Cell Phone Interference Caution

Caution Using a cell, mobile, or GSM phone, or two-way radio in close proximity to Cisco Smart+Connected Residential products might cause interference. For more information, refer to the manufacturer's documentation of the interfering device.

Using External Devices With Your Cisco Smart+Connected Residential Products

The following information applies when you use external devices with Cisco Smart+Connected Residential products:

Cisco recommends the use of good quality external devices (speakers, microphones, and headsets) that are shielded (screened) against unwanted radio frequency (RF) and audio frequency (AF) signals.

Depending on the quality of these devices and their proximity to other devices such as mobile phones or two-way radios, some audio noise may still occur. In these cases, Cisco recommends that you take one or more of the following actions:

- Move the external device away from the source of the RF or AF signals.
- Route the external device cables away from the source of the RF or AF signals.
- Use shielded (screened) cables for the external device, or use cables with a better shield (screen) and connector.
- Shorten the length of the external device cable.
- Apply ferrites or other such devices on the cables for the external device.

Cisco cannot guarantee the performance of the system because Cisco has no control over the quality of external devices, cables, and connectors. The system will perform adequately when suitable devices are attached using good quality cables and connectors.

Caution

Caution: In European Union countries, use only external speakers, microphones, cables, and headsets that are fully compliant with the EMC Directives 2006/95/EC and 2004/108/EC.

International Guidelines for Exposure to Radio Waves

THIS DEVICE MEETS INTERNATIONAL GUIDELINES FOR EXPOSURE TO RADIO WAVES.

Your mobile device is a radio transmitter and receiver. It is designed not to exceed the limits for exposure to radio waves (radio frequency electromagnetic fields) recommended by international guidelines. The guidelines were developed by an independent scientific organization (ICNIRP) and include a substantial safety margin designed to assure the safety of all persons, regardless of age and health.

The radio wave exposure guidelines use a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR limit for mobile devices is 2.0 W/kg.

Tests for SAR are conducted using standard operating positions with the device transmitting at its highest certified power level in all tested frequency bands. The highest SAR values under the ICNIRP guidelines for this device model are:

Maximum SAR for Cisco Controller 200 model SCH-CONTROL-200 (FCC ID: R33C4HC2001 and ICID: 7848A-C4HC200B) and conditions under which it was recorded

During use, the actual SAR value for this device may be well below the value stated above. The operating power of your mobile device is automatically decreased by the base-station, thereby conserving battery life and minimizing interference with adjacent network cells, if full power is not needed for the call. The amount of power reduction (if any) is dependent on a number of factors such as how close you are to a base-station. In general, the lower the power output by the device, the lower its SAR value.

The World Health Organization has stated that present scientific information does not indicate the need for any special precautions for the use of mobile devices. They recommend that if you are interested in further reducing your exposure then you can easily do so by limiting your usage or simply using a hands-free kit to keep the device away from the head and body.

IEEE ANSI C95.1 1992 Guidelines for Exposure to Radio Waves

THIS DEVICE MEETS IEEE ANSI C95.1 1992 GUIDELINES FOR EXPOSURE TO RADIO WAVES.

Your mobile device is a radio transmitter and receiver. It is designed not to exceed the limits for exposure to radio waves (radio frequency electromagnetic fields) recommended by international guidelines. The guidelines were developed by the IEEE ANSI C 95.1 and include a substantial safety margin designed to assure the safety of all persons, regardless of age and health.

The radio wave exposure guidelines use a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR limit for mobile devices is 1.6W/kg.

Tests for SAR are conducted using standard operating positions with the device transmitting at its highest certified power level in all tested frequency bands. The highest SAR values under the FCC guidelines for this device model are:

CET APPAREIL EST CONFORME AUX DIRECTIVES DU CODE 6 DE SÉCURITÉ DE LA SANTÉ CANADA POUR L'EXPOSITION AUX ONDES RADIO.

Votre appareil mobile est un émetteur-récepteur radio. Il est conçu pour ne pas dépasser les limites d'exposition aux ondes radio (champs électromagnétiques de fréquence radio) recommandées par les directives internationales. Les lignes directrices ont été élaborées par Santé Canada et comprennent une marge de sécurité importante destinée à assurer la sécurité de toutes les personnes, indépendamment de l'âge et de la santé.

Les lignes directrices pour l'exposition aux ondes radio utilisent une unité de mesure appelée Débit d'Absorption Spécifique, ou DAS. La limite DAS pour les appareils mobiles est 1,6W/kg.

Les tests de DAS sont effectués en utilisant des positions standards de fonctionnement quand l'appareil fonctionne à son niveau de puissance maximum certifié dans toutes les bandes de fréquences testées. Les valeurs DAS les plus élevées selon les directives de Santé Canada pour ce modèle sont les suivants:

Maximum du DAS pour le modèle SCH-CONTROL-200 (IC ID: 7848A-C4HC200B) et les conditions dans lesquelles il a été enregistré

Le DAS corps	2.4 GHz @ 10 g	Wi-Fi: 0.464 W/kg

En cours d'utilisation, la valeur de DAS réel de ce dispositif peut être bien inférieur à la valeur indiquée ci-dessus. La puissance de fonctionnement de votre appareil mobile est automatiquement diminué de la station de base, qui permet de préserver la vie de la batterie et en minimisant les interférences avec les cellules de réseau adjacent, si pleine puissance n'est pas nécessaire pour l'appel. Le montant de la réduction de puissance (le cas échéant) est tributaire d'un certain nombre de facteurs tels que la distance qui vous sépare d'une station de base. En général, plus la puissance de sortie par le dispositif, plus sa valeur DAS.

L'Organisation mondiale de la Santé (OMS) a déclaré que l'information scientifique actuelle n'indique pas la nécessité de prendre des précautions particulières pour l'utilisation de dispositifs mobiles. Ils recommandent que si vous êtes intéressé à réduire encore davantage votre exposition, vous pouvez facilement le faire en limitant votre consommation ou tout simplement en utilisant un kit mains-libres pour maintenir le dispositif éloigné de la tête et du corps.
