## **Video Services Provisioning Model**

The Cisco cBR-8 router offers the next generation CCAP platform supporting converged CMTS and EQAM functionality. The redesigned video data model supports the creation of virtual edge devices within the platform. This data model simplifies the provisioning procedure and enables seamless migration to virtualized video service management in the future.

The video provisioning constructs of the new data model provide hardware abstraction and divides services into virtual edge devices for easier provisioning at scale. It also provides isolation between the service applications at the software layer. A bind-operation connects these constructs to the physical resources.

- Information about Video Services Provisioning, on page 1
- Feature Information for Video Services Provisioning, on page 2

## Information about Video Services Provisioning

### **Video Provisioning Constructs**

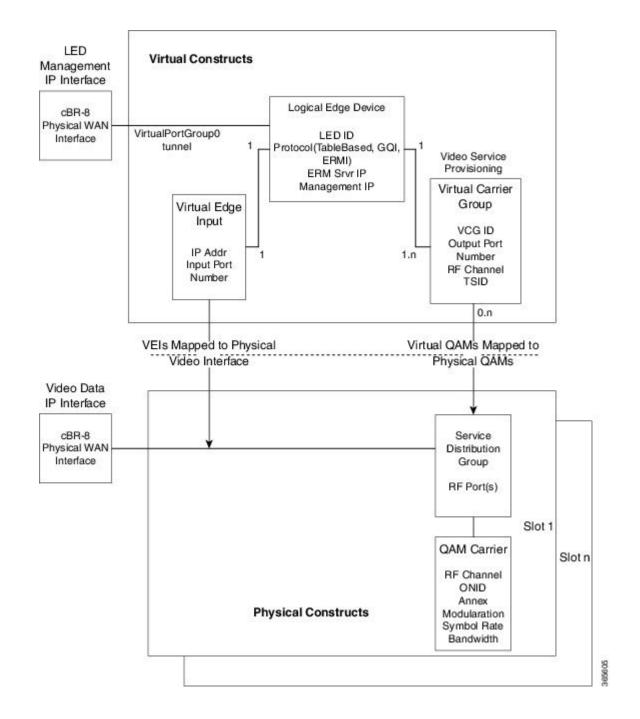

The Video Services Provisioning Model has the following elements:

- Logical Edge Device (LED)—a virtual edge device in the Cisco cBR-8 chassis that can be provisioned for static or dynamic sessions.
- Virtual Carrier Group (VCG)—a collection of Virtual QAM Carriers (RF channels) provisioned on an LED.
- Virtual Edge Input (VEI)—assigned either globally to all VCGs in the LED or optionally assigned uniquely to an individual VCG.
- Service Distribution Group (SDG)—a collection of one or more RF ports that define the physical slot/bay/port to be used in a video service.

#### **Connection of Virtual and Physical Constructs**

The VCGs are bound to an SDG using a bind command (bind-vcg). This connects the virtual carriers to the physical ports listed in the SDG. After binding, a path from the VEI is mapped to the RF ports.

The image below shows the elements in the Video Provisioning Construct.

## **Feature Information for Video Services Provisioning**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 1: Feature Information for Video Services Provisioning

Feature Name	Releases	Feature Information		
Video Services Provisioning	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.		

Cisco cBR Converged Broadband Routers Basic Configuration and Provisioning Construct for Cisco IOS XE Amsterdam 17.3.x

## Video Virtual Carrier Group and Virtual Edge Input

A Virtual Carrier Group (VCG) is a collection of virtual QAM carriers (RF channels) provisioned on a Logical Edge Device (LED). A Virtual Edge Input (VEI) is a customer assigned IP address that is used, from the Head End, as a destination IP address for unicast video IP packets.

- Information about Virtual Carrier Group and Virtual Edge Input, on page 5
- How to Configure Virtual Carrier Group and Virtual Edge Input, on page 6
- Configuration Examples for Virtual Carrier Group and Virtual Edge Input, on page 9
- Feature Information for Virtual Carrier Group and Virtual Edge Input, on page 10

## Information about Virtual Carrier Group and Virtual Edge Input

### **Virtual Carrier Group**

A Virtual Carrier Group (VCG) is a collection of virtual QAM carriers (RF channels) provisioned on a Logical Edge Device (LED).

Each VCG must have a unique name and ID, since it also assigns attributes such as TSID and output port number to the virtual QAM carriers. The output port number only needs to be unique per LED. However, TSID/ONID pair must be unique for the chassis.

Duplicate TSIDs can be assigned to multiple QAM carriers by overriding the default TSID. Overriding the default TSID does not affect the unique TSID/ONID pair on the cBR router. The duplicate TSID overrides the unique TSID on the PAT header.

For more information, see Overriding the Default TSID section.

The service type must be designated in each VCG and the encrypt command must be entered if the carriers are to be encrypted. Enabling the VCG to use encryption and service type designates that each QAM carrier listed in the VCG will consume a QAM encryption license and video service type license. The actual number of licenses consumed will be done at VCG binding operation and is also dependent on the QAM replication requirements.

For more information on how the licenses are consumed, see Cisco Smart Licensing for Video.

#### Virtual Edge Input

A Virtual Edge Input (VEI) is a customer assigned IP address that is used, from the Head End, as a destination IP address for unicast video IP packets. Each VEI will need to be configured with a routable IP address from within the customer's network.

A VEI is assigned within a Logical Edge Device. Each Virtual Carrier Group (VCG) is associated with one or more IP addresses that represent VEIs.

For GQI protocol, VEI must be configured under the LED, since GQI expects VEI to be able to reach any Virtual QAM carrier listed in the same LED. Again, for GQI protocol, there is a limit of five VEIs per LED.

For the table based protocol, VEI may be configured under the LED or under a VCG. If the VEI is configured under a VCG, it can only reach the virtual QAM carriers associated with that particular VCG.

During the VCG binding operation, each VEI IP address will be bound to a single Video IP interface.

You can isolate the video traffic from other network traffic using MPLS (Multiprotocol Label Switching) and VRF (Virtual Routing and Forwarding), by configuring the VRF name parameter in video-edge-input command.

Note

Do not use the same VEI IP address in multiple VRFs, as Head End video session management servers are not MPLS or VRF aware.

## How to Configure Virtual Carrier Group and Virtual Edge Input

#### **Configuring Virtual Carrier Group**

#### Before you begin

Since each VEI needs to be configured with a routable IP address from within the customer's network, choose the IP addresses to use prior to configuring the VEIs.

Error messages for problems with the VCG configuration will become evident during the bind operation. Errors include overlapping rf-channels.

In virtual-edge-input-ip command line configuration, vrf is an optional parameter and can be used for MPLS routing or to make VEI private from other parts of the network.

To configure virtual carrier group, follow the steps below:

```
enable
configure terminal
cable video
virtual-carrier-group name [id number]
virtual-edge-input-ip ip-address [vrf vrf-name] input-port-number port-number
encrypt
service-type narrowcast
rf-channel start_channel-end_channel tsid start_tsid-end_tsid output-port-number
start_number-end_number
```

### **Overriding the Default TSID**

To assign duplicate TSIDs to multiple QAM carriers, you can override the default TSID by using the **override-tsid** command as shown in the example below.

```
enable
configure terminal
cable video
virtual-carrier-group name [id number]
override-tsid TSID
```

### **Verifying Virtual Carrier Group Configuration**

To verify the virtual carrier group configuration, use the **show cable video virtual-carrier-group** command as shown in the example below.

Router# <b>show cable video virtual-carrier-group all</b> Number of Virtual Carrier Groups: 1								
ID Nam	ne Service -Distribution -Group Name	Logical -Edge -Device Name	ServiceType	Encrypted	Low Latency	Override TSID	Total VEI	Total RF- Channel
1 vcc	jl sdgl	led1	narrowcast	N	N	-	0	1

### **Configuring Virtual Edge Input under Logical Edge Device**

#### Before you begin

Since each VEI will need to be configured with a routable IP address from within the customer's network, choose the IP addresses to use prior to configuring the VEIs.

To configure virtual edge input, follow the steps below:

```
enable
configure terminal
cable video
virtual-carrier-group name [id] number
virtual-edge-input-ip ip-address [vrf vrf-name] input-port-number port-number
vcg vcg-name
active
```

To configure virtual edge input under logical edge device, follow the steps below:

```
enable
configure terminal
cable video
logical-edge-device name [id] number
protocol table-based
virtual-edge-input-ip ip-address [vrf vrf-name] input-port-number port-number
vcg vcg-name
active
```

### Verifying Virtual Edge Input Configuration

To verify the virtual edge input configuration, use the **show cable video logical-edge-device** command as shown in the example below.

```
Router# show cable video logical-edge-device id 1
Logical Edge Device: led
Id: 1
Protocol: GQI
Service State: Active

To verify the VEI configuration with MPLS-VPN VRF, use the **show ip arp vrf** command as shown in the example below:

Router# <b>s</b>	how ip arp vrf	Video-VOD-Vrf			
Protocol	Address	Age (min)	Hardware Addr	Туре	Interface
Internet	174.102.1.1	-	12ab.0007.ce01	ARPA	Video7/0/0

## Configuration Examples for Virtual Carrier Group and Virtual Edge Input

This section provides configuration examples for the Virtual Carrier Group and Virtual Edge Input:

### **Example: Configuring Virtual Carrier Group**

The following example shows how to configure virtual carrier group:

```
enable
configure terminal
cable video
virtual-carrier-group vcg-0 id 1
virtual-edge-input-ip 174.101.1.1 input-port-number 1
virtual-edge-input-ip 174.102.1.1 vrf Video-VOD-Vrf input-port-number 2
encrypt
service-type narrowcast
rf-channel 0-10 tsid 1-11 output-port-number 1-11
```

### **Example: Configuring Virtual Edge Input**

The following example shows how to configure virtual edge input:

```
enable
configure terminal
cable video
logical-edge-device led_bc1 id 1
protocol table-based
virtual-edge-input-ip 174.102.1.1 input-port-number 1
vcg vcg_bc1
active
```

You can also configure VEI to be associated with a MPLS-VPN VRF:

```
enable
configure terminal
cable video
virtual-carrier-group vcg1 id 1
virtual-edge-input-ip 174.102.1.1 vrf Video-VOD-Vrf input-port-number 1
vcg vcg-name
active
```

Under logical edge device, follow the steps below:

```
enable
configure terminal
cable video
logical-edge-device led_bc1 id 1
protocol table-based
virtual-edge-input-ip 174.102.1.1 vrf Video-VOD-Vrf input-port-number 1
```

vcg vcg\_bc1 active

### **Example: Overriding the Default TSID**

The following example shows how to override the default TSID:

```
enable
configure terminal
cable video
virtual-carrier-group vcg1 id 1
override-tsid 100
%%Configuring this will regenerate the PAT with overridden TSID value for all QAM channels
under this VCG.
Do you want to continue? [Yes/No][confirm]y
```

## Feature Information for Virtual Carrier Group and Virtual Edge Input

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 2: Feature Information for Virtual Carrier Group and Virtual Edge Input

Feature Name	Releases	Feature Information
Virtual Carrier Group and	Cisco IOS XE Everest	This feature was integrated on the Cisco cBR
Virtual Edge Input	16.6.1	Series Converged Broadband Routers.
Using VRF for Video Session	Cisco IOS XE Everest	This feature was integrated on the Cisco cBR
Traffic	16.6.1	Series Converged Broadband Routers.

## **Service Distribution Group**

The Service Distribution Group (SDG) is a collection of one or more RF ports and defines the physical slot/bay/port to be used in a video service.

#### Contents

- Information About Service Distribution Group, on page 11
- How to Configure the Service Distribution Group, on page 12
- Troubleshooting Tips, on page 15
- Configuration Examples, on page 15
- Feature Information for Service Distribution Group, on page 16

### Information About Service Distribution Group

The following are the required components for configuring an SDG:

- Multiple Ports—Multiple ports in an SDG replicate all QAMs from the Virtual Carrier Group (VCG) to every port.
- Unicast—Unicast (VoD) services cannot be replicated across line cards.
- TSID—The TSIDs should always be unique (North American MSO). Non-unique TSIDs can be used if the ONID is changed from the default value of zero (0).

The convention slot/bay/port represents the following:

- Slot—Slot is the line card slot number. Slot can be configured 0–3 or 6–9. Slots 4 and 5 are the supervisor slots.
- Bay—Bay is the Cisco cBR-8 chassis number. This parameter is always configured as 0.
- Port—Port is the RF port number. This parameter can be configured 1-8.

Note

- For a Remote PHY line card, the SDG does not describe a collection of RF ports. SDG specifies the line card, bay, and downstream cable controller where the video will be destined. Use rpd downstream-cable *slot/bay/controller* command instead of rf-port integrated-cable *slot/bay/port* command. Only one downstream cable controller can be specified for an SDG, so QAM replication is not supported. (However, the controller can be multicast to multiple remote PHY devices which is similar to QAM replication but occurs external to the cBR-8.)
- Cisco Remote PHY Device 1x2 can join up to 30 multicast streams simultaneously for video.
- Cisco HA Shelf can join up to 30 multicast streams simultaneously per RPD for video.

### How to Configure the Service Distribution Group

This section describes how to configure SDGs for the video session on Cisco cBR-8.

### **Defining the Physical Slot/Bay/Port**

To define the Service Distribution Group (SDG), you must define the physical *slot/bay/port* to be used in a video service.

#### **Before You Begin**

Make sure that the controller type is **video** for the *slot/bay/port* that you use for the SDG. Errors due to the incorrect controller type used in the SDG appear during the bind operation.

To define the physical *slot/bay/port*, complete the following procedure:

```
configure terminal
cable video
service-distribution-group sdg name
rf-port integrated-cable slot/bay/port
```

#### **Configuring QAM Replication**

To configure QAM replication for service group size alignment between the DOCSIS and video services to one or more ports, you can add more ports into the service distribution group configuration.

#### **Before You Begin**

Make sure that the controller type is video for the slot/bay/port that you would use for the SDG. For more information, see the **Video QAM Carriers** section. Errors due to the incorrect controller type used in the SDG appear during the bind operation.

To configure QAM replication, complete the following procedure:

```
configure terminal
cable video
service-distribution-group service distribution group name
rf-port integrated-cable slot/bay/port
rf-port integrated-cable slot/bay/port
```

### **Overriding the Default ONID**

You can override the default ONID, by defining a new ONID value in the SDG configuration. If you perform this configuration, all channels associated with the configured SDG will have the new ONID value. By default, the system ONID is 0, which is commonly used in North America.

To override the default ONID, complete the following procedure:

```
configure terminal
cable video
service-distribution-group service distribution group name
onid onid number
```

### **Overriding the Default PSI Value**

To override the default PSI value, complete the following procedure:

```
configure terminal
cable video
service-distribution-group service distribution group name
psi-interval psi-interval msec
```

### **Configuring the Serving Area**

Configure the serving area to enable the set tops to discover VOD content.

```
configure terminal
cable video
service-distribution-group service distribution group name id id
serving-area value
```

To configure the service descriptor default, complete the following procedure:

```
configure terminal
cable video
service-descriptor-default
service-id id
service-name string
service-type id
provider-name string
```

If the serving area is specified and there are no defaults specified, the service name should be set as **VOD** and provider name should be set as **VOD-SERVER**, service id set as **1**, service type set as **1**.

#### Verifying the Serving Area Configuration

If the serving area is configured, session detail output will list the SDT information.

Router# show cable video session logical-edge-device id 2 session-id 270532608 Session Name : mptsl.2.199 Session Id : 270532608 Creation Time : Fri Oct 12 22:07:03 2018 Output Port : 41

  PID 20: Type 4, Info len 15, (lang fre), (CA SYS-ID 3584, PID 1, Private data: 010104)
```

To verify the service descriptor default value, use the command as shown in the following example:

```
Router# show run | s service-descriptor-default
Service-descriptor-default
Service-id 200
Service-name HD-Service
Service-type 1
Provider-name NEWS-channel
```

### Verifying Service Distribution Group Configuration

To verify the SDG configuration, use the **show cable video service-distribution-group** command as shown in the example below:

```
Router# show cable video service-distribution-group all
Number of Service Distribution Groups: 1
ID Name Virtual-Carrier-Group Logical-Edge-Device RF-Port ONID PSI Serving
      Name
                      Name
                                              Interval Area
_____
                                              _____
                     table-based 9/0/0 0 100 10

                                     table-based
    1
```

### **Troubleshooting Tips**

To undo any configuration, use the **no** form of the command. This command is useful if you have configured something by mistake. The errors are not apparent until you perform the bind operation.

### **Configuration Examples**

This section provides example configurations for the service distribution group.

### **Configuring a Service Distribution Group**

```
configure terminal
cable video
service-distribution-group vod id 1
onid 100
rf-port integrated-cable 7/0/0
rf-port integrated-cable 7/0/1
```

```
rf-port integrated-cable 7/0/2
rf-port integrated-cable 7/0/3
```

## **Feature Information for Service Distribution Group**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Feature Name	Releases	Feature Information
Service Distribution Group	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.
SDT	Cisco IOS XE Gibraltar 16.10.1c	Thisfeature was introduced on the Cisco cBR Series Converged Broadband Routers.

#### Table 3: Feature Information for Service Distribution Group

## **QAM** Profile

A QAM profile describes the common downstream channel modulator settings, referred to as physical layer parameters. This includes QAM constellation, symbol rate, interleaver-depth, spectrum-inversion, and annex.

For more information about the downstream interface configuration, see Downstream Interface Configuration.

But be aware that, if you configure annex A 6MHz or 7MHz in a QAM profile, then this QAM profile cannot be applied to a DOCSIS channel.

- QAM Profile, on page 17
- How to Configure the Video QAM Carriers, on page 17
- Configuration Examples, on page 19
- Feature Information for QAM Video Carriers, on page 19
- How to Configure the Video QAM Carriers, on page 20
- Configuration Examples, on page 21
- Feature Information for QAM Video Carriers, on page 21

### **QAM** Profile

A QAM profile describes the common downstream channel modulator settings, referred to as physical layer parameters. This includes QAM constellation, symbol rate, interleaver-depth, spectrum-inversion, and annex.

For more information about the downstream interface configuration, see Downstream Interface Configuration.

But be aware that, if you configure annex A 6MHz or 7MHz in a QAM profile, then this QAM profile cannot be applied to a DOCSIS channel.

### How to Configure the Video QAM Carriers

### **Configuring the Video QAM Profile**

To configure the video QAM profile, complete the following procedure:

```
configure terminal
cable downstream qam-profile id
annex {A freq_spacing|B|C}
modulation value
```

interleaver-depth value
symbol-rate value
spectrum-inversion {on|off}
description line

The frequency spacing of 6MHz, 7MHz and 8 MHz can be selected or annex A. In this case, the QAM profile can only be applied to a video channel.

#### **Spectrum Inversion**

Spectrum inversion happens as a result of mixing processes in RF or IF electronics. Spectrum inversion allows for the adaptation of older equipment with the new plant. The mixing of I and Q are used to create a quadrant profile. For some settops, the inversion of the quadrant profile is needed where the axis are flipped such that I represents the X and Q represents the Y-axis. Most modern equipment can detect and resolve the inversion split.

You can change this spectrum inversion configuration on a user-defined qam-profile. It cannot be changed on a system generated qam-profile from 0 to 5.

### Configuring the Video QAM Carriers

To configure the Video QAM carriers, complete the following procedure:

```
configure terminal
controller integrated-cable slot/bay/port
rf-channel start-channel - end-channel
type video
start-frequency frequency
rf-output normal
power-adjust number
qam-profile qam-profile number
```

```
V
```

Note

For video provisioning, the carriers must be of type "video" in the controller integrated-cable configuration.

#### Verify the configuration of the RF Channel

To verify the RF channel configuration, use the Show controller integrated-cable rf-chan command as shown in the example below:

Rout	er#sho	w cont	rollers int	egrated	l-Cable	9/0/	7 rf-cł	nannel 0-10			
Load	for f	ive se	cs: 6%/0%;	one min	ute: 5	%; fi	ve minu	ites: 5%

3	UP	UP	118000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
4	UP	UP	124000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
5	UP	UP	130000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
6	UP	UP	136000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
7	UP	UP	142000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
8	UP	UP	148000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
9	UP	UP	154000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
10	UP	UP	160000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL

### **Configuration Examples**

This section provides configuration examples for the QAM video carrier.

### **Video QAM Carriers**

The following is a sample for the Video QAM carrier configuration:

```
Router#enable
Router(config)#cable downstream qam-profile 4
Router(config-qam-prof) #annex A 6MHz
Router(config-qam-prof)#modulation 256
Router(config-qam-prof)#interleaver-depth I32-J4
Router(config-qam-prof)#symbol-rate 5361
Router(config-qam-prof)#spectrum-inversion off
Router(config-qam-prof)#description default-annex-a-256-qam
Router(config-qam-prof) #exit
Router(config)#controller Integrated-Cable 3/0/0
Router(config-controller) #max-carrier 128
Router(config-controller)#base-channel-power 34
Router(config-controller)#freq-profile 0
Router(config-controller) #rf-chan 0 95
Router(config-rf-chan) #type video
Router(config-rf-chan)#frequency 93000000
Router(config-rf-chan) #rf-output NORMAL
Router(config-rf-chan) #power-adjust 0
Router(config-rf-chan)#docsis-channel-id 1
Router(config-rf-chan)#qam-profile 1
```

## **Feature Information for QAM Video Carriers**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 4: Feature Information for (	<b>QAM Video Carriers</b>
------------------------------------	---------------------------

Feature Name	Releases	Feature Information		
QAM Video Carriers	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.		
Annex A Variable Channel Witdh	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.		

## How to Configure the Video QAM Carriers

### **Configuring the Video QAM Profile**

To configure the video QAM profile, complete the following procedure:

```
configure terminal
cable downstream qam-profile id
annex {A freq_spacing|B|C}
modulation value
interleaver-depth value
symbol-rate value
spectrum-inversion {on|off}
description line
```

The frequency spacing of 6MHz, 7MHz and 8 MHz can be selected or annex A. In this case, the QAM profile can only be applied to a video channel.

#### **Spectrum Inversion**

Spectrum inversion happens as a result of mixing processes in RF or IF electronics. Spectrum inversion allows for the adaptation of older equipment with the new plant. The mixing of I and Q are used to create a quadrant profile. For some settops, the inversion of the quadrant profile is needed where the axis are flipped such that I represents the X and Q represents the Y-axis. Most modern equipment can detect and resolve the inversion split.

You can change this spectrum inversion configuration on a user-defined qam-profile. It cannot be changed on a system generated qam-profile from 0 to 5.

### **Configuring the Video QAM Carriers**

To configure the Video QAM carriers, complete the following procedure:

```
configure terminal
controller integrated-cable slot/bay/port
rf-channel start-channel - end-channel
type video
start-frequency frequency
rf-output normal
power-adjust number
qam-profile gam-profile number
```

Note

For video provisioning, the carriers must be of type "video" in the controller integrated-cable configuration.

### Verify the configuration of the RF Channel

To verify the RF channel configuration, use the Show controller integrated-cable rf-chan command as shown in the example below:

Router#show controllers integrated-Cable 9/0/7 rf-channel 0-10											
Load	for f	ive se	cs: 6%/0%;	one min	ute: 5	%; fi	ve minu	ites: 5%			
Chan	State	Admin	Frequency	Туре	Annex	Mod	srate	Interleaver	dcid	power	output
0	UP	UP	100000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
1	UP	UP	106000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
2	UP	UP	112000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
3	UP	UP	118000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
4	UP	UP	124000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
5	UP	UP	130000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
6	UP	UP	136000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
7	UP	UP	142000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
8	UP	UP	148000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
9	UP	UP	154000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL
10	UP	UP	160000000	VIDEO	A	256	5361	I12-J17	-	34.0	NORMAL

### **Configuration Examples**

This section provides configuration examples for the QAM video carrier.

### Video QAM Carriers

The following is a sample for the Video QAM carrier configuration:

```
Router#enable
Router(config)#cable downstream qam-profile 4
Router(config-qam-prof) #annex A 6MHz
Router(config-qam-prof)#modulation 256
Router(config-qam-prof)#interleaver-depth I32-J4
Router(config-qam-prof)#symbol-rate 5361
Router(config-qam-prof) #spectrum-inversion off
Router(config-qam-prof)#description default-annex-a-256-qam
Router(config-qam-prof) #exit
Router(config)#controller Integrated-Cable 3/0/0
Router(config-controller) #max-carrier 128
Router(config-controller)#base-channel-power 34
Router(config-controller)#freq-profile 0
Router(config-controller) #rf-chan 0 95
Router(config-rf-chan) #type video
Router(config-rf-chan)#frequency 93000000
Router(config-rf-chan) #rf-output NORMAL
Router(config-rf-chan) #power-adjust 0
Router(config-rf-chan)#docsis-channel-id 1
Router(config-rf-chan)#qam-profile 1
```

### Feature Information for QAM Video Carriers

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

#### Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

#### Table 5: Feature Information for QAM Video Carriers

Feature Name	Releases	Feature Information		
QAM Video Carriers	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.		
Annex A Variable Channel Witdh	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.		

### CHAPTER 🕻

## **PSIP** and EAS Support for Broadcast QAM

This document provides information on the support for PSIP and EAS and how to configure Cisco cBR series routers to avail the support.

#### **Finding Feature Information**

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

- Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 23
- Information About PSIP and EAS Support, on page 24
- How to Configure PSIP and EAS Sessions, on page 25
- Configuration Example, on page 28
- Troubleshooting Tips, on page 28
- Feature Information for PSIP and EAS Support, on page 28

## Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

Cisco CMTS Platform	Processor Engine	Interface Cards
Cisco cBR-8 Converged Broadband Router	Cisco IOS-XE Release 16.5.1 and Later Releases	Cisco IOS-XE Release 16.5.1 and Later Releases
	Cisco cBR-8 Supervisor:	Cisco cBR-8 CCAP Line Cards:
	• PID—CBR-SUP-250G	• PID—CBR-LC-8D30-16U30
	• PID—CBR-CCAP-SUP-160G	• PID—CBR-LC-8D31-16U30

		Cisco cBR-8 Downstream PHY Module:
		• PID—CBR-D31-DS-MOD
		Cisco cBR-8 Upstream PHY Modules:
		• PID—CBR-D31-US-MOD

Table 6: Hardware Compatibility Matrix for the Cisco cBR Series Routers

## **Information About PSIP and EAS Support**

The Cisco cBR Series Router provides support for merging of Program and System Information Protocol (PSIP) and Emergency Alert Signaling (EAS) streams. This support allows to merge the PSIP and EAS information for digital terminal adapter (DTA) boxes. Merging these two streams helps in avoiding Continuity Counter (CC) errors and packet drops.

An operator can configure a session as PSIP and EAS when creating a session in a broadcast QAM. Operators can configure Passthru session as psip and data-piping session as eas.

### Prerequisites for PSIP and EAS Support

PSIP and EAS are applicable to table based sessions on broadcast QAMs. The following prerequisites are applicable to configuring the PSIP and EAS sessions:

- Service Distribution Group (SDG)
- Virtual Carrier Group (VCG)
- Bind VCG to SDG
- Logical Edge Device (LED)
- · Protocol of LED specified as table-based.
- Associate VCG to LED

### How to Configure PSIP and EAS Sessions

You should create a Passthru session with PSIP and data session with EAS.

This section contains the following:

### **Configuring PSIP and EAS Sessions**

The following sample commands show how to configure the sessions with PSIP and EAS.

```
cable video
  service-distribution-group service distribution group name id <ID>
   rf-port integrated-cable slot/bay/port
  virtual-carrier-group name [id number]
   service-type narrowcast
   rf-channel start channel-end channel tsid start tsid-end tsid output-port-number
start number-end number
 bind-vcq
   vcg vcg-name sdg <sdg name>
  logical-edge-device name [id] number
   protocol table-based
      virtual-edge-input-ip ip-address [vrf vrf-name] input-port-number port-number
      vcg <vcg name>
      active
  table-based
    vcg <vcg name>
      rf-channel <channel number>
        session SESS PSIP input-port <id> start-udp-port udp port number processing-type
passthru psip
       session SESS EAS input-port <id> start-udp-port udp port number processing-type
data eas
```

### Verifying the PSIP and EAS Configurations

The following example shows how to verify the configured PSIP and EAS sessions.

```
show cable video session logical-edge-device id 1
Total Sessions = 2
Session Output Frequency Streaming Sess Session Source UDP Input Output Input Output
```

Input Output Encrypt Encrypt Low PMV Session Id Port Hz Type Type Ucast Dest IP/ Port Program Program State State Bitrate Bitrate Type Status Lat NUM Name Mcast IP (S,G) 1048576 101 9300000 Passthru UDP 174.102.1.1 49652 - - ACTIVE-PSI ON 895556 904871 CLEAR - N - SESS\_PSIP.1.0.1.0.49652 1048577 101 9300000 Data-Piping UDP 174.102.1.1 49653 - - ACTIVE ON 908578 904857 CLEAR - N - SESS EAS.1.0.1.0.49653

#### Verifying the PSIP Session Configuration

```
show cable video session logical-edge-device id 1 session-id 1048576
1048576
Session Name
                  : SESS PSIP.1.0.1.0.49652

   vcg vcgl sdg sdgl
  logical-edge-device led1 id 1
   protocol table-based
      virtual-edge-input-ip 192.168.1.1 input-port-number 1
      vca vcal
      active
  table-based
    vcq vcq1
    rf-channel 0
      session SESS PSIP input-port 1 start-udp-port 49652 processing-type passthru psip
      session SESS EAS input-port 1 start-udp-port 49653 processing-type data eas
```

### **Troubleshooting Tips**

The following tips help in troubleshooting issues:

- Make sure that PSIP session is configured as processing-type passthru and psip
- · Make sure that EAS session is configured as processing-type data and eas
- When the PSIP session becomes ACTIVE-PSI, verify the PSIP Stats under the session details command.

Similarly, when the EAS session becomes ACTIVE, verify the EAS Stats under the session details command.

The out-count and carousel-count should increment.

## Feature Information for PSIP and EAS Support

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 7: Feature Information for PSIP and EAS Support

Feature Name	Releases	Feature Information
PSIP and EAS Support	-	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

Cisco cBR Converged Broadband Routers Basic Configuration and Provisioning Construct for Cisco IOS XE Amsterdam 17.3.x

# **NIT Reference Support for Broadcast QAM**

This document provides information on the support for NIT reference and how to configure Cisco cBR series routers to avail the support.

### **Finding Feature Information**

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

- Hardware Compatibility Matrix for the Cisco cBR Series Routers, on page 31
- Information About NIT Reference Support, on page 32
- How to Configure NIT Reference, on page 33
- Configuration Example, on page 34
- Troubleshooting Tips, on page 34
- Feature Information for NIT Reference Support, on page 35

# Hardware Compatibility Matrix for the Cisco cBR Series Routers

**Note** The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

Cisco CMTS Platform	Processor Engine	Interface Cards
Cisco cBR-8 Converged Broadband Router	Cisco IOS-XE Release 16.5.1 and Later Releases	Cisco IOS-XE Release 16.5.1 and Later Releases
	Cisco cBR-8 Supervisor:	Cisco cBR-8 CCAP Line Cards:
	• PID—CBR-SUP-250G	• PID—CBR-LC-8D30-16U30
	• PID—CBR-CCAP-SUP-160G	• PID—CBR-LC-8D31-16U30

		• PID—CBR-D31-DS-MOD
		Cisco cBR-8 Upstream PHY Modules:
		• PID—CBR-D31-US-MOD

Table 8: Hardware Compatibility Matrix for the Cisco cBR Series Routers

# **Information About NIT Reference Support**

The Cisco cBR Series Router provides support for Network Information Table (NIT) reference. This feature enables the operator to configure NIT PID from the IOS CLI. The NIT helps in conveying information about the physical organization of the multiplexes and transport streams (TS) carried through a specific network and also the characteristics of the network.

When the NIT PID is not configured, it falls back to the input stream's NIT PID. In this case, the NIT PID may be none or NIT PID based on the input stream.

# **How to Configure NIT Reference**

This section contains the following topics:

## **Configuring NIT Reference**

The following sample commands show how to configure NIT reference.

## Verifying the NIT Reference Configuration

The following example shows how to verify the NIT reference configuration.

```
video-LWR-S-A4#sh run | s cable vid
cable video
  multicast-uplink Port-channel23 access-list all-multicasts rp 2.23.1.1
  default-nit-reference 100
  mgmt-intf VirtualPortGroup 0
  encryption
```

### **Removing the NIT Reference**

To remove the configured NIT PID, use the no default-nit-reference <NIT PID> command.

```
no default-nit-reference
%%All existing sessions will be updated with default-nit-reference.
Re-configure Default NIT reference? [Yes/No][confirm]
```

# **Configuration Example**

This section provides example of Cisco cBR-8 Converged Broadband Router NIT reference configuration.

## **Example: NIT Reference Configuration**

# **Troubleshooting Tips**

The following tips help in troubleshooting issues:

- · After configuring NIT PID, check whether the streams are in ACTIVE-PSI for the QAM
- Verify that the configured NIT PID is present in the PAT's program 0
- After removing the NIT reference configuration (NIT PID), verify the following,
  - If the input stream has NIT PID, the PAT's program 0 contains the input stream's NIT PID
  - If the NIT PID is not present in the input stream, the program 0 should not be present in the PAT

# **Feature Information for NIT Reference Support**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 12: Feature Information for NIT Reference Support

Feature Name	Releases	Feature Information
NIT Reference	Cisco IOS XE Fuji	This feature was integrated on the Cisco cBR Series
Support	16.7.1	Converged Broadband Routers.

