

# Add an AP or ME to an Existing CBW Network

## Objective

This article will show you how to add a Primary Capable Access Point (AP) or a Mesh Extender (ME) to an existing Cisco Business Wireless (CBW) network.

## Applicable Devices | Firmware Version

- CBW 140AC ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))
- CBW 145AC ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))
- CBW 240AC ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))
- CBW 141ACM Mesh Extender ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))
- CBW 142ACM Mesh Extender ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))
- CBW 143ACM Mesh Extender ([Data Sheet](#)) | 10.6.1.0 ([Download latest](#))

## Table of Contents

- [Important for Setup](#)
- [Add a new Primary Capable AP](#)
- [Add a Mesh Extender](#)
  - [Add an additional Mesh Extender](#)
  - [Move an ME from one network to a different network](#)
  - [Add your first Mesh Extender](#)

## Introduction

You have your CBW network up and running, and it's fantastic. Now you want to add another AP or ME. Sweet, let's get to it!

## Important for Setup

- The new AP or ME needs to be on the same VLAN/subnet.
- Have a DHCP server on for the initial installation process, even if you plan to change it to a static address later.

## Add a new Primary Capable AP

If you are moving the AP over from another existing network, you will want to [perform a factory reset](#) to clear erase the old configuration.

Plug in your new 140AC, 145AC, or 240AC AP. The firmware on the new AP will be updated automatically by pulling it from another AP. Once updated, the new AP will join

the network. It's as easy as that!

## Add a Mesh Extender

Before you add a new 141ACM, 142ACM, or 143ACM ME, there are a few things you need to do on your Primary AP Web UI:

- [Add the MAC address of the ME to the Allow List](#)
- Make sure *Mesh* is enabled. This can be found under **Wireless Settings > Mesh**.

## Add an additional Mesh Extender

If you already have at least one ME up and running on your network, adding a brand-new ME is easy at this point. Just plug it in! The firmware will update and join the network.

## Moving an ME from one network to a different network

If you are removing an ME from a different network, you should [perform a factory reset](#) before plugging it into the new network. If this is the first ME that is going to be on the network, follow the steps in the [next section](#). If this is not the first ME for the network, the existing ME will provide the software to the new ME, so you can just plug it in!

## Add your first Mesh Extender

If you don't have any MEs in your existing network, there are a few additional steps to take. Out of the box, the first mesh extender is likely to have older firmware than the Primary-Capable APs already installed, which will prevent it from joining the network.

If you are connected to the Internet, you can set up your software updates to auto-update from Cisco.com.

## Updating the Software through Cisco.com

Updating the software through Cisco.com is the recommended as the easiest method.

### Step 1

From the *Transfer Mode* drop-down list, choose **Cisco.com**.

Transfer Mode	Cisco.com ▼
Automatically Check For Updates	HTTP
	TFTP
Last Software Check	SFTP
Latest Software Release	Cisco.com

### Step 2

To set the Primary AP to automatically check for software updates, choose **Enabled** in the *Automatically Check For Updates* drop-down list. This is enabled by default.

Transfer Mode	Cisco.com ▼
Automatically Check For Updates	Enabled ▼

### Step 3

Click **Save**. This saves the entries or changes you have made in the *Transfer Mode* and *Automatically Check For Updates* fields.

Software Update

Version 10.4.1.0

Transfer Mode	Cisco.com ▼
Automatically Check For Updates	Enabled ▼
Last Software Check	Sat Feb 27 04:40:25 2021 <a href="#">Check Now</a>
Latest Software Release	Up-to-date ?
Recommended Software Release	Up-to-date ?

Save Update Abort

The *Last Software Check* field displays the time stamp of the last automatic or manual software check. You can view the release notes of displayed releases by clicking the "?" icon next to it.

Software Update

Version 10.4.1.0

Transfer Mode	Cisco.com ▼
---------------	-------------

## Step 4

You can manually run a software check anytime by clicking *Check Now*.

Transfer Mode	Cisco.com	▼
Automatically Check For Updates	Enabled	▼
Last Software Check	Sat Feb 27 04:40:25 2021	<a href="#">Check Now</a>
Latest Software Release	Up-to-date	?
Recommended Software Release	Up-to-date	?

[Save](#) [Update](#) [Abort](#)

## Step 5

To proceed with the software update, click **Update**.

Transfer Mode	Cisco.com	▼
Automatically Check For Updates	Enabled	▼
Last Software Check	Tue Apr 21 13:07:11 2020	<a href="#">Check Now</a>
Latest Software Release	10.0.1.0	?
Recommended Software Release	10.0.1.0	?

[Save](#) [Update](#) [Abort](#)

The *Software Update Wizard* appears. The wizard takes you through the following three tabs in sequence:

- Release tab - Specify whether you want to update to the recommended software release or the latest software release.
- Update tab - Specify when the APs should be reset. You can opt to have it done right away or schedule it for a later time. To set the Primary AP to automatically reboot after the image pre-download is complete, check the Auto Restart checkbox.
- Confirm tab - Confirm your selections.

