

# Service Node Configuration Mode Commands

To configure a WAAS Node (WN) that is part of an AppNav Cluster, use the **service-insertion service-node** global configuration command. To unconfigure settings, use the **no** form of this command.

```
service-insertion service-node {authentication sha1 key authkey | description description | enable | node-discovery enable | shutdown max-wait seconds}

no service-insertion service-node {authentication sha1 key authkey | description description | enable | node-discovery enable | shutdown max-wait seconds}
```

| Syntax Description               | <b>authentication sha1 key</b> <i>authkey</i> (Optional) Enables authentication between the WN and other devices in the AppNav Cluster and specifies an authentication key of up to 64 alphanumeric characters. This key must match the key configured in the service context. |
|----------------------------------|--|
| <b>description description</b>   | (Optional) Specifies a description of the node with up to 200 alphanumeric and space characters.   |
| <b>enable</b>                    | (Optional) Enables the participation of the node in the AppNav Cluster.  |
| <b>node-discovery enable</b>     | (Optional) Specifies service-node discovery parameters and enables service-node discovery.   |
| <b>shutdown max-wait seconds</b> | (Optional) Specifies the number of seconds that the node should wait for all connections to terminate when shutting down. Valid values range from 0-3600 seconds. The default is 120 seconds.  |

|          |   |
|----------|---|
| Defaults | There is no authentication key and no description configured. The shutdown waiting time is 120 seconds. The node is disabled. |
|----------|---|

|               |                      |
|---------------|----------------------|
| Command Modes | global configuration |
|---------------|----------------------|

|              |  |
|--------------|--|
| Device Modes | application-accelerator<br>appnav-controller |
|--------------|--|

|                  |  |
|------------------|--|
| Usage Guidelines | Use the <b>service-insertion service-node</b> command to configure a WN that is part of an AppNav Cluster. When used without options, this command initiates the service node configuration mode, which is indicated by a different prompt (config-sn). To return to global configuration mode, enter the <b>exit</b> command. |
|------------------|--|

Each WN (and ANC acting as a WN) in the AppNav Cluster must be configured with WN settings by using the **service-insertion service-node** command. To begin using the node in the cluster, you must use the **enable** option.

---

**Examples**

The following example shows how to configure and enable a WN:

```
WAE(config)# service-insertion service-node
WAE(config-sn)# description London branch node 1
WAE(config-sn)# authentication sha1 key myauthkey
WAE(config-sn)# shutdown max-wait 120
WAE(config-sn)# enable
```

---

# (config-sn) authentication

To configure the WN authentication key, use the **authentication** service node configuration command. To unconfigure the authentication key, use the **no** form of this command.

**authentication sha1 key *authkey***

**no authentication sha1 key**

|                           |                                |  |
|---------------------------|--------------------------------|--|
| <b>Syntax Description</b> | <b>sha1 key <i>authkey</i></b> | Enables authentication between the WN and other devices in the AppNav Cluster and specifies an authentication key of up to 64 alphanumeric characters. |
|---------------------------|--------------------------------|--|

|                 |  |
|-----------------|--|
| <b>Defaults</b> | No key is defined and authentication is not enabled. |
|-----------------|--|

|                      |                            |
|----------------------|----------------------------|
| <b>Command Modes</b> | Service node configuration |

■ (config-sn) **description**

## (config-sn) description

To configure the WN description, use the **description** service node configuration command. To unconfigure the description, use the **no** form of this command.

**description** *description*

**no description**

|                           |   |   |
|---------------------------|---|---|
| <b>Syntax Description</b> | <i>description</i>  | Specifies a description of the node with up to 200 alphanumeric and space characters. |
| <b>Defaults</b>           | No default behavior or values.  |   |
| <b>Command Modes</b>      | Service node configuration  |   |
| <b>Device Modes</b>       | application-accelerator<br>appnav-controller  |   |
| <b>Examples</b>           | The following example shows how to configure a description:<br><br>WAE(config)# <b>service-insertion service-node</b><br>WAE(config-sn)# <b>description London branch node 1</b>  |   |
| <b>Related Commands</b>   | <a href="#">(config-sn) authentication</a><br><a href="#">(config-sn) enable</a><br><a href="#">(config-sn) node-discovery enable</a><br><a href="#">(config-sn) shutdown</a><br><a href="#">(config) service-insertion</a><br><a href="#">show service-insertion</a> |   |

# (config-sn) enable

To enable the participation of the WN in the AppNav Cluster, use the **enable** service node configuration command. To disable the node, use the **no** form of this command.

