

DualCrypt Encryption Mode Support

The Dualcrypt Encryption feature enables the Session and Resource Manager (SRM) to configure the PowerKey and DVB CAS sessions on the same line card (LC) of the Cisco cBR-8 Converged Broadband Router.

Finding Feature Information

Your software release may not support all the features that are documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. The Feature Information Table at the end of this document provides information about the documented features and lists the releases in which each feature is supported.

Use Cisco Feature Navigator to find information about the platform support and Cisco software image support. To access Cisco Feature Navigator, go to the link <http://tools.cisco.com/ITDIT/CFN/>. You do not require a cisco.com login account.

Hardware Compatibility Matrix for the Cisco cBR Series Routers

Note The hardware components that are introduced in a given Cisco IOS-XE Release are supported in all subsequent releases unless otherwise specified.

Table 1: Hardware Compatibility Matrix for the Cisco cBR Series Routers

Cisco CMTS Platform	Processor Engine	Interface Cards
Cisco cBR-8 Converged Broadband Router	<p>Cisco IOS-XE Release 16.5.1 and Later Releases</p> <p>Cisco cBR-8 Supervisor:</p> <ul style="list-style-type: none"> • PID—CBR-SUP-250G • PID—CBR-CCAP-SUP-160G • PID—CBR-CCAP-SUP-60G 	<p>Cisco IOS-XE Release 16.5.1 and Later Releases</p> <p>Cisco cBR-8 CCAP Line Cards:</p> <ul style="list-style-type: none"> • PID—CBR-LC-8D30-16U30 • PID—CBR-LC-8D31-16U30 • PID—CBR-RF-PIC • PID—CBR-RF-PROT-PIC • PID—CBR-CCAP-LC-40G • PID—CBR-CCAP-LC-40G-R • PID—CBR-SUP-8X10G-PIC • PID—CBR-2X100G-PIC <p>Digital PICs:</p> <ul style="list-style-type: none"> • PID—CBR-DPIC-8X10G • PID—CBR-DPIC-2X100G <p>Cisco cBR-8 Downstream PHY Module:</p> <ul style="list-style-type: none"> • PID—CBR-D31-DS-MOD <p>Cisco cBR-8 Upstream PHY Modules:</p> <ul style="list-style-type: none"> • PID—CBR-D31-US-MOD

Information about DualCrypt Encryption Mode

You can use this feature when you want the PowerKey and DVB sessions on the same QAM channel. This feature is applicable only to GQI-based sessions, as it uses the Generic QAM Interface (GQI) protocol.

To configure the dualcrypt encryption mode, you should set up connections with Event Information Scheduler (EIS) and Entitlement Control Message Generator (ECMG).

Prerequisites for Dualcrypt Encryption Mode

- Ensure that the following components are available on your system before configuring dualcrypt encryption for sessions.
 - Service Distribution Group (SDG)

- Virtual Carrier Group (VCG) with encrypt
 - Logical Edge Device (LED) with GQI protocol
 - Event Information Scheduler (EIS)
 - Entitlement Control Message Generator (ECMG)
- Ensure that the VCG is bound to SDG
 - Ensure that the VCG is associated to LED
 - Ensure that the Virtual Edge Input is configured only on LED
 - Ensure that the following configurations are available on your system:

- The encryption algorithm of the line card is set to DVB-CSA.

You can set it using the following command:

```
linecard <slot>/<bay> ca-system dualcrypt scrambler dvb-csa
```

- The virtual port group interface is configured and the same is set for the management interface under cable video, because the DVB requires a management IP address for communicating with external servers.

Use the following commands to set the virtual port group interface as management interface for cable video:

```
configure terminal
cable video
mgmt-intf VirtualPortGroup <id>
```

- The CA interface on the line card and the route for reaching the ECMG server are specified for session-based scrambling.

Use the following commands to specify CA interface and the route:

```
ca-interface linecard <slot>/<bay> <IP_Address>
route-ecmg <ECMG_Server_IP_Address> <Netmask> <Interface>
<Forwarding_Router_IP_Address>
```

- The **vrf** **<vrf_name>** keyword is configured for routes to populate on the respective VRFs, if you are using VRF for traffic or management separately. Configure the CA interface with specific VRF name.

```
ca-interface linecard <slot>/<bay> <IP_Address> vrf <vrf_name>
```

- (Optional) The bind option is used to associate EIS with specific IP address or GQI-based LED

To use a single IP address for GQI (create and delete sessions) and EIS (provision/de-provision SCGs), the operator should bind the EIS with GQI-based LED using the IP option and configure the required IP address. The IP address should be the subnet of the configured virtual port group. By default, the EIS uses the management IP address configured under DVB and the GQI uses the management IP address configured under LED for session control.