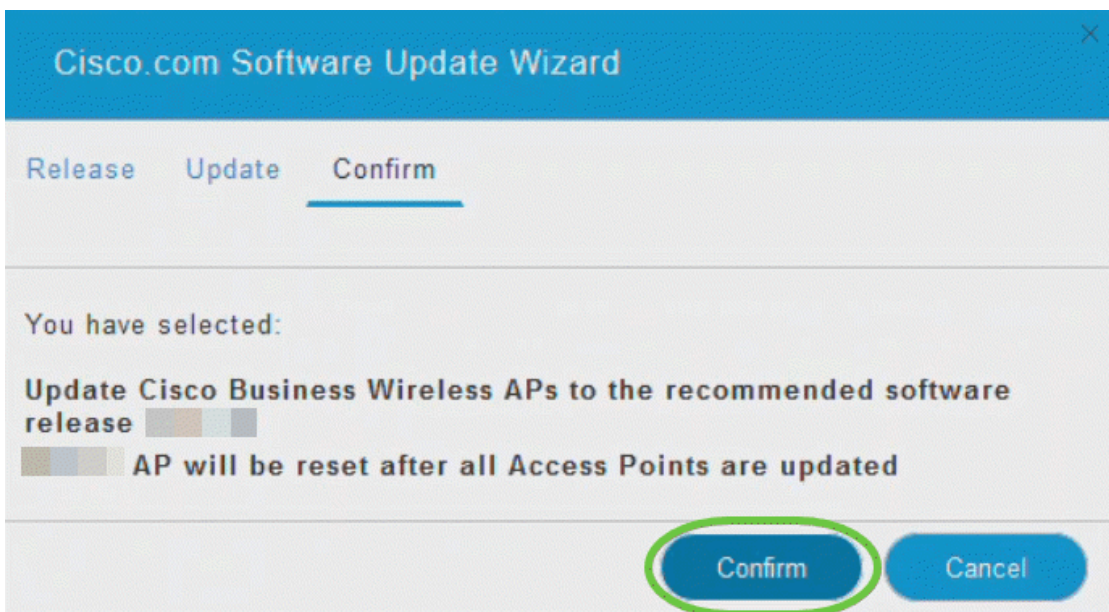

Follow the instructions in the wizard. You can go back to any tab at any time before you click *Confirm*.

# Cisco.com Software Update Wizard

Release   **Update**   Confirm

## Step 6

Click **Confirm**.

You can monitor the status and progress of the update on the **Software Update** page. The following data is displayed as the update progresses:

- Total number of APs in the network.
- Number of APs that:
  - Have initiated the update
  - Are currently being updated
  - Completed the update
  - Are waiting to be updated.
  - Failed to update.

Additionally, for each AP, the progress of the update is also shown using the following data:

- AP Name
- Download Percentage with color
- Last Update Error
- State - Pre-downloading software, Completed, or Failed
- Retry Attempts

Predownload Image Status

Total Number of Aps	5
Number of APs initiated	0
Number of APs Currently Being Updated	2
Number of APs Completed	3
Number of APs that are waiting/failed	0

Q Search

AP Name	AP Type	AP Location	Download Percentage	Last Update Error	State	Retry Attempts
---------	---------	-------------	---------------------	-------------------	-------	----------------

You can abort a software update that is in progress at any time before the Primary AP completes rebooting by clicking *Abort*.

The screenshot shows a software update configuration panel. It includes a 'Transfer Mode' dropdown set to 'Cisco.com', an 'Automatically Check For Updates' dropdown set to 'Enabled', and a 'Last Software Check' field showing 'Sat Feb 27 04:40:25 2021' with a 'Check Now' button. Below these are 'Latest Software Release' and 'Recommended Software Release' fields, both showing 'Up-to-date' with a question mark icon. At the bottom, there are three buttons: 'Save', 'Update', and 'Abort'. The 'Abort' button is highlighted with a red circle.

The updates are simple and automatic. However, if you are using the network as a staging area, you may prefer to update using HTTP.

## Updating the Software using HTTP

As a second option, follow these steps to update the software.

### Step 1

Go to [cisco.com](https://www.cisco.com). On the website, click **Support**. Enter ACM141, ACM142, or ACM143 depending on the ME you are going to add. Click **Enter** on your keyboard. A dropdown menu will open. Click **Product Support**.

### Step 2

Select **Downloads** and select the latest version available.

