

## Downstream Resiliency Bonding Group

With more wideband (WB) modems being deployed in cable plants, WB modem resiliency is an important feature. When a comparatively smaller number of cable modems (CMs) observe an impairment on an RF channel, that RF channel stops working. It impacts all the CM using that RF channel, irrespective of whether they reported the impairment on that RF channel. Instead, the solution should be to communicate with the affected cable modems using the good RF channel, without affecting the other cable modems.

The Downstream Resiliency Bonding Group feature allows cable modems with multiple impaired RF channels to be allocated to a dynamically-created wideband interface, which ensures that the performance of the wideband cable modems is not drastically affected.

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://tools.cisco.com/ITDIT/CFN/>. An account on <http://www.cisco.com/> is not required.

# Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

**Table 1: Hardware Compatibility Matrix for the Cisco cBR Series Routers**

Cisco CMTS Platform	Processor Engine	Interface Cards
Cisco cBR-8 Converged Broadband Router	<b>Cisco IOS-XE Release 16.5.1 and Later Releases</b> Cisco cBR-8 Supervisor: <ul style="list-style-type: none"> <li>• PID—CBR-SUP-250G</li> <li>• PID—CBR-CCAP-SUP-160G</li> </ul>	<b>Cisco IOS-XE Release 16.5.1 and Later Releases</b> Cisco cBR-8 CCAP Line Cards: <ul style="list-style-type: none"> <li>• PID—CBR-LC-8D30-16U30</li> <li>• PID—CBR-LC-8D31-16U30</li> <li>• PID—CBR-RF-PIC</li> <li>• PID—CBR-RF-PROT-PIC</li> <li>• PID—CBR-CCAP-LC-40G</li> <li>• PID—CBR-CCAP-LC-40G-R</li> <li>• PID—CBR-CCAP-LC-G2-R</li> <li>• PID—CBR-SUP-8X10G-PIC</li> <li>• PID—CBR-2X100G-PIC</li> </ul> Digital PICs: <ul style="list-style-type: none"> <li>• PID—CBR-DPIC-8X10G</li> <li>• PID—CBR-DPIC-2X100G</li> </ul> Cisco cBR-8 Downstream PHY Module: <ul style="list-style-type: none"> <li>• PID—CBR-D31-DS-MOD</li> </ul> Cisco cBR-8 Upstream PHY Modules: <ul style="list-style-type: none"> <li>• PID—CBR-D31-US-MOD</li> </ul>

**Note** Do not use DPICs (8X10G and 2x100G) to forward IP traffic, as it may cause buffer exhaustion, leading to line card reload.

The only allowed traffic on a DPICs DEPI, UEPI, and GCP traffic from the Cisco cBR-8 router to Remote PHY devices. Other traffic such as DHCP, SSH, and UTSC should flow via another router, since DPICs cannot be used for normal routing.

## Prerequisites for Downstream Resiliency Bonding Group

- Set aside WB interfaces so that new WB interfaces can be dynamically created from the reserved list of WB interfaces.
- Free up RF bandwidth so that those RF channels can be added to a resiliency bonding group (RBG).
- Remove all existing RBG configuration from the WB interface.

## Restrictions for the Downstream Resiliency Bonding Group

- If an existing wideband interface is reserved as a Resiliency Bonding Group (RBG) and later the RBG is removed (through the **no cable ds-resiliency** command), the modems using this RBG go offline and the RBG configuration itself is deleted. Therefore, it is highly recommended that users should not configure an existing BG as an RBG.
- This feature is enabled only when the number of cable modems observing an RF channel impairment is *below* the resiliency threshold. If the number of cable modems on an impaired RF channel is above the resiliency threshold, the impaired RF channel is temporarily removed from the bonding group.
- A cable modem is assigned to an RBG on a first-come-first-served basis. To handle this feature optimally, it is recommended to set aside more WB interfaces and RF channel bandwidth.
- The Cisco CMTS controls the freeing of unused RBGs, when there is no modem using the RGB. The freeing of the unused RGB may take some time and the RGB, which is not completely free cannot be used by the modems. Irrespective of the number of configured RBGs, if all the old RBGs are not completely set free and if the Cisco CMTS tries to move the cable modem to a new RBG, the Cisco CMTS moves the cable modem to the primary DS channel instead of RBG.
- Only SFs on the WB interface associated with the primary SF are moved to an RBG. SFs on other interfaces will not be moved.
- Static SFs are assigned to an RBG on a best effort quality of service (QoS).
- If the **resiliency rf-change-trigger** setting does not have the **secondary** keyword set, only the primary SF is moved to the RBG or a NB interface.
- If the Downstream Resiliency Bonding Group feature is not enabled to use an RBG, only cable modems with impairments on the primary WB interface are moved to the NB interface.
- SFs carrying multicast traffic are not moved.

