
- Serial Presence Detect (SPD) Error
Configuration Error
- Not supported DIMMs
- Not supported DIMM population
- Unpaired DIMMs
- Mismatch errors
- Identity unestablishable error
  - Check and update the catalog.

Correctable versus Uncorrectable Errors

Whether a particular error is correctable or uncorrectable depends on the strength of the ECC code employed within the memory system.

Dedicated hardware is able to fix correctable errors when they occur with no impact on program execution.

The DIMMs with correctable errors are not disabled and are available for the OS to use. The Total Memory and Effective Memory are the same.

These correctable errors are reported in the UCSM operability state as Degraded while overall operability is Operable with correctable errors.

Uncorrectable errors make it impossible for the application or operating system to continue execution.

The DIMMs with uncorrectable errors are disabled and OS does not see them. UCSM operState change to Inoperable in this case.

Troubleshoot DIMM’s via UCSM and CLI

Check Errors from GUI

<table>
<thead>

</tbody>
</table>
To obtain statistics, navigate to Equipment > Chassis > Server > Inventory > Memory, then right-click Memory and select show navigator.

**Check Errors from CLI**

These commands are useful when troubleshooting errors from CLI.

```<#root>
scope server x/y ->
show memory detail

scope server x/y ->
show memory-array detail

scope server x/y ->
scope memory-array x -> show stats history memory-array-env-stats detail
```

From memory array scope, you can also get access to DIMM.

```<#root>
scope server X/Y > scope memory-array Z > scope DIMM N
```

From there, then you can obtain per-DIMM statistics or reset the error counters.

```<#root>
UCS/chassis/server/memory-array/dimm #
reset-errors

UCS /chassis/server/memory-array/dimm* #
commit-buffer

UCS /chassis/server/memory-array/dimm #
show stats memory-error-state
```

If you see a correctable error that matches this information, the problem can be corrected by resetting the BMC instead of resetting the blade server.
Use these Cisco UCS Manager CLI commands:

(Resetting the BMC does not impact the OS running on the blade.)

```
To reset memory-error counters on a Cisco UCS C-Series Rack Server operating in standalone mode, run the script on the CLI:

UCS-C# scope reset-ecc
UCS-C/reset-ecc # set enabled yes
UCS-C/reset-ecc *# commit

<#root>

For colusa servers:

UCS# scope chassis
UCS /chassis # scope server x
UCS /chassis/server #

reset-ecc
```

With UCS releases 2.27, and 3.1 and above, the thresholds for memory corrected errors have been removed. Therefore, memory modules are no longer reported as Inoperable or Degraded solely due to corrected memory errors.

As per whitepaper [Managing Correctable Memory Errors on Cisco UCS Servers](#)

Industry demands for greater capacity, greater bandwidth, and lower operating voltages lead to increased memory error rates.

Traditionally, the industry has treated correctable errors in the same way as uncorrectable errors, requiring the module to be replaced immediately upon alert.

Given extensive research that correctable errors are not correlated with uncorrectable errors, and that correctable errors do not degrade system performance, the Cisco UCS team recommends against immediate replacement of modules with correctable errors.

Customers who experience a Degraded memory alert for correctable errors are advised to reset the memory error and resume operation. This recommendation helps to avoid unnecessary server disruption. Future enhancements to error management distinguish among various types of correctable errors, and identify the appropriate actions, if any, needed.

At minimum, use version 2.1(3c) or 2.2(1b) which has enhancement with UCS memory error management.

**Log Files to Check in Tech Support**

```
UCSM_X_TechSupport > sam_techsupportinfo provides information about DIMM and memory array.

Chassis/server tech support
```
CIMX_TechSupport\tmp\CIMX_TechSupport.txt -> Generic tech support information about server X.
CIMX_TechSupport\obfl\obfl-log -> OBFL logs provide an ongoing logs about status and boot of server X.
CIMX_TechSupport\var\log\sel -> SEL logs for server X.

Based on the platform/version, navigate to the files in tech support bundle.

var/nuova/BIOS > RankMarginTest.txt

var/nuova/BIOS > MemoryHob.txt

var/nuova/var/nuova/BIOS > MrcOut_*.txt

These files provide information about memory as seen from BIOS level.

Information there can be cross-referenced again with DIMM states report tables.