Documentation Downloads Community

1

### Software Available For This Product

Business Wireless Access Point Software

Latest Release

---

10.6.1.0 [2 Downloads](#) | [Details](#)

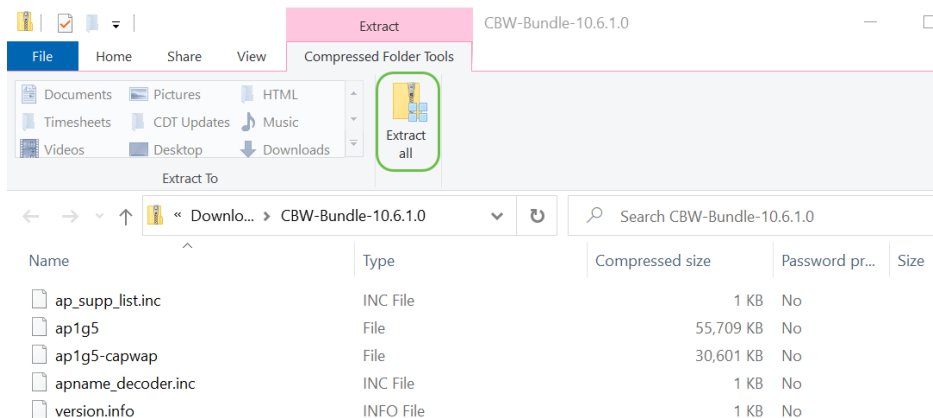

---

10.4.1.0 [Downloads](#) | [Details](#)

### Step 3

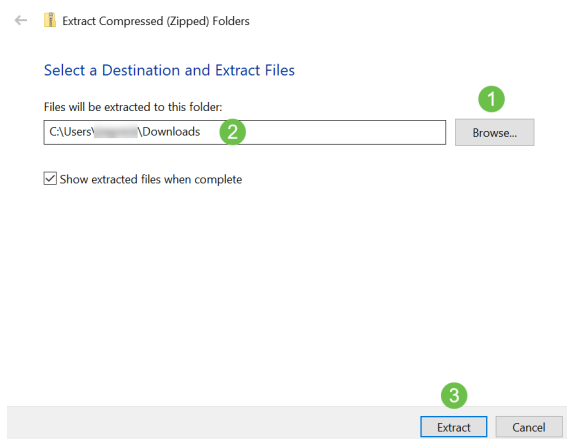

On your PC, extract the files. Your process may vary.

In this example, Windows is the operating system and 7-Zip is used to extract the files. Navigate to **Downloads**. Select the CBW Bundle and click **Extract All**.

### Step 4

Click **Browse**. Select the folder you want for the extracted files. Click **Extract**.

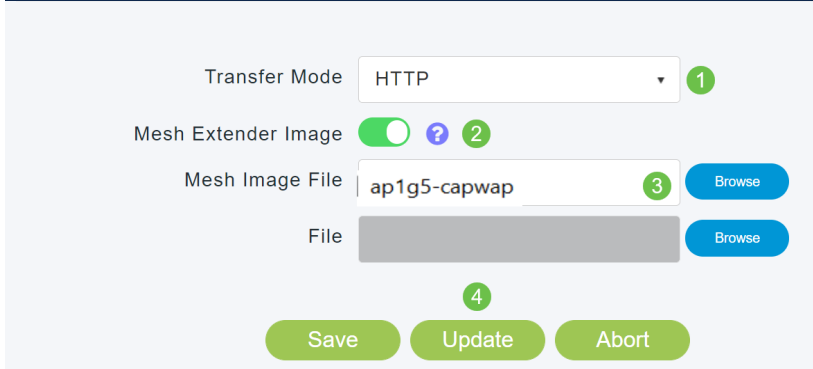

### Step 5

On the Web User Interface (UI) of your Primary AP, navigate to **Management > Software Update**.

## Step 6

Select HTTP as the Transfer Mode. Toggle the *Mesh Extender Image* on. Add the file in the form of *ap1g5-capwap* from your PC. Updating the first mesh extender via HTTP requires at least firmware version 10.3.1.0 to be installed on the primary AP.

Mesh Extenders need to be updated before the Primary AP.

The screenshot shows a configuration interface with the following elements:

- Transfer Mode:** A dropdown menu set to "HTTP", marked with a green circle "1".
- Mesh Extender Image:** A toggle switch that is turned on, marked with a green circle "2".
- Mesh Image File:** A text input field containing "ap1g5-capwap", marked with a green circle "3". To its right is a blue "Browse" button.
- File:** A greyed-out text input field, marked with a green circle "4". To its right is a blue "Browse" button.
- Buttons:** At the bottom, there are three buttons: "Save" (green), "Update" (green), and "Abort" (green).

You are all set. Have more MEs to add? Just plug them in! Additional mesh extenders will simply pull the correct firmware version from the ME that you just installed.

## Conclusion

Enjoy your expanded wireless network!

Quick question. Are you using the Cisco Business Wireless App to manage your wireless network? It's a great tool and helps keep management a snap. [Get Familiar with the Cisco Business Wireless App](#) or download the app from the [App Store](#) or [Google Play](#).