There may not be enough reserved bonding groups to support all modems facing an impairment at any given time thus the following restrictions must be considered:

- Each RBG has at least two RF channels.
- RBG RF assignments are always a subset of the RF channel assignment of the parent WB interface.
- If an RBG is unavailable for a cable modem, the SF of the CM is moved to a NB interface.
- If a high percentage of cable modems experience an RF impairment and there are no more available bonding group IDs, the impaired RF itself may be removed from the bonding group. Removal of an impaired RF from a parent bonding group is also reflected in the RBG. If an RBG drops to a single RF, all SFs are moved to the NB interface.

The Downstream Resiliency Bonding Group feature has the following cross-functional restrictions:

- All Dynamic service flows, whether they require a committed information rate (CIR) or not, typically voice flows, are created on the NB interface when an RF channel is impaired. Because all SFs assigned to an RBG are best effort only, voice calls may report a quality issue.
- Cable modems participating in the resiliency mode do not take part in load balancing.
- The Downstream Resiliency Bonding Group feature is only supported in the Dynamic Bandwidth Sharing (DBS) mode.

## Information About Downstream Resiliency Bonding Group

You can set aside unused bonding groups as RBGs. Ensure that each RF channel is assigned at least 1% of the available bandwidth. Use the **cable rf-channel bandwidth-percent** command to configure the RF channel bandwidth.

---

**Note** If the bandwidth-percent is set to 100, the Cisco CMTS does not add any RFs to the RBG. In other words, this feature will not be enabled.

---

The Cisco CMTS controls the assignment and freeing of unused RBGs. If an RF channel is removed from a WB interface, it is also removed from any associated RBGs.

---

**Note** If the wideband interface is in standby mode, the Cisco CMTS does not assign or free up the unused downstream bonding group.

---

A suspended RF channel is restored for all affected wideband interfaces when a specified number of cable modems report (via CM-STATUS) that the channel connectivity is restored. The Wideband Modem Resiliency feature defines the specified number of cable modems as half of the configured count or percentage of rf-change-trigger, or both. For example, if the count is 20 and the percent is 10, then the number of cable modems reporting recovery should reduce the count to 10 and the percent to 5 for the suspended RF channel to be restored.

## Finding a Best-Fit RBG for the Cable Modem

A bonding group is a list of channels that provide a means to identify the channels that are bonded together. The Cisco CMTS assigns a service flow (SF) to an RBG based on the attributes of the SF and the attributes of the individual channels of the bonding group.

In the Downstream Resiliency Bonding Group feature, when a line card receives a CM-STATUS message from the cable modem informing the line card that there is an RF channel impairment, the line card checks for the number of good RF channels and:

- Moves the cable modem to narrowband mode if there is only one available RF channel.
- Moves the cable modem to wideband mode if the cable modem reports all RF channels are in good state.
- Moves the cable modem to an RBG if there are two or more good RF channels, with at least one RF channel impaired, and if the Downstream Resiliency Bonding Group feature is enabled.

When the Cisco CMTS receives a message from the line card to move a cable modem to an RBG, the Cisco CMTS attempts to find an existing RBG or creates an RBG that satisfies the impairment.

**Note** If two or more RBGs are reserved for the same wideband controller, the Cisco CMTS creates one RBG for each cable modem.

**Note** The Cisco CMTS creates more than one RBG from a parent WB interface if the user has set aside more than one WB interface as the RBG and the RF bandwidth does not exceed 100%.

If a matching RBG is not found or cannot be created, the Cisco CMTS looks for an RBG with a subset of the required RF channels and if available, the cable modem is assigned to such an RBG.