**enable**

**no enable**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Disabled.

**Command Modes** Service node configuration

**Device Modes** application-accelerator  
appnav-controller

**Usage Guidelines** A WN must be enabled before it can actively participate in an AppNav Cluster and receive traffic for optimization.

**Examples** The following example shows how to enable a WN for participation in an AppNav Cluster:

```
WAE(config)# service-insertion service-node
WAE(config-sn)# enable
```

**Related Commands**

- [\(config-sn\) description](#)
- [\(config-sn\) node-discovery enable](#)
- [\(config-sn\) shutdown](#)
- [\(config\) service-insertion](#)
- [show service-insertion](#)

---

```
■ (config-sn) node-discovery enable
```

## (config-sn) node-discovery enable

To enable the node discovery of the Service Node(SN) in the AppNav Cluster, use the **node-discovery enable** service node configuration command. To disable the service node, use the **no** form of this command.

```
node-discovery enable{bvi bridge_group_number | GigabitEthernet interface_slot | portchannel etherchannel_index | standby standby_index}
```

```
no node-discovery enable
```

|        |   |
|--------|---|
| Syntax | <b>bvi bridge_group_number</b> Select a bridge virtual interface for node-discovery.            |
|        | <b>GigabitEthernet interface_slot</b> Selects a gigabit ethernet interface for node discovery.  |
|        | <b>portchannel etherchannel_index</b> Selects an ethernet channel interface for node discovery. |
|        | <b>standby standby_index</b> Selects a standby group for node discovery.                        |

---

|          |   |
|----------|---|
| Defaults | When service node is enabled, node discovery is enabled by default on eth0 interface. |
|----------|---|

|               |                            |
|---------------|----------------------------|
| Command Modes | Service node configuration |
|---------------|----------------------------|

|              |  |
|--------------|--|
| Device Modes | application-accelerator<br>appnav-controller |
|--------------|--|

---

|                  |  |
|------------------|--|
| Usage Guidelines | Use the <b>node-discovery enable command</b> to configure the service node in the L2 proximity of any participating AppNav Controller so that it is automatically added to the cluster and can participate in WAN optimization. The node discovery configuration for a Service Node cannot be changed when the SN is enabled. To make changes on the node discovery configuration for a SN, the SN should be first disabled. For e.g. if you want to enable/disable the node discovery or change the node discovery interface, you can do so only when the SN is disabled. |
|------------------|--|

---

|          |  |
|----------|--|
| Examples | The following example shows how to enable the node discovery of a SN for participation in an AppNav Cluster: |
|----------|--|

```
WAE(config)# service-insertion service-node
WAE(config-sn)# node-discovery enable ?
WAE(config-sn)# bvi 1
WAE(config-sn)# GigabitEthernet 1
WAE(config-sn)# portchannel 2
WAE(config-sn)# standby 1
```

---

[\(config-sn\) description](#)  
[\(config-sn\) shutdown](#)  
[\(config\) service-insertion](#)  
[show service-insertion](#)

(config-sn) shutdown

## (config-sn) shutdown

To configure the WN shutdown timeout, use the **shutdown** service node configuration command. To unconfigure the shutdown timeout, use the **no** form of this command.

**shutdown max-wait seconds**

**no shutdown max-wait**

---

|                           |                         |  |
|---------------------------|-------------------------|--|
| <b>Syntax Description</b> | <b>max-wait seconds</b> | Specifies the number of seconds that the node should wait for all connections to terminate when shutting down. Valid values range from 0-3600 seconds. The default is 120 seconds. |
|---------------------------|-------------------------|--|

---

**Defaults** The shutdown waiting time is 120 seconds.

**Command Modes** Service node configuration

**Device Modes** application-accelerator  
appnav-controller

**Examples** The following example shows how to configure the shutdown timeout for two minutes:

```
WAE(config)# service-insertion service-node
WAE(config-sn)# shutdown max-wait 120
```
