- How to Configure Conditional Debugging, on page 4
- Configuration Examples for Trace Management, on page 7

# **Information About Trace Management**

The tracing functionality logs internal events. Trace files are automatically created and saved on the persistent storage device of specific platforms.

If the device has issues, the contents of the trace files are useful to troubleshoot the issue. The trace file outputs provide logs that are used to locate and solve the issue, and helps to get a detailed view of system actions and operations.

To view the recent trace information for a specific process, use the **show logging [process | Profile | process-helper]** command. The **process** keyword uses the first few letters of the name of a process and provides trace logs of the process that starts or matches with the entered string, the **profile** keyword lists the predefined set of process names, and the **profile-helper** keyword displays the available names.

To change the verbosity in a trace message output, you can adjust the trace level of processes using the **set platform software trace level** command. You can choose the **all** keyword to adjust the trace level for all the processes listed or you can select a specific process. When you select a specific process, there's also the option to adjust the trace level for a specific module, or you can use the **all-modules** keyword to adjust all the modules of processes.

### **Introduction to Binary Tracing**

Binary tracing is helpful in gathering trace information with a minimal impact on performance. In binary tracing, the tracing is always on for the system components and a basic level of trace is collected on all the time; thus, the data necessary for troubleshooting a problem has been captured the first time it occurs.

### Introduction to Conditional Debugging and Radioactive Tracing

The Conditional Debugging feature allows you to enable debugging and logging for specific features based on the set of conditions you define. This feature is useful in systems where many features are supported.

The Conditional debug allows granular debugging in a network that is operating at a large scale with a large number of features. It allows you to observe detailed debugs for granular instances within the system. This

type of debugging is useful when we need to debug only a particular session among thousands of sessions. It's also possible to specify multiple conditions.

A condition refers to a feature or identity, where an identity could be an interface, IP Address, or a MAC address and so on.

Conditional debugging is in contrast to the general debug command, that produces its output without discriminating on the feature objects that are being processed. General debug command consumes numerous system resources and impacts the system performance.

Radioactive tracing provides the ability to form a chain of execution for operations of interest across the system, at an increased verbosity level. This provides a way to print conditionally debug information (up to DEBUG Level or a specified level) across threads, processes, and function calls.

Radioactive Tracing when coupled with Conditional Debugging, provides a single debug command to debug all execution contexts related to the condition. You can execute this command without being aware of the various control flow processes of the feature within the box and without having to issue debugs at these processes individually.

### **Tracing Levels**

Trace level determines the types of traces outputted. Each trace message is assigned a trace level. If the trace level of a process or its module it set as greater than or equal to the level as the trace message, the trace message is displayed otherwise, it's skipped. For example, the default trace level is **Notice** level, so all traces with the **Notice** level and below the notice level are included while the traces above the **Notice** level are excluded.

The following table shows the available tracing levels, and provides descriptions of the message that are displayed with each tracing level. The tracing levels listed in the table are from the lowest to the highest order. The default trace level is **Notice**.

**Table 1: Tracing Levels and Descriptions** 

Tracing Level	Description
Fatal	The message stating the process is aborted.
Emergency	The message is regarding an issue that makes the system unusable.
Alert	The message indicating that an action must be taken immediately.
Critical	The message is regarding a critical event causing loss of important functions.
Error	The message is regarding a system error.
Warning	The message is regarding a system warning.
Notice	The message is regarding a significant event.
Informational	The message is useful for informational purposes only.
Debug	The message provides debug-level output.

Tracing Level	Description
Verbose	All possible trace messages are sent.
Noise	All possible trace messages for the module are logged.  The noise level is always equal to the highest possible tracing level. Even if a future enhancement to tracing introduces a higher tracing level, the noise level will become equal to the level of that new enhancement.

# **Payload Filter**

This feature is used to filter trace messages. Trace messages contain actual debug information such as text strings, special characters, and variable arguments (strings), integers, long, IPv4/IPv6/MAC addresses, and so on. Using the payload feature, the trace messages can be filtered based on the selected criteria and without string operations.

You can use the following set and show commands to configure a payload filter and to view the applied filters.

Table 2: Set Commands for Payload Filter

set platform software btrace-manager utm-pf enable	Enables and disables the payload filtering feature.
set platform software btrace-manager utm-pf disable	
set platform software btrace-manager consumer-name <input/> create	Creates and deletes consumer/stream.
set platform software btrace-manager consumer-name <input/> delete	
set platform software btrace-manager consumer-name <input/> filter <input/> add	Applies and removes filter on stream/consumer
set platform software btrace-manager consumer-name <input/> filter <input/> remove	

Table 3: Show Commands for Payload Filter

#show platform software btrace-manager utm-pf	Shows the current status of the payload feature and other additional details
show platform software btrace-manager utm-pf consumer-name <input/> all-filters	Shows all filters currently applied on consumer/stream.
show platform software btrace-manager utm-pf consumer-name <input/> all-luids	Shows all or selected LUID of consumer for the applied filter.
show platform software btrace-manager utm-pf consumer-name <input/> filter <input/>	

show platform software btrace-manager utm-pf	Shows consumer/stream messages.
message	

# **How to Configure Conditional Debugging**

## **Conditional Debugging and Radioactive Tracing**

Radioactive Tracing when coupled with Conditional Debugging, prpvides a single debug command to debug all execution contexts related to the condition. You can execute this command without being aware of the various control flow processes of the feature within the box and without having to issue debugs at these processes individually.