However, if no such RBG exists, the Cisco CMTS instructs the line card to move the cable modem to NB mode.

## How to Configure Downstream Resiliency Bonding Group

This section contains the following:

### Enabling Downstream Resiliency Bonding Group

#### Procedure

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Router# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>cable rf-change-trigger {percent value   count number} [secondary]</b> <b>Example:</b> Router(config)# <code>cable rf-change-trigger percent 50 count 1 secondary</code>	Specifies the amount of time an event must persist before it triggers an action for the reporting CM.
<b>Step 4</b>	<b>cable resiliency ds-bonding</b> <b>Example:</b> Router(config)# <code>cable resiliency ds-bonding</code>	Enables the downstream resiliency bonding group.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Router(config)# <code>exit</code>	Returns to the global configuration mode.

### What to do next

**Note** The result of using the **cable rf-change-trigger** command with the **cable resiliency ds-bonding** command is different from using only the **cable rf-change-trigger** command. For more information, see [Downstream Resiliency Narrowband Mode Versus Resiliency Bonding Group, on page 8](#).

## Reserving a Resiliency Bonding Group for a Line Card

This section describes reserving a bonding group or a wideband interface for a line card per controller.

**Restriction** When you reserve a resiliency bonding group using the **cable ds-resiliency** command, the existing bundle and RF channel configurations on the wideband interface will be removed automatically. Other configurations like admission control, should be removed manually.

After downstream resiliency bonding group is configured, avoid other manual configurations.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
Step 2	<b>configure terminal</b> <b>Example:</b> Router# <b>configure terminal</b>	Enters global configuration mode.
Step 3	<b>interface wideband-cable</b> <i>slot/subslot/port:wideband-channel</i> <b>Example:</b> Router(config)# <b>interface wideband-cable 1/0/0:7</b>	Configures a wideband cable interface.
Step 4	<b>cable ds-resiliency</b> <b>Example:</b> Router(config-if)# <b>cable ds-resiliency</b>	Reserves an individual bonding group or WB interface for usage on a line card, on a per controller basis.
Step 5	<b>exit</b> <b>Example:</b> Router(config-if)# <b>exit</b>	Returns to the global configuration mode.

## Verifying Downstream Resiliency Bonding Group Configuration

This section contains the following:

### Verifying the Downstream Resiliency Bonding Group

To verify if the Downstream Resiliency Bonding Group feature is enabled, use the **show cable modem resiliency** command as shown in the following example:

```
Router# show cable modem resiliency
```

				Orig BG		Curr BG		
I/F	MAC Address	ID	I/F	RFs	ID	I/F	RFs	
C7/0/0	0025.2eaf.843e	897	Wi7/0/0:0	4	898	Wi7/0/0:1	3	
C7/0/0	0025.2eaf.8356	897	Wi7/0/0:0	4	899	Wi7/0/0:2	3	
C7/0/0	0015.d176.5199	897	Wi7/0/0:0	4	720	In7/0/0:0		

The **Current BG I/F** field indicates whether Downstream Resiliency Bonding Group feature is enabled and if the cable modems are assigned to a WB interface.

Starting with Cisco IOS XE Cupertino 17.9.1w, VTY injection is not used during RBG change, and the system shows the username of the last user who has performed the last configuration update.

To verify the configuration, use the **show running-config** command as shown in the following example:

```
Router# show running-config
oad for five secs: 25%/4%; one minute: 43%; five minutes: 39%
Time source is NTP, 11:21:16.148 CST Mon Oct 17 2022

Building configuration...
```

```

Current configuration : 1305898 bytes
!
! Last configuration change at 08:43:48 CST Mon Oct 17 2022
! NVRAM config last updated at 11:19:42 CST Mon Oct 17 2022 by cstuser

```

## Verifying a Reserved Resiliency Bonding Group

To verify if a BG is reserved for a line card, use the **show cable resiliency** command as shown in the following example:

```

Router# show cable resiliency

```

Resil BG I/F	BG ID	Resil BG State	Count	Time	RF Ctrl	Num
Wi1/0/0:10	10	Free				
Wi1/0/0:20	20	Free				
Wi7/0/0:1	1	Assigned	3	Nov 3 09:55:49	0	0
						1
						2
Wi7/0/0:2	2	Assigned	3	Nov 3 09:57:09	0	0
						1
						3

## Downstream Resiliency Narrowband Mode Versus Resiliency Bonding Group

This section provides the sample outputs when using the **cable rf-change-trigger** command with the **cable resiliency ds-bonding** command and using only the **cable rf-change-trigger** command.