Example:
/var/nuova/BIOS/RankMarginTest.txt

- Useful for showing the test results from BIOS Training test MEMBIST.
- Look for errors.
- Look to see if any DIMMs are mapped out.
- Show DIMM specific information (Vendor/speed/PID).

</table>

The first column has two values:

DIMM locator (F2)

DIMM status (01)

Here is a brief description for each status:

0x00 // Not Installed (No DIMM)
0x01 // Installed (Working)

///// 0x02-0F (Reserved)
/// Failed

0x10 // Failed Training
0x11 // Failed Clock Training
/// 0x12-17 (Reserved)
0x18 // Failed MemBIST
/// 0x19-1F (Reserved)
/// Ignored

0x20 // Ignored (Disabled from debug console)
0x21 // Ignored (SPD Error reported by BMC)
0x22 // Ignored (Non-RDIMM)
0x23 // Ignored (Non-ECC)
0x24 // Ignored (Non-x4)
0x25 // Ignored (Other PDIMM in same LDIMM failed)
0x26 // Ignored (Other LDIMM in same channel failed)
0x27 // Ignored (Other channel in LockStep or Mirror failed)
0x28 // Ignored (Invalid PDIMM population)
0x29 // Ignored (PDIMM Organization Mismatch)
0x2A // Ignored (PDIMM Register Vendor Mismatch)
/// 0x2B-7F (Reserved)

var/nuova/BIOS > MemoryHob.txt

Shows effective and failed memory installed on the server.

</table>
18h - DIMM status is marked as failed when it fails in MemBist test. Replace with a known good DIMM.

DIMM Status Description

00h Not Installed (No DIMM)
01h Installed (Working)
02h-0Fh Reserved
10h Failed (Training)
11h Failed (Clock training)
12h-17h Reserved
18h Failed (MemBIST)
19h-1Fh Reserved
20h Ignored (Disabled from debug console)
21h Ignored (SPD Error reported by BMC)
22h Ignored (Non-RDIMM)
23h Ignored (Non-ECC)
24h Ignored (Non-x4)
25h Ignored (Other PDIMM in same LDIMM failed)
26h Ignored (Other LDIMM in same channel failed)
27h Ignored (Other channel in LockStep or Mirror)
28h Ignored (Invalid memory population)
29h Ignored (Organization mismatch)
2Ah Ignored (Register vendor mismatch)
2Bh- 7Fh Reserved
80h Ignored (Workaround -Looping)
81h Ignored (Stuck I2C bus)
82h – FFh Reserved
**DIMM Blocklisting**

In Cisco UCS Manager, the state of the Dual In-line Memory Module (DIMM) is based on SEL event records.

When the BIOS encounters a noncorrectable memory error during memory test execution, the DIMM is marked as faulty.

A faulty DIMM is a considered a nonfunctional device.

If you enable DIMM blocklisting, Cisco UCS Manager monitors the memory test execution messages and blocklists any DIMMs that encounter memory errors in the DIMM SPD data.

DIMM Blocklisting was introduced as an optional global policy in UCSM 2.2(2).

Server firmware must be 2.2(1)+ for B-series blades and 2.2(3)+ for C-series rack servers to properly implement this feature.

In UCSM 2.2(4), the DIMM, Blocklisting is enabled.

Open the tech support file .../var/log/DimmBL.log

Open the file /var/nuova/BIOS/MrcOut.txt if it is available

Find the DIMM Status table. Look for DIMM Status:

DIMM Blocklisted = 1E

Find the DIMM Status table. Look for DIMM Status:

| DIMM Status:
| 00 - Not Installed
| 01 - Installed
| 10 - Failed (Training failure) clear
| 1E - Failed (DIMM Blocklisted by BMC)
| 1F - Failed (SPD Error)
| 25 - Disabled (Other DIMM failed in same channel.)

Example:

<table>
<thead>
<tr>
<th>DIMM Status:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
</tr>
<tr>
<td>Channel</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>A</td>
</tr>
<tr>
<td>B</td>
</tr>
<tr>
<td>C</td>
</tr>
<tr>
<td>D</td>
</tr>
<tr>
<td>E</td>
</tr>
<tr>
<td>F</td>
</tr>
<tr>
<td>G</td>
</tr>
<tr>
<td>H</td>
</tr>
</tbody>
</table>

DIMM Status:

01 - Installed
1E - Failed (DIMM Blocklisted by BMC)
1F - Failed (SPD Error)
25 - Disabled (Other DIMM failed in same channel)