The following sample commands show how to bind the EIS:

```
configure terminal
cable video
encryption
dvb
eis <name of eis>
```

```
listening-port <1-65535> bind ip <ip address>
or
listening-port <1-65535> bind led <id | name> <led id | led name>
```

**Note**

- If all configured EIS are bound to a specific IP/LED using the bind option, the configuration of management IP address under DVB is optional.
- The bind option is not available in Cisco RF Gateway 10.

Restrictions for DualCrypt Encryption Mode

The following restrictions are applicable for configuring DualCrypt encryption mode:

- The DualCrypt Encryption feature is applicable only to GQI-based remapped sessions.
- Use this feature only for PowerKey, DVB, and Clear sessions.
- Do not use this feature along with tier-based scrambling mode.

How to Configure Dualcrypt Encryption Mode

Configuring DVB Session for DualCrypt Encryption

This section explains how to configure the session-based scrambling with DualCrypt encryption mode.

Procedure

To configure a DVB session for DualCrypt encryption, use the following commands:

```
enable
configure terminal
cable video
mgmt-intf VirtualPortGroup <group_id>
encryption
linecard <lcslot/subslot> ca-system dualcrypt scrambler dvb-csa
dvb
 route-ecmg ECMG_Server_IP_Address Netmask Interface Forwarding_Router_IP_Address
mgmt-ip IP_Address
eis EIS_Name id EIS_ID
listening-port port_number [bind {ip <ip address> | led < id <led id >| name <led name>>}]

ca-interface linecard <slot>/<bay> IP_Address
ecmg ECMG_Name id ECMG_ID
 mode vod linecard <slot>/<bay>
 type <standard/hitachi/irdeto/nagra/pkey>
 ca-system-id CA_System_ID CA_Subsystem_ID
 ecm-pid-source <sid/auto/ecm-id>
 connection id ID priority connection_priority IP_Address Port
```

Verifying DVB Session for DualCrypt Encryption

To verify the configuration of the encryption algorithm on the linecard, use the **show cable video encryption linecard <slot>/<bay>** command as shown in the following example:

```
Router#show cable video encryption linecard 8/0
Line card: 8/0
CA System      Scrambler      DVB-Conformance
=====
dualcrypt      dvb-csa        Enabled
```

To verify the scrambler configuration, use the **show cable video encryption scrambler brief** command as shown in the following example:

```
Router#show cable video encryption scrambler brief
Scrambler information
Chassis wide scrambler: none
-----
Linecard      Current      Configured
              Scrambler    Scrambler
=====
1             Not Ready    None
2             Not Ready    None
3             Not Ready    None
4             Not Ready    None
5             Not Ready    None
6             Not Ready    None
7             dvb-csa      None
8             dvb-csa      dvb-csa
9             des/dvs042   None
```

To verify the ECMG connection, use the **show cable video encryption dvb ecmg id <id> connection** command as shown in the following example:

```
Router#show cable video encryption dvb ecmg id <ID> connection
-----
ECMG ECMG ECMG      CA Sys CA Subsys PID      Lower Upper  Streams/ Open Streams/ Auto Chan
Slot ECMG          ECMG   ID      ID      Source limit limit  ECMG   ECMG   ID
ID  Name Type      ID      ID      Application
-----
1   test standard 0x950 0x0      sid     0     0     1     1     Enabled
7   1      VOD
```

ECMG Connections for ECMG ID = 1

```
-----
Conn Conn  IP          Port  Channel Conn  Open
-ID  Priority Address      Number ID    Status Streams
-----
1    1      10.10.1.1   9878  1     Open   1
```

The `Conn Status` field shows the status of the connection with the ECMG server and the `Open Streams` field indicates the number of active ECM streams.

To verify the EIS connection, use the **show cable video encryption dvb eis id <id>** command as shown in the following example:

```
Router#show cable video encryption dvb eis id <ID>
-----
EIS EIS Peer      Management TCP CP      CP      Overwrite Fail-To-Clear Connection
```

ID	Name	IP	IP	Port	Overrule	Duration	SCG	Duration	Status
1	test	10.10.1.1	10.10.1.10	9898	DISABLED	0	DISABLED	0	Connected

Verifying the GQI Configuration

To verify the GQI connection, use the **show cable video gqi connection** command, as shown in the following example:

```
Router>show cable video gqi connection
LED Management Server      Connection Version Event   Reset      Encryption
ID  IP          IP          Status      Pending Indication Discovery
-----
2   10.10.1.1   10.100.1.1 Connected  2         0         ACKED      Sent
```

To verify the statistics of GQI, use the **show cable video logical-edge-device id <ID> statistics** command, as shown in the following example:

```
Router>show cable video logical-edge-device id <ID> statistics

      Create Delete  Insert Cancel Switch Reset      Encryption Event
      Session Session Packet Packet Source Indication Discovery Notification
-----
Success 4      0      0      0      0      3      7      0
Error   0      0      0      0      0      0      0      0
Total   4      0      0      0      0      3      7      0
```