**Table 2: Downstream Resiliency Narrowband Mode Versus Resiliency Bonding Group - Scenario 1**

Effect on	Using only cable rf-change-trigger command (Downstream Resiliency NB Mode)		Using cable rf-change-trigger command with cable resiliency ds-bonding (Downstream Resiliency Bonding Group)	
	Below Threshold	Above Threshold	Below Threshold	Above Threshold
Primary Service Flow	Moves to the primary channel.	Remains on the original bonding group while the impaired downstream channels are not used and are reported as DOWN.	Moves to dynamic bonding group.	Remains on the original bonding group while the impaired downstream channels are not used and are reported as DOWN.
Secondary Service Flows	Remain on the original WB interface.	Remains on the original bonding group while the impaired downstream channels are not used and are reported as DOWN.	Remains on the original bonding group.	Remains on the original bonding group while the impaired downstream channels are not used and are reported as DOWN.

The following is a sample output for a cable modem when the **cable rf-change-trigger** command is used with the **cable resiliency ds-bonding** command and the number of cable modems observing an RF channel impairment is *below* the resiliency threshold:

```

Router# show cable modem

```

MAC Address	IP Address	I/F	MAC State	Prim Sid	RxPwr (dBm)	Timing Offset	Num CPE	I P

# Troubleshooting the Downstream Resiliency Bonding Group Configuration

Use the following commands to get information on the WB interface, number of CMs in an impaired state, resiliency bonding groups, their associated bonding groups, available RF channels, and the number of CMS and service flows assigned to them:

- **debug cable wbcmts resiliency**
- **debug cable wbcmts resiliency report**
- **show cable resiliency**
- **show cable modem resiliency**
- **show cable modem wideband rcs-status**
- **show cable modem service-flow verbose**
- **show cable resil-rf-status**
- **show cable modem summary wb-rfs**

In case the CPU usage of the downstream resiliency process is high, use following commands to optimize the downstream resiliency bonding group configuration:

- **cable rf-change-up-multiplier *value*** - The default value is 2. Use this command to set the rf-channel up dampen time as an integer multiplier of the rf-channel down dampen time, in order to lengthen the recovery time to keep certain modems from falling back into DOWN state shortly after recovery.
- **cable resiliency free-interval *seconds*** - The recommended value is 360. Use this command to set the wait time before a created resiliency bonding group is freed/recycled, in order to hold the resiliency bonding group up long enough for it to be reused by impaired cable modems.

## Configuration Examples for the Downstream Resiliency Bonding Group

The following is an example of the configuration of the Downstream Resiliency Bonding Group feature:

```
cable rf-change-trigger count 10 secondary
cable resiliency ds-bonding
!
controller Upstream-Cable 9/0/1
us-channel 0 frequency 13200000
us-channel 0 channel-width 6400000 6400000
us-channel 0 power-level -1
us-channel 0 docsis-mode atdma
us-channel 0 minislot-size 8
us-channel 0 modulation-profile 221
no us-channel 0 shutdown
us-channel 1 frequency 19600000
us-channel 1 channel-width 6400000 6400000
us-channel 1 power-level -1
```

```
us-channel 1 docsis-mode atdma
us-channel 1 minislot-size 8
us-channel 1 modulation-profile 221
no us-channel 1 shutdown
us-channel 2 frequency 26000000
us-channel 2 channel-width 6400000 6400000
us-channel 2 power-level -1
us-channel 2 docsis-mode atdma
us-channel 2 minislot-size 8
us-channel 2 modulation-profile 221
no us-channel 2 shutdown
us-channel 3 frequency 32400000
us-channel 3 channel-width 6400000 6400000
us-channel 3 power-level -1
us-channel 3 docsis-mode atdma
us-channel 3 minislot-size 8
us-channel 3 modulation-profile 221
no us-channel 3 shutdown
!
controller Integrated-Cable 9/0/1

