## Introduction

Multicast control plane traffic is always seen by every router on a LAN environment. The Stub IP Multicast is used to reduce and minimize the unnecessary multicast traffic that is seen on LAN in the access layer and save the bandwidth on the media to forward multicast traffic to the upstream distribution/core layer.

In the Catalyst 3750 and 3560 Series Switches, the PIM Stub Multicast feature supports multicast routing between the distribution layer and access layer. It supports two types of PIM interfaces: uplink PIM interfaces and PIM passive interfaces. In particular, a routed interface configured with the PIM Passive mode does not pass/forward PIM control plane traffic; it only passes/forwards IGMP traffic.

## Prerequisites

### Requirements

Ensure that you meet these requirements before you attempt this configuration:

- The PIM stub router does not route the transit traffic between distribution routers. This behavior is enforced by unicast (EIGRP) stub routing. The proper unicast stub routing configuration is required to assist this PIM stub router behavior. The PIM stub feature does not prevent router administrator configuring RIP, static routes, or PIM RP to bypass this restriction.
- Only direct-connected multicast (IGMP) receivers and sources are allowed in the layer 2 access domains. The PIM protocol is not supported in access domains.
- The redundant PIM stub router topology is not supported.

### Components Used

The information in this document is based on output from the Catalyst 3750 Switch.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Related Products

This configuration can also be used with these switch types:

- Catalyst 3750 and 3560 Series Switches

Cisco Catalyst 3750 and 3560 switches support PIM Stub Multicast Routing Code Version 12.2(37)SE and later.

## Conventions

Refer to the Cisco Technical Tips Conventions for more information on document conventions.

## Configure

In this section, you are presented with the information to configure the features described in this document.

PIM SSM is used on the uplinks to communicate with the upstream router. Users can use any other PIM Mode (for example, Dense or Sparse).

For additional information about the configuration of Multicast Routing on the 3750 Series Switches, refer to [Configuring IP Multicast Routing](#).

**Note:** Use the Command Lookup Tool (registered customers only) to obtain more information on the commands used in this section.

## Network Diagram

This document uses this network setup:

# Configurations

This document uses these configurations:

Complete these steps to configure PIM Stub Routing:

1. Issue this command to enable multicast routing globally on the switch or switch stack:

```
mix_stack(config)#ip multicast-routing distributed
```

2. Issue this command to define the SSM range of IP multicast address with default group range:

```
mix_stack(config)#ip pim ssm default
```

3. Issue this command to enable PIM SSM on the uplink:

```
mix_stack(config)#interface GigabitEthernet3/0/25
```

```
!--- By default switch configures the Layer 2 parameters.  
So in order to configure the Layer 3 parameter, use the next command.
```

```
mix_stack(config-if)#no switchport
```

```
mix_stack(config-if)#ip pim sparse-dense-mode
```

4. Issue this command to enable PIM Stub Routing on the VLAN interface:

```
mix_stack(config)#interface vlan100
```

```
mix_stack(config-if)#ip pim passive
```

## Switch (mix\_stack) Configuration

```
mix_stack#show run

## Verify

Use this section to confirm that your configuration works properly.

The Output Interpreter Tool (registered customers only) (OIT) supports certain **show** commands. Use the OIT to view an analysis of **show** command output.

Issue the **show ip pim interface** command in order to display the PIM Stub that is enable for each interface.

```
mix_stack#show ip pim interface

Address      Interface                Ver/   Nbr   Query  DR    DR
              Interface                Mode   Count Intvl  Prior
              Interface                Mode   Count Intvl  Prior

3.1.1.2      GigabitEthernet3/0/25   v2/SD  1     30     1     3.1.1.2
100.1.1.1    Vlan100                 v2/P   0     30     1     100.1.1.1
10.1.1.1     GigabitEthernet9/0/24   v2/P   0     30     1     10.1.1.1
```

Issue the **show ip igmp groups detail** to display the interested client that has joined the specific Multicast source/group.

```
mix_stack#show ip igmp groups 232.0.0.9 det

Flags: L - Local, U - User, SG - Static Group, VG - Virtual Group,
SS - Static Source, VS - Virtual Source,
Ac - Group accounted towards access control limit