# **Logical Edge Devices**

A Logical Edge Device (LED) is a virtual edge device within the cBR-8 and can be provisioned for static or dynamic sessions.

### Contents

- Information about Logical Edge Devices, on page 37
- How to Configure the Logical Edge Devices, on page 37
- Configuration Examples, on page 44
- Feature Information for Logical Edge Devices, on page 45

# **Information about Logical Edge Devices**

An LED interfaces remotely to a head end video Session Resource Manager (SRM) using the GQI protocol. It also represents a group of locally managed table-based video sessions.

In Cisco cBR-8, you can create up to 32 LEDs to simultaneously manage the video QAM carriers. Each LED manages a set of virtual QAM carriers independently. Due to the limitation of the GQI protocol, a GQI LED can only manage a set of QAM carriers in a single line card, unlike the table-based LED, which can manage more than a single line card.

In addition, an LED can be optionally configured to support the D6 discovery protocol to report a QAM resource to the SRM.

# How to Configure the Logical Edge Devices

This section describes how to configure LEDs for the video session on Cisco cBR-8.

## **Configuring Session-Based (Dynamic) Logical Edge Devices**

GQI is a protocol for the GQI LED to interface with the remote SRM.

For system using discovery protocol, the D6 discovery protocol should be enabled to report the QAM resources of the LED to the remote SRM.

An active flag should be enabled on the LED to indicate that it is active. This flag indicates that the connectivity with the SRM can be setup and the LED can start handling GQI message exchange from the SRM.

You cannot edit or remove the LED data when it is in the active mode. To do so, you must first move the LED to inactive mode and then disconnect it from the SRM.

Due to the limitations of the GQI protocol, GQI LED cannot have Virtual Carrier Groups that span across multiple cable line cards (CLC).

Note

In Cisco IOS-XE Release 16.5.1, only GQI version 2 is supported for all GQI LEDs.

### **Before You Begin**

The following data is necessary to define a GQI LED:

- The Management IP address that the SRM uses to setup connectivity with the LED. The IP address must be in the same subnet as configured in the VirtualPortGoup.
- A unique MAC address per LED. Using the chassis MAC address as a basis, increment the least significant number to give a unique identifier (MAC address) for each LED. This number should be unique with respect to the GQI server and does not really relate to a true MAC address. Thus, the number is irrelevant, but needs to be unique.

**Tip** Use the **show diag all eeprom detail** | **include MAC** command to get the chassis MAC address.

- The primary and secondary IP addresses of the remote SRM.
- Virtual Carrier Group (VCG). For more information, see Video Virtual Carrier Group and Virtual Edge Input.
- Connection-orientated controls such as, keep alive, reset interval, and timeout value.
- Virtual Edge Input (VEI) configured with a routable IP address from within the network. For more information, see Video Virtual Carrier Group and Virtual Edge Input.

To configure the session-based LEDs, complete the following procedure:

```
configure terminal
cable video
logical-edge-device name [id number]
protocol gqi
mgmt-ip ip address
server ip address
virtual-edge-input ip address input-port-number port number
vcg vcg name
wcg vcg name
mac-address mac address
keepalive retry retry count interval seconds
reset interval seconds
active
```

L

### Verifying the Session-Based (Dynamic) Logical Edge Devices Configuration

To verify a GQI LED configuration, use the **show cable video logical-edge-device** command as shown in the example below:

```
show cable video logical-edge-device id 1
Logical Edge Device: led
Id: 1
Protocol: GOI
Service State: Active
Discovery State: Disable
Management IP: 1.33.2.10

## **Configuring the D6 Discovery Protocol**

D6 discovery protocol is the discovery portion of the Comcast Next Generation on Demand (NGOD) specification. D6 discovery protocol sends out carrier information such as frequency, annex, modulation mode, interleave, and edge input information such as IP address and maximum bandwidth to an Edge Resource Manager (ERM). D6 discovery protocol also sends unique structured names (topological location information) for each edge input or carrier output. From these structured names, and input and RF port numbers, the ERM can infer the topological network location of both the QAM streaming input port (IP) and RF output port (MPEG).

The D6 discovery protocol configuration can be performed only when the LED protocol is either table-based or GQI. The LED must be in inactive mode to edit or create a D6 discovery protocol configuration. The D6 discovery protocol configuration parameters are:

• Management IP—The source IP address used to establish a connection with the external D6 discovery protocol server (ERM). The IP address must be in the same subnet as configured in a virtual port group.

For GQI LED, this configuration is not needed under D6 discovery protocol as it is automatically fetched from the LED configuration.

- D6 discovery protocol server IP address and port—Identifies the remote D6 discovery protocol server (ERM) IP address and listening port used by the D6 discovery protocol client in LED to setup a connection with the peer. You can configure only one server address and port per LED.
- FQDN (Fully Qualified Domain Name)—This can be given instead of IP address for D6 discovery protocol server.
- Streaming zone—Streaming zone as configured in the D6 discovery protocol server (ERM). The name should match with the configured D6 discovery protocol server in the ERM for the connection to be established.
- Component name—The name of the Edge QAM device. Each LED is considered by the D6 discovery
  protocol server as a separate Edge QAM component. This name is used by the D6 discovery protocol
  server to represent the LED.
- Timeout value—(Optional) Time to wait for connection in socket call.
- Hold time value—(Optional) Time interval that decides the interval of the keepalive message exchange between the client and the server.
- Input group—(Optional) Each virtual edge input IP address under the LED can be assigned an input group name and the maximum bandwidth that is used to send traffic to it. This information is used in D6 discovery protocol messages when advertising the edge inputs to the D6 discovery protocol server. If these parameters are not configured then for group name, the LED or the VCG name, and the default bandwidth of 20 Gbps are used. You must repeat this command for each VEI and VCG under the LED. For GQI LED, there is no option to set VEI IP under the VCG, so, this input group CLI is not available for the VCGs for GQI LEDs.

To configure the D6 discovery protocol, complete the following procedure:

```
configure terminal
cable video
logical-edge-device device name [id number]
protocol gqi | table-based
mgmt-ip ip address
server ip address
virtual-edge-input ip address input-port-number port number
vcg vcg name
vcg vcg name
mac-address mac address
keepalive retry retry count interval seconds
reset interval seconds
discovery d6
streaming-zone name
component-name name
d6-server ip address [port]
d6-server fqdn domain-name
timeout seconds
holdtime seconds
input-group led vei-ip led vei ip address group-name group name [bandwidth mbps]
```

exit active

### Verifying the D6 Configuration

To verify the D6 discovery protocol configuration, use the **show cable video logical-edge-device** command as shown in the example below.

This CLI command shows the status and statistics of the D6 client associated to the LED. In the example below, it shows the duration and number of open, updated, keepalive and notification messages exchanged between the D6 client and the server in that duration. It also indicates how many unknown or unrecognized messages are received from the server. When the open message count is more than 1, it indicates that the connection is terminated and reconnected.

```
show cable video logical-edge-device id 1 d6
  Logical Edge Device: led1

# **Feature Information for Logical Edge Devices**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 13: Feature Information for Logical Edge Devices

Feature Name	Releases	Feature Information
Logical Edge Devices	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Cisco Smart Licensing for Video**

The Cisco Smart Licensing for Video on the Cisco cBR router leverages existing Cisco cBR Smart Licensing framework that includes Call Home and SLA capabilities.

- Video Smart Licensing, on page 47
- Information About Video Smart Licensing, on page 47
- How to Verify Video Smart Licensing, on page 48
- Configuration Examples, on page 49
- Use Cases or Deployment Scenarios, on page 50
- Feature Information for Video Smart Licensing, on page 52

# Video Smart Licensing

The Cisco Smart Licensing feature uses a pooled license model. All FRUs in the chassis and multiple such chassis share the entitlements for Upstream (US), Downstream (DS), WAN, Narrowcast (NC), Broadcast (BC), encrypted licenses (PME, PKY, DVB), and Replicate (RPL) as long as they do not exceed the entitlement count for that pool.

For information on entitlement usage, see the Cisco Smart Licensing.

# **Information About Video Smart Licensing**

## **Benefits of Smart Licensing**

Cisco Smart Licensing is intended to overcome the limitations and issues of the enforced licensing method. For more information, see the Cisco Smart Licensing document.

## **Prerequisites for Video Smart Licensing**

See the Cisco Smart Licensing document.

## **Restrictions for Video Smart Licensing**

For video services, the VCG service type determines the number of licenses consumed for bound VCGs. The QAM channel **shut/no shut** state has no relevance for video (unlike DOCSIS services). When the service type is not defined, the NC license entitlements are consumed per QAM channel.

# **How to Verify Video Smart Licensing**

### Verifying Video Smart Licensing Using Show Commands

Use the show cable license command to verify video smart licensing configuration.

To verify all license information, use the show cable license all command:

Router# show cable license all

```
_____
Entitlement: Downstream License
Consumed count: 768
Consumed count reported to SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
_____
Entitlement: Upstream License
Consumed count: 64
Consumed count reported to SmartAgent: 64 Forced-Shut count: 0 Enforced state: No Enforcement
_____
Entitlement: WAN License
Consumed count: 2
Consumed count reported to SmartAgent: 2 Forced-Shut count: 0 Enforced state: No Enforcement
  _____
Entitlement: LCHA License
Consumed count: 0
Consumed count reported to SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
Entitlement: Video Narrowcast License
Consumed count: 0
Consumed count reported to SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
Entitlement: Video Narrowcast Replicate License Consumed count: 0 Consumed count reported
to SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
_____
Entitlement: Video Narrowcast PKEY License Consumed count: 0 Consumed count reported to
SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
_____
Entitlement: Video Narrowcast PME License Consumed count: 0 Consumed count reported to
SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement
Entitlement: Video Narrowcast DVB License Consumed count: 0 Consumed count reported to
```

SmartAgent: 0 Forced-Shut count: 0 Enforced state: No Enforcement

To view specific video license configuration, use the appropriate keyword with the **show cable license** command:

```
Router# show cable license ?
        Show all license information
 all
  ds
        DOCSIS downstreams
 lcha LCHA groups
 nc
         Narrowcast video
 nc dvb Narrowcast video DVB
 nc pky Narrowcast video PowerKEY
 nc pme Narrowcast video PME
 nc rpl Narrowcast video replicate
 us
     DOCSIS upstreams
  wan
        WAN ports
```

For example, to verify Narrowcast video configuration, use the show cable license nc command:

#### 

# **Configuration Examples**

### Example 1: Show Running Output for Basic Configuration

```
cable video
service-distribution-group sdg-lic id 64
  rf-port integrated-cable 7/0/0
service-distribution-group sdg-lic1 id 63
 rf-port integrated-cable 7/0/1
virtual-carrier-group vcg-lic1 id 158
 rf-channel 0 tsid 65535 output-port-number 1
virtual-carrier-group vcg-lic2 id 157
 rf-channel 1-3 tsid 65532-65534 output-port-number 2-4

# **Feature Information for Video Smart Licensing**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

### Table 14: Feature Information for Video Smart Licensing

Feature Name	Releases	Feature Information
Video Smart Licensing		This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Physical to Virtual Binding**

The Virtual Carrier Group (VCG) is bound to a Service Distribution Group (SDG) using a bind command (bind-vcg). This connects the virtual carriers to the physical ports listed in the SDG. After binding, a path from the Virtual Edge Input (VEI) is mapped to the RF ports.

- Information About Physical to Virtual Binding, on page 53
- How to Configure VPME Encryption, on page 53
- Configuration Examples, on page 54
- Feature Information for Physical to Virtual Binding, on page 55

# **Information About Physical to Virtual Binding**

In general, more than one VCG can be bound to the same SDG, only if the RF-channels in the VCG are not overlapping each other. However, one VCG cannot be bound to multiple SDGs.

If you want to configure one VCG to multiple SDGs, you should configure QAM replication instead. For more information, see Configuring QAM Replication section.

# **How to Configure VPME Encryption**

This section describes how to configure physical to virtual binding and QAM replication on Cisco cBR-8.

- Configuring Physical to Virtual Binding, on page 53
- Configuring QAM Replication, on page 54

## **Configuring Physical to Virtual Binding**

To bind a set of virtual RF-channels defined in the VCG to the physical port in the SDG, perform the following:

```
enable
configure terminal
cable video
bind-vcg
vcg vcg-name sdg sdg-name
exit
```

## **Configuring QAM Replication**

To configure QAM replication to one or more ports, add the ports to an SDG configuration as following:

```
enable
configure terminal
cable video
service-distribution-group name
rf-port integrated-cable slot/bay/port
rf-port integrated-cable slot/bay/port
exit
```

# **Configuration Examples**

This section provides configuration examples for the physical to virtual binding configuration.

## **Example 1: Physical to Virtual Binding Configuration**

The following is a sample in which the port 7/0/2 of SDG *west-region* binds with 0 to 10 RF-channels of VCG *movie-channels* to physically identify the 7/0/2:0 to 7/0/2:10 QAM carriers.

### Example 1 :

```
Router#config t
Router(config)#cable video
Router(config-video)#service-distribution-group west-region
Router(config-video-sdg)#rf-port integrated-cable 7/0/2
Router(config-video-sdg)#exit
Router(config-video)#virtual-carrier-group movie-channels
Router(config-video-vcg)#rf-channel 0-10 tsid 1-11 output-port-num 1-11
Router(config-video-vcg)#exit
Router(config-video)#bind-vcg
Router(config-video-bd)# vcg movie-channels sdg west-regions
```

### **Example 2: Physical to Virtual Binding Configuration**

The following is a sample in which the *movie-channels* VCG and *news-channels* VCG bind with *west-regions* SDG.

### Example 2 :

```
Router#config t
Router(config)#cable video
Router(config-video)#service-distribution-group west-region
Router(config-video-sdg)#rf-port integrated-cable 7/0/2
Router(config-video-sdg)#exit
Router(config-video)#virtual-carrier-group movie-channels
Router(config-video-vcg)#rf-channel 0-10 tsid 1-11 output-port-num 1-11
Router(config-video-vcg)#exit
Router(config-video)#virtual-carrier-group news-channels
Router(config-video)#virtual-carrier-group news-channels
Router(config-video-vcg)#rf-channel 11-15 tsid 12-16 output-port-num 12-16
Router(config-video-wcg)#exit
Router(config-video-wcg)#exit
Router(config-video)#bind-vcg
Router(config-video-bd)# vcg movie-channels sdg west-regions
Router(config-video-bd)# vcg news-channels sdg west-regions
```

L

## **Example 3: QAM Replication Configuration**

The following is a sample in which video replication is set across 7/0/0 and 7/0/1 ports:

### Example 3 :

```
Router#config t
Router(config)#cable video
Router(config-video)# service-distribution-group qrg-example
Router(config-video-sdg)# rf-port integrated-cable 7/0/0
Router(config-video-sdg)# rf-port integrated-cable 7/0/1
```

# **Feature Information for Physical to Virtual Binding**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 15: Feature Information for Physical to Virtual Binding

Feature Name	Releases	Feature Information
Physical to Virtual Binding	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Table Based Configuration**

The table-based video is a local session management that provisions using CLI. The statically allocated local video sessions can be either unicast or multicast video stream.

- Information About Table Based Configuration, on page 57
- Configuring Table Based Session, on page 57
- Virtual Edge Input Bundling, on page 58
- 10-6 UDP Port Mapping, on page 60
- Feature Information for Table Based Configuration, on page 62

# Information About Table Based Configuration

Table-based video session configuration can be performed for a range or an individual session under each Quadrature Amplitude Modulation (QAM) carrier that is being assigned to a table-based Logical Edge Device (LED). In cBR-8, you can create multiple LEDs for table-based video sessions; each LED manages one set of QAM carriers for table-based sessions. Table-based sessions can be configured as a pass-through, remap, or a data piping session.

# **Configuring Table Based Session**

To configure the encryption type for a VOD session, perform the following steps:

```
enable
configure terminal
cable video
table-based
vcg vcg-name
rf-channel n-m
session sess-name input-port id start-udp-port udp port number
num-sessions-per-qam 1-80 processing-type remap start-program n jitter
10-200 msec [cbr | vbr]
exit
```

## **Configuration Example**

The following is a sample in which two sessions are created per RF channel, HBO-1 and HBO-2 are for channel 0, HBO-3 and HBO-4 are for channel 1. The destination IP address is obtained from VCG (if any), otherwise from the LED broadcast.

```
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#vcg bcast
Router(config-video-tb-vcg)#rf-channel 0-1
Router(config-video-tb-vcg-sess)# session HBO input-port 10 start-udp-port 1
num-sessions-per-qam 2 processing-type remap start-program 1 jitter 100 cbr
Router(config-video-tb-vcg-sess)# session HBO bundle-id 1 start-udp-port 49152
num-sessions-per-qam 2 processing-type program start-program 1 jitter 100 cbr
```

## Virtual Edge Input Bundling

Virtual Edge Input Bundling assists with load balancing from the Head End. This allows multiple VEIs to be accessed via a gateway, since it is unknown at the time of configuration which VEI the stream will come in on. Thus, when the Head End sends a stream to the gateway, it enters the cBR-8 in on any VEI in the bundle. VEI bundling can be performed only if table based protocol is used for a particular LED.

To bundle the VEIs, perform the following steps:

### **Before You Begin**

- All video sessions must have unique UDP ports for the Head End.
- Create two or more Virtual Edge Inputs using the following command:

virtual-edge-input-ip ipaddr vrf vrfname input-port-number #

Note Same IP address cannot be used in more than one bundle.

```
enable
configure terminal
cable video
logical-edge-device
protocol table-based
vei-bundle id input-port-number #
exit
```

### Verifying Virtual Edge Input Data

To verify the VEI data, use the following command:

Router# show cable video logical-edge-device [all | id | name]

Example:

```
Router# show cable video logical-edge-device id 1
Logical Edge Device: led-vei
Id: 1
Protocol: Table-based
Service State: Active
```

Discovery St Number of Vi Number of Sh Number of Ph Number of Se No Reserve F	rtual Carr hare Virtua hysical Qan essions: O	rier Gro al Edge	-

7/0/3:4	212	ON	UP		4	0	5	1	1	clear

## **Verifying VEI Bundles**

To view the VEI bundles, use the following command:

Router# show cable video vei-bundle all

Example:

This is a sample output of the show command that displays the VEI bundle details.

Router# show cable video vei-bundle all					
Total VEI Bu	ndles: 1				
Bundle	LED	Input Port	VEI	Slot/Bay	Gateway
ID	ID	ID	IP		IP
40000	1	33	33.33.33.33	7/0	177.0.10.3
40000	1	44	44.44.44.44	7/0	177.0.10.3
40000	1	66	66.66.66.66	7/0	177.0.10.3
40000	1	77	77.77.77.77	7/0	177.0.10.3
40000	1	222	222.222.222.222	7/0	177.0.10.3

## **Configuration Example**

The following is a sample in which five VEIs are created on VCG and bundled:

```
cable video
service-distribution-group sdg-vei id 1
```

```

## 10-6 UDP Port Mapping

Starting from Cisco IOS XE Fuji 16.9.1, 10-6 UDP port mapping feature is supported in the table-based configuration for VOD.

To be consistent and compatible with the existing configuration, this feature adds a 10-6 UDP port mapping method to identify that this LED supports the feature, and change UDP port number to an optional parameter in the table-based session configuration.

If table-based session is not configured and 10-6 UPD port mapping is enabled for the LED, then the system generates remap sessions configuration only. If table-based session is configured, user has the option to skip providing UDP port number if he/she wants the udp port number to be automatically generated by the system.

## **Restrictions for 10-6 UDP Port Mapping**

In order to fit the output port number and program number in a 16-bit value to represent an UDP port number per VOD session, output port number must be configured in the range of 1 to 1024, and program number must be configured in the range of 1 to 63 per QAM channel. Due to this limitation, the configuration must follow this guideline, otherwise the UDP port mapping for table-based configuration will be rejected.

UDP port mapping feature supports remap sessions configuration for table-based protocol LED only.

## Configuring 10-6 UDP Port Mapping

To configure the 10-6 UDP port mapping, perform the following steps:

```
cable video
logical-edge-device name[id id ]
protocol table-based
udp-port-mapping-method 10-6
```

If 10-6 mapping is used and no unicast remap session is configured for the VCG, table-based unicast remap sessions will be automatically created for each VCG with default setting and using the first input port configured on the VCG if any, otherwise it will use the input port from the LED. User doesn't need to explicitly provision the sessions.

## Verifying 10-6 UDP Port Mapping Configuration

To verify if the 10-6 UDP port mapping is enabled, use **show cable video logical-edge-device** command as shown in the following example:

```
Router# show cable video logical-edge-device id 1
Logical Edge Device: LED DVB
Id: 1
Protocol: Table-based
Service State: Active
Discovery State: Disable
10-6 UDP Port Mapping Enabled: Yes
Number of Virtual Carrier Groups: 3
Number of Share Virtual Edge Input: 3
Number of Physical Qams: 384
Number of Sessions: 0
No Reserve PID Range
Virtual Edge Input:
                                         Bundle
Input Port VEI
                              Slot/Bav
                                                      Gatewav

# **Feature Information for Table Based Configuration**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

#### Table 16: Feature Information for Table Based Configuration

Feature Name	Releases	Feature Information
Table based configuration	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Management IP Interface**

The management interface is used for the video control plane messages, such as session creation and deletion, between the Logical Edge Devices (LED) and the external Edge Resource Manager (ERM) server.

### Contents

- Information About Management IP Interface, on page 63
- How to Configure the Management IP Interface, on page 63
- Configuration Examples, on page 66
- Feature Information for Management IP Interface, on page 66

# Information About Management IP Interface

Video Logical Edge Device (LED) communicates with an external Edge Resource Manager (ERM) and a D6 server via the management interface. The physical interface for the connection is a front panel WAN port.

The following are the characteristics of the management interface:

- The management interface configuration is applied on both active and standby supervisor. However, only the active supervisor's management interface is connected to the external server.
- VirtualPortGroup interface must be configured prior to configuring the cable video management interface.
- Cable video management interface must be configured prior to configuring an LED that uses the management interface.

# How to Configure the Management IP Interface

This section describes how to configure the management IP interface for the video session on Cisco cBR-8.

Configuring the Management IP Interface consists of the following three steps:

- Configuring the VirtualPortGroup Interface, on page 64
- Configuring the Cable Video Management Interface, on page 65
- Configuring the LED Management Interface, on page 65

## Configuring the VirtualPortGroup Interface

Building configuration ...

First step towards configuring the Management IP Interface is to configure a VirtualPortGroup interface. You can also configure secondary IP addresses on the VirutalPortGroup interface, similar to a gigabit Ethernet interface IP address configuration.

To configure the VirtualPortGroup interface, complete the following procedure:

```
configure terminal
interface VirtualPortGroup virtual port group number
ip address ip address subnet-mask
ip address ip address subnet-mask secondary
end
```

### Verifying the VirtualPortGroup Interface Configuration

To verify the VirtualPortGroup interface configuration, use the **show run interface VirtualPortGroup** command as shown in the example below:

```
show run interface VirtualPortGroup 0
```

```
Current configuration : 145 bytes
!
interface VirtualPortGroup0
ip address 1.22.3.1 255.255.255.0 secondary
ip address 1.22.2.1 255.255.255.0
no mop enabled
no mop sysid
end
```

The VirtualPortGroup interface is in a down state. The interface comes up after the cable video management interface is configured.

#### Verifying the VirtualPortGroup Interface State

To verify the VirtualPortGroup interface state, use the **show interfaces VirtualPortGroup** command as shown in the example below:

```
show interfaces VirtualPortGroup 0
VirtualPortGroup0 is up, line protocol is up
 Hardware is Virtual Port Group, address is badb.ad09.7077 (bia badb.ad09.7077)
  Internet address is 1.22.2.1/24
  MTU 1500 bytes, BW 2500000 Kbit/sec, DLY 1000 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive not supported
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output 00:24:14, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/375/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
     0 packets input, 0 bytes, 0 no buffer
     Received 0 broadcasts (0 IP multicasts)
     0 runts, 0 giants, 0 throttles
     0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
     0 input packets with dribble condition detected
```

```
0 packets output, 0 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 unknown protocol drops
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier
0 output buffer failures, 0 output buffers swapped out
```

#### **Troubleshooting Tips**

• To check if the management interface IP route is up, use the following command:

```
show ip interface brief | include VirtualPortGroup 0
VirtualPortGroup0 1.22.2.1 YES NVRAM up up
```

• To ping the VirtualPortGroup interface, use the following command:

```
ping 1.22.2.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 1.22.2.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

### **Configuring the Cable Video Management Interface**

#### **Before You Begin**

VirtualPortGroup interface must be configured before configuring the cable video management.

To configure the cable video management interface, complete the following procedure:

```
configure terminal
cable video
mgmt-interface VirtualPortGroup virtual port group number
end
```

#### Verifying the Cable Video Management Interface Configuration

To verify the VirtualPortGroup interface configuration, use the **show run** | **include mgmt-intf** command as shown in the example below:

```
show run | include mgmt-intf
mgmt-intf VirtualPortGroup 0
```

### **Configuring the LED Management Interface**

#### **Before You Begin**

- Cable video management interface must be configured before configuring an LED that uses the management interface.
- Management IP address and the VirtualPortGroup IP address must be in the same subnet. It is
  recommended that the management IP addresses (for LED with Protocol GQI, DVB, PME and D6) are
  configured starting at the VirtualPortGroup IP address plus 2 and incrementing or Broadcast address
  minus 3 and decrementing. Typically, the VirtualPortGroup IP address is network address plus 1. Then,
  network address plus 2 is used internally by cBR-8. If the VirtualPortGroup IP is the Broadcast address
  minus 1, then the Broadcast address minus 2 is used internally by cBR-8.

To configure the LED management interface, complete the following procedure:

```
configure terminal
cable video
logical-edge-device device name
protocol gqi
mgmt-ip management ip address
exit
```

#### Verifying the LED Management Interface Configuration

To verify the VirtualPortGroup interface state, use the **show run** | **begin logical-edge-device test** command as shown in the example below:

```
sh run | begin logical-edge-device test
logical-edge-device test id 2
protocol gqi
mgmt-ip 1.22.2.10
```

#### **Troubleshooting Tips**

To ping the management interface, use the following command:

```
video-LWR-S-C2# ping 1.22.2.10
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 1.22.2.10, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

## **Configuration Examples**

This section provides configuration examples for the management IP interface.

### Management IP Interface

The following example shows how to create a management IP interface:

```
configure terminal
interface VirtualPortGroup 0
ip address 1.23.2.1 255.255.0
cable video
mgmt-interface VirtualPortGroup 0
logical-edge-device test id 2
protocol gqi
mgmt-ip 1.23.2.10
exit
exit
```

## **Feature Information for Management IP Interface**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 17: Feature Information for Management IP Interface

Feature Name	Releases	Feature Information
Management IP Interface	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Video Encryption**

The Cisco cBR-8 supports PowerKey and Privacy Mode Encryption (PME) encryption CA systems for Video On Demand (VOD) sessions to address security concerns. However, only one encryption type can be installed on the line card. There are two levels to the CA system. The lower level encrypts the actual data streams. The upper level specifies the control words that are used to encrypt the data streams.

- Information About Encryption, on page 69
- How to Configure Encryption for the Data Stream, on page 70
- Configuration Examples for Encryption, on page 71
- Configuring Privacy Mode Encryption, on page 71
- Troubleshooting Video Encryption Issues, on page 74
- Feature Information for Encryption, on page 78

## Information About Encryption

The encrypted sessions can be created on any QAM carriers on a line card. Only the Single Program Transport Stream (SPTS) VOD session can be encrypted. Encryption is not supported on the Pass-through, and Data-piping sessions.

The VOD session can be encrypted in any of the following types of encryption:

- · PowerKey for video session management protocol GQI
- Privacy Mode Encryption (PME) for Table-based session
- Digital Video Broadcasting (DVB)

The scrambler mode varies based on the type of encryption, as given in the following table:

#### Table 18: Supported Encryption Types and Scrambler Modes

Encryption Type	Scrambler Mode
PowerKey	DES, 3DES
PME	DVS-042
DVB	DVB-CSA

### Prerequisites for Encryption

You should configure the Virtual Carrier Group (VCG) to setup an encrypted session. For more details, see the Configuring Virtual Carrier Group, on page 70.

## How to Configure Encryption for the Data Stream

This section describes how to configure encryption for the video session on Cisco cBR-8.

- Enforcing Data Stream Encryption Type, on page 70
- Configuring Virtual Carrier Group, on page 70
- Verifying Encryption Configuration, on page 71

## **Enforcing Data Stream Encryption Type**

**Note** Once the line card and VCG are configured for PowerKey encryption, further configuration of the Cisco cBR-8 is not required.

To configure the encryption type for a VOD session, perform the following steps:

#### **Before You Begin**

Configure the Virtual Carrier Group (VCG) to setup an encrypted session. For more details, see .

```
enable
configure terminal
cable video
encryption
linecard slot/bay ca-system [dvb | pme | powerkey] scrambler scrambler-type
exit
```

## **Configuring Virtual Carrier Group**

To configure the Virtual Carrier Group (VCG) for setting up an encrypted session, perform the following steps:

```
enable
configure terminal
cable video
virtual-carrier-group name [id #]
rf-channel start-channel#-end-channel# tsid start-tsid-end-tsid output-port-number
start-number-end-num
virtual-edge-input ipaddr input-port-number #
encrypt
exit
```

### Verifying Encryption Configuration

To verify the encryption configurations, use the following command:

```
show cable video encryption linecard [all | slot number]
```

#### **Example 1:**

```
Router#show cable video encryption linecard 7/0 Line card: 7/0
CA System Scrambler
powerkey des
```

#### Example 2:

```
Router#show cable video encryption linecard all Line card: 7/0
CA System Scrambler
powerkey des
```

## **Configuration Examples for Encryption**

This section provides configuration examples for the Encryption feature.

### Example: Enforcing Data Stream Encryption Type

The following is a sample in which the line card in slot 7 is configured for powerkey encryption.

```
Router(config)#cable video Router(config-video)#encryption
Router(config-video-encrypt)#linecard 7/0 ca-system powerkey scrambler des
```

### **Example: Configuring Virtual Carrier Group**

The following is a sample in which the QAM channel from 64 to 158 are encryption capable if the virtual channels are successfully bound to a Service Distribution Group. The sessions created on those QAM carriers are encrypted using the scrambler installed on the line card.

```
Router(config)#cable video
Router(config-video)#virtual-carrier-group sdv-grp
Router(config-video-vcg)#rf-channel 64-158 tsid 64-158 output-port-number 64-158
Router(config-video-vcg)virtual-edge-input 14.1.1.1 input-port-number 1
Router(config-video-vcg)encrypt
Router(config-video-vcg)#exit
```

## **Configuring Privacy Mode Encryption**

Only one device from the MSO site can communicate with the Encryption Renewal System (ERS) and obtain the latest ECM templates. The CEM communicates with the ERS and sends the ECM templates to the Cisco Edge QAM devices in the MSO site.

You can configure the following:

• VODS-ID—IDs assigned by CCAD or ARRIS to the MSO site. The configured VODS-ID on the Cisco cBR-8 and the CEM must be same.

- CEM IP—Interface IP of the Windows/Linux system through which the CEM can be reached by Cisco cBR-8.
- CEM Port—Port number on which the CEM listens for connections from the Cisco cBR-8.
- Management Interface—Source IP address of the Cisco cBR-8 virtual interface through which the connection must be established with the CEM server.

- Note
  - There can be only one entry for VODS-ID, CEM IP, CEM Port, and Management Interface IP. If you configure any new values for these parameters, the previous configuration is cleared. You can clear the configurations using the 'no' form of the command.

### **Configuring VODS-ID**

To configure the VODS-ID of the CEM, perform the following steps:

```
enable
configure terminal
cable video
encryption
pme vodsid id
exit
```

### **Configuring CEM IP and Port**

To configure the CEM IP and port of the CEM, perform the following steps:

```
enable
configure terminal
cable video
encryption
pme cem ip-address tcp_port
exit
```

### **Configuring Management IP**

To configure the PME management IP address to establish CEM connection, perform the following steps:

#### **Before You Begin**

The virtual port group must be configured before configuring the management IP. For more information, see the *Configuring a VirtualPortGroup iIterface* section.

```
enable
configure terminal
cable video
encryption
pme mgmt-ip ip-address
exit
```

### Verifying PME Connection Status

To verify the connection status between the Cisco Converged EdgeQAMManager (CEM) application and the Cisco cBR-8, use the following command:

show cable video encryption linecard [all | slot number]

This command displays the following information:

- VODS-ID—Specifies the configured VODS-ID on the CEM and Cisco cBR-8.
- CEM IP—Specifies the IP through which CEM can be reached by Cisco cBR-8.
- CEM Port—Specifies the port on which the CEM obtain connections from Cisco cBR-8.
- Local Mgmt IP—Specifies the Cisco cBR-8 interface through which the connection is established with the CEM.
- Local Port-Specifies the Local Port number assigned for the connection with the CEM.
- CEM Connection State—Specifies the status of the connection with the CEM (Connected (or) Not Connected).
- Count of ECMs recd—Specifies the count of ECMs received from the CEM.

#### Example:

This is a sample output of the show command that displays the connection status of PME.