Verifying the GQI Sessions for Encryption

To verify whether the sessions are encrypted, use the **show cable video session logical-edge-device id <ID>** command, as shown in the following example, and check the **Encrypt Status** field.

```
Router>show cable video session logical-edge-device id <ID>
Total Sessions = 4

Session Output Streaming Session Session Source      UDP  Output  Input
Output Input  Output Encrypt Encrypt Low      Session
Id      Port  Type  Type  Ucast Dest IP/Mcast IP (S,G) Port  Program State  State
Bitrate Bitrate Type  Status Latency Name
-----
1048580 20    Passthru UDP    10.10.10.11      49152 -      ACTIVE-PSI ON
      1713128 1698122 CLEAR -      N      0x00000000000000000000000000000000
1048581 20    Remap  UDP    10.10.10.11      49153 2      ACTIVE-PSI ON
      1711859 1707422 DVB    Encrypted N      0x00000000000000000000000000000002
1048582 23    Passthru UDP    10.10.10.11      49154 -      ACTIVE-PSI ON
      1711962 1699101 CLEAR -      N      0x00000000000000000000000000000003
1048583 23    Remap  UDP    10.10.10.11      49155 4      ACTIVE-PSI ON
      1712498 1707834 DVB    Encrypted N      0x00000000000000000000000000000004
```

The session's **Encrypt Status** should be **Encrypted**. The **Output State** should be **ON** to show the proper **Encrypt Status** for **DVB** sessions. If the **Output State** is **Pending**, the **Encrypt Status** will be shown as **Pending**.

To get a list of SCGs, use the **show cable video scg allq** command as shown in the following example:

```
Router>show cable video scg allq
SCGs: 4      Carriers with SCGs: 3

-----
SCG      ON  TS  SCG Ref Activation CP Duration SCG  Sess LED/
ID      ID  ID  ID   Time      (msec)  Status Id  EIS
```

```

-----
900      1      20 65535 Immediate 10000      Active N/A 1
  Service IDs : 2
  ES PIDs : NA

9001     1      20 65535 Immediate 10000      Active N/A 1
  Service IDs : 1
  ES PIDs : NA

9006     1      22 65535 Immediate 10000      Active N/A 1
  Service IDs : 1
  ES PIDs : NA

9002     1      23 65535 Immediate 10000      Active N/A 1
  Service IDs : 4
  ES PIDs : NA

Number of SCGs = 4

```

Verifying ONID and TSID of the QAMs Configured for Specific LED

To get the details of ONID and TSID configured for QAMs configured under LED, use the **show cable video logical-edge-device id 1**, as shown in the following example, and verify the ONID and TSID details:

```

Logical Edge Device: led1
Id: 1
Protocol: GQI
Service State: Active
Discovery State: Disable
Management IP: 10.10.10.11
MAC Address:
Number of Servers: 1
  Server 1: 10.10.10.11

Troubleshooting Tips

If some configuration errors occur, see the following troubleshooting tips:

- The Management IP must be unique and in the subnet of virtual port group.
- Ensure that the ECMG Server is pingable with source interface as the virtual port group from the Cisco cBR-8 console. This indicates that the ECMG Server is reachable and route is valid.
- Ensure that the TCP port number configured for the ECMG Server in the Cisco cBR-8 is the same as that of the ECMG Server listening port.
- Ensure that the management IP is pingable from the EIS Server. Otherwise, check the routing between the cBR-8 chassis and the EIS server.
- Ensure that the listening port that is configured for the EIS is used for establishing the connection from the EIS Server.
- Ensure that the Virtual Port Group interface is active.
- Ensure that the TenGigabitEthernet interface using which the management traffic reaches the Cisco cBR-8 and the interface through which the CA interface route is configured are active.
- Ensure that the GQI connection is active and sessions are available to be set up.
- Ensure that the EIS connection is active and SCG is available in the Cisco cBR-8.

- Ensure that the CAS configured for ECMG matches the ECM group in SCG.
- Ensure that the ONID, TSID, and Program Number are synchronized with the configured sessions and SCG.

Configuration Examples

This section provides examples for configuring DualCrypt Encryption Mode:

Example: Basic Session-based Scrambling Configuration

```

cable video
mgmt-intf VirtualPortGroup 0
encryption
linecard 8/0 ca-system dualcrypt scrambler dvb-csa
dvb
route-ecmg 10.10.10.11 255.255.255.224 Port-channel26 2.26.1.2
mgmt-ip 10.10.10.11
eis test id 1

Feature Information for DualCrypt Encryption Mode

Use Cisco Feature Navigator to find information about the platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to the www.cisco.com/go/cfn link. An account on the Cisco.com page is not required.

Note The following table lists the software release in which a given feature is introduced. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 2: Feature Information for DualCrypt Encryption Mode

Feature Name	Releases	Feature Information
DualCrypt Encryption Mode	Cisco IOS XE Everest 16.6.1	This feature was integrated on the Cisco cBR Series Converged Broadband Routers.
