Introduction

This document describes how to configure and verify maximum transmission unit (MTU) on Cisco Nexus switches.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

This document is not restricted to specific software and hardware versions.

Configure

Layer 3 MTU Configurations

MTU on a Switched Virtual Interface (SVI) Configuration

Switch(config)#interface vlan 1
Switch(config-if)#mtu 9216

MTU on a Layer 3 Port Configuration

Switch(config)#interface ethernet 1/1
Switch(config-if)#no switchport
Layer 2 MTU Configurations

Layer 2 MTU can be set either through the network Quality of Service (QoS) policy or by configuring the port itself on switches that support per-port MTU. Only the Nexus 7000, 7700, 9300, and 9500 support per-port MTU.

Nexus 3048, 3064, 3100, 3500, 5000, 5500, and 6000 Configuration

In order to configure elevated MTU on the 3048, 3064, 3100, 5000, 5500, and 6000 switches, create a **network-qos** policy or modify an existing policy in order to specify the elevated MTU. This configuration applies to all ports. This includes any Cisco Fabric Extender (FEX) ports connected to the switch. Per-port MTU is not supported.

```plaintext
policy-map type network-qos jumbo
class type network-qos class-default
  mtu 9216
system qos
  service-policy type network-qos jumbo
```

Nexus 7000, 7700, 9300, and 9500 Configuration

In order to configure MTU on a per-port basis, this configuration is needed:

```plaintext
Switch(config)#interface ethernet 1/1
Switch(config-if)#mtu 9216
```

Nexus 2000 Configuration

**Note:** The Nexus 2000 MTU is set with the configuration of jumbo frames on the parent switch. For parent switches that allow jumbo on a per-port basis, configure the FEX Fabric Port-channel (FPC). If the parent switch requires a **network-qos** policy then jumbo is set with the configuration of the parent switch's QoS policy. These changes are automatically pushed down to the FEX in both cases.

Fabric Port Channel (FPC) on the Parent Nexus Switch Configuration

```plaintext
interface port-channel136
switchport mode fex-fabric
fex associate 136
vpc 136
mtu 9216
```

**Note:** The Nexus 7000 does not allow you to set FEX MTU with the FPC in Version 6.2 and later. You must instead create a custom QoS policy as the next configuration shows.

Allow Jumbo Frames in the Nexus 7000 FEX Configuration

**Note:** Modify the template currently in use. In order to find the current template in use, enter the `show policy-map system type network-qos` command.

```plaintext
Switch(conf)#class-map type network-qos match-any c-nq-8e-custom
(config-cmap-nqos)#match cos 0-7
```
Network QoS Policy on the Parent Nexus Switch Configuration

Switch(config)#policy-map type network-qos nq-8e-custom template 8e
Switch(config-pmap-nqos)#class type network-qos c-nq-8e-custom
Switch(config-pmap-nqos-c)#congestion-control tail-drop
Switch(config-pmap-nqos-c)#mtu 9216

Switch(config)#system qos
Switch(config-sys-qos)#service-policy type network-qos nq-8e-custom

policy-map type network-qos jumbo
class type network-qos class-default
mtu 9216
system qos
service-policy type network-qos jumbo

Verify

Use this section in order to confirm that your configuration works properly.

The Cisco CLI Analyzer (registered customers only) supports certain show commands. Use the Cisco CLI Analyzer in order to view an analysis of show command output.

Layer 3 MTU

Verify Layer 3 MTU on all Nexus platforms with the show interface eth x/y command as this example shows:

Nexus#show interface ethernet 1/19
Ethernet1/19 is up
Dedicated Interface
Hardware: 100/1000/10000 Ethernet, address: 547f.ee5d.413c (bia 547f.ee5d.40fa)
MTU 9216 bytes, BW 1000000 Kbit, DLY 10 usec

Verify SVI MTU with the show interface vlan X command as this output shows:

Leaf3#show interface vlan 1
Vlan1 is down (Non-routable VDC mode), line protocol is down
Hardware is EtherSVI, address is 547f.eed8.ec7c
Internet Address is 1.1.1.1/23
MTU 9216 bytes, BW 1000000 Kbit, DLY 10 usec

Layer 2 MTU

This section describes how to verify Layer 2 MTU per platform. The commands are run from the parent switch.

Nexus 3100, 3500, 5000, 5500, and 6000

Nexus#show queuing interface ethernet 1/1
Ethernet1/1 queuing information:
TX Queuing
qos-group sched-type oper-bandwidth
0 WRR 100
RX Queuing
qos-group 0
q-size: 469760, HW MTU: 9216 (9216 configured)

Nexus 3000, 7000, 7700, and 9000
Nexus#show interface ethernet 1/12
Ethernet1/12 is up
admin state is up, Dedicated Interface
Hardware: 1000/10000 Ethernet, address: 7c0e.ceca.f183 (bia 7c0e.ceca.f183)
MTU 9216 bytes, BW 10000000 Kbit, DLY 10 usec

Note: When the Nexus 3000 is on code earlier than NXOS.7.0.3.I2(2a), check the MTU value with the `show queueing interface ethernet x/x` command. On versions equal to or later than the aforementioned code you can check the MTU size as noted previously.

Nexus 2000

Note: When you change the FEX MTU, the FEX increases its MTU to a higher but predetermined amount that does not match the configured value exactly. The parent device enforces the configured MTU at the FEX Fabric Port-Channel (FPC).

For a FEX connected to Nexus 5000, 6000, and 7000:

Nexus#show queueing interface ethernet 136/1/1
if_slot 68, ifidx 0x1f870000
Ethernet136/1/1 queuing information:
Input buffer allocation:
Qos-group: 0
frh: 3
drop-type: drop
cos: 0 1 2 3 4 5 6 7
xon xoff buffer-size
---------+---------+-----------
19200 78080 90880
Queueing:
queue qos-group cos priority bandwidth mtu
---------+--------------+-------------------+---------+----------------+--------
3 0 0 1 2 3 4 5 6 WRR 100 9280

For a FEX connected to Nexus 9000:

9396-B#show interface ethernet 104/1/1
Ethernet104/1/1 is up
admin state is up,
Hardware: 100/1000 Ethernet, address: 5475.d0e0.e5c2 (bia 5475.d0e0.e5c2)
MTU 9216 bytes, BW 1000000 Kbit, DLY 10 usec

Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

The Cisco CLI Analyzer (registered customers only) supports certain `show` commands. Use the Cisco CLI Analyzer in order to view an analysis of `show` command output.

**Note:** Refer to Important Information on Debug Commands before you use `debug` commands.

Sometimes it is necessary to verify the changes in software. In order to do this, check the Ethernet port manager (ethpm) in order to verify that the changes were pushed through software on any platform:
Switch#show system internal ethpm info interface eth 6/5 | egrep -i mtu
medium(broadcast), snmp trap(on), MTU(4000)

It is also possible on M1, M2, F1, and F2 modules to verify in the hardware that the changes were pushed down:

module-1#show hardware internal mac port 20 state | i MTU
GD: Port speed Undecided GD MTU 10240 (fixed to max), PL MTU 9238 mode 0
Or, you can look at the QoS configuration on the linecard:

module-1# show hardware internal mac port 33 qos configuration | beg mtu
pm_adj  qos_mtu  qos_adj  last_mtu 0  9238 9728 22 9216 22 9216

Known Defects

Cisco bug ID CSCuf20035 - (Nexus 7000) FEX MTU changes do not take effect on FEX queues.