```
Router#show cable video encryption pme status

PME Connection Status:

VODS-ID : 111

CEM IP : 1.200.1.163

CEM Port : 5000

Local Mgmt IP : 1.24.2.6

Local Port : 50394

CEM Connection State : Connected Count of ECMs recd : 2
```

### Verifying PME Version

To verify the version information of the PME module loaded in the chassis, use the following command:

#### show cablevideo encryption pme version

The version information is read from the IOS PME subsystem. The version information displays in MAJOR.MINOR version format.

#### Example:

This is a sample output of the show command that displays the version details of PME.

```
Router#show cable video encryption pme version
PME Version: 1.0
```

### Verifying PME Sessions on a Line Card

To verify the sessions that use the PME modules that are loaded on a specific line card, use the following command:

show cable video encryption pme linecard [slot | bay] session {1-65535 | all |
summary}

Example 1:

This is a sample output of the show command that displays the session details that use PME modules.

```
Router#show cable video encryption pme linecard 7/0 session all Count of ECMG Streams: 4
Stream
ID num EcmId CP# CwE CPDur NomCPD EcmRqst EcmRsp
0020(0032) 0020(0032) 0002 0 0 40000 7 2
0021(0033) 0021(0033) 0002 0 0 40000 7 2
0040(0064) 0040(0064) 0002 0 0 40000 7 2
0041(0065) 0041(0065) 0002 0 0 40000 7 2
video-LWR-B-A7B#show cable video encryption pme linecard 7/0 session 32 Stream 32, session
7681 is active
Stream number = 32 Session number = 7681
ECM requests = 8 ECM replies = 2
ECM ID = 32 CryptoPeriod num = 2
CP duration = 0 Nominal duration = 40000
CA transfer mode = 1 Stream status = No Error Blob details
video-LWR-B-A7B#show cable video encryption pme linecard 7/0 session summary Currently
active streams:
Active = 4 ECM req/resp mismatch = 4
ECM req, all streams = 32 ECM resp, all streams = 8
Since last reset:
Sessions created = 4 Sessions deleted = 0
ECMs received = 2 ECMs discarded = 0
```

## **Troubleshooting Video Encryption Issues**

A Video On Demand (VOD) session might fail at the subscriber site due to multiple factors. One of the factors is scrambling.

If scrambling fails during the VOD purchase, the Program Map Table is held back which in turn results in a VOD failure. Though there are alarms already available in the software that indicates the scrambling failure, it gives a high level error and does not provide information about the reason for the failure. These alarms are logged in syslog.

### New Events and Alarms for Video Encryption Debugging

Cisco IOS-XE Release 16.12.1y supports New Events and Alarms for Video Scrambling Debugging Log Enhancement. The following new logs provide better debugging of VOD failures. All the new logs are written in btrace log of respective line card.

- Whenever a session under an encrypted VCG gets input to ACTIVE-PSI, the log will be written along with session id, on-id, ts-id and program number.
- Whenever the scrambling starts, the log will be written along with on-id, ts-id and program number.
- After the VoD ends and input goes to off state, a log will be written along with session id, on-id, ts-id and program number.
- If the scrambling fails for any session, then details about the failure will be logged along with the existing alarm in supervisor console.

You can use the **show platform software trace message lc-veman <LC slot number>/0** command to view the logs. See the following example:

```
Router# show platform software trace message lc-veman 8/0
This command is being deprecated. Please use 'show logging process' command.
executing cmd on chassis local ...
2020/02/03 03:34:05.046653 {veman_8-0}{1}: [scs] [7197]: (warn): 02/03 20:34:04.477 [scs]:
[7197]: (warning): PERFORMANCE: entering ScsTask too late (65 ms since last tick)
2020/02/03 03:34:05.046624 {veman_8-0}{1}: [scs] [7197]: (warn): 02/03 20:34:04.179 [scs]:
[7197]: (warning): PERFORMANCE: entering ScsTask too late (67 ms since last tick)
2020/02/03 03:34:05.046558 {veman_8-0}{1}: [scs] [7197]: (warn): 02/03 20:34:04.073 [scs]:
[7197]: (warning): PERFORMANCE: entering ScsTask too late (61 ms since last tick)
```

The following table shows all the new logs and alarms logged in the btrace log.

Alarm/Event	Log Type	Log Message	
Input ON	Event	I/p on Ses <session id=""> qam <on-id>/<ts-id> Sid <program number&gt; qid <qam-id></qam-id></program </ts-id></on-id></session>	
Input OFF	Event	I/p off Ses <session id=""> qam <on-id>/<ts-id> Sid <program number&gt; qid <qam-id></qam-id></program </ts-id></on-id></session>	
Scrambling started	Event	Scrambling started. Qam <on-id>/<ts-id> Sid <program number&gt; SCG <scg id=""></scg></program </ts-id></on-id>	
Scrambling not started (no Input)	Alarm Set/Clear	(117) No i/p=Qam: <on-id>/<ts-id> Sid: <program number=""></program></ts-id></on-id>	
Scrambling not started (no ECMs)	Alarm Set/Clear	(19) No ECMs=CAS: <cas-id> Qam: <on-id>/<ts-id> Sid: <program number="">; SCG=<scg id&gt;</scg </program></ts-id></on-id></cas-id>	
Scrambling not started (no ECMG)	Alarm Set/Clear	(19) Missing Ecmg/Timings; SuperCAS Id= <cas id="">; ECM Id=1</cas>	

#### Table 19: New logs and alarms logged in the btrace log

#### • Input ON

When a subscriber purchases a VOD session, the VOD asset stream is expected to be hitting the cBR8 input. Once the input stream is detected and the session gets to ACTIVE-PSI state, this information is logged along with the following information:

- Session ID
- QAM ID

- · Original network ID
- Transport stream ID
- Program number

#### • Input OFF

When the VoD ends, the input stream stops. The session will move to IDLE state after few milliseconds of input unavailability. After the Off timer, the session will move to OFF state during which this information is logged along with the following.

- Session ID
- QAM ID
- · Original network ID
- Transport stream ID
- Program number

#### Scrambling started

On VOD purchase, after all the required conditions are met for scrambling (Input stream availability, ECM availability, etc.,), the session will get scrambled. That event is logged with following information.

- Original network ID
- · Transport stream ID
- Program number
- SCG ID

#### • Scrambling not started (no input)

On VoD purchase, if the input VoD asset stream is not hitting the cBR8 for more than 10 seconds, then this alarm is set and logged in the btrace log. After this log is set, if the input starts hitting the cBR8 or if the VoD session is torn down, this alarm will be cleared and also be logged in the btrace log. This log has the following information.

- · Original network ID
- Transport stream ID
- Program number

**Note** This alarm is applicable only for Powerkey and DVB session-based scrambling.

Scrambling not started (no ECMs)

If the scrambling is not started due to unavailability of ECMs, then this alarm is set and logged in the btrace log. After this log is set, if the ECM is received or if the VoD session is torn down, this alarm will be cleared and also be logged in the btrace log. This log has the following information.

- Original network ID
- Transport stream ID
- Program number
- CAS ID
- SCG ID

#### • Scrambling not started (no ECMG)

If the scrambling is not started due to unavailability of ECMG server, then this alarm is set and logged in the btrace log. After this log is set, if the ECMG is connected or if the VoD session is torn down, this alarm will be cleared and also be logged in the btrace log. This log has the following information.

- CAS ID
- ECM ID

Note This alarm should never happen for Powerkey and PME scrambling.

### **Example Logs**

Following are the example logs for the new events and alarms:

#### • Input ON

I/p on Ses 1048578 qam 65535/65041 Sid 65002 qid 9

• Input OFF

I/p off Ses 1048578 qam 65535/65041 Sid 65002 qid 9

Scrambling started

Scrambling started. Qam 65535/65002 Sid 65041 SCG 1057576

· Scrambling not started (no ECMs) Alarm set

Set: (19) No ECMs=CAS:0x09520000 Qam:65535/65041 Sid:65002,=;SCG=1057576=;

Scrambling not started (no ECMs) Alarm clear

Clear: (19) No ECMs=CAS:0x09520000 Qam:65535/65041 Sid:65002,=;SCG=1057576=;

Scrambling not started (no input) Alarm set

Set: (117) No i/p=Qam:65535/65041 Sid:65002,=;

• Scrambling not started (no input) Alarm clear

Clear: (117) No i/p=Qam:65535/65041 Sid:65002,=;

Scrambling not started (no ECMG) Alarm set
 Set: (19) =Missing Ecmg/Timings=;SuperCAS Id=0x01230000=;ECM Id=1=;

# **Feature Information for Encryption**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Feature Name	Release	Feature Information
Encryption	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.
Video Encryption Debugging Log Enhancement	16.12.1y	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

#### Table 20: Feature Information for Encryption

# **Global Video Configuration**

You can perform some global configurations for provisioning the video services. These configurations have some default values. If you do not choose to change those values, the default values are used. The following sections describe the procedures for global configurations.

#### Contents

- Configuring the Default ONID, on page 79
- Configuring the Default PSI interval, on page 79
- Configuring Video Session Timeouts, on page 80
- Configure Video Interface IP, on page 80
- Configure Virtual Routing and Forwarding, on page 81
- Configuration Examples, on page 81
- Feature Information for Global Video Configuration, on page 82

## **Configuring the Default ONID**

By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. You can change the default ONID. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535.

```
configure terminal
cable video
default-onid default onid number
```

## **Configuring the Default PSI interval**

By default, the Program Specific Information (PSI) interval is 100 msec. You can change the default PSI interval. The PSI interval must be in the range of 40 to 1000.

```
configure terminal
cable video
default-psi-interval default-psi-interval msec
```

## **Configuring Video Session Timeouts**

The default video session init timeout is 1000 msec, the idle session timeout is 250 msec, and the off session timeout is 60 seconds. You can change these default values. The following are the permissible ranges for the timeouts:

- Init session timeout—100 to 60000
- Idle session timeout —100 to 5000
- Off session timeout —1 to 1800

```
configure terminal
cable video
timeout init-session timeout msec
timeout idle-session timeout msec
timeout off-session timeout sec
```

# **Configure Video Interface IP**

The Cisco cBR-8 can automatically configure IP addresses of line card video interfaces. The Cisco cBR-8 uses IP addresses from a pool of IP addresses that you provide.

Use the **routing-interface-ip** command to set the video interface IP address for each CLC in the Cisco cBR-8. If the subnet size is 2, the Cisco cBR-8 sets the video interface IP address starting at Slot 0 to the IP address you provide. For subnet sizes greater than 2, the Cisco cBR-8 adds 1 to the IP address you provide and sets it as the video interface IP address. Do not use subnet 255.255.255.255. The Cisco cBR-8 sets the IP address of each subsequent video interface by incrementing IP address by the subnet size.

Video Interface	Primary IP Address	Secondary IP Address	Subnet Mask	Subnet Size
Video 0/0/0	192.0.2.1	198.51.100.1	255.255.255.252	4
Video 0/0/1	192.0.2.5	198.51.100.5	255.255.255.252	4
Video 1/0/0	192.0.2.9	198.51.100.9	255.255.255.252	4
Video 1/0/1	192.0.2.13	198.51.100.13	255.255.255.252	4
Video 2/0/0	192.0.2.17	198.51.100.17	255.255.255.252	4
Video 2/0/1	192.0.2.21	198.51.100.21	255.255.255.252	4
Video 3/0/0	192.0.2.25	198.51.100.25	255.255.255.252	4
Video 6/0/0	192.0.2.33	198.51.100.33	255.255.255.252	4
Video 7/0/0	192.0.2.41	198.51.100.41	255.255.255.252	4
Video 7/0/1	192.0.2.45	198.51.100.45	255.255.255.252	4

For example, executing the command **routing-interface-ip** *192.0.2.0 255.255.255*.*255* **secondary** *198.51.100.0 255.255.255*, configures the video interfaces as follows:

Video 8/0/0	192.0.2.49	198.51.100.49	255.255.255.252	4
Video 8/0/1	192.0.2.53	198.51.100.53	255.255.255.252	4
Video 9/0/0	192.0.2.57	198.51.100.57	255.255.255.252	4
Video 9/0/1	192.0.2.61	198.51.100.61	255.255.255.252	4

Note

- Video interface IP configuration is optional. By default, the Cisco cBR-8 uses 10.100.x.x subnets for primary IP addresses and 10.101.x.x subnets for secondary IP addresses of video interfaces. Use the routing-interface-ip command only when the default configuration conflicts with the existing network.
  - Configure the video interface IP before configuring any other video-specific configurations like logical edge device and virtual service group configurations.

## **Configure Virtual Routing and Forwarding**

From Cisco IOS XE Amsterdam 17.3.1x, you can configure user-specific VRF to line card video interfaces. This configuration is to support video interfaces to participate in NX-GEN VPN.

Use the **routing-interface-vrf** command to configure user-specific VRF to line card video interfaces.

```
configure terminal
cable video
routing-interface-vrf slot slot vrf-name vrf-name
```

Note

- Virtual routing and forwarding configuration is optional. This configuration is not required in non-VPN deployments. By default the Cisco cBR-8 places all video interfaces in the VRF Mgmt-MPEG-video-intf.
  - Configure VRF separately for each line card.
  - Configure virtual routing and forwarding before configuring any other video-specific configurations like logical edge device and virtual service group configurations.

## **Configuration Examples**

This section provides examples for the global video configuration.

### **Example: Global Video Configuration**

```
configure terminal
cable video
default-onid 10
```

```
default- psi-interval 50
timeout init-session 200 msec
timeout idle-session 250 msec
timeout off-session 500 sec
```

## **Feature Information for Global Video Configuration**

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

**Note** The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 21: Feature Information for Global Video Configuration

Feature Name	Releases	Feature Information
Global Video Configuration	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.

# **Advanced Video MPEG Features**

Cisco cBR Series Converged Broadband Router supports the following video features.

- Information about Advanced Video MPEG Features, on page 83
- How to Configure Advanced Video MPEG Features, on page 83
- Configuration Examples for Advanced Video MPEG Features, on page 84
- Feature Information for Advanced Video MPEG Features, on page 84

## Information about Advanced Video MPEG Features

### **Reserved Output PID Range**

The reserved output PID range allows the user to specify a range of PIDs that will not be used as output for remapped sessions. A range of up to 4000 PIDs from 1-8190 can be reserved.

One continuous reserved PID range is supported for each chassis. Note that the protection is only good for future output remapped PIDs, so the reserved PID range is expected to be configured before any remapped sessions are created. Remapped PIDs within the reserved range that already exists will not be reallocated.

## **How to Configure Advanced Video MPEG Features**

### **Configuring Reserved Output PID Range**

To configure reserved output range, follow the steps below:

```
enable
configure terminal
cable video
reserve-pid-range start-pid-end-pid
```

### Verifying Reserved Output PID Range Configuration

To verify the reserved output PID range configuration, use the **show cable video logical-edge-device id** *id* **reserve-pid-range** command as shown in the example below.

Router# show cable video logical-edge-device id 1 reserve-pid-range Logical Edge Device: led1 Id: 1 Reserve PID Range: 1-4000

## **Configuration Examples for Advanced Video MPEG Features**

This section provides configuration examples for the advanced video MPEG features:

### Example: Configuring Reserved Output PID Range

The following example shows how to configure reserved output PID range.

```
enable
configure terminal
cable video
reserve-pid-range 4000-4100
```

## Feature Information for Advanced Video MPEG Features

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

Note The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Feature Name	Releases	Feature Information
Advanced Video MPEG	Cisco IOS XE Everest	This feature was integrated on the Cisco cBR
Features	16.6.1	Series Converged Broadband Routers.

# **Important Notes**

The following are some important notes for Management IP Interface and Virtual Routing Interface.

Video Packet Routing Requirements, on page 85

# **Video Packet Routing Requirements**

A routing protocol, such as OSPF or IS-IS, must be enabled on the cBR-8 in order for video data packets from the head end to reach the virtual QAMs. On the cBR-8, enable a routing protocol as described in the routing configuration guide.

Once the routing protocol is set up correctly, the cBR-8 will advertise the internal static routes for the video data path to the head end.

The user needs to configure the Virtual Edge Input (VEI) with a routable IP address from within the customer's network. More information, see Configuring Virtual Edge Input under Logical Edge Device.

l

# cBR-8 as Auxiliary Video Core

The Cisco cBR-8 Converged Broadband Router can act as the video core, the DOCSIS core, and the principal core in a cable network. This chapter describes the use of a Cisco cBR-8 Converged Broadband Router as an auxiliary video core.

- Information About cBR-8 as Auxiliary Video Core, on page 87
- How to Configure cBR-8 as Auxiliary Video Core, on page 88
- Configuration Examples for cBR-8 as Auxiliary Video Core, on page 89
- Feature Information for cBR-8 as Auxiliary Video Core, on page 90

## Information About cBR-8 as Auxiliary Video Core

The Cisco cBR-8 supports both Generic Control Protocol (GCP) and Downstream External PHY Interface (DEPI) control and data planes. From Cisco IOS XE Amsterdam 17.3.1w release, you can configure a Cisco cBR-8 as an Remote PHY Auxiliary Video Core. Use the Cisco cBR-8 as an Auxiliary Video Core to support video and OOB with a Cisco cnBR or to support video on a separate Cisco cBR-8 other than the DOCSIS core.

This feature allows configuring a Cisco cBR-8 as an auxiliary video core without having DOCSIS configuration on the same Cisco cBR-8. The auxiliary video core, the DOCSIS core, and the principal core interface separately with RPDs.

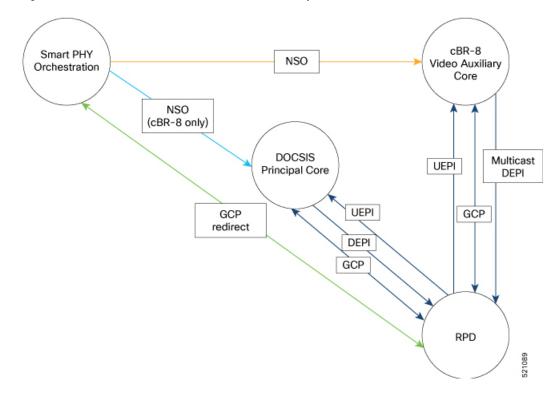

Figure 1: Remote PHY Architecture with a Cisco cBR-8 as Auxiliary Video Core

### Limitations

When you configure separate Cisco cBR-8s as DOCSIS and video cores, you must avoid RF channel reuse. A combined cBR-8 DOCSIS and Video Core ensures that RF channel reuse does not occur. Error detection occurs only when an RPD receives the configuration.

## How to Configure cBR-8 as Auxiliary Video Core

When you configure a Cisco cBR-8 as an auxiliary video core, downstream RPDs receive video configuration from the auxiliary video core. The RPDs receive DOCSIS configuration and other management configuration from the DOCSIS core and the principal core respectively. The DOCSIS core can also be the principal core.

You can configure the auxiliary core such that RPDs receive video, OOB, and NDF-NDR configurations. Alternately, you can configure these features on the principal core.

Note

- The Viavi system allows Narrowband Digital Forward (NDF) and Narrowband Digital Return (NDR) configuration only from the principal core as it relies on MIBs from the principal core.
- If the Auxiliary Video Core and RPD are in separate PTP domains, you have to configure the downstream controller-profile channel type as Video Async.

### **Configure DOCSIS Principal Core**

To configure the DOCSIS principal core, run the following commands.

```
cable rpd <RPD name>
identifier <RPD ID>
rpd-ds <port-ID> downstream-pilot-tone profile <ID>
core-interface <slot/subslot/port>
principal
rpd-ds <port-ID> downstream-cable <slot/subslot/port> profile <ID>
rpd-us <port-ID> upstream-cable <slot/subslot/port> profile <ID>
r-dti <ID>
rpd-event profile <ID>
rpd-event profile <ID>
```

### **Configure cBR-8 as Auxiliary Video Core**

To configure a Cisco cBR-8 as an auxiliary video core, run the following commands.

```
cable rpd <RPD name>
identifier <RPD ID>
core-interface <slot/subslot/port>
rpd-ds <ID> downstream-cable <slot/subslot/port> profile <ID>
core-interface <slot/subslot/port>
rpd-ds <ID> downstream-cable <slot/subslot/port> profile <ID>
rpd-ds <ID> downstream-cable <slot/subslot/port> profile <ID>
rpd-event profile <ID>
rpd-state
```

## Configuration Examples for cBR-8 as Auxiliary Video Core

#### Example: Configuring cBR-8 as Auxiliary Video Core

The following example shows how to configure a Cisco cBR-8 as an auxiliary video core.

```
cable rpd RPD-A
identifier 0053.0014.be8e
core-interface Te9/1/0
rpd-ds 0 downstream-cable 9/0/1 profile 2
core-interface Te9/1/6
rpd-ds 0 downstream-cable 9/0/31 profile 31
rpd-ds 0 downstream-cable 9/0/30 profile 32
rpd-event profile 0
rpd-55d1-us-event profile 0
```

#### Example: Configuring cBR-8 as Auxiliary Video and OOB Core

The following example shows how to configure a Cisco cBR-8 as auxiliary video and OOB core.

```
cable rpd RPD-A
identifier 0053.0014.be8e
core-interface Te9/1/0
rpd-ds 0 downstream-cable 9/0/1 profile 2
rpd-ds 0 downstream-oob-vom 1 profile 1
rpd-us 0 upstream-oob-varpd 1 profile 1
core-interface Te9/1/6
rpd-ds 0 downstream-cable 9/0/31 profile 31
rpd-ds 0 downstream-cable 9/0/30 profile 32
```

```
rpd-event profile 0
rpd-55d1-us-event profile 0
```

#### Example: Configuring DOCSIS Principal Core

The following example shows how to configure the DOCSIS principal core.

```
cable rpd RPD-RI01
identifier 0053.0014.be8e
rpd-ds 0 downstream-pilot-tone profile 1
core-interface Te9/1/2
principal
rpd-ds 0 downstream-cable 9/0/8 profile 1
rpd-us 0 upstream-cable 9/0/22 profile 1
r-dti 2
rpd-event profile 0
rpd-55d1-us-event profile 0
```

## Feature Information for cBR-8 as Auxiliary Video Core

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the https://cfnng.cisco.com/ link. An account on the Cisco.com page is not required.

The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 23:

Feature Name	Release	Feature Information
cBR-8 as Auxiliary Video Core		This feature was introduced on the Cisco cBR-8 Converged Broadband Router.