```

The following is a sample output for the **show cable modem** command to display impaired cable modems below the resiliency threshold value:

Router# **show cable modem**

MAC Address	IP Address	I/F	MAC State	Prim Sid	RxPwr (dBm)	Timing Offset	Num CPE	I P
e448.c70c.96d5	80.17.150.6	C9/0/1/U2	p-online	1	0.00	1784	0	N
e448.c70c.96f3	80.17.150.14	C9/0/1/U1	w-online	2	-1.00	1797	0	N

68ee.9633.0699	80.17.150.31	C9/0/1/U0	w-online	3	-1.00	2088	1	N
e448.c70c.96e7	80.17.150.29	C9/0/1/U3	p-online	4	-0.50	1785	0	N
e448.c70c.982b	80.17.150.18	C9/0/1/U2	w-online	5	0.00	1780	0	N
e448.c70c.9804	80.17.150.13	C9/0/1/U3	w-online	6	-0.50	1788	0	N
e448.c70c.9819	80.17.150.30	C9/0/1/U0	w-online	7	-1.00	1782	0	N
e448.c70c.980d	80.17.150.17	C9/0/1/U0	w-online	8	-1.00	1787	0	N

**Note** p-online indicates that the cable modem has reported NP RF failure and it is in downstream partial service mode.

The following is a sample output when RBGs are created:

Router# **show cable resiliency**

Resil BG I/F	BG ID	Resil BG State	Count	Time	RF Ctrl	Num
Wi9/0/1:60	28989	Assigned	1	Jan 9 07:35:08	1	0
						1
						2
Wi9/0/1:61	28990	Assigned	1	Jan 9 07:36:54	1	0
						1
						3
Wi9/0/1:62	28991	Free	0			

The following is a sample output when cable modems service flows are assigned to RBGs:

Router# **show cable modem resiliency**

I/F	MAC Address	ID	Orig BG I/F	RFs ID	Curr BG I/F	RFs
C9/0/1	e448.c70c.96d5	28929	Wi9/0/1:0	4	28989 Wi9/0/1:60	3
C9/0/1	e448.c70c.96e7	28929	Wi9/0/1:0	4	28990 Wi9/0/1:61	3

The following is a sample output of the **show cable modem** command when the impaired cable modems have recovered:

Router# **show cable modem**

MAC Address	IP Address	I/F	MAC State	Prim Sid	RxPwr (dBmv)	Timing Offset	Num CPE	I P
e448.c70c.96d5	80.17.150.6	C9/0/1/U2	w-online	1	0.00	1784	0	N
e448.c70c.96f3	80.17.150.14	C9/0/1/U1	w-online	2	-1.00	1797	0	N
68ee.9633.0699	80.17.150.31	C9/0/1/U0	w-online	3	-1.00	2088	1	N
e448.c70c.96e7	80.17.150.29	C9/0/1/U3	w-online	4	-0.50	1785	0	N
e448.c70c.982b	80.17.150.18	C9/0/1/U2	w-online	5	0.00	1780	0	N
e448.c70c.9804	80.17.150.13	C9/0/1/U3	w-online	6	-0.50	1788	0	N
e448.c70c.9819	80.17.150.30	C9/0/1/U0	w-online	7	-1.00	1782	0	N
e448.c70c.980d	80.17.150.17	C9/0/1/U0	w-online	8	-1.00	1787	0	N

The following is a sample output of the **show cable resiliency** command when the impaired cable modems have recovered:

Router# **show cable resiliency**

Resil BG I/F	BG ID	Resil BG State	Count	Time	RF Ctrl	Num
--------------	-------	----------------	-------	------	---------	-----

```

-----
Wi9/0/1:60      28989 Free      1      Jan 9   07:35:08

## Feature Information for Downstream Resiliency Bonding Group

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the <https://cfnng.cisco.com/> link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 4: Feature Information for Downstream Resiliency Bonding Group**

Feature Name	Releases	Feature Information
Downstream Resiliency Bonding Group	Cisco IOS XE Fuji 16.7.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.
Resiliency Bonding Group Enhancement	Cisco IOS XE Gibraltar 16.12.1y	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.