## **Configuring Conditional Debugging**

Follow the steps to configure conditional debugging:

#### **Procedure**

	Command or Action	Purpose
	Enables privileged EXEC mode.	
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	debug platform condition mac {mac-address}  Example:  Device# debug platform condition mac bc16.6509.3314	Configures conditional debugging for the MAC Address specified.
Step 3	debug platform condition start  Example:  Device# debug platform condition start	Starts conditional debugging (this step starts radioactive tracing if there's a match on one of the preceding conditions).
Step 4	show platform condition OR show debug  Example:  Device# show platform condition Device# show debug	Displays the current conditions set.
Step 5	debug platform condition stop  Example:  Device# debug platform condition stop	Stops conditional debugging (this step stops radioactive tracing).

Command or Action	Purpose
request platform software trace archive [last {number} days] [target {crashinfo:   flashinfo:}]	(Optional) Displays historical logs of merged tracefiles on the system. Filter on any combination of number of days or location.
Example: # request platform software trace archive last 2 days	
show platform software trace [filter-binary   level   message]  Example:  Device# show platform software trace message	(Optional) Displays logs merged from the latest trace file. Filter on any combination of application condition, trace module name, and trace level.  • filter-binary - Filter the modules to be collated
	• level - Show trace levels     • message - Show trace message ring contents  Note
	On the device:  • Available from IOS console in addition to linux shell.  • Generates a file with merged logs  • Displays merged logs only from staging area.
clear platform condition all  Example:	Clears all conditions.
	request platform software trace archive [last {number} days] [target {crashinfo:   flashinfo:}]  Example: # request platform software trace archive last 2 days  show platform software trace [filter-binary   level   message]  Example:  Device# show platform software trace message

#### What to do next

Note

The commands request platform software trace filter-binary and show platform software trace filter-binary work in a similar way. The only difference is:

- request platform software trace filter-binary Sources the data from historical logs.
- show platform software trace filter-binary Sources the data from the flash Temp directory.

The  $mac\_log < ...date...>$  is the important file, as it provides messages for the MAC that is being debugged. The command **show platform software trace filter-binary** also generates the same flash files, and also prints the mac\_log on the screen.

### **Collecting Trace Files**

To collect trace files from a device, follow these steps:

1. To request the tracelogs for a specific time period (For example: Five days), use the command:

```
Device# request platform software trace archive last 5 day
```

2. The system generates a tar ball (.gz file) of the tracelogs in the location /flash:

## **Copying Archived Trace Files**

The following is an example of the trace file for a switching device:

```
Device# dir crashinfo:/tracelogs
Directory of crashinfo:/tracelogs/

50664 -rwx 760 Sep 22 2015 11:12:21 +00:00 plogd_F0-0.bin_0.gz
50603 -rwx 991 Sep 22 2015 11:12:08 +00:00 fed_pmanlog_F0-0.bin_0.9558.20150922111208.gz
50610 -rw- 11 Nov 2 2015 00:15:59 +00:00 timestamp
50611 -rwx 1443 Sep 22 2015 11:11:31 +00:00
auto_upgrade_client_sh_pmanlog_R0-.bin_0.3817.20150922111130.gz
50669 -rwx 589 Sep 30 2015 03:59:04 +00:00 cfgwr-8021_R0-0.bin_0.gz
50612 -rwx 1136 Sep 22 2015 11:11:46 +00:00 reflector_803_R0-0.bin_0.1312.20150922111116.gz
50794 -rwx 4239 Nov 2 2015 00:04:32 +00:00 IOSRP_R0-0.bin_0.14239.20151101234827.gz
50615 -rwx 131072 Nov 2 2015 00:19:59 +00:00 linux_iosd_image_pmanlog_R0-0.bin_0
```

You can copy the trace files using one of the following options:

```
Device# copy crashinfo:/tracelogs ?
 crashinfo: Copy to crashinfo: file system
 flash: Copy to flash: file system
  ftp: Copy to ftp: file system
 http: Copy to http: file system
 https: Copy to https: file system
 null: Copy to null: file system
 nvram: Copy to nvram: file system
 rcp: Copy to rcp: file system
  running-config Update (merge with) current system configuration
 scp: Copy to scp: file system
 startup-config Copy to startup configuration
 syslog: Copy to syslog: file system
 system: Copy to system: file system
  tftp: Copy to tftp: file system
  tmpsys: Copy to tmpsys: file system
```

The general syntax for copying onto a TFTP server is as follows:

```
Device# copy source: tftp:
Device# copy crashinfo:/tracelogs/IOSRP_R0-0.bin_0.14239.20151101234827.gz tftp:
Address or name of remote host []? 2.2.2.
Destination filename [IOSRP R0-0.bin 0.14239.20151101234827.gz]?
```

Note

It's important to clear the generated report or archive files off the device so that there's flash space available for tracelog and other purposes.

## **Configuring Payload Filter**

To configure a payload filter, you must create a consumer and add the relevant payload filter data.

#### **Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	set platform software btrace-manager utm-pf enable	Enables or disables the payload filter.
	Example:	
	Device# set platform software btrace-manager chassis active r0 utm-pf enable	
	Device# set platform software btrace-manager chassis active r0 utm-pf disable	
Step 3	set platform software btrace-manager {consumer-name} create	Creates a consumer name.
	Example:	
	Device# set platform software btrace-manager chassis active r0 consumer-name utm_pf_test create	
Step 4	set platform software btrace-manager consumer {consumer-name} filter {input} add	Add a filter data.
	Example:	
	Device# set platform software btrace-manager chassis active r0 consumer-name utm_pf_test filter "Failed to retrieve an interface" add	

# **Configuration Examples for Trace Management**

The following is an output example of the show platform condition command.

The following is a sample of the *debug platform condition stop* command.

Device# debug platform condition stop Conditional Debug Global State: Stop

The following is an example of the **show logging** command for the **ios** process.

```
Device# show logging process ios
Logging display requested on 2022/10/27 09:32:06 (PDT) for Hostname: [vwlc 1 9222], Model:
