The following example shows the host Protect CMTS being configured to assume traffic responsibility for member 2 Working CMTS in group 2:

```
Router# hccp 2 switch 2R
```

|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hccp lockout</b>        | Prevents a Working CMTS from automatically switching to a Protect CMTS in the same group.                                                         |
| <b>hccp unlockout</b>      | Negates the effects of the <b>hccp lockout</b> command, making the CMTS available for automatic switchover from a Working CMTS to a Protect CMTS. |
| <b>show hccp</b>           | Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.                     |
| <b>show hccp interface</b> | Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.              |

# hccp timers

To configure HELLO packet interval and hold time for a specified group on a Protect CMTS, use the **hccp timers** command in cable interface configuration mode. To erase the HELLO interval and hold time configuration and to assume the default values for each parameter, use the **no** form of this command.

**Note** Issuing the **no** form of this command erases any manual HELLO interval and hold time values and automatically resets them to their default values.

**hccp group timers hello-time hold-time**  
**no hccp group timers** [*hello-time hold-time*]

## Syntax Description

|                   |                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group</i>      | The group number for the specified interface. Valid values are any number from 1 to 255, inclusive.                                                                                                                                             |
| <i>hello-time</i> | The HELLO packet interval (in milliseconds) between subsequent HELLO packet transmissions. The acceptable range is 1666 to 5,000 milliseconds, inclusive.                                                                                       |
| <i>hold-time</i>  | The time (in milliseconds) that a Protect CMTS will wait before assuming control of voice traffic for a Working CMTS that has failed to acknowledge a series of HELLO packets. The acceptable range is 5,000 to 25,000 milliseconds, inclusive. |

## Command Default

The default HELLO interval is 2,000 milliseconds, and the default hold time is 6,000 milliseconds.

## Command Modes

Interface configuration (cable interface only)

## Command History

| Release                | Modification                                                                                                                                              |

| 12.1(3a)EC             | This command was introduced for the Cisco uBR7200 series routers.                                                                                         |
| 12.1(7)EC1             | Support was added for the Cisco uBR-MC16S cable interface line card.                                                                                      |
| 12.2(4)XF1, 12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.                                                |
| 12.2(8)BC2             | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards. |
| 12.2(11)BC1            | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.           |
| IOS-XE 3.15.OS         | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                        |

## Examples

The following example shows the HELLO interval and hold time on a Protect CMTS in group 2 being configured to 1,750 and 3,000 milliseconds, respectively:

```
Router(config)# interval c4/0
```

```
Router(config-if)# hccp 2 timers 1750 3000
```

#### Related Commands

|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>hccp protect</b>        | Configures a particular cable interface to protect another peer cable interface in the same group.                                   |
| <b>hccp working</b>        | Configures a specified cable interface to be a working member of a given group.                                                      |
| <b>show hccp</b>           | Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.        |
| <b>show hccp interface</b> | Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured. |

# hccp track

To configure a cable interface on a Working CMTS or Protect CMTS to enable automatic switchover based on the interface state, use the **hccp track** command in cable interface configuration mode. To disable the automatic switchover based on interface state, use the **no** form of this command.

**hccp group track** [*interface*]

**no hccp group track** [*interface*]

## Syntax Description

|                  |                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------|
| <i>group</i>     | The group number for the specified interface. Valid values are any number from 1 to 255, inclusive. |
| <i>interface</i> | Specifies another cable interface (the default is the current cable interface).                     |

## Command Default

Enabled for the current interface

## Command Modes

Interface configuration (cable interface only)

## Command History

| Release                | Modification                                                                                                                                              |

| 12.1(7)EC1             | Support was added for the Cisco uBR-MC16S cable interface line card.                                                                                      |
| 12.2(4)XF1, 12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.                                                |
| 12.2(8)BC2             | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards. |
| 12.2(11)BC1            | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.           |
| IOS-XE 3.15.OS         | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                        |

## Usage Guidelines

This command enables automatic switchover of one interface when a tracked interface switches over from “up” to “down.”

Typically, this command is used to allow all interfaces on one card to track one another, so that if one interface goes down and switches over to the Protect, all other interfaces can also switch over, allowing the Protect card to assume full operation for these interfaces. This allows support engineers to troubleshoot the problem on the Working interface, or to remove and replace the Working card, if necessary, without interfering with traffic.

### Using hccp track with hccp revertive

As a general rule, if you are using the **hccp track** command on a cable interface, do not also configure the **hccp revertive** command without also configuring **no keepalive** on the cable interface. Configuring both commands on the same interface, along with keepalives, can cause multiple switchovers on the same fault.

If you want to use keepalives along with both the **hccp track** and **hccp revertive** commands, use the **hccp track** command on both the Working and Protect interfaces, so that the Working interfaces on the same card track each other and the Protect interfaces on the same card track each other. The following table summarizes the guidelines for using these three commands:

**Table 30: Possible hccp track and hccp revertive Configurations**

| <b>hccp track<br/>(Working I/Fs)</b> | <b>hccp track<br/>(Protect I/Fs)</b> | <b>hccp revertive</b> | <b>keepalive Configuration</b>   |
|--------------------------------------|--------------------------------------|-----------------------|----------------------------------|
| Yes                                  | No                                   | No                    | <b>keepalive or no keepalive</b> |
| Yes                                  | No                                   | Yes                   | <b>no keepalive</b>              |
| Yes                                  | Yes                                  | Yes                   | <b>keepalive or no keepalive</b> |

## Examples

The following example shows switchover behavior being enabled on a Cisco CMTS in group 2:

```
Router(config)# interface c3/0
Router(config-if)# hccp 2 track
Router(config-if)# keepalive
Router(config-if)#
```

The following example shows two Cisco uBR-LCP2-MC28C cards being used in a Cisco uBR10012 router, with each downstream being configured for a separate HCCP group. The card in slot 5/1 is being configured as the Working interfaces and the card in slot 6/1 is being configured as the Protect interfaces.

The two downstreams on each card track each other, so if one downstream fails and switches over, the other can do so as well, allowing the Protect card to assume full control of both interfaces. Similarly, when the Working interfaces come back into service, both Protect interfaces switch back at the same time.

```
Router(config)# interface cable c5/1/0
Router(config-if)# hccp 1 working 1
Router(config-if)# hccp 1 track c5/1/1
Router(config-if)# keepalive 3
Router(config-if)# exit
Router(config)# interface cable c5/1/1
Router(config-if)# hccp 2 working 1
Router(config-if)# hccp 2 track c5/1/0
Router(config-if)# keepalive 3
Router(config-if)# exit
Router(config)# interface cable c6/1/0
Router(config-if)# hccp 1 protect 1
```

```

ip-address-of-mgmt-lan

Router(config-if)# hccp 1 track c6/1/1

Router(config-if)# keepalive 3

Router(config-if)# exit
Router(config)# interface cable c6/1/1

Router(config-if)# hccp 2 protect 1
ip-address-of-mgmt-lan

Router(config-if)# hccp 2 track c6/1/0

Router(config-if)# keepalive 3

Router(config-if)#

```

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>keepalive</b>           | A global configuration command that allows you to specify the keepalive message transmission interval on a Working CMTS or Protect CMTS. |
| <b>show hccp</b>           | Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.            |
| <b>show hccp interface</b> | Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured.     |

# hccp unlockout

To reverse the effects of the **hccp lockout** command—that is, to make a Working CMTS available for automatic switchover to Protect CMTS, use the **hccp unlockout** command in privileged EXEC mode.

**hccp group unlockout member**

## Syntax Description

|               |                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------|
| <i>group</i>  | The group number for the specified interface. Valid values are any number from 1 to 255, inclusive. |
| <i>member</i> | The member number within the specified group.                                                       |

## Command Default

By default, the **hccp unlockout** command is active for all groups and members.

## Command Modes

Privileged EXEC

## Command History

| Release                | Modification                                                                                                                                              |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(3a)EC             | This command was introduced for the Cisco uBR7200 series routers.                                                                                         |
| 12.1(7)EC1             | Support was added for the Cisco uBR-MC16S cable interface line card.                                                                                      |
| 12.2(4)XF1, 12.2(4)BC1 | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC28C card.                                                |
| 12.2(8)BC2             | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards. |
| 12.2(11)BC1            | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.           |
| IOS-XE 3.15.OS         | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                        |

## Usage Guidelines

This command reverses the effect of the **hccp lockout** command. Once you have reconfigured or tested your Protect CMTS, issuing this command manually reintroduces the CMTS back into your 1+1 redundancy protection scheme.

### Note

This command is applicable only on a Working CMTS in a given group. Issuing this command on a Protect CMTS has no effect.

## Examples

The following example shows the lockout feature of a Working CMTS in group 1 being deactivated:

```
hccp 1 unlockout
```

**Related Commands**

| Command                    | Description                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>hccp lockout</b>        | Prevents a Working CMTS from automatically switching to a Protect CMTS in the same group.                                            |
| <b>show hccp</b>           | Displays information for all cable interfaces on which one or more HCCP groups and authentication modes have been configured.        |

| 12.2(8)BC2             | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR10012 router and Cisco uBR-LCP-MC16C, Cisco uBR-LCP-MC16E, and Cisco uBR-LCP-MC16S cards. |
| 12.2(11)BC1            | Support was added for the N+1 (1:n) RF Switch with the Cisco uBR7246VXR router and Cisco uBR-MC16C, Cisco uBR-MC16S, and Cisco uBR-MC28C cards.           |
| IOS-XE 3.15.OS         | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                        |

## Usage Guidelines

When N+1 HCCP redundancy is configured, the Protect interface switches over and becomes the active interface when it detects a situation similar to the following:

- The Working interface is removed from the chassis, is powered down, or is reset
- The Working interface crashes
- The Working interface no longer sends out regular keepalive messages
- The Working interface loses connectivity with the cable network

The Protect cable interface must be configured identically to the Working cable interface, which typically means the interfaces should be the same card type. However, when the Cisco uBR-MC16S is used, it can be used with either another Cisco uBR-MC16S card or a Cisco uBR-MC16C card.

The table below shows how a switchover affects the enhanced spectrum management features of the Cisco uBR-MC16S card.

**Table 31: Switchover Operation for a Cisco uBR-MC16C/Cisco uBR-MC16S Configuration**

| Working Cable Interface | Protect Cable Interface | Operation After Switchover                                                                                                                                                                                                                                        |
|-------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco uBR-MC16C         | Cisco uBR-MC16S         | The protect card (Cisco uBR-MC16S) uses the same upstream frequency as the working card, but after the system stabilizes, the protect card begins using the enhanced spectrum management features of the Cisco uBR-MC16S card, as configured on the protect CMTS. |
| Cisco uBR-MC16S         | Cisco uBR-MC16C         | The protect card (Cisco uBR-MC16C) uses the same upstream frequency as the working card. If the upstream becomes unstable, the Cisco uBR-MC16C performs only blind frequency hopping.                                                                             |
| Cisco uBR-MC16S         | Cisco uBR-MC16S         | The protect card initially uses the same upstream frequency as the working card, but after the system stabilizes, the protect card continues using the enhanced spectrum management features of the Cisco uBR-MC16S card.                                         |

### Examples

The following example shows cable interface 4/0 being designated as a Working CMTS interface as member number 2 of group 2:

```
Router(config)# interface cable 4/0
```

```
Router(config-if)# hccp 2 working 2
```

# hw-module bay reload

To reload the software and restart a SPA, use the **hw-module bay reload** command in privileged EXEC mode.

**Cisco IOS Releases 12.3(23)BC and 12.2(33)SCA**

**hw-module bay slot/subslot/bay reload**

**Cisco IOS Release 12.2(33)SCB**

**hw-module bay slot/bay/port reload**

## Syntax Description

|                |                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------|
| <i>slot</i>    | The slot where a SIP resides. On the Cisco uBR10012 router, slots 1 and 3 can be used for SIPs. |
| <i>subslot</i> | The subslot where a SIP resides. On the Cisco uBR10012 router, subslot 0 is always specified.   |
| <i>bay</i>     | The bay in a SIP where a SPA is located. Valid values are 0 (upper bay) and 1 (lower bay).      |
| <i>port</i>    | Specifies the interface number on the SPA.                                                      |

## Command Default

None

## Command Modes

Privileged EXEC (#)

|----------------|----------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router.                                                                 |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                            |
| 12.2(33)SCB    | This command was modified to change the addressing format for a SPA from <i>slot/subslot/bay</i> to <i>slot/bay/port</i> . |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                         |

## Usage Guidelines

The **hw-module bay reload** command reloads the software and restarts a SPA.

## Examples

The following example shows how to reload the software for the Cisco Wideband SPA in slot 1, subslot 0, and bay 1.

```
Router# hw-module bay 1/0/1 reload
```

```
Router#
```

## Related Commands

| Command                   | Description                                       |
|---------------------------|---------------------------------------------------|
| <b>hw-module shutdown</b> | Shuts down a PRE1 module, line card, SIP, or SPA. |

## hw-module shutdown (ubr10012)

To shut down a particular Performance Routing Engine (PRE1) module, line card, Wideband SIP or Wideband SPA, use the **hw-module shutdown (ubr10012)** command in global configuration mode. To activate a specific PRE1, line card, Wideband SIP or Wideband SPA, use the **no** form of this command.

**hw-module** {**main-cpu** | **pre** {**A** | **B**} | **sec-cpu** | **slot** *slot-number* | **subslot** *slot/subslot* | **bay** *slot/subslot/bay*} **shutdown** [**unpowered**]  
**no**hw-module {**main-cpu** | **pre** {**A** | **B**} | **sec-cpu** | **slot** *slot-number* | **subslot** *slot/subslot* | **bay** *slot/subslot/bay*} **shutdown** [**unpowered**]

### Syntax Description

|                                    |                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>main-cpu</b>                    | Shuts down the PRE1 module that is currently acting as the active PRE1 module.                                                                                                                                                                                                                                       |
| <b>pre</b> { <b>A</b>   <b>B</b> } | Shuts down the PRE1 module that is physically in either PRE slot A (left slot) or PRE slot B (right slot).                                                                                                                                                                                                           |
| <b>sec-cpu</b>                     | Shuts down the PRE1 module that is currently acting as the standby PRE1 module.                                                                                                                                                                                                                                      |
| <b>slot</b> <i>slot-number</i>     | Shuts down the line cards that are physically present in the specified <i>slot-number</i> (valid range is 1 to 8).                                                                                                                                                                                                   |
| <b>subslot</b> <i>slot/subslot</i> | Shuts down the line card or SIP that is physically present in the slot with the specified slot and subslot numbers. The following are the valid values: <ul style="list-style-type: none"> <li>• <i>slot</i> = 1 to 8</li> <li>• <i>subslot</i> = 0 or 1</li> </ul>                                                  |
| <b>bay</b> <i>slot/subslot/bay</i> | Shuts down the SPA in the location specified by the <i>slot/subslot/bay</i> argument. The following are the valid values: <ul style="list-style-type: none"> <li>• <i>slot</i> = 1 to 3</li> <li>• <i>subslot</i> = 0 or 1 (0 is always specified)</li> <li>• <i>bay</i> = 0 (upper bay) or 1 (lower bay)</li> </ul> |
| <b>unpowered</b>                   | Used with the Wideband SPA, shuts down the SPA and its interfaces, and leaves them in an administratively down state without power.                                                                                                                                                                                  |

### Command Default

No default behavior or values

### Command Modes

Global configuration

### Command History

| Release    | Modification                                                                |
|------------|-----------------------------------------------------------------------------|
| 12.2(4)XF  | This command was introduced for the Cisco uBR10012 router.                  |
| 12.3(21)BC | Support was added for the Cisco Wideband SIP and Cisco 1-Gbps Wideband SPA. |

**Usage Guidelines**

The **hw-module shutdown (ubr10012)** command shuts down in a controlled manner a particular Performance Routing Engine (PRE1) module, line card, Wideband SIP or Wideband SPA. To activate a specific PRE1, line card, Wideband SIP, or Wideband SPA, use the **no** form of this command.

**Caution**

Shutting down the active PRE1 module will trigger a switchover, so that the standby PRE1 module becomes the active PRE1 module.

**Examples**

The following example shows the standby PRE1 module being shut down:

```
Router(config)# hw-module sec-cpu shutdown
Router(config)#
```

The following example shows the active PRE1 module being shut down (which will trigger a switchover to the standby PRE1 module):

```
Router(config)# hw-module main-cpu shutdown
Router(config)#
```

The following example shows the PRE1 module in PRE1 slot B being shut down:

```
Router(config)# hw-module pre B shutdown
Router(config)#
```

**Note**

The **hw-module pre B shutdown** command shuts down the PRE1 module that is physically present in slot B, regardless of whether the module is the active or standby PRE1 module.

The following example shows how to deactivate and verify deactivation for the Cisco Wideband SPA located in slot 1, subslot 0, bay 0. In the output of the **show hw-module bay 0 oir** command, notice the “admin down” in the Operational Status field.

```
Router# configure terminal
Router(config)# hw-module bay 1/0/0 shutdown unpowered
%SPAWCMTS-4-SFP_MISSING: Wideband-Cable 1/0/0, 1000BASE-SX SFP missing from port 0

# hw-module slot

To control a component in a slot, use the **hw-module slot** command in Privileged EXEC mode.

```
hw-module slot slot-number { { logging onboard { disable | enable } } | { reload [force] }
| { start } | { stop [force] } }
```

## Syntax Description

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>slot-number</i> | The line cards that are physically present in the specified slot. Valid range is 0 to 9, F0 to F1 and R0 to R1. |
| <b>logging</b>     | Specifies the logging commands.                                                                                 |
| <b>onboard</b>     | Specifies the onboard commands.                                                                                 |
| <b>disable</b>     | Disables the onboard logging commands.                                                                          |
| <b>enable</b>      | Enables the onboard logging commands.                                                                           |
| <b>reload</b>      | Restarts the line card.                                                                                         |
| <b>force</b>       | Proceeds without prompting for a confirmation.                                                                  |
| <b>start</b>       | Activates the line card in the slot.                                                                            |
| <b>stop</b>        | Deactivates the line card in the slot.                                                                          |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.16.OS | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **hw-module slot** command to power-on, shutdown and power-cycle the line card.

## Examples

The following example shows the status of line card in slot 4:

```
Router# show logging onboard slot 4 status
Status: Disabled
```

The following example shows how to enable onboard logging commands on line card in slot 2:

```
Router# hw-module slot 4 logging onboard enable
```

The following example shows how to reload a line card in slot 1:

---

**Warning** All modems will go offline and all the services will be impacted.

---

Router# **hw-module slot 4 reload**

The following example shows how to start a line card in slot 2:

Router# **hw-module slot 4 start**

The following example shows how to stop a line card in slot 3:

---

**Warning** All modems will go offline and all the services will be impacted.

---

Router# **hw-module slot 4 stop**

# hw-module slot pos

To configure a line card slot for Packet over SONET (POS) operation, use the **hw-module slot pos** command in privileged EXEC mode. To remove the configuration for a line card slot, use the **no** form of this command.

**hw-module slot *slot-number* pos**  
**no hw-module slot *slot-number* pos**

## Syntax Description

|                    |                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <i>slot-number</i> | Resets the line cards that are physically present in the specified <i>slot-number</i> (valid range is 1 to 8). |
|--------------------|----------------------------------------------------------------------------------------------------------------|

## Command Default

None

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                                                                            |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(11)BC3    | This command was introduced for the Cisco uBR10012 OC-48 Dynamic Packet Transport (DPT) Interface Module for the Cisco uBR10012 router. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                      |

## Usage Guidelines

You must first use the **hw-module slot pos** command to preconfigure a line card slot for POS operation of the Cisco uBR10012 OC-48 DPT card before you can configure the card with any further commands. You must also use the **card 1oc48dpt/pos-1** command to configure the card slot for the proper card type.

**Note** If you have previously used the **hw-module slot srp** command to configure line card slots for Spatial Reuse Protocol (SRP) operation, you must first cancel that configuration using the **no hw-module slot srp** command before you can configure the slots for POS operation using the **hw-module slot pos** command.

## Examples

The following example shows the Cisco uBR10012 OC-48 DPT line card in slot 3 being configured for POS operation:

```
Router# hw-module slot 3 pos
```

```
Router# card 3/0 1oc48dpt/pos-1
```

The following example shows the Cisco uBR10012 OC-48 DPT line cards in slots 3 and 4 being reconfigured from SRP operation to POS operation:

```
Router# no hw-module slot 3 srp
```

```
Router# no hw-module slot 4 srp
```

```
Router# hw-module slot 3 pos
```

```
Router# card 3/0 loc48dpt/pos-1
```

```
Router# hw-module slot 4 pos
```

```
Router# card 4/0 loc48dpt/pos-1
```

| Release        | Modification                                                                                                                            |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(11)BC3    | This command was introduced for the Cisco uBR10012 OC-48 Dynamic Packet Transport (DPT) Interface Module for the Cisco uBR10012 router. |
| 12.2(33)SCB    | This command is obsolete.                                                                                                               |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                      |

## Usage Guidelines

You must first use the **hw-module slot srp** command to preconfigure a line card slot for SRP operation of a pair of Cisco uBR10012 OC-48 DPT cards before you can configure the cards with any further commands. You must also use the **card 1oc48dpt/pos-1** command to configure each card slot for the proper card type.

### Tip

The Cisco uBR10012 OC-48 DPT line cards support SRP operation only when installed in adjacent odd- and even-numbered slots (such as slots 1 and 2 or 3 and 4). You need to use the **hw-module slot srp** command only for the lower-numbered (odd-numbered) slot to preconfigure both slots of the SRP pair.

### Note

If you have previously used the **hw-module slot pos** command to configure line card slots for Packet over SONET (POS) operation, you must first cancel that configuration using the **no hw-module slot pos** command before you can configure the slots for POS operation using the **hw-module slot srp** command.

## Examples

The following example shows the Cisco uBR10012 OC-48 DPT line cards in slots 1 and 2 being configured for POS operation:

```
Router# hw-module slot 1 srp
Router# card 1/0 1oc48dpt/pos-1
```

```
Router# card 2/0 loc48dpt/pos-1
```

The following example shows the Cisco uBR10012 OC-48 DPT line cards in slots 3 and 4 being reconfigured from POS operation to SRP operation:

```
Router# no hw-module slot 3 pos
```

```
Router# no hw-module slot 4 pos
```

```
Router# hw-module slot 3 srp
```

```
Router# card 3/0 loc48dpt/pos-1
```

```
Router# card 4/0 loc48dpt/pos-1
```

**Related Commands**

| Command                              | Description                                    |
|--------------------------------------|------------------------------------------------|
| <b>hw-module reset</b>               | Resets a PRE1 module or line card.             |
| <b>hw-module shutdown (ubr10012)</b> | Shuts down a PRE1 module or line card.         |
| <b>hw-module slot pos</b>            | Configures a line card slot for POS operation. |

# hw-module subslot

To control a component in subslot, use the **hw-module subslot** command in Privileged EXEC mode.

**hw-module subslot** *card slot/subslot number* { {**reload** [ **force** ] } | {**start** } | {**stop** [ **force** ] } }

## Syntax Description

|               |                                                |
|---------------|------------------------------------------------|
| <b>reload</b> | Restarts the targeted subslot.                 |
| <b>force</b>  | Proceeds without prompting for a confirmation. |
| <b>start</b>  | Activates the targeted subslot.                |
| <b>stop</b>   | Deactivates the targeted subslot.              |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.16.OS | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **hw-module subslot** command to enable, stop and restart the RF-PICs after upgrading the RF-PIC firmware. This command does not support SUP-PIC command.

## Examples

The following example shows how to force reload a line card present in subslot 1:

**Warning** All modems will go offline and all the services will be impacted.

```
Router# hw-module subslot 0/1 reload force
```

The following example shows how to start a line card in subslot 2:

```
Router# hw-module subslot 0/2 start
```

The following example shows how to force stop a line card in subslot 3:

**Warning** All modems will go offline and all the services will be impacted.

```
Router# hw-module subslot 0/3 stop force
```

|                  | <b>cable rpd</b> | Enters the RPD configuration mode. |

# init-tech-list

To set the DCC initialization techniques that the CMTS can use to load balancing cable modems, use the **init-tech-list** command in the config-lb-group configuration mode. To reset the DCC initialization techniques, use the **no** form of this command.

**init-tech-list** *group*list [**ucc**]  
**no** **init-tech-list**

## Syntax Description

|                   |                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>group</i> list | DCC initialization technique list.                                                                                         |
| <b>ucc</b>        | (Optional) Determines whether Upstream Channel Change (UCC) can be used for modems during dynamic upstream load balancing. |

## Command Default

No default behavior or values.

## Command Modes

DOCSIS load balancing group mode (config-lb-group)

## Command History

| Release           | Modification                                                                      |
|-------------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC       | This command was introduced.                                                      |
| IOS-XE<br>3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to set the DCC initialization techniques on a DOCSIS load balancing group on the CMTS, using the **init-tech-list** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# init-tech-list 1 ucc
Router(config-lb-group)#
```

## Related Commands

| Command                                     | Description                                                                                                             |

| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# init-tech-ovr

To set DCC initialization techniques that override the physical upstream channel pair, use the **init-tech-ovr** command in the config-lb-group configuration mode.

## Cisco uBR10012 Router

**init-tech-ovr** *cableslot/subslot/port upstream cable slot/subslot/port upstream* **init-tech-list** *init-tech-list* *0 -4* [**ucc**]

## Cisco uBR7225VXR and Cisco uBR7246VXR Routers

**init-tech-ovr** *cableslot/subslot/port upstream cable slot/subslot/port upstream* **init-tech-list** *init-tech-list* *0 -4* [**ucc**]

| Syntax Description                             |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b> <i>slot/subslot/port upstream</i> |  | Specifies the CMTS interface slot, subslot, port number, and upstream parameters that are to be overridden. <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the line card resides. The permitted range is from 5 to 8.</li> <li>• <i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1.</li> <li>• <i>port</i>—The downstream controller number on the line card. The permitted <i>port</i> range is from 0 to 4.</li> </ul>                              |
| <b>cable</b> <i>slot/subslot/port upstream</i> |  | Specifies the CMTS interface slot, subslot, port number, and upstream channel ID parameters that will override the CMTS interface and upstream channel.                                                                                                                                                                                                                                                                                                                                                 |
| <b>cable</b> <i>slot/port upstream</i>         |  | Specifies the CMTS interface slot, port number, and upstream parameters that are to be overridden. <ul style="list-style-type: none"> <li>• <i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> </ul> </li> <li>• <i>port</i>—Downstream controller number on the line card. The permitted <i>port</i> values are 0 or 1.</li> </ul> |
| <b>cable</b> <i>slot/port upstream</i>         |  | Specifies the CMTS interface slot, port number, and upstream parameters that will override the CMTS interface and upstream channel.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>init-tech-list</b> <i>0-4</i>               |  | Specifies the DCC initialization technique list ranging from 0 to 4 for the upstream channel pair.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ucc</b>                                     |  | Determines whether Upstream Channel Change (UCC) can be used for modems during dynamic upstream load balancing.                                                                                                                                                                                                                                                                                                                                                                                         |

**Command Default** None

**Command Modes** DOCSIS load balancing group mode (config-lb-group)

**Command History**

| Release           | Modification                                                                       |
|-------------------|------------------------------------------------------------------------------------|
| 12.2(33)SCC       | This command was introduced.                                                       |
| IOS-XE<br>3.15.OS | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines**

The **init-tech-list** command accepts an upstream that is not added into the load balancing group. The upstream channel pair is invalid until the upstream is added. When the load balancing group is removed, all upstream channel pairs are also removed.

**Examples**

The following example shows how to set DCC initialization techniques that override the physical upstream channel pair to a DOCSIS load balancing group on the CMTS, using the **init-tech-ovr** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group
1
Router(config-lb-group)# init-tech-ovr cable
1/0 1 cable
1/1 2 1
```

**Related Commands**

| Command                                     | Description                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# interface cable

To configure a cable interface, use the **interface cable** command in global configuration mode.

**interface cable** {*slot/port slot/subslot/port*}

**Cisco IOS Release 12.2(33)SCE and later**

**interface cable** {*slot/cable-interface-index slot/subslot/cable-interface-index*}

| Syntax Description           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                     |

| 12.2(33)SCD    | This command was modified to support Cisco uBR7225VXR and Cisco uBR7246VXR routers.                                                                                                               |
| 12.2(33)SCE    | This command was modified. The port parameter was changed to cable-interface-index to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                 |

## Examples

The following example shows how to configure a cable interface in slot 5, and port 0 on a Cisco uBR7246VXR or Cisco uBR7225VXR router:

```
Router# configure terminal
Router(config)# interface cable 5/0
```

The following example shows how to configure a cable interface in slot 8, subslot 0, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 8/0/0
```

The following example shows how to configure a Cisco uBR-MC3GX60V cable interface line card in slot 5, subslot 0, and cable interface index 13 (MAC domain index) on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface cable 5/0/13
```

The following example shows how to configure a Cisco uBR-MC3GX60V cable interface line card in slot 1, subslot 0, and cable interface index 13 (MAC domain index) on a Cisco cBR Series Converged Broadband Routers:

```
Router# configure terminal
Router(config)# interface cable 1/0/13
```

## Related Commands

| Command                           | Description                             |
|-----------------------------------|-----------------------------------------|
| <b>interface integrated-cable</b> | Specifies a integrated cable interface. |
| <b>interface modular-cable</b>    | Specifies a modular cable interface.    |
| <b>interface wideband-cable</b>   | Specifies a wideband cable interface.   |

# interface cable-modem

To enter interface configuration mode for the cable interface on a router, use the **interface cable-modem** command in global configuration mode.

**Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**  
**interface cable-modem** *number*

## Syntax Description

|               |                                            |
|---------------|--------------------------------------------|
| <i>number</i> | Identifies the cable interface (always 0). |
|---------------|--------------------------------------------|

## Command Default

Disabled

## Command Modes

Global configuration

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 11.3(4)NA      | This command was introduced for the Cisco uBR904 cable access router.              |
| 12.0(4)XI1     | Support was added for the Cisco uBR924 cable access router.                        |
| 12.1(3)XL      | Support was added for the Cisco uBR905 cable access router.                        |
| 12.1(5)XU1     | Support was added for the Cisco CVA122 Cable Voice Adapter.                        |
| 12.2(2)XA      | Support was added for the Cisco uBR925 cable access router.                        |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

When this command is used, the router switches from global configuration mode to interface configuration mode.

## Examples

The following example shows how to enter interface configuration mode for the router's cable interface and then to enter the available interface configuration commands:

```
Router(
config)#
interface cable-modem
0
Router(config-if)# cable-modem ?
 compliant Enter compliant modes for interface
 downstream Downstream channel characteristics
 fast-search Enable/disable the DS fast search
 upstream upstream channel characteristics
 voip Options for Voice over IP traffic over the cable interface
Router(config-if)#
```

## Related Commands

|                 | IOS-XE 3.18.0SP | This command was modified on the Cisco cBR Series Converged Broadband Routers. The <i>rf-channel</i> range is 0 to 162 now. |

**Usage Guidelines** The **interface integrated-cable** command is used to configure the following line cards:

**interface integrated-cable**

- [Configuring the Cisco UBR-MC20X20V Cable Interface Line Card](#)
- [Configuring the Cisco uBR-MC88V Cable Interface Line Card](#)

The **interface integrated-cable** command is supported on Cisco cBR Converged Broadband Routers and also on Cisco uBR-MC88V and Cisco UBR-MC20X20V line cards.

---

**Examples**

The following example shows how to configure a integrated cable interface in slot 7, subslot 0, and port 0 on a Cisco UBR-MC20X20V cable interface line card:

```
Router# configure terminal
Router(config)# interface integrated-cable 7/0/0:1
```

---

|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced.                                                                                                                                                         |
| 12.3(23)BC     | This command was integrated into Cisco IOS Release 12.3(23)BC.                                                                                                                       |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                                                                      |
| 12.2(33)SCB    | This command was modified to change the addressing format for the modular cable interface from <i>slot/subslot/bay:nb-channel-number</i> to <i>slot/bay/port:nb-channel-number</i> . |
| 12.2(33)SCE    | Support for configuring modular-cable interface on the Cisco uBR-MC3GX60V cable line card was introduced.                                                                            |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                                                   |

## Examples

The following example shows how to configure a modular cable interface in slot 1, bay 3, and channel 23 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface modular-cable 1/3/0:23
```

The following example shows how to configure a modular cable interface in slot 5, subslot 1, and port 2 on a Cisco uBR-MC3GX60V cable line card.

```
Router# configure terminal
Router(config)# interface modular-cable 5/1/2:0
```

## Related Commands

| Command                         | Description                                                      |
|---------------------------------|------------------------------------------------------------------|
| <b>cable attribute-mask</b>     | Specifies an attribute mask value for a modular cable interface. |
| <b>interface wideband-cable</b> | Specifies a wideband cable interface.                            |
| <b>interface cable</b>          | Specifies a cable interface.                                     |

# interface port-channel

To create an EtherChannel interface on the Cisco Cable Modem Termination System (CMTS), use the **interface port-channel** command in global configuration mode. To remove this EtherChannel port from the Cisco CMTS, use the **no** form of this command.

**interface port-channel** *n*  
**no interface port-channel** *n*

## Syntax Description

|               |                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------|
| <i>number</i> | Identifying port channel number for this interface (EtherChannel port). The range is 1 to 64. |
|---------------|-----------------------------------------------------------------------------------------------|

## Command Default

By default, EtherChannel groups and ports are not defined, and they are disabled.

## Command Modes

Global configuration (config)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(11)BC3    | This command was introduced on the Cisco uBR7246VXR router.                       |
| 12.2(9a)BC     | This command was introduced on the Cisco uBR10012 router.                         |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The first EtherChannel interface configured becomes the bundle primary for all EtherChannel interfaces in the group. That is, the MAC address of the first EtherChannel interface is the MAC address for all EtherChannel interfaces in the group. If the first EtherChannel interface is later removed, the second EtherChannel interface to be configured becomes the bundled primary by default.

Repeat this configuration on every EtherChannel port to be bundled into:

- FastEtherChannel (FEC) or GigabitEtherChannel (GEC) group on the Cisco uBR10012 and Cisco uBR7200 series routers.
- Ten Gigabit EtherChannel (Ten GEC) group on the Cisco cBR series routers.

This configuration must be present on all EtherChannel interfaces before the EtherChannel group can be configured.

## Examples

The following example configures the port to have an EtherChannel port number of 1 within its EtherChannel group. The EtherChannel group is defined with the **channel-group** command.

```
Router(config-if)# interface port-channel 1
```

## Related Commands

| Command              | Description                                            |
|----------------------|--------------------------------------------------------|
| <b>channel-group</b> | Assigns an EtherChannel port to an EtherChannel group. |

| Command                            | Description                                                                                           |
|------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>show interface port-channel</b> | Displays the EtherChannel interfaces and channel identifiers, with their mode and operational status. |

# interface virtualportgroup

To configure a VirtualPortGroup interface, use the **interface** command in the global configuration mode. To delete the VirtualPortGroup created, use the **no** form of the command.

**interface virtualportgroup** *number*  
**no interface virtualportgroup** *number*

## Syntax Description

*number* Specifies the Virtual Port Group number. Valid range is 0 to 31.

## Command Default

None.

## Command Modes

Global configuration mode (config)

## Command History

| Release                      | Modification                                                                     |
|------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command is used to configure a VirtualPortGroup interface. If a VirtualPortGroup interface is configured, you will need to assign a primary IP address to it. You can also configure a secondary IP address on the VirtualPortGroup interface, similar to a gigabit Ethernet interface IP address configuration. You can assign only one secondary IP address.

The following example shows how to configure a VirtualPortGroup interface:

```
Router#configure terminal
Router(config)#interface VirtualPortGroup0
Router(config-if)#ip address 1.23.2.1 255.255.255.0
Router(config-if)#ip address 1.23.2.2 255.255.255.0 secondary
Router(config-if)#end
```

| IOS-XE 3.18.0SP | This command was modified on Cisco cBR Series Converged Broadband Routers. The <i>wideband-channel</i> range is 0 to 162 now.                                                       |

## Examples

The following example shows how to configure a wideband cable interface in slot 1, bay 3, and port 0 on a Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# interface wideband-cable 1/3/0:0
```

The following example shows how to configure a wideband cable interface in slot 5, subslot 1, and port 2 on a Cisco uBR-MC3GX60V cable line card.

```
Router# configure terminal
Router(config)# interface wideband-cable 5/1/2:0
```

The following example shows how to configure a wideband cable interface in slot 1, and port 0 on a Cisco uBR7225VXR or Cisco uBR7246VXR router:

```
Router# configure terminal
Router(config)# interface wideband-cable 1/0:0
```

|----------------------------------------|----------------------------------------------------------------------------------------|
| <b>cable downstream attribute-mask</b> | Specifies an attribute mask value for a wideband cable interface.                      |
| <b>cable rf-channels</b>               | Associates RF channels on the router with a wideband interface and allocate bandwidth. |
| <b>cable bundle</b>                    | Specifies bundle number for bundling of cable interfaces.                              |
| <b>interface modular-cable</b>         | Specifies a modular cable interface.                                                   |
| <b>interface cable</b>                 | Specifies a cable interface.                                                           |

## interleaver-depth (QAM profile)

To set the interleaver-depth for a specific QAM profile, use the **interleaver-depth** command in QAM profile configuration mode.

**interleaver-depth** {**I12-J17** | **I128-J1** | **I128-J2** | **I128-J3** | **I128-J4** | **I128-J5** | **I128-J6** | **I128-J7** | **I128-J8** | **I16-J8** | **I32-J4** | **I64-J2** | **I8-J16**}

### Syntax Description

|                |                                        |
|----------------|----------------------------------------|
| <b>I12-J17</b> | INTERLEAVER-I-12-J-17 for Annex A or C |
| <b>I128-J1</b> | INTERLEAVER-I-128-J-1 for Annex B      |
| <b>I128-J2</b> | INTERLEAVER-I-128-J-2 for Annex B      |
| <b>I128-J3</b> | INTERLEAVER-I-128-J-3 for Annex B      |
| <b>I128-J4</b> | INTERLEAVER-I-128-J-4 for Annex B      |
| <b>I128-J5</b> | INTERLEAVER-I-128-J-5 for Annex B      |
| <b>I128-J6</b> | INTERLEAVER-I-128-J-6 for Annex B      |
| <b>I128-J7</b> | INTERLEAVER-I-128-J-7 for Annex B      |
| <b>I128-J8</b> | INTERLEAVER-I-128-J-8 for Annex B      |
| <b>I16-J8</b>  | INTERLEAVER-I-16-J-8 for Annex B       |
| <b>I32-J4</b>  | INTERLEAVER-I-32-J-4 for Annex B       |
| <b>I64-J2</b>  | INTERLEAVER-I-64-J-2 for Annex B       |
| <b>I8-J16</b>  | INTERLEAVER-I-8-J-16 for Annex B       |

### Command Default

None

### Command Modes

QAM profile configuration (config-qam-prof)

### Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Use this command to set the interleaver-depth for a specific QAM profile.

### Examples

The following example shows how to set the interleaver-depth for a specific QAM profile:

```
Router# configure terminal
```

**interleaver-depth (QAM profile)**

```
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# interleaver-depth I12-J17
```

**Related Commands**

| Command                             | Description                                            |
|-------------------------------------|--------------------------------------------------------|
| <b>cable downstream qam-profile</b> | Set the QAM profile for the cable interface line card. |
| <b>annex</b>                        | Set the MPEG framing format.                           |
| <b>modulation</b>                   | Set the QAM modulation format.                         |
| <b>spectrum-inversion</b>           | Set the spectrum-inversion on or off.                  |
| <b>symbol-rate</b>                  | Set the symbol rate.                                   |

# interleaver-depth (OFDM channel profile)

To specify the channel interleaver-depth, use the **interleaver-depth** command in OFDM channel profile configuration mode. To undo the interleaver-depth assignment, use **no** form of this command.

**interleaver-depth** *value*

**no interleaver-depth**

## Syntax Description

|              |                                                         |
|--------------|---------------------------------------------------------|
| <i>value</i> | 1 to 16 for 25 KHz spacing, 1 to 32 for 50 KHz spacing. |
|--------------|---------------------------------------------------------|

## Command Default

16

## Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the channel interleaver-depth.

## Examples

The following example shows how to specify the channel interleaver-depth:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# interleaver-depth 3
```

## Related Commands

| Command                                   | Description                                                              |
|-------------------------------------------|--------------------------------------------------------------------------|
| <b>cable downstream ofdm-chan-profile</b> | Define the OFDM channel profile on the OFDM channel.                     |
| <b>cyclic-prefix</b>                      | Specify the channel cyclic-prefix.                                       |
| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                      |
| <b>pilot-scaling</b>                      | Specify the value used to calculate the number of continuous pilots.     |
| <b>profile-control</b>                    | Specify default modulation or profile as the channel control profile.    |
| <b>profile-data</b>                       | Specify default modulation or profile as the channel data profile.       |
| <b>profile-ncp</b>                        | Specify default modulation or profile as the channel ncp profile.        |
| <b>roll-off</b>                           | Specify the channel roll-off value.                                      |
| <b>subcarrier-spacing</b>                 | Specify the spacing for specific subcarriers configured in this profile. |

# interval

To set the duration of time the CMTS waits before checking the load on an interface, use the **interval** command in the load balancing group configuration mode. To reset the duration of time, use the **no** form of this command.

**interval** *seconds*

**no interval**

## Syntax Description

|                |                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>seconds</i> | The polling interval for the CMTS to determine the current load on each cable interface. The valid range is from 1 to 1000. The default value is 10 seconds in Cisco IOS Release 12.2(33)SCE and earlier. The default value is 30 seconds in Cisco IOS Release 12.2(33)SCE1 and later. |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

None

## Command Modes

Load balancing group configuration (config-lb-group)

## Command History

| Release        | Modification                                                                                                    |
|----------------|-----------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                                                    |
| 12.2(33)SCE1   | This command was modified. The default value for this <b>command</b> was changed from 10 seconds to 30 seconds. |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                               |

## Examples

The following example shows how to set the duration of time that the CMTS waits before checking the load on the interface, using the **interval** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# interval
50
Router(config-lb-group)#
```

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real time configuration, statistical, and operational information for load balancing operations on the router. |

## ip (virtual-arpd)

To configure the virtual advanced return path demodulator (ARPD) source IP address, use the **ip** command in OOB virtual ARPD configuration mode. To void the virtual ARPD source IP configuration, use the **no** form of this command.

**ip** *ip subnet\_mask* [*vrf*]

**no ip** *ip*

| Syntax Description | <i>ip</i>          | Specifies the virtual ARPD source IP address.  |
|--------------------|--------------------|------------------------------------------------|
|                    | <i>subnet_mask</i> | Specifies the virtual ARPD source subnet mask. |

| Command Default | None |
|-----------------|------|
|-----------------|------|

| Command Modes | OOB Virtual ARPD configuration (config-oob-varpd) |
|---------------|---------------------------------------------------|
|---------------|---------------------------------------------------|

| Command History | Release                     | Modification                                                                     |
|-----------------|-----------------------------|----------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

| Usage Guidelines | Use this command to configure the virtual ARPD source IP address. |
|------------------|-------------------------------------------------------------------|
|------------------|-------------------------------------------------------------------|

| Examples | The following example shows how to configure the virtual ARPD source IP address: |
|----------|----------------------------------------------------------------------------------|
|----------|----------------------------------------------------------------------------------|

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-arpd 1
Router(config-oob-varpd)# ip 225.225.225.225 255.255.255.0
```

| Related Commands | Command             | Description                                         |
|------------------|---------------------|-----------------------------------------------------|
|                  | <b>virtual-arpd</b> | Defines a virtual ARPD configuration.               |
|                  | <b>nc</b>           | Configures the network controller for virtual ARPD. |
|                  | <b>source-id</b>    | Configures the source ID for virtual ARPD.          |

# ip (virtual-om)

To configure the virtual OOB modulator (OM) source IP address, use the **ip** command in OOB virtual OM configuration mode. To void the virtual OM source IP configuration, use the **no** form of this command.

**ip** *ip subnet\_mask* [**vrf**]

**no ip** *ip*

|                           |                    |                                              |
|---------------------------|--------------------|----------------------------------------------|
| <b>Syntax Description</b> | <i>ip</i>          | Specifies the virtual OM source IP address.  |
|                           | <i>subnet_mask</i> | Specifies the virtual OM source subnet mask. |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                               |
|----------------------|-----------------------------------------------|
| <b>Command Modes</b> | OOB Virtual OM configuration (config-oob-vom) |
|----------------------|-----------------------------------------------|

| <b>Command History</b> | Release                     | Modification                                                                     |
|------------------------|-----------------------------|----------------------------------------------------------------------------------|
|                        | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

|                         |                                                                 |
|-------------------------|-----------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to configure the virtual OM source IP address. |
|-------------------------|-----------------------------------------------------------------|

|                 |                                                                                |
|-----------------|--------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to configure the virtual OM source IP address: |
|-----------------|--------------------------------------------------------------------------------|

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)# ip 225.225.225.225 255.255.255.0
```

| <b>Related Commands</b> | Command           | Description                         |

|                         | <b>virtual-om</b> | Defines a virtual OM configuration. |
|                         | <b>join-group</b> | Joins multicast group address.      |

# ip address

To specify the IP address range for multicast pool, use the **ip address** command in multicast pool configuration mode. To void the IP address configuration, use the **no** form of this command.

**ip address** *ip mask*

**no ip address**

|                           |                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ip mask</i> Specifies the IP address and subnet mask for the DEPI multicast pool. |
|---------------------------|--------------------------------------------------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                                      |
|----------------------|------------------------------------------------------|
| <b>Command Modes</b> | Multicast pool configuration (config-multicast-pool) |
|----------------------|------------------------------------------------------|

| Command History | Release                     | Modification                                                                     |
|-----------------|-----------------------------|----------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

|                         |                                                                      |
|-------------------------|----------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to specify the IP address range for multicast pool. |
|-------------------------|----------------------------------------------------------------------|

The following example shows how to specify the IP address range for multicast pool:

```
Router# configure terminal
Router(config)# cable depi multicast pool 1
Router(config-multicast-pool)# ip address 225.225.225.0 255.255.255.0
```

| Related Commands | Command                          | Description                         |
|------------------|----------------------------------|-------------------------------------|
|                  | <b>cable depi multicast pool</b> | Configures the DEPI multicast pool. |

# ip address docsis

To specify that the cable access router should use the DHCP protocol, as required by the DOCSIS specification, to assign an IP address for its cable interface, use the **ip address docsis** command in cable interface configuration mode. To disable the use of DHCP, use the **no** form of this command.

**Cisco uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**ip address docsis**

**no ip address docsis**

## Syntax Description

There are no key words or arguments for this command.

## Command Default

The cable access router uses the DHCP protocol, as required by the DOCSIS specification, to assign an IP address to its cable interface during system power-on.

## Command Modes

Interface configuration (cable interface only)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.1(3)XL      | This command was introduced for the Cisco uBR905 cable access router.              |
| 12.1(4)T       | Support was added for the Cisco uBR924 cable access router.                        |
| 12.1(3)XL      | Support was added for the Cisco uBR905 cable access router.                        |

| 12.2(2)XA      | Support was added for the Cisco uBR925 cable access router.                        |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The **ip address docsis** command configures the cable access router so that it obtains its IP address from a DHCP server at system power-on, which is a requirement for DOCSIS operation. This is the default mode of operation. If the configuration for the cable interface does not include any form of **ip address** command, the cable access router defaults to configuring the cable interface with the **ip address docsis** command.

Configuring the cable interface with any other form of the **ip address** command or with the **no ip address docsis** command prevents the cable access router from operating in DOCSIS networks. This mode of operation should be used only in lab or test networks.

### Note

Earlier Cisco IOS software releases for the cable access routers used either the **ip address negotiated** or the **ip address dhcp** command to specify that the cable interface should obtain its IP address from a DHCP server. These commands should no longer be used to configure the router's cable interface.

## Examples

The following example shows how to configure the cable access router so that it obtains the IP address for its cable interface from a DHCP server:

```
Router(config)# interface cable-modem 0
```

```
Router(config-if)# ip address docsis
```

```
Router(config-if)# exit
```

```
Router(config)#
```

|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>cable-modem dhcp-proxy</b> | Specifies that a DHCP server should provide the IP address for the router's Ethernet interface or for a NAT address pool.       |
| <b>ip http dhcp</b>           | Specifies the use of the DHCP protocol to obtain an IP address for any interface except the cable interface at system power-on. |
| <b>ip http negotiated</b>     | Specifies that a serial interface should use the PPP/PCP to obtain an IP address at system power-on                             |

# ip-address (controller)

To set the IP address of the Wideband SPA FPGA, use the **ip-address (controller)** command in controller configuration mode. To remove the IP address of the Wideband SPA FPGA, use the **no** form of this command.

**ip-address** *ip-address*  
**no ip-address** *ip-address*

## Syntax Description

|                   |                                       |
|-------------------|---------------------------------------|
| <i>ip-address</i> | IP address for the Wideband SPA FPGA. |
|-------------------|---------------------------------------|

## Command Default

No IP address is set for the Wideband SPA FPGA.

## Command Modes

Controller configuration (config-controller)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router.                         |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                    |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to set the IP address for the Wideband SPA FPGA. This address is used as the source IP address for packets that the Wideband SPA transmits to the EQAM device.

## Examples

The following example shows how to set the IP address of the Wideband SPA FPGA. The SPA is located in slot 1, subslot 0, bay 0.

```
Router(config)# controller modular-cable 1/0/0
```

```
Router(config-controller)# ip-address 192.168.200.6
```

## Related Commands

| Command                                           | Description                                                                    |
|---------------------------------------------------|--------------------------------------------------------------------------------|
| <b>annex modulation</b>                           | Sets the annex and modulation for the Wideband SPA.                            |
| <b>cable rf-channel</b>                           | Associates an RF channel on a Wideband SPA with a wideband channel.            |
| <b>controller modular-cable</b>                   | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>modular-host subslot</b>                       | Specifies the modular-host line card.                                          |
| <b>rf-channel frequency</b>                       | Sets the frequency for each RF channel.                                        |
| <b>rf-channel ip-address mac-address udp-port</b> | Sets the IP address, MAC address and UDP port for each RF channel.             |

| Command                                       | Description                                       |
|-----------------------------------------------|---------------------------------------------------|
| <b>rf-channel network delay</b>               | Specifies the CIN delay for each RF channel.      |
| <b>rf-channel description</b>                 | Specifies the description for each RF channel.    |
| <b>rf-channel cable downstream channel-id</b> | Assigns a downstream channel ID to an RF channel. |

# ip dhcp ping packet 0

To instruct the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address, use the **ip dhcp ping packet 0** command in global configuration mode. Use the no form of this command to remove this configuration.

**ip dhcp ping packet 0**

**no ip dhcp ping packet 0**

## Syntax Description

This command has no additional keywords or arguments.

## Command Default

By default, the DHCP server pings a pool address twice before assigning a particular address to a requesting client. If the ping is unanswered, the DHCP server assumes that the address is not in use and assigns the address to the requesting client.

## Command Modes

Global configuration

## Command History

| Release    | Modification                                  |
|------------|-----------------------------------------------|
| 12.1<br>EC | Command support introduced on the Cisco CMTS. |

## Usage Guidelines

Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- *Filtering Cable DHCP Lease Queries on the Cisco CMTS*
- *DHCP and Time-of-Day Services on the Cisco CMTS*

## Examples

The following example of the show version command illustrates configuration of this feature on the Cisco CMTS:

```
version 12.1
no service pad
! provides nice timestamps on all log messages
service timestamps debug datetime msec localtime
service timestamps log uptime
! turn service password-encryption on to encrypt passwords
no service password-encryption
! provides additional space for longer configuration file
service compress-config
! supports a large number of modems / hosts attaching quickly
service udp-small-servers max-servers no-limit
!
hostname Router
!
boot system disk0:
!
```

```
no cable qos permission create
no cable qos permission update
cable qos permission modems
! permits cable modems to obtain Time of Day (TOD) from uBR7100
cable time-server
!
! High performance DOCSIS config file, additional options may be added
! 10 Mbit/sec download, 128 Kbit/sec upload speed, 10 Kbit/sec guaranteed upstream
! NOTE: cable upstream 0 admission-control 150 will prevent modems from
! connecting after 150% of guaranteed-bandwidth has been allocated to
! registered modems. This can be used for peak load balancing.
! max-burst 1600 prevents a modem with concatenation turned on from consuming
! too much wire time, and interfering with VoIP traffic.
! cpe max 8 limits the modem to 8 hosts connected before the CMTS refuses
! additional host MAC addresses.
! Timestamp option makes the config file only valid for a short period of time.
!
cable config-file platinum.cm
 service-class 1 max-upstream 128
 service-class 1 guaranteed-upstream 10
 service-class 1 max-downstream 10000
 service-class 1 max-burst 1600
 cpe max 8
 timestamp
!
! Medium performance DOCSIS config file, additional options may be added
! 5 Mbit/sec download, 128 Kbit/sec upload speed
!
cable config-file gold.cm

|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable dhcp-giaddr policy</b>         | Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients. |
| <b>cable dhcp-parse option</b>          | Enables the parsing of certain DHCP options.                                                                                                                                                                       |
| <b>cable helper-address</b>             | Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.                                                   |
| <b>ip dhcp ping packet 0</b>            | Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.                                            |
| <b>ip dhcp relay information option</b> | Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.                                                                                                         |
| <b>ip dhcp smart-relay</b>              | Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.  |

# ip dhcp pool

To create a DHCP address pool and enter DHCP pool configuration file mode, use the **ip dhcp pool** command in global configuration mode. To remove a configured DHCP pool, use the **no** form of this command.

## Syntax Description

Provide a name for the DHCP address pool

|             |                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The <i>name</i> can be either an arbitrary string, such as <i>service</i> , or a number, such as <b>1</b> . |
|-------------|-------------------------------------------------------------------------------------------------------------|

## Command Default

DHCP pool names are not configured by default.

## Command Modes

Global configuration

## Command History

| Release    | Modification                                  |
|------------|-----------------------------------------------|
| 12.1<br>EC | Command support introduced on the Cisco CMTS. |

## Usage Guidelines

Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- <http://www.cisco.com/en/us/docs/cable/cmts/feature/cblsrcvy.html> Filtering Cable DHCP Lease Queries on the Cisco CMTS

# ipdr associate

To associate the Collector with a session, use the **ipdr associate** command in global configuration mode. To remove the association, use the **no** form of this command.

**ipdr associate** *session\_id collector\_name priority*  
**no ipdr associate** *session\_id collector\_name*

## Syntax Description

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>session_id</i>     | The unique IPDR session ID.                                                                                                             |
| <i>collector_name</i> | The collector name. The name should not contain extra spaces.                                                                           |
| <i>priority</i>       | The priority value between the session and the collector. The value range is 1 to 10. A value of 1 indicates that the highest priority. |

## Command Default

An association with the session will not be created.

## Command Modes

Global configuration mode

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to associate the Collector with a session. Once the Collector is configured, the Exporter sends data to the Collector. IPDR supports redundant collector and consistent streaming continues when a collector is down or not functioning.

The no form of the command will only remove the association for the stopped session.

**Note** The collector and the session should be configured before running this command.

## Examples

The following example configures a Collector.

```
Router# configure terminal
Router(config)#ipdr associate 1 federal 1
```

## Related Commands

| Command                    | Description                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>ipdr collector</b>      | Configures the IPDR Collector details.                                                                                        |
| <b>show ipdr collector</b> | Displays the collector information, message statistics and event for all the sessions that are associated with the collector. |

| Command             | Description                          |
|---------------------|--------------------------------------|
| <b>ipdr session</b> | Adds a session to the IPDR Exporter. |

# ipdr authorization

To enable the Internet Protocol Detail Record (IPDR) authorization, use **ipdr authorization** command in global configuration mode. To remove the configuration, use the **no** form of this command.

**ipdr authorization**  
**no ipdr authorization**

**Syntax Description** This command has no arguments or keywords.

**Command Default** This IPDR authorization will be disabled by default.

**Command Modes** Global configuration (config)

| Command History | Release      | Modification                 |
|-----------------|--------------|------------------------------|
|                 | 12.2(33)SCI2 | This command was introduced. |

**Usage Guidelines** The IPDR authorization is disabled by default. Use the **ipdr authorization** command to enable IPDR authorization. You can include it in the start-up configuration file as well. Whether IPDR authorization is enabled or not, any Collector coming from the bundle side will always be rejected.

**Examples** The following example shows how to enable IPDR authorization:

```
Router#configure terminal
Router(config)#ipdr authorization
IPDR authorization is enabled.
Router(config)#
```

**ipdr collector** *collector\_name* *ip\_addr* [*port*] [**nat-address** *ip\_addr* [*port*] ]  
**no ipdr collector** *collector\_name*

### Syntax Description

|                                   |                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>collector_name</i>             | The collector name. The name should not contain extra spaces.                                                |
| <i>ip_addr</i>                    | The collector IP address.                                                                                    |
| <i>port</i>                       | (Optional) The collector port value. The default port number will be considered if the value is not entered. |
| <b>nat-address</b> <i>ip_addr</i> | (Optional) The collector's Network Address Translation (NAT) in IP header.                                   |

### Command Default

A Collector will not be configured.

### Command Modes

Global configuration mode

### Command History

| Release        | Modification                                                                                               |
|----------------|------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                                               |
| 12.2(33)SCI2   | This command was integrated into Cisco IOS Release 12.2(33)SCI2. The <b>nat-address</b> keyword was added. |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                          |

### Usage Guidelines

This command allows the user to configure an IPDR Collector and authenticate the IPDR protocol. Once the Collector is configured, the Exporter sends data to the Collector. User must provide the collector name and the IP address. Port number is used when an exporter creates an active connection.

The no form of the command will remove a specific IPDR Collector. If the collector is associated with an active session, you should stop the session before using the no command.

### Examples

The following example configures a Collector.

```
Router# configure terminal
Router(config)#ipdr collector federal 192.0.2.0
```

---

**Related Commands**

| Command                    | Description                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>show ipdr collector</b> | Displays the collector information, message statistics and event for all the sessions that are associated with the collector. |
| <b>ipdr session</b>        | Adds a session to the IPDR Exporter.                                                                                          |

# ipdr exporter ack-timeout

To set IPDR Exporter acknowledged records timeout value, use the **ipdr exporter ack-timeout** command in global configuration mode. To disable the acknowledged records timeout value, use the **no** form of this command.

**ipdr exporter ack-timeout** *time\_interval*  
**no ipdr exporter ack-timeout**

|                           |                      |                                                                                                       |
|---------------------------|----------------------|-------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>time_interval</i> | Acknowledged records timeout count. The valid range is from 5 to 60 seconds. The default value is 60. |
|---------------------------|----------------------|-------------------------------------------------------------------------------------------------------|

**Command Default** This command is enabled when the IPDR Exporter is running.

**Command Modes** Global configuration (config)

|                        |                |                                                                                   |
|------------------------|----------------|-----------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                               |
|                        | 12.3(33)SCG    | This command was introduced.                                                      |
|                        | IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command allows you to set acknowledged records timeout value for a session.

**Note** Restart the IPDR Exporter for the timer values to take effect.

## Examples

The following example shows how to configure the acknowledged records timeout value on the Cisco CMTS router:

```
Router# configure terminal
Router(config)
)# ipdr exporter ack-timeout 60
Router(config)# ipdr exporter start
```

|                         |                           |                                                                              |
|-------------------------|---------------------------|------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>            | <b>Description</b>                                                           |
|                         | <b>show ipdr exporter</b> | Displays information about the IPDR Exporter state on the Cisco CMTS router. |

# ipdr exporter connection active

To enable the IPDR exporter to start connection, use the **ipdr exporter connection-active** command in global configuration mode. To enable collectors to start connection, use the **no** form of this command. It does not support to change connection type when the exporter is started. Stop exporter then change to another type.

**ipdr exporter connection-active** [*source-interface interface*]  
**no ipdr exporter connection-active**

## Syntax Description

**source-interface** Specifies the interface on which the connection is established.

## Command Default

By default, the IPDR exporter process will not be started.

## Command Modes

Global configuration mode

## Command History

| Release                  | Modification                                                                     |
|--------------------------|----------------------------------------------------------------------------------|
| IOS XE Gibraltar 16.12.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the IPDR exporter to start connection.

The **no** form of the command will change the IPDR Exporter connection mode to default.

## Examples

The following example allows the IPDR Exporter to start connection on the TenGigabitEthernet port 4/1/0 of the CMTS.

```
Router# configure terminal
Router(config)#ipdr exporter connection-active source-interface TenGigabitEthernet4/1/0
```

## Related Commands

| Command                    | Description                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>show ipdr exporter</b>  | Displays information about the IPDR Exporter state.                                                                           |
| <b>show ipdr collector</b> | Displays the collector information, message statistics and event for all the sessions that are associated with the collector. |
| <b>ipdr collector</b>      | Configures the Internet Protocol Detail Record (IPDR) Collector details.                                                      |

# ipdr exporter keepalive

To set the keepalive timer value on the IPDR exporter, use the **ipdr exporter keepalive** command in global configuration mode. To disable the keepalive timer value, use the **no** form of this command.

**ipdr exporter keepalive** *time\_interval*  
**no ipdr exporter keepalive**

## Syntax Description

|                      |                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------|
| <i>time_interval</i> | Keepalive timer count. The valid range is from 5 to 300 seconds. The default value is 300. |
|----------------------|--------------------------------------------------------------------------------------------|

## Command Default

This command is enabled when the IPDR Exporter is running.

## Command Modes

Global configuration (config)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(33)SCG    | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows you to set the keepalive timeout value for a session.

**Note** Restart the IPDR Exporter for the keepalive timer values to take effect.

## Examples

The following example shows how to configure the keepalive value on the Cisco CMTS router:

```
Router# configure terminal
Router(config)
)# ipdr exporter keepalive 300
Router(config)# ipdr exporter start
```

## Related Commands

|---------------------------|-----------------------------------------------------------------------|
| <b>show ipdr exporter</b> | Displays information about the IPDR Exporter state on the Cisco CMTS. |

# ipdr exporter max-unacked

To set the maximum number of unacknowledged records on the IPDR exporter, on the Cisco CMTS, use the **ipdr exporter max unacked** command in global configuration mode. To reset the maximum number of unacknowledged records, use the **no** form of this command.

**ipdr exporter max-unacked** *records*  
**no ipdr exporter max-unacked**

|                           |                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>records</i> Number of unacknowledged records. The valid range is from 5 to 200 records. The default value is 200. |
|---------------------------|----------------------------------------------------------------------------------------------------------------------|

**Command Default** This command is enabled when IPDR Exporter is running.

**Command Modes** Global configuration (config)

| <b>Command History</b> | Release        | Modification                                                                      |
|------------------------|----------------|-----------------------------------------------------------------------------------|
|                        | 12.3(33)SCG    | This command was introduced.                                                      |
|                        | IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command allows you to set the maximum number of unacknowledged records for a session.

**Note** Restart the IPDR Exporter for the number of records to take effect.

## Examples

The following example shows how to configure the number of unacknowledged records configured on the Cisco CMTS router:

```
Router# configure terminal
Router(config)
)# ipdr exporter max-unacked 200
Router(config)# ipdr exporter start
```

| <b>Related Commands</b> | Command                   | Description                                                                  |
|-------------------------|---------------------------|------------------------------------------------------------------------------|
|                         | <b>show ipdr exporter</b> | Displays information about the IPDR Exporter state on the Cisco CMTS router. |

## ipdr exporter start

To enable the CMTS application, to start the Internet Protocol Detail Record (IPDR) Exporter process to connect the exporter and the collector, use the **ipdr exporter start** command in global configuration mode. To terminate the connection between the exporter and collector, use the **no** form of this command.

**ipdr exporter start [ipv6]**  
**no ipdr exporter start**

### Syntax Description

**ipv6** Configure IPDR in IPv6 mode.

### Command Default

By default, the IPDR exporter process will not be started.

### Command Modes

Global configuration mode

### Command History

| Release                  | Modification                                                                      |
|--------------------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCB              | This command was introduced.                                                      |
| IOS-XE 3.15.OS           | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |
| IOS XE Gibraltar 16.12.1 | This command was updated to include <b>ipv6</b> keyword.                          |

### Usage Guidelines

This command allows the user to explicitly start the IPDR Exporter and connect to the collector. As a default behavior, the command will initiate all the sessions configured in the Exporter to a "Start" state.

The **no** form of the command will stop the IPDR Exporter process. The command will also clear the connection with the collector while retaining other configurations.

### Examples

The following example starts the IPDR Exporter process on the CMTS.

```
Router# configure terminal
Router(config)#ipdr exporter start
```

### Related Commands

|----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>show ipdr exporter</b>  | Displays information about the IPDR Exporter state.                                                                           |
| <b>show ipdr collector</b> | Displays the collector information, message statistics and event for all the sessions that are associated with the collector. |
| <b>ipdr collector</b>      | Configures the Internet Protocol Detail Record (IPDR) Collector details.                                                      |

# ipdr session

To start or stop a specific session, use the **ipdr session** command in the privileged EXEC mode.

**ipdr session** *session\_id* {**start** | **stop**}

## Syntax Description

|                   |                                   |
|-------------------|-----------------------------------|
| <i>session_id</i> | The unique IPDR session ID.       |
| <b>start</b>      | The keyword to start the session. |
| <b>stop</b>       | The keyword to stop the session.  |

## Command Default

No sessions are started.

## Command Modes

Privileged EXEC mode

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to start or stop a specific session. This command can be executed only when the IPDR exporter is started.

**Note** The user has to stop the session before configuring any tasks if the session is active.

## Examples

The following example enables the user to start a session.

```
Router# configure terminal
Router(config)#ipdr session 1 start
```

## Related Commands

| Command                    | Description                                             |
|----------------------------|---------------------------------------------------------|
| <b>ipdr exporter start</b> | Starts the IPDR Exporter and connects to the collector. |
| <b>show ipdr exporter</b>  | Displays information about the IPDR Exporter state.     |
| <b>ipdr associate</b>      | Associates the Collector with a session.                |

## ipdr session (global configuration)

To enable the CMTS application to add a session to the Internet Protocol Detail Record (IPDR) exporter, use the **ipdr session** command in global configuration mode. To remove the session, use the **no** form of this command.

**ipdr session** *session\_id session\_name session\_descr*  
**no ipdr session** *session\_id*

### Syntax Description

|                      |                                                             |
|----------------------|-------------------------------------------------------------|
| <i>session_id</i>    | The unique IPDR session ID.                                 |
| <i>session_name</i>  | The session name. The name should not contain extra spaces. |
| <i>session_descr</i> | The description of the session.                             |

### Command Default

No sessions are added to the IPDR exporter. It depends on the status of the IPDR exporter. After configuring one session, if the status of exporter is started, then the session is started automatically.

### Command Modes

Global configuration mode

### Command History

| Release           | Modification                                                                      |
|-------------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCB       | This command was introduced.                                                      |
| IOS-XE<br>3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command allows the user to add a session to the IPDR exporter. User should provide session ID, session name and session description for every session.

The **no** form of the command will remove a specific session. Once a session is removed, the template and other information associated with the session is also lost.

**Note** You can not update template details or other details when a session already created.

### Examples

The following example adds a session to the Exporter.

```
Router# configure terminal
Router(config)#ipdr session 1 test no_descr
```

### Related Commands

| Command                    | Description                                             |
|----------------------------|---------------------------------------------------------|
| <b>ipdr exporter start</b> | Starts the IPDR exporter and connects to the collector. |
| <b>show ipdr exporter</b>  | Displays information about the IPDR exporter state.     |

| Command               | Description                                   |
|-----------------------|-----------------------------------------------|
| <b>ipdr associate</b> | Associates the IPDR collector with a session. |

# ipdr template

To add an Internet Protocol Detail Record (IPDR) template to the IPDR session on the Cisco CMTS, use the **ipdr template** command in global configuration mode. To remove the template, use the **no** form of this command.

**ipdr template** *session\_id* *template\_name*  
**no ipdr template** *session\_id* *template\_name*

## Syntax Description

|                      |                         |
|----------------------|-------------------------|
| <i>session_id</i>    | Unique IPDR Session ID. |
| <i>template_name</i> | Template name.          |

## Command Default

The IPDR template is not added to the IPDR session.

## Command Modes

Global configuration (config)

## Command History

| Release        | Modification                                                                               |
|----------------|--------------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                               |
| 12.2(33)SCG    | A new template SERVICE-FLOW is added to the event-based and ad-hoc session types.          |
| 12.2(33)SCH5   | A new template is defined for CM-STATUS and the old template is renamed as CM-STATUS-2008. |
| 12.2(33)SCI1   | This command is integrated from Cisco IOS Release 12.2(33)SCH5.                            |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers.          |

## Usage Guidelines

This command allows the user to add an IPDR template to the desired session (based on session ID) on the Cisco CMTS.

**Note** You can only add the system-supported templates. The list can be viewed by entering “?” at the command prompt.

## Examples

The following example displays the **show running-config** command output of the configured IPDR sessions and types:

```
Router(config)# do show running-config | i ipdr
ipdr session 1 test test
ipdr session 2 event2 event2
ipdr session 3 ad-hoc3 ad-hoc3
ipdr type 1 time-interval 15
ipdr type 2 event
```

```
ipdr type 3 event
```

The following example shows the templates available in a timer-interval session.

```
Router# ipdr template 1 ?
CM-STATUS DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CM-US DOCSIS-CMTS-CM-US-STATS-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
SAMIS-TYPE1 DOCSIS-SAMIS-TYPE-1 template
SAMIS-TYPE2 DOCSIS-SAMIS-TYPE-2 template
SPECTRUM DOCSIS-SPECTRUM-MEASUREMENT-TYPE template
TEST Template for test
```

The following example shows how to add the SAMIS\_TYPE1 template in a timer-interval session.

```
Router(config)# ipdr template 1 SAMIS-TYPE1
```

The following example shows how to view the templates available in an event-based session.

```
Router(config)# ipdr template 2 ?
CM-STATUS DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CPE-TYPE DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS OSS12.0 SAMIS template
SERVICE-FLOW SERVICE-FLOW-TYPE template
TEST Template for test
TOPOLOGY DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

The following example shows how to view the templates available in an ad-hoc session.

```
Router(config)# ipdr template 3 ?
CM-STATUS DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CPE-TYPE DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS OSS12.0 SAMIS template
SERVICE-FLOW SERVICE-FLOW-TYPE template
TEST Template for test
TOPOLOGY DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

The following example shows the templates available in a timer-interval session for Cisco IOS Release 12.2(33)SCH5:

```
Router(config)# ipdr template 1 ?
CM-STATUS DOCSIS-CMTS-CM-REG-STATUS-TYPE template
CM-STATUS-2008 DOCSIS-CMTS-CM-REG-STATUS-TYPE-2008 template
CPE-TYPE DOCSIS-CPE-TYPE template
DIAGLOG-DETAIL DOCSIS-DIAG-LOG-DETAIL-TYPE template
DIAGLOG-EVENT DOCSIS-DIAG-LOG-EVENT-TYPE template
DS-UTIL DOCSIS-CMTS-DS-UTIL-STATS-TYPE template
SAMIS OSS12.0 SAMIS template
```

```
SERVICE-FLOW SERVICE-FLOW-TYPE template
TEST Template for test
TOPOLOGY DOCSIS-CMTS-TOPOLOGY-TYPE template
US-UTIL DOCSIS-CMTS-US-UTIL-STATS-TYPE template
```

**Related Commands**

|----------------------------|---------------------------------------------------------------------------|
| <b>ipdr exporter start</b> | Starts the IPDR Exporter on the Cisco CMTS and connects to the collector. |
| <b>show ipdr exporter</b>  | Displays information about the IPDR Exporter state on the Cisco CMTS.     |
| <b>ipdr session</b>        | Adds a session to the IPDR Exporter on the Cisco CMTS.                    |

# ipdr type

To configure the IPDR session type, use the **ipdr type** command in global configuration mode. The IPDR session types that can be defined using this command are event type, time-interval type, and the ad hoc type.

Use the **no** form of the command to reset the session type to the default "event" type.

**ipdr type** *session\_id* [{**ad-hoc** | **event** | **time-interval** *value*}]

**no ipdr type** *session\_id*

## Syntax Description

|                                   |                                                                            |
|-----------------------------------|----------------------------------------------------------------------------|
| <i>session_id</i>                 | IPDR session ID. Range is from 1 to 255.                                   |
| <b>ad-hoc</b>                     | The ad hoc session type.                                                   |
| <b>event</b>                      | The event session type.                                                    |
| <b>time-interval</b> <i>value</i> | The time-interval session type. Interval range is from 15 to 1440 minutes. |

## Command Default

The IPDR session type is not defined.

## Command Modes

Global configuration (config)

## Command History

| Release           | Modification                                                                      |
|-------------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCD2      | This command was introduced.                                                      |
| IOS-XE<br>3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to define the specific IPDR session type.

**Note** Once the IPDR session type is configured, the templates supported by this IPDR type are automatically associated with it.

## Examples

The following example shows how to configure the IPDR "time-interval" session type for a time interval of 15 minutes.

```
Router> enable
Router# configure terminal
Router(config)# ipdr type 1 time-interval 15
```

## Related Commands

|-----------------------------------------|---------------------------------------------------------------|
| <b>cable ipdr cm-us-status interval</b> | Displays a cable modem's upstream channel status information. |

| Command                                  | Description                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------|
| <b>cable ipdr docs-spectrum interval</b> | Sets the interval between different spectrum measurements' data for a CMTS. |
| <b>cable ipdr diaglog interval</b>       | Sets the time interval between different diagnostic logs' data for a CMTS.  |
| <b>cable ipdr cm-status interval</b>     | Displays the CMTS and cable modem registration status information.          |

### Related Commands

To configure IPv6 segment routing (SRv6), use the **ipv6 address** command in the global configuration mode.

**ipv6 address** {*ipv6\_address\_prefixprefix\_length*} **segment-routing**  
**no ipv6 address** {*ipv6\_address\_prefixprefix\_length*} **segment-routing**

|                            |                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------|
| <i>ipv6_address_prefix</i> | IPv6 prefix associated with a particular SAV group, specified in the X:X:X:X::X format. |
| <i>prefix_length</i>       | Length of the IPv6 prefix. The valid range is from 0 to 128                             |

### Command Default

None.

### Command Modes

Global configuration mode (config)

### Command History

| Release                     | Modification                                                                     |
|-----------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command is used to configure IPv6 Segment Routing. You can also configure multiple IPv6 addresses for SRv6 under the same interface. An IPv6 address with a prefix SID can also be associated with SRv6. to define a local prefix as an SID, use the following commands:

```
ipv6-sr prefix-sid
```

Use the **no ipv6-sr prefix-sid** command to disable the local prefix SID.

The following example shows how to configure IPv6 segment routing.

```
Router#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether0/0
Router(config-if)#ipv6 address 2001::0DB8/32 segment-routing
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#exit
Router(config-if)#exit
Router(config)#exit
```

The following example shows how to configure multiple IPv6 addresses for SRv6 under the same interface.

```
Router#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#inter Ether 0/0
Router(config-if)# ipv6 address 110::110/64 segment-routing
Router(config-if)# ipv6 address 111::111/64 segment-routing
Router(config-if-sr-ipv6)#ipv6-sr prefix-sid
Router(config-if-sr-ipv6)#end
```

|---------------------------|-----------------------------------|
| <b>ipv6-sr prefix-sid</b> | Defines a local prefix as an SID. |

# issu linecard abortversion

To roll back the current image version on a single line card or multiple line cards to the previous version, use the **issu linecard abortversion** command in the privileged EXEC mode.

**Note** This command is used to roll back the versions on redundant line cards only.

```
issu linecard abortversion {all|lc slot/subslot} [forced]
```

## Syntax Description

|                |                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>     | All redundant line cards.                                                                                                                                            |
| <i>lc_slot</i> | The line card slot number.                                                                                                                                           |
| <i>subslot</i> | The line card sub slot number.                                                                                                                                       |
| <b>forced</b>  | (Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with abortversion instead of stopping and error handling. |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to roll back to prior image on working or primary line card on a single or multiple line cards to the previous versions.

**Note** The **issu linecard reloadversion** command is used to reload a line card with the original version of images.

The following example rolls back the specific redundant line card's image version.

```
Router# configure terminal
Router(config)#issu linecard abortversion
```

## Related Commands

| <b>issu linecard loadversion</b>   | Loads a specific image version on the primary line card. |

| Command                             | Description                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>issu linecard prepareversion</b> | Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version. |
| issu linecard reloadversion         | Reloads the new loaded image on a working or a primary line card.                                                         |
| issu linecard runversion            | Runs the new loaded image on a working or a primary line card.                                                            |
| issu linecard changeversion         | Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.              |

# issu linecard acceptversion

To accept the new image version on the working line card, use the **issu linecard acceptversion** command in the privileged EXEC mode.

**issu linecard acceptversion** *lc slot* [/subslot]

## Syntax Description

|                |                                |
|----------------|--------------------------------|
| <i>lc_slot</i> | The line card slot number.     |
| <i>subslot</i> | The line card sub slot number. |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to accept the new image version on the working line card. The command also indicates the completion of changing the image version for the specific line card and allows the ISSU of the next line card in the queue.

## Examples

The following example indicates a command accepting the image version on the slot 7 of the line card.

```
Router# configure terminal
Router(config)#issu linecard acceptversion 7/0
```

## Related Commands

| Command                             | Description                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>issu linecard abortversion</b>   | Rolls back to the prior image on working/primary line card.                                                               |
| <b>issu linecard loadversion</b>    | Loads a specific image version on the primary line card.                                                                  |
| <b>issu linecard prepareversion</b> | Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version. |
| <b>issu linecard reloadversion</b>  | Reloads the new loaded image on a working or a primary line card.                                                         |
| <b>issu linecard runversion</b>     | Runs the new loaded image on a working or a primary line card.                                                            |
| <b>issu linecard changeversion</b>  | Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.              |

# issu linecard changeversion

To start the upgrade or downgrade activity of the image version for a single working line card or multiple working line cards, use the **issu linecard changeversion** command in the privileged EXEC mode.

**Note** Effective with Cisco IOS Release 12.2(33)SCH2, the issu linecard changeversion command is used to check and upgrade the line card images automatically during the RP-only ISSU process.

**issu linecard changeversion** { **all** | **stop**slot\_1 [/subslot\_1]} . . . [slot\_n [/subslot\_n]] [**forced**]

## Syntax Description

|               |                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>    | All redundant line cards.                                                                                                                                             |
| slot_1        | The slot number for the first line card.                                                                                                                              |
| subslot_1     | The sub slot number for the first line card.                                                                                                                          |
| slot_n        | The slot number for the n th line card.                                                                                                                               |
| subslot_n     | The sub slot number for the n th line card.                                                                                                                           |
| <b>forced</b> | (Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with changeversion instead of stopping and error handling. |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to start the upgrade or downgrade activity of the image version for a single line card or multiple line cards. Here the line cards are of the primary or working type only.

Using the all option, you can change the image version of all the redundant line cards instead of specifying explicitly each of the line card.

Using the stop option, you can stop the version change process for a line card.

## Examples

The following example displays the command and uses the all option.

```
Router# configure terminal
Router(config)#issu linecard changeversion all
```

The following example displays the command and uses the slot value of 6.

```
Router# configure terminal
Router(config)#issu linecard changeversion 6/0
```

**Related Commands**

| <b>issu linecard loadversion</b>    | Loads a specific image version on the primary line card.                                                                  |
| <b>issu linecard prepareversion</b> | Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version. |
| <b>issu linecard reloadversion</b>  | Reloads the new loaded image on a working or a primary line card.                                                         |
| <b>issu linecard runversion</b>     | Runs the new loaded image on a working or a primary line card.                                                            |

# issu linecard loadversion

To load a specific image version on the primary line card, use the **issu linecard loadversion** command in the privileged EXEC mode.

**issu linecard loadversion** *slot* [/subslot]

## Syntax Description

|                |                                |
|----------------|--------------------------------|
| <i>slot</i>    | The line card slot number.     |
| <i>subslot</i> | The line card sub slot number. |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to load a specific image version on the working line card.

## Examples

The following example shows the command that loads the image version on a line card with the slot number 7.

```
Router# configure terminal
Router(config)#issu linecard loadversion 7/0
```

## Related Commands

|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>issu linecard abortversion</b>   | Rolls back to the prior image on working/primary line card.                                                               |
| <b>issu linecard acceptversion</b>  | Accepts the new image version on the working line card.                                                                   |
| <b>issu linecard prepareversion</b> | Determines if the image version on the line card has to be upgraded or downgraded to the route processor's image version. |
| <b>issu linecard reloadversion</b>  | Reloads the new loaded image on a working or a primary line card.                                                         |
| <b>issu linecard runversion</b>     | Runs the new loaded image on a working or a primary line card.                                                            |
| <b>issu linecard changeversion</b>  | Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.              |

# issu linecard prepareversion

To determine if the image version on the line card has to be upgraded or downgraded to the route processor's image version, use the **issu linecard prepareversion** command in the privileged EXEC mode.

**issu linecard prepareversion** *lc\_slot* [/subslot] [forced]

|                           |                |                                                                                                                                                                        |
|---------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>lc_slot</i> | The line card slot number.                                                                                                                                             |
|                           | <i>subslot</i> | The line card sub slot number.                                                                                                                                         |
|                           | <b>forced</b>  | (Optional) The ISSU would ignore potential service outage and line card incompatibility errors and proceed with prepareversion instead of stopping and error handling. |

**Command Default** None

**Command Modes** Privileged EXEC (#)

|                        |                |                                                                                    |
|------------------------|----------------|------------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                                |
|                        | 12.2(33)SCB    | This command was introduced.                                                       |
|                        | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command allows the user to check if the image version on the line card has to be upgraded or downgraded to the route processor's image version.

This command also checks if the line card has a valid redundancy configuration. If the line card does not have a valid configuration, then the user has to reload the line card using the **issu linecard reloadversion** command.

**Examples** The following example shows the command executed for a line card with a slot value of 7.

```
Router# configure terminal
Router(config)#issu linecard prepareversion 7/0
```

|                         |                                    |                                                                   |

|                         | <b>issu linecard abortversion</b>  | Rolls back to the prior image on working/primary line card.       |
|                         | <b>issu linecard acceptversion</b> | Accepts the new image version on the working line card.           |
|                         | <b>issu linecard loadversion</b>   | Loads a specific image version on the primary line card.          |
|                         | <b>issu linecard reloadversion</b> | Reloads the new loaded image on a working or a primary line card. |
|                         | <b>issu linecard runversion</b>    | Runs the new loaded image on a working or a primary line card.    |

| Command                     | Description                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------|
| issu linecard changeversion | Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards. |

# issu linecard process stop

**Note** Effective with Cisco IOS Release 12.2(33)SCG and later, `issu linecard process stop` is no longer supported on the Cisco CMTS router.

To stop the automatic line card ISSU process, use the `issu linecard process stop` command in privileged EXEC mode.

## issu linecard process stop

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is enabled by default.

**Command Modes** Privileged EXEC (#)

| Command History | Release        | Modification                                                                       |
|-----------------|----------------|------------------------------------------------------------------------------------|
|                 | 12.2(33)SCB    | This command was introduced.                                                       |
|                 | 12.2(33)SCG    | This command is obsolete.                                                          |
|                 | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** Use the `issu linecard process stop` command to interrupt the automatic ISSU process continuing to the next line card.

### Associated Features:

The `issu linecard process stop` command is associated with following features:

[Cisco IOS In Service Software Upgrade Process](#)

### Example

The following example shows how to stop the ISSU process:

```
Router> enable
Router# issu linecard process stop
```

| <b>issu linecard runversion</b>     | Runs the new loaded image on a working or a primary line card.                                                            |
| <b>issu linecard changeversion</b>  | Starts the upgrade or downgrade activity of the image version for a single line card or multiple line cards.              |

# issu linecard reloadversion

To reload the new loaded image on a working or a primary line card, use the **issu linecard reloadversion** command in the privileged EXEC mode.

**issu linecard prepareversion** {**original** | **target**} {**all**[*slot\_1* [*subslot\_1*]... [*slot\_n* [/*subslot\_n*]]}

## Syntax Description

|                  |                                              |
|------------------|----------------------------------------------|
| <b>original</b>  | The original image version.                  |
| <b>all</b>       | All redundant line cards.                    |
| <i>slot_1</i>    | The slot number for the first line card.     |
| <i>subslot_1</i> | The sub slot number for the first line card. |
| <i>slot_n</i>    | The slot number for the n th line card.      |
| <i>subslot_n</i> | The sub slot number for the n th line card.  |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command allows the user to reload the new loaded image on a working or a primary line card.

This command can be used for the following line card conditions.

- Line cards that are not configured with redundancy, and do not support Minimal Disruptive Restart (MDR.)
- Line cards which are capable of line card redundancy which were rolled back due to an unsuccessful **changeversion** command.

## Examples

The following example shows the command executed with the original keyword.

```
Router# configure terminal
Router(config)#issu linecard reloadversion original 8/0
```

The following example shows the command executed with the target keyword.

```
Router# configure terminal
Router(config)#issu linecard reloadversion target 8/0
```

**no jitter**{sdv | vod | broadcast | gaming | table-based}*value*

## Command Default

None.

## Command Modes

Cable video configuration (config-video)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to set session jitter:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# jitter gaming 5
```

## Related Commands

| Command                        | Description                              |
|--------------------------------|------------------------------------------|
| <b>show cable video jitter</b> | Displays the session jitter information. |

# join-group

To join multicast group address, use the **join-group** command in OOB virtual OM configuration mode. To void the virtual OM configuration, use the **no** form of this command.

**join-group** *ip* **source-ip** *ip* **out-group** *ip*

**no join-group** *ip* **source-ip** *ip* **out-group** *ip*

## Syntax Description

|                             |                                          |
|-----------------------------|------------------------------------------|
| <b>join-group</b> <i>ip</i> | Specifies the group IP address.          |
| <b>source-ip</b> <i>ip</i>  | Specifies the SSM source IP address.     |
| <b>out-group</b> <i>ip</i>  | Specifies the local OM group IP address. |

## Command Default

None

## Command Modes

OOB Virtual OM configuration (config-oob-vom)

## Command History

| Release                     | Modification                                                                     |
|-----------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to join multicast group address.

## Examples

The following example shows how to join multicast group address:

```
Router# configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)# join-group 235.1.1.1 source-ip 2.3.4.5 out-group 239.2.2.2
```

## Related Commands

| Command           | Description                                  |
|-------------------|----------------------------------------------|
| <b>virtual-om</b> | Defines a virtual OM configuration.          |
| <b>ip</b>         | Configures the virtual OM source IP address. |

# keepalive

To set the default ONID number, use the **default-onid** command in the video configuration mode.

**default-onid** *number*

## Syntax Description

*number* The ONID number. By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535.

## Command Default

None.

## Command Modes

Video configuration mode (config-video)

## Command History

| Release                      | Modification                                                                     |
|------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command is used to change the default system ONID.

The following example shows how to change the default ONID number:

```
configure terminal
cable video
default-onid 1580
```

# lACP fast-switchover

To enable Link Aggregation Control Protocol (LACP) 1:1 link redundancy, use the **lACP fast-switchover** command in interface configuration mode. To disable LACP 1:1 link redundancy, use the **no** form of this command.

**lACP fast-switchover**  
**no lACP fast-switchover**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                                                  |
|------------------------|--------------------------------------------------|
| <b>Command Default</b> | LACP 1:1 link redundancy is disabled by default. |
|------------------------|--------------------------------------------------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

| Command History | Release               | Modification                 |
|-----------------|-----------------------|------------------------------|
|                 | Cisco IOS 12.2(33)SCJ | This command was introduced. |

|                         |                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Prior to entering the <b>lACP fast-switchover</b> command, you must ensure the following: |
|-------------------------|-------------------------------------------------------------------------------------------|

- The port channel protocol type is LACP.
- The **lACP max-bundle 1** command has been entered on the port channel. The **lACP fast-switchover** command will not affect the **lACP max-bundle** command.

When you enable LACP 1:1 link redundancy, based on the system priority and port priority, the port with the higher system priority chooses the link as the active link and the other link as the standby link. When the active link fails, the standby link is selected as the new active link without taking down the port channel. When the original active link recovers, it reverts to its active link status. During this change-over, the port channel is also up.

|             |                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | We recommend that you configure two ports only (one active and one hot-standby) in the bundle for optimum performance. |
|-------------|------------------------------------------------------------------------------------------------------------------------|

## Examples

This example shows how to enable LACP 1:1 link redundancy:

```
Router(config-if)# lACP fast-switchover
```

| Related Commands | Command                  | Description                                                                |
|------------------|--------------------------|----------------------------------------------------------------------------|
|                  | <b>lACP max-bundle</b>   | Assigns and configures an EtherChannel interface to an EtherChannel group. |
|                  | <b>show etherchannel</b> | Displays the EtherChannel information for a channel.                       |

# lacp max-bundle

To define the maximum number of active bundled Link Aggregation Control Protocol (LACP) ports allowed in a port channel, use the **lacp max-bundle** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

**lacp max-bundle** *max-bundles number*  
**no lacp max-bundle**

## Syntax Description

|                    |                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>max-bundles</i> | Maximum threshold of active member links allowed in the LACP bundle. The range from is 1 to 8. The maximum threshold value must be greater than or equal to the minimum threshold value. |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

A maximum number of active bundled ports is not configured.

## Command Modes

Interface configuration (config-if)

## Command History

| Release               | Modification                             |
|-----------------------|------------------------------------------|
| Cisco IOS 12.2(33)SCJ | Support for this command was introduced. |

## Usage Guidelines

The value specified in the *max-bundles* argument determines the number of active links that are bundled in the port channel. The remaining links are in hot-standby mode.

## Examples

This example shows how to set 3 ports to bundle in port channel 2:

```
Router(config)# interface port-channel 2
Router(config-if)# lacp max-bundle 3
Router(config-if)#
```

## Related Commands

| Command                             | Description                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------|
| <b>interface port-channel</b>       | Creates a port-channel virtual interface and puts the CLI in interface configuration mode. |
| <b>ip address</b>                   | Sets a primary or secondary IP address on an interface.                                    |
| <b>show etherchannel</b>            | Displays the EtherChannel information for a channel.                                       |
| <b>show interfaces port-channel</b> | Displays traffic that is seen by a specific port channel.                                  |

# lACP min-bundle

To define the minimum number of active bundled LACP ports allowed in a port channel, use the **lACP min-bundle** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

**lACP min-bundle** *min-bundle*  
**no lACP min-bundle**

## Syntax Description

|                   |                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------|
| <i>min-bundle</i> | Minimum threshold of active member links allowed in the LACP bundle. The range is from 1 to 8. The default is 1. |
|-------------------|------------------------------------------------------------------------------------------------------------------|

## Command Default

The port-channel operational state will be “Down” only when there are no active links in the channel. If there are one or more active links, the port-channel state will be “Up.”

## Command Modes

Interface configuration (config-if)

## Command History

| Release               | Modification                 |
|-----------------------|------------------------------|
| Cisco IOS 12.2(33)SCJ | This command was introduced. |

## Usage Guidelines

Use the **lACP min-bundle** command to configure the minimum number of active links allowed in an LACP bundle. When the number of active links falls below this minimum threshold, the port channel shuts down.

## Examples

This example shows how to set the minimum number of active links to five ports:

```
Device(config-if)# lACP min-bundle 5
```

## Related Commands

| Command                             | Description                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------|
| <b>interface port-channel</b>       | Creates a port-channel virtual interface and enters interface configuration mode. |

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-----------------------|------------------------------|
| Release                | Modification                                                                                                                                   |         |              |                       |                              |
| Cisco IOS 12.2(33)SCJ  | This command was introduced.                                                                                                                   |         |              |                       |                              |

**Usage Guidelines** You may assign a port priority to each port on a device running Link Aggregation Control Protocol (LACP). You can specify the port priority by using the **lacp port-priority** command at the command-line interface (CLI) or use the default port priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. Port priority is used to decide which ports should be put in standby mode when a hardware limitation or the **lacp max-bundle** command configuration prevents all compatible ports from aggregating. Priority is supported only on port channels with LACP-enabled physical interfaces.

**Note** A high priority number means a low priority.

Port priority together with port number form a port identifier.

To verify the configured port priority, issue the **show lacp** command.

## Examples

This example shows how to set a priority of 23700 for an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet 0/0
Device(config-if)# lacp port-priority 23700
Device(config-if)#
```

| <b>Related Commands</b> | <table> <tr> <th>Command</th><th>Description</th></tr> <tr> <td><b>channel-group</b></td><td>Assigns and configures an EtherChannel interface to an EtherChannel group.</td></tr> <tr> <td><b>debug lacp</b></td><td>Enables debugging of LACP activities.</td></tr> </table> | Command | Description | <b>channel-group</b> | Assigns and configures an EtherChannel interface to an EtherChannel group. | <b>debug lacp</b> | Enables debugging of LACP activities. |

| Cisco IOS 12.2(33)SCJ  | This command was introduced.                                                                                                                   |         |              |                       |                              |

**Usage Guidelines** You can assign a system priority to each device running Link Aggregation Control Protocol (LACP). You can specify the system priority by using the **lacp system-priority** command at the command-line interface (CLI) or use the default system priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. System priority is used with the MAC address of the device to form the system ID and also is used during negotiation with other systems. Priority is supported only on port channels with LACP-enabled physical interfaces.

**Note** A high priority number means a low priority.

To verify the configured system priority, issue the **show lacp** command.

## Examples

The following example shows how to set a system priority of 25500 for a device:

```
Router> enable
Router# configure terminal
Router(config)# lacp system-priority 25500
```

# lane start-freq

To set the start frequency for a specific lane, use the **lane start-freq** command from frequency profile configuration mode.

**lane** *lane\_id***start-freq** *start-freq*

## Syntax Description

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <i>lane_id</i>    | Specifies the ID of the lane that the start frequency to be set. |
| <i>start-freq</i> | Configures the start frequency for the lane.                     |

## Command Default

None

## Command Modes

Frequency profile configuration (config-freq-prof)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to set the start frequency for a specific lane.

## Examples

The following example shows how to set start frequency for a specific lane:

```
Router# Configure terminal
Router(config)# cable downstream freq-profile 4
Router(config-freq-prof)# lane 1 start-freq 45000000
```

|--------------------------------------|----------------------------------------------|
| <b>cable downstream freq-profile</b> | Set the start frequency for a specific lane. |

# lc-control-plane-timeout

To set the interval of monitoring cable line card control plane process restart, use the **lc-control-plane-timeout** *time* command in the process restart configuration mode.

```
lc-control-plane-timeout time
```

## Syntax Description

|             |                                                                               |
|-------------|-------------------------------------------------------------------------------|
| <i>time</i> | Cable line card control plane process restart monitoring interval in seconds. |
|-------------|-------------------------------------------------------------------------------|

## Command Default

None

## Command Modes

Process restart configuration (config-process-restart)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command sets the interval of monitoring cable line card control plane process restart.

The following example shows how to set the interval of monitoring cable line card control plane process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# lc-control-plane-timeout 200
```

# license feature evaluation disable

To disable an evaluation license for Cisco uBR-MC3GX60V and Cisco UBR-MC20X20V cable interface line cards on the Cisco uBR10012 router, use the **license feature evaluation disable** command in global configuration mode.

**license feature evaluation disable** {**DS\_license** | **US\_license** | **all** } **subslot** *slot/subslot*

|                    |                                    |                                                                                                                                                                                                                                             |
|--------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>disable</b>                     | Disables an evaluation license for a cable interface line card.                                                                                                                                                                             |
|                    | <b>DS_License</b>                  | Disables a downstream evaluation license for a cable interface line card.                                                                                                                                                                   |
|                    | <b>US_License</b>                  | Disables an upstream evaluation license for a cable interface line card.                                                                                                                                                                    |
|                    | <b>all</b>                         | Disables both downstream and upstream evaluation licenses for a cable interface line card.                                                                                                                                                  |
|                    | <b>subslot</b> <i>slot/subslot</i> | <ul style="list-style-type: none"><li>• <i>slot</i>—Slot where the line card resides. The valid range is from 5 to 8.</li><li>• <i>subslot</i>—Secondary slot number of the cable interface line card. The valid value is 0 or 1.</li></ul> |

**Command Default** A cable interface line card evaluation license is disabled by default.

**Command Modes** Global configuration (config)

|                 |                |                                                                                    |
|-----------------|----------------|------------------------------------------------------------------------------------|
| Command History | <b>Release</b> | <b>Modification</b>                                                                |
|                 | 12.2(33)SCE    | This command was introduced.                                                       |
|                 | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** Evaluation licenses are temporary and used to evaluate a feature set on a new line card. Ensure that an equivalent permanent license is installed on the Cisco CMTS before the evaluation license expires to avoid any service disruptions.

To obtain evaluation licenses from the Cisco licensing portal, go to:  
<https://tools.cisco.com/SWIFT/LicensingUI/demoPage>

## Examples

The following example shows how to disable both downstream and upstream evaluation licenses for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation disable all subslot 5/0
```

The following example shows how to disable a downstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
```

**license feature evaluation disable**

```
Router(config)# license feature evaluation disable DS_License subslot 6/0
```

The following example shows how to disable an upstream evaluation license for a cable interface line card on the Cisco uBR10012 router:

```
Router# configure terminal
Router(config)# license feature evaluation disable US_License subslot 6/1
```

# linecard

To define the encryption type of a linecard, use the **linecard** command in the encryption configuration mode. To remove the configuration, use the **no** form of this command.

**linecard** *slot / bay*

**ca-system** {**pme scrambler** *dvs042* | **powerkey scrambler** *des* | **powerkey scrambler** *dvb-csa* | **dvb scrambler** *dvb-csa* | **dualcrypt scrambler** *dvb-csa*}

**no linecard** *slot / bay*

**ca-system** {**pme scrambler** *dvs042* | **powerkey scrambler** *des* | **powerkey scrambler** *dvb-csa* | **dvb scrambler** *dvb-csa* | **dualcrypt scrambler** *dvb-csa*}

## Syntax Description

|                                                       |                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot / bay</i>                                     | <ul style="list-style-type: none"> <li>• <i>slot</i>—Specifies the slot number. The valid range is from 0 to 9.</li> <li>• <i>bay</i>—Specifies the bay number. The valid value is 0.</li> </ul>                                                                                                                            |
| <b>ca-system</b>                                      | Specifies the encryption type of the virtual carrier group. <ul style="list-style-type: none"> <li>• <i>pme</i>—Sets to privacy mode encryption.</li> <li>• <i>powerkey</i>—Sets to powerkey encryption.</li> <li>• <i>dvb</i>—Sets to DVB encryption.</li> <li>• <i>dualcrypt</i>—Sets to Dualcrypt encryption.</li> </ul> |
| <b>pme scrambler</b> <i>dvs042</i>                    | Specifies the scrambler algorithm for privacy mode encryption.                                                                                                                                                                                                                                                              |
| <b>powerkey scrambler</b> <i>des</i>   <i>dvb-csa</i> | Specifies the scrambler algorithm for powerkey encryption.                                                                                                                                                                                                                                                                  |
| <b>dvb scrambler</b> <i>dvb-csa</i>                   | Specifies the scrambler algorithm for DVB encryption.                                                                                                                                                                                                                                                                       |
| <b>dualcrypt scrambler</b> <i>dvb-csa</i>             | Specifies the scrambler algorithm for DualCrypt encryption.                                                                                                                                                                                                                                                                 |

## Command Default

None.

## Command Modes

Encryption configuration (config-video-encrypt)

## Command History

| Release                     | Modification                                                                                                  |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| IOS-XE 3.18.0S              | This command is introduced on the Cisco cBR Series Converged Broadband Routers.                               |
| Cisco IOS XE Everest 16.5.1 | This command was updated to support DualCrypt encryption on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command defines the encryption type of a linecard.

## Examples

The following example shows how to configure the encryption for the linecard:

```

Router# configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 7/0 ca-system powerkey scrambler des

```

The following example shows how to configure the Dualcrypt encryption mode:

```

Router(config)#cable video
Router(config-video)#mgmt-intf VirtualPortGroup 0
Router(config-video)#encryption
Router(config-video-encrypt)#linecard 8/0 ca-system dualcrypt scrambler dvb-csa

```

|------------------------------|---------------------------------------------------------------|
| <b>encrypt</b>               | Enables encryption on a virtual carrier group.                |
| <b>rf-channel</b>            | Specifies the virtual RF channels in a virtual carrier group. |
| <b>virtual-edge-input-ip</b> | Configures a virtual edge input.                              |
| <b>virtual-carrier-group</b> | Defines a virtual carrier group.                              |

# linecard-group (redundancy)

To configure the redundancy group, use the **linecard-group** command in redundancy configuration mode. To remove the configuration, use the **no** form of this command.

**linecard-group** *group-id* **internal-switch**  
**no linecard-group** *group-id* **internal-switch**

## Syntax Description

|                        |                                                                                 |
|------------------------|---------------------------------------------------------------------------------|
| <i>group-id</i>        | The line card group identifier. The valid value is 0 on the Cisco cBR-8 Router. |
| <b>internal-switch</b> | Sets the redundancy type to internal switch.                                    |

## Command Default

None.

## Command Modes

Redundancy configuration (config-red)

## Command History

| Release                | Modification                                                                     |
|------------------------|----------------------------------------------------------------------------------|
| IOS-XE Release 3.16.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Line card group members must be removed before removing the redundancy group configuration.

## Examples

The following example shows how to configure the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)#
```

| <b>description</b>              | Adds a description to the line card group.                             |
| <b>member slot</b>              | Adds a slot to the line card redundancy group.                         |
| <b>redundancy</b>               | Configures line card redundancy.                                       |
| <b>show redundancy linecard</b> | Displays information about a redundant line card or a line card group. |

# listening-port

To configure the listening TCP port, use the **listening-port** command in the DVB scrambling EIS configuration mode. To void the listening TCP port configuration, use the **no** form of this command.

**listening-port** *port*  
**no listening-port** *port*

|             |                                   |
|-------------|-----------------------------------|
| <i>port</i> | Specifies the listening TCP port. |
|-------------|-----------------------------------|

**Command Default** None

**Command Modes** DVB scrambling EIS configuration mode (config-video-encrypt-dvb-eis)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following is an example of how to configure the listening TCP port:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#listening-port 8890
```

**Related Commands**

|----------------------|------------------------------------------------------------|
| <b>cp-override</b>   | Overrules and specifies the crypto period duration.        |
| <b>overwrite-scg</b> | Enables Scrambling Control Group (SCG) overwrite.          |
| <b>eis</b>           | Enters the Event Information Scheduler configuration mode. |

# logging cmts ipc-cable

To enable debug logging for the cable inter-processor communication (IPC) software, use the **logging cmts ipc-cable** command from the global configuration mode. To disable logging of these messages, use the **no** form of the command.

**Note** Use this command for debugging purpose only.

## logging cmts ipc-cable log-level

[{*alertscriticaldebuggingemergencieserrorsinformationalnotificationswarnings*}]

## no logging cmts ipc-cable log-level

[{*alertscriticaldebuggingemergencieserrorsinformationalnotificationswarnings*}]

### Syntax Description

|                            |                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>log-level</b>           | Configures the log severity level. Logs with severity equal to or higher than the specified log-level are logged in log buffer.                         |
| <i>level=emergencies</i>   | Emergency severity level indicates system is unusable. The default severity level for emergencies syslog messages is 0.                                 |
| <i>level=alerts</i>        | Alerts severity level indicates that immediate action is needed. The default severity level for alerts syslog messages is 1.                            |
| <i>level=critical</i>      | Critical severity level indicates the critical condition of the system. The default severity level for critical syslog messages is 2.                   |
| <i>level=errors</i>        | Errors severity level indicates the error conditions. The default severity level for errors syslog messages is 3.                                       |
| <i>level=warnings</i>      | Warning severity level warns the network administrator. The default severity level for warnings syslog messages is 4.                                   |
| <i>level=notifications</i> | Notification severity level indicates normal but significant condition of the system. The default severity level for notification syslog messages is 5. |
| <i>level=informational</i> | Informational severity level provides additional information about the system. The default severity level for informational syslog messages is 6.       |
| <i>level=debugging</i>     | Debugging severity level provides debugging messages. The default severity level for debugging syslog messages is 7.                                    |

### Command Default

By default, the log-level is set to 'errors'.

### Command Modes

Global configuration (config)

### Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCF | This command was introduced. |

### Usage Guidelines

Each cable IPC debug log has a severity level. The **logging cmts ipc-cable** command allows you to selectively enable cable IPC debug logs based on the log severities. Each debug log has a debug-enable flag that is set by the **debug cmts ipc-cable** command in Privileged EXEC mode. A debug log is recorded only if its severity is equal to or higher than the configured log-level, and if its debug enable flag is set.

### Examples

The following example shows how to enable all the cable IPC debug logs:

```
Router(config)# logging cmts ipc-cable log-level debugging
```

The following example shows how to disable debug logging for the cable IPC:

```
Router(config)# no logging cmts ipc-cable log-level debugging
```

### Related Commands

| Command                     | Description                                                     |
|-----------------------------|-----------------------------------------------------------------|
| <b>debug cmts ipc-cable</b> | Sets the debug-enable flag for the cable IPC debug logs.        |
| <b>show cmts ipc-cable</b>  | Displays statistics of all IPC messages on a Cisco CMTS router. |

# logging cmts sea

To enable the logging of syslog messages to System Event Archive (SEA), use the **logging cmts sea** command from global configuration mode. To disable logging of syslog messages to SEA, use the **no** form of the command.

**logging cmts sea**

**no logging cmts sea**

## Syntax Description

|                                                            |                                                                                                                                                                                                                                  |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>syslog-level</b> <i>level</i>                           | (Optional) Configures the level of syslog messages inclusive of and above the specified level which will be stored in the SEA log file.                                                                                          |
| Possible values for level are:<br><i>level=emergencies</i> | Emergency security level indicates system is unusable. The default severity level for emergency syslog messages is 0.                                                                                                            |
| <i>level=alerts</i>                                        | Alerts severity level indicates that immediate action is needed. The default severity level for alerts syslog messages is 1.                                                                                                     |
| <i>level=critical</i>                                      | Critical severity level indicates the critical condition of the system. The default severity level for critical syslog messages is 2.                                                                                            |
| <i>level=errors</i>                                        | Errors severity level indicates the error conditions. The default severity level for errors syslog messages is 3.                                                                                                                |
| <i>level=warnings</i>                                      | Warning severity level warns the network administrator. The severity level for warning syslog messages is 4.                                                                                                                     |
| <i>level=notifications</i>                                 | Notification severity level indicates normal but significant condition of the system. By default severity level for syslog messages is configured as 'normal'. The default severity level for notification syslog messages is 5. |
| <i>level=informational</i>                                 | Informational severity level provides additional information about the system. The default severity level for informational syslog messages is 6.                                                                                |
| <i>level=debugging</i>                                     | Debugging severity level provides debugging messages. The default severity level for debugging syslog messages is 7.                                                                                                             |

## Command Default

By default, storing of syslog messages to SEA log file is enabled, with the severity-level of syslog messages being set to 'notification'.

## Command Modes

Global configuration (config)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                       |
| IOS-XE 3.15.OS | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

---

**Usage Guidelines**

Use the **logging cmts sea** command is used to enable the logging of syslog messages to SEA log file. To change the severity-level of syslog messages inclusive of and above the level to be stored in SEA log file, specify the command **logging cmts sea [syslog-level *level*]**.

---

**Examples**

The following example shows how to enable logging of syslog messages to SEA log file on the Cisco uBR10012 router:

```
Router(config)# logging cmts sea
```

The following example shows how to disable logging of syslog messages to SEA log file on the Cisco uBR10012 router:

```
Router(config)# no logging cmts sea
```

The following example shows how to change the severity-level of syslog messages inclusive of and above the level being stored in the SEA log file:

```
Router(config)# logging cmts sea syslog-level warning
```

---

**Related Commands**

|-----------------------------|--------------------------------------------------------|
| <b>clear logging system</b> | Clears the event records stored in the SEA.            |
| <b>copy logging system</b>  | Copies the archived system events to another location. |
| <b>logging system</b>       | Enables or disables the SEA logging system.            |

# logical-edge-device

To define a logical edge device, use the **logical-edge-device** command in video configuration mode. To delete a logical edge device, use the **no** form of this command.

**logical-edge-device** *name* [**id** *id*]  
**no logical-edge-device** *name* [**id** *id*]

## Syntax Description

|                                        |                                               |
|----------------------------------------|-----------------------------------------------|
| <b>logical-edge-device</b> <i>name</i> | Specifies the logical edge device name.       |
| <b>id</b> <i>id</i>                    | Specifies the logical edge device identifier. |

## Command Default

None.

## Command Modes

Video configuration (config-video)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command defines a logical edge device.

## Examples

The following example shows how to define a logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
```

|---------------------------------------------|---------------------------------------------------------|
| <b>protocol</b>                             | Specifies the protocol used in the logical edge device. |
| <b>show cable video logical-edge-device</b> | Displays the logical edge device information.           |

# load-interval

To change the length of time for which data is used to compute load statistics, use the **load-interval** command in MAC domain profile configuration mode, wideband-cable interface profile configuration mode, or downstream profile configuration mode. To void the configuration, use the **no** form of this command.

**load-interval** *seconds*  
**no low-latency** *seconds*

**Command Default**      None.

**Command Modes**

MAC domain profile configuration (config-profile-md)

Wideband-cable interface profile configuration (config-profile-wb)

Downstream profile configuration (config-profile-ds)

| Command History | Release                         | Modification                                                                                                                    |
|-----------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
|                 | Cisco IOS XE Fuji 16.7.1        | This command was introduced on the Cisco cBR Series Converged Broadband Routers.                                                |
|                 | Cisco IOS XE Gibraltar 16.10.1c | This command was modified to support downstream profile configuration mode on the Cisco cBR Series Converged Broadband Routers. |

**Examples**

The following example shows how to set load interval:

```
Router# configure terminal
Router(config)# cable profile mac-domain MD
Router(config-profile-md)# load-interval 30
```

# low-latency

To set low latency VCG, use the **low-latency** command in virtual carrier group configuration mode. To disable low latency VCG, use the **no low-latency** command.

**low-latency**  
**no low-latency**

## Command Default

None.

## Command Modes

Virtual carrier group configuration (config-video-vcg)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to set low latency VCG:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# low-latency
```

| <b>show platform software iomd</b> | Verifies the MAC filtering status. |

# mac-address

To define the MAC address for a logical edge device, use the **mac-address** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

**mac-address** *mac-address*  
**no mac-address** *mac-address*

## Syntax Description

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <i>mac-address</i> | Specifies the MAC address for a logical edge device. |
|--------------------|------------------------------------------------------|

## Command Default

None

## Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Each logical edge device requires a unique MAC address. MAC address is required only when you configure the logical edge device with GQI protocol.

### Tip

Use the following command to get the chassis MAC address:

**show diag all eeprom detail | include MAC**

```
Chassis MAC Address : 54a2.120e.3000
MAC Address block size : 1024
```

Increment the least significant digit of the Chassis MAC address to give a unique identifier (mac-address) for each logical edge device. Example: 54a2.120e.3001.

The MAC address for a logical edge device should be unique with respect to the GQI server and it should not relate to a real MAC address.

## Examples

The following example shows how to define the MAC address for a logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#logical-edge-device vod id 1
Router#(config-video-led)protocol gqi
Router#(config-video-led-protocol)mac-address 0800.270e.25b8
```

| <b>show cable video gqi connections</b>          | Displays the GQI connection information of the logical edge device with the Session Resource Manager. |
| <b>show diag all eeprom detail   include MAC</b> | Displays the chassis MAC address information.                                                         |

## mgmt-intf virtualportgroup

To configure the cable video management interface, use the **mgmt-intf virtualportgroup** command in the video configuration mode. To delete the management interface created, use the **no** form of the command.

**mgmt-intf virtualportgroup** *number*  
**no mgmt-intf virtualportgroup** *number*

| <b>Syntax Description</b>    | <b>VirtualPortGroup</b> <i>number</i> Defines the specified Virtual Port Group as the management interface. Valid range is 0 to 31.                                                                  |         |              |                              |                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|----------------------------------------------------------------------------------|
| <b>Command Default</b>       | None.                                                                                                                                                                                                |         |              |                              |                                                                                  |
| <b>Command Modes</b>         | Video configuration mode (config-video)                                                                                                                                                              |         |              |                              |                                                                                  |
| <b>Command History</b>       | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS-XE Release 3.18.0S</td><td>This command was introduced on the Cisco cBR Series Converged Broadband Routers.</td></tr></table> | Release | Modification | Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |
| Release                      | Modification                                                                                                                                                                                         |         |              |                              |                                                                                  |
| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers.                                                                                                                     |         |              |                              |                                                                                  |

**Usage Guidelines** This command is used to configure the cable video management interface.

The following example shows how to change the default ONID number:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)#mgmt-intf VirtualPortGroup0
```

# main-cpu

To enter main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules or Supervisor cards, use the **main-cpu** command in redundancy configuration mode.

## main-cpu

### Syntax Description

This command has no keywords or arguments.

### Command Default

No default behavior or values

### Command Modes

Redundancy configuration (config-r)

### Cisco RF Gateway 10

Redundancy configuration (config-red)

### Command History

| Release        | Modification                                                                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------|
| 12.2(4)XF      | This command was introduced for the Cisco uBR10012 router.                                                    |
| 12.2(11)BC3    | Support for the <b>switchover timeout</b> command was added.                                                  |
| 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                    |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                               |
| 12.2(44)SQ     | This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added. |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                             |

### Usage Guidelines

When you enter main-CPU redundancy configuration mode, the prompt changes to the following:

```
Router(config-r-mc) #
```

After you enter main-CPU redundancy configuration mode, you can use the **auto-sync** command to specify which files are synchronized between the active and standby PRE1 modules or Supervisor cards. In Cisco IOS Release 12.2(11)BC3 and later releases, you can also use the **switchover timeout** command to specify the amount of time that the standby PRE1 module should wait when it first detects that the active PRE1 module is not active and when it initiates a switchover and becomes the active PRE1 module.

To leave main-CPU redundancy configuration mode and to return to redundancy configuration mode, use the **exit** command.

### Examples

The following example shows how to enter main-CPU redundancy mode and the commands that are available there:

```

Router# config t

Router(config)# redundancy

Router(config-r)# main-cpu

Router(config-r-mc)# ?

Main Cpu redundancy configuration commands:
 auto-sync Sync elements
 exit Exit from main-cpu configuration mode
 no Negate a command or set its defaults
 switchover Configuration of switchover
Router(config-r-mc)#

```

### Cisco RF Gateway 10

The following example shows how to enter main-CPU redundancy mode, and its associated commands:

```

Router# configure terminal

Router(config)# redundancy

Router(config-red)# main-cpu

Router(config-r-mc)# ?

Main CPU redundancy configuration commands:
 auto-sync Sync elements
 default Set a command to its defaults
 exit Exit from main-cpu configuration mode
 no Negate a command or set its defaults

```

#### Related Commands

| Command                   | Description                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------|
| <b>associate slot</b>     | Logically associate slots for APS processor redundancy                                                   |
| <b>auto-sync</b>          | Configures which files are synchronized between the active and standby PRE1 modules or Supervisor cards. |
| <b>redundancy</b>         | Enters redundancy configuration mode.                                                                    |
| <b>switchover timeout</b> | Configures the switchover timeout period of the PRE1 module.                                             |

# maintenance-mode

To configure the PRE1 modules on the router for maintenance mode, use the **maintenance-mode** command in redundancy configuration mode. To return to normal operations, use the **no** form of this command.

**maintenance-mode**  
**no maintenance-mode**

**Syntax Description** This command has no keywords or arguments.

**Command Default** Normal operations (**no maintenance-mode**)

**Command Modes**  
Redundancy configuration

| Command History | Release        | Modification                                                                       |
|-----------------|----------------|------------------------------------------------------------------------------------|
|                 | 12.2(4)XF      | This command was introduced for the Cisco uBR10012 router.                         |
|                 | IOS-XE 3.15.OS | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** When the Cisco uBR10012 router is configured with redundant PRE1 modules, the active PRE1 module automatically synchronizes the configuration, network state information, and other information with the standby PRE1 module, so that if a switchover occurs, the standby module can restore normal operations quickly. You can use the **maintenance-mode** command to disable this automatic synchronization of the PRE1 modules, and to disable the reporting of any faults on the standby module to the active module.

**Note** The **maintenance-mode** command disables the ability of the Cisco uBR10012 router to switchover PRE1 modules and should be used only while upgrading the router or troubleshooting network problems.

## Examples

The following example shows how to disable the automatic PRE1 module synchronization on the Cisco uBR10012 router and enter maintenance mode:

```
Router# config t
Router(config)# redundancy
Router(config-r)# maintenance-mode
Router(config-r)# exit
Router(config)#
```

The following example shows how to leave maintenance mode and return to normal operations, which includes the automatic synchronization of the PRE1 modules:

```
Router# config t
Router(config)# redundancy
```

```
Router(config-r)# no maintenance-mode
Router(config-r)# exit
Router(config)#
```

# match

To configure the matching option for the DHCP IPv4 profile, use the **match** command in DHCP IPv4 profile configuration mode. To void the configuration, use the **no** form of this command.

**match option** { **43 suboption** *type* | **hex** *value* || **60 hex** *value* }  
**no match option** { **43 suboption** *type* | **hex** *value* || **60 hex** *value* }

## Syntax Description

|                              |                                            |
|------------------------------|--------------------------------------------|
| <b>option</b>                | Specifies the matching option.             |
| <b>suboption</b> <i>type</i> | Specifies the suboption for the option 43. |
| <b>hex</b> <i>value</i>      | Specifies the HEX pattern                  |

## Command Default

None.

## Command Modes

DHCP IPv4 profile configuration (config-dhcpv4-profile)

| Release            | Modification                                                                     |
|--------------------|----------------------------------------------------------------------------------|
| IOS XE Fuji 16.8.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to configure the matching option:

```
Router# configure terminal
Router(config)# cable dhcp ipv4 profile DEVICE1
Router(config-dhcpv4-profile)# match option 43 suboption 100 hex 123456
Router(config-dhcpv4-profile)# match option 60 hex *efef*
```

## Related Commands

| Command                        | Description                                      |
|--------------------------------|--------------------------------------------------|
| <b>cable dhcp ipv4 profile</b> | Enters the IPv4 DHCP profile configuration mode. |

## match rule

To configure the match rule, rule priority and related action in the selected cable multicast authorization profile, use the **match rule** command in interface configuration mode. To disable a cable multicast authorization profile match, use the **no** form of this command.

**match rule** [{*ipv4**ipv6*}] [*source-prefix*] [*group-prefix*] **priority** [*priority-value*] [{*permit**deny*}]  
**no match rule** [{*ipv4**ipv6*}] [*source-prefix*] [*group-prefix*] **priority** [*priority-value*] [{*permit**deny*}]

| Syntax Description                              |                                                                              |  |
|-------------------------------------------------|------------------------------------------------------------------------------|--|
| <b>match rule</b> [ <i>ipv4</i> / <i>ipv6</i> ] | Specifies the matching source rule.                                          |  |
|                                                 | Though CLI allows IPv6 to be configured, only IPv4 is supported in the CMTS. |  |
| <i>source-prefix</i>                            | (Optional) Specifies the matching source address prefix.                     |  |
|                                                 | Example: 223.1.1.1/16                                                        |  |
| <i>group-prefix</i>                             | (Optional) Specifies the matching group address prefix.                      |  |
|                                                 | Example: 223.1.1.1/16                                                        |  |
| <b>priority</b> [ <i>priority-value</i> ]       | Specifies the priority of the cable multicast authorization profile.         |  |
|                                                 | Priority value range is: 0-255.                                              |  |
| <i>permit</i>                                   | The argument <i>permit</i> allows specified packets to be forwarded.         |  |
| <i>deny</i>                                     | The argument <i>deny</i> allows to specified packets to be rejected.         |  |

**Command Default** Cable multicast authorization is disabled.

**Command Modes** Interface configuration—cable interface only (config-mauth)

| Command History | Release        | Modification                                                                       |
|-----------------|----------------|------------------------------------------------------------------------------------|
|                 | 12.2(33)SCB    | This command was introduced.                                                       |
|                 | IOS-XE 3.15.OS | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the cable multicast authorization profile match to be used.

**Examples** The following example shows how to use the selected multicast authorization profile match:

```
Router(config-mauth)# match rule rule1
```

**Related Commands**

## max-carrier

To specify the maximum number of carriers, use the max-carrier command in the controller sub configuration mode.

**max-carrier** *value*

| <b>Syntax Description</b> | <i>value</i> Value for the maximum number of carriers. Valid range is from 0 to 128.                                               |         |              |                |                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|----------------|------------------------------|
| <b>Command Default</b>    | The default value is 128.                                                                                                          |         |              |                |                              |
| <b>Command Modes</b>      | Controller sub configuration mode (config-controller).                                                                             |         |              |                |                              |

| <b>Usage Guidelines</b>   | This command is used to specify the maximum number of carriers on an RF port.                                                      |         |              |                |                              |

```
router#configure terminal
router (config)#controller Integrated-Cable 3/0/0
router (config-controller)#max-carrier 96
router (config-controller)#end
router #show controllers Integrated-Cable 3/0/0 rf-port
```

```
Admin: UP MaxCarrier: 96 BasePower: 32 dBmV Mode: normal
```

## max-comp-time

To configure the maximum time needed by ECMG to compute an ECM, use the **max-comp-time** command in the DVB scrambling ECMG override configuration mode. To void the maximum time configuration, use the **no** form of this command.

**max-comp-time** *time*

**no max-comp-time**

|                                  |                                                      |
|----------------------------------|------------------------------------------------------|
| <b>max-comp-time</b> <i>time</i> | Specifies the maximum computing time in millisecond. |
|----------------------------------|------------------------------------------------------|

**Command Default** None

**Command Modes** DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the maximum time needed by ECMG to compute an ECM in milliseconds. The valid range is from 0 to 60000.

The following is an example of how to configure the maximum computing time:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#override
Router(config-video-encrypt-dvb-ecmg-override)#max-comp-time 10000
```

### Related Commands

|------------------------|-----------------------------------------------------------------------------------------------|
| <b>override</b>        | Enters DVB scrambling configuration mode.                                                     |
| <b>ac-start-delay</b>  | Specifies the time between start of first CP after a change in AC and start of ECM broadcast. |
| <b>ac-stop-delay</b>   | Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.  |
| <b>max-streams</b>     | Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel. |
| <b>min-cp-duration</b> | Specifies the minimum crypto period.                                                          |

| Command                  | Description                                                    |
|--------------------------|----------------------------------------------------------------|
| <b>rep-period</b>        | Specifies the time between two ECM packets at the output.      |
| <b>start-delay</b>       | Specifies the delay between the start of CP and ECM broadcast. |
| <b>stop-delay</b>        | Specifies the delay between the end of CP and ECM broadcast.   |
| <b>trans-start-delay</b> | Specifies the transition start delay.                          |
| <b>trans-stop-delay</b>  | Specifies the transition stop delay.                           |

# max-ofdm-spectrum

To specify the maximum spectrum used by all the OFDM channels on the given port, use the **max-ofdm-spectrum** command in controller configuration mode. To undo the maximum spectrum assignment, use **no** form of this command.

**max-ofdm-spectrum** *value*

**no max-ofdm-spectrum**

## Syntax Description

|              |                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------|
| <i>value</i> | Maximum OFDM spectrum value (Hz), in 1 MHz increments. Valid range is from 24000000 to 1170000000. |
|--------------|----------------------------------------------------------------------------------------------------|

## Command Default

None.

## Command Modes

Controller configuration (config-controller)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the maximum spectrum used by all the OFDM channels on the given port.

## Examples

The following example shows how to specify the maximum spectrum used by all the OFDM channels on the given port:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# max-ofdm-spectrum 24000000
```

## max-streams

To configure the maximum number of simultaneous open streams supported by the ECMG on a channel, use the **max-streams** command in the DVB scrambling ECMG override configuration mode. To void the maximum number configuration, use the **no** form of this command.

**max-streams** *number*

**no max-streams**

|                                  |                                                                                               |
|----------------------------------|-----------------------------------------------------------------------------------------------|
| <b>max-streams</b> <i>number</i> | Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel. |
|----------------------------------|-----------------------------------------------------------------------------------------------|

### Command Default

None

### Command Modes

DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command specifies the maximum number of simultaneous open streams supported by the ECMG on a channel. The valid range is from 0 to 30000.

The following is an example of how to configure the maximum number of simultaneous open streams supported by the ECMG on a channel:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#override
Router(config-video-encrypt-dvb-ecmg-override)#max-streams 10000
```

| <b>trans-stop-delay</b>  | Specifies the transition stop delay.                           |

## member slot

To add a line card as a primary or secondary card in a redundancy group, use the **member slot** command in line card redundancy configuration sub-mode. To remove the configuration, use the **no** form of this command.

**member slot** *slot* { **primary** | **secondary** }  
**no member slot** *slot* { **primary** | **secondary** }

### Syntax Description

|                  |                                                                                              |
|------------------|----------------------------------------------------------------------------------------------|
| <i>slot</i>      | Slot number of the line card. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router. |
| <b>primary</b>   | Specifies the primary slot of the line card group.                                           |
| <b>secondary</b> | Specifies the secondary slot of the line card group.                                         |

### Command Default

None.

### Command Modes

Line card redundancy configuration (config-red-lc)

### Command History

| Release                | Modification                                                                     |
|------------------------|----------------------------------------------------------------------------------|
| IOS-XE Release 3.16.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

We can only add the secondary card (protect card) after which there should be at least one primary member in the group. You can add a single secondary card for multiple primary cards.

#### Note

You cannot remove the last primary member if there is secondary member in redundancy group. You should remove the secondary member first in such case. If the primary card is in Standby role, you must revert back to it before removing.

When a line card is added as secondary card, the line card will be reloaded automatically. On the Cisco cBR-8 router, slot 3 and 6 cannot be configured as secondary card. Only the line card with CBR-RF-PROT-PIC installed could be set as secondary card. In addition, only the line card with CBR-RF-PIC installed could be set as primary card.

The CBR-RF-PROT-PIC can only send RF signals to lower slot (with larger slot number). So the slot number of the secondary card must be the smallest one in the line card redundancy group.

It is recommended to install the PROT-PIC in slot 0 and make line card 0 as secondary. The RF signal can only be relayed from upper slot to lower slot by CBR-RF-PIC. So, do not install any RF blank PICs between the secondary and primary cards.

### Examples

The following example shows how to add the line card as a primary card in the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
```

```
Router(config-red-lc)# member slot 1 primary
```

The following example shows how to add the line card as a primary card in the redundancy group:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# member slot 0 secondary
```

#### Related Commands

| <b>class</b>                          | Configures redundancy class on the line card.                          |
| <b>description</b>                    | Adds a description to the line card group.                             |
| <b>linecard-group internal-switch</b> | Creates a line card group for the line card.                           |
| <b>redundancy</b>                     | Configures line card redundancy.                                       |
| <b>show redundancy linecard</b>       | Displays information about a redundant line card or a line card group. |

# method

To select the method the CMTS uses to determine the load, use the **method** command in the config-lb-group configuration mode. To reset the method, use the **no** form of this command.

## Cisco uBR Series Router

**method** {modems | service-flows | utilization} **us-method** {modems | service-flows | utilization}  
**no method**

## Cisco cBR Series Router

**method** {modems | service-flows | utilization} **us-method** {modems | utilization}  
**no method**

| Syntax Description | modems                                                  | Specifies the load balancing method for the number of modems on the CMTS.                                                                                                                       |
|--------------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | service-flows                                           | Specifies the load balancing method for the number of service flows on the CMTS.                                                                                                                |
|                    | utilization                                             | Specifies the load balancing method for the interface utilization on the CMTS.                                                                                                                  |
|                    | <b>us-method</b> {modems   service-flows   utilization} | Specifies the load balancing method for upstream (US) channels on modems, service-flows, or utilization.<br><br><b>Note</b> <b>service-flows</b> method is not supported in Cisco cBR-8 router. |

**Command Default**        No default behavior or values.

**Command Modes**        DOCSIS load balancing group mode (config-lb-group)

| Command History | Release        | Modification                                                                                                                    |
|-----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.2(33)SCC    | This command was introduced.                                                                                                    |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>service-flows</b> keyword was removed. |

**Usage Guidelines**        The upstream channel uses the same method as the downstream channel. Change the method of the upstream channel using the **method** command.

**Examples**                The following example shows how to select the method the CMTS uses to determine the load, using the **method** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# method modems us-method service-flows
```

```
Router(config-lb-group) #
```

| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# mgmt-ip

To define the local management IP address for a logical edge device, use the **mgmt-ip** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

**Note** The **mgmt-ip** address should be in the same subnet as the IP address of interface VirtualPortGroup.

**mgmt-ip** *ip-address*  
**no mgmt-ip** *ip-address*

## Syntax Description

|                   |                                            |
|-------------------|--------------------------------------------|
| <i>ip-address</i> | Specifies the local management IP address. |
|-------------------|--------------------------------------------|

## Command Default

None

## Command Modes

Logical edge device protocol configuration (config-video-led-protocol)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command defines the local management IP address for a logical edge device.

## Examples

The following example shows how to define the local management IP address for a logical edge device:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)#logical-edge-device vod id 1
Router#(config-video-led)protocol gqi
Router#(config-video-led-protocol)mgmt-ip 172.16.0.1
```

| <b>show cable video gqi connections</b>          | Displays the GQI connection information of the logical edge device with the Session Resource Manager. |
| <b>show diag all eeprom detail   include MAC</b> | Displays the chassis MAC address information.                                                         |

## mgmt-ip (DVB)

To configure the management IP for EIS/Broadcast ECMG, use the **mgmt-ip** command in the DVB scrambling configuration mode. To void the management IP configuration, use the **no** form of this command.

**mgmt-ip** *ip\_address*  
**no mgmt-ip**

|                   |                                                                    |
|-------------------|--------------------------------------------------------------------|
| <i>ip_address</i> | Specifies the management IP for EIS and Broadcast ECMG Connection. |
|-------------------|--------------------------------------------------------------------|

**Command Default** None

**Command Modes** DVB scrambling configuration mode (config-video-encrypt-dvb)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following is an example of how to configure the management IP for EIS/Broadcast ECMG:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#mgmt-ip 1.24.2.10
```

# microcode (uBR10012)

To reload the microcode software images on a Parallel eXpress Forwarding (PXF) processor or on all line cards that support downloadable microcode, use the **microcode** command in global configuration mode.

**microcode** {**pxf** *filename* | **reload**}

## Syntax Description

|                 |                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| <b>pxf</b>      | Reloads the microcode for the PXF processors on the Performance Routing Engine (PRE1) module.                        |
| <i>filename</i> | Specifies the microcode software image for the PXF processors by device name and filename.                           |
| <b>reload</b>   | Reloads the microcode for all PRE1 modules and other line cards that support downloadable microcode software images. |

## Command Default

None

## Command Modes

Global configuration (config)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(1)XF1     | This command was introduced for the Cisco uBR10012 router.                         |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

By default, the Cisco uBR10012 router automatically loads all required microcode on to the PXF processors and other line cards when it loads the Cisco IOS software image. Also, the PRE1 module automatically reloads the microcode on a card when certain faults occur, allowing the card to recover from the fault.

You can reload the microcode on the PRE1 module or on all line cards that support downloadable microcode by using the **microcode** command. Typically, this is not needed and should be done only upon the advice of Cisco TAC or field service engineers.

**Tip** You can also reload the microcode on the PXF processors or on all cards using the **microcode reload** command in privileged EXEC mode. In particular, use the **microcode reload** command to reload the PXF processors with the default microcode that was loaded along with the Cisco IOS software image.

## Examples

The following example shows how to reload the microcode on all PRE processors and line cards that support downloadable microcode:

```
Router# configure terminal
```

```
Router(config)# microcode reload
```

```
Reload microcode? [confirm] yes
```

```
00:49:41: Downloading Microcode: file=system:pxf/ubr10k-ucode.1.2.3,
version=1.1.0, description=Release Software created Wed 17-Jul-02 16:58
<<list of interfaces going down or coming up>>
```

```
00:49:42: !!pxf clients started, forwarding code operational!!
Router(config)#
```

The following example shows how to reload the microcode on the PXF processors on the PRE1 module, using a specific image that is stored in the Flash memory:

```
Router# configure terminal
```

```
Router(config)# microcode pxf flash:pxf/ubr10k-ucode.122.1.2.3
```

```
Reload microcode? [confirm] yes
```

```
1d04h: Downloading Microcode: file=flash:pxf/ubr10k-ucode.122.1.2.3, version=122.1.2.3,
description=Release Software created Thu 17-Oct-02 11:33
<<list of interfaces going down or coming up>>
1d04h: !!pxf clients started, forwarding code operational!!
Router(config)#
```

| <b>microcode reload</b>   | Reloads the microcode software images on one or all line cards that support downloadable microcode. |
| <b>show pxf microcode</b> | Displays display identifying information for the microcode being used on the PXF processors.        |

## microcode reload (uBR10012)

To reload the microcode software images on one or all line cards that support downloadable microcode, use the **microcode reload** command in privileged EXEC mode.

**microcode reload** {**all** | **pxf**} *device:* [*filename*]

### Syntax Description

|                                       |                                                                                                                                                                                                                     |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                            | Reloads the microcode for all Performance Routing Engine (PRE1) modules and other line cards that support downloadable microcode software images.                                                                   |
| <b>pxf</b>                            | Reloads the microcode for the Parallel eXpress Forwarding (PXF) processors on the PRE1 module.                                                                                                                      |
| <i>device:</i><br>[ <i>filename</i> ] | (Optional) Loads the PXF processors with the microcode software image that has the specific filename on the specific device. If no filename is specified, the first image found on the device is loaded by default. |

### Command Default

For **microcode reload pxf**, defaults to loading the microcode image that was originally loaded when the Cisco IOS software image was loaded.

### Command Modes

Privileged EXEC (#)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(1)XF1     | This command was introduced for the Cisco uBR10012 router.                         |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

By default, the Cisco uBR10012 router automatically loads all required microcode on to the PXF processors and other line cards when it loads the Cisco IOS software image. Also, the PRE1 module automatically reloads the microcode on a card when certain faults occur, allowing the card to recover from the fault.

You can reload the microcode on the PRE1 module or on all line cards that support downloadable microcode by using the **microcode reload** command. Typically, this is not needed and should be done only upon the advice of Cisco TAC or field service engineers.

**Tip** You can also reload the microcode on the PXF processors or on all cards using the **microcode** command in global configuration mode.

### Examples

The following example shows how to reload the microcode on all PRE processors and line cards that support downloadable microcode:

```
Router# microcode reload all
Reload microcode? [confirm] yes
```

```
00:49:41: Downloading Microcode: file=system:pxf/ubr10k-1-ucode.122.1.0, version=122.1.0,
```

```

description=Release Software created Wed 17-Jul-02 16:58
<<list of interfaces going down or coming up>>
00:49:42: !!pxf clients started, forwarding code operational!!
Router#

```

The following example shows a typical list of devices that you can use when loading microcode for the PXF processors. This list might vary, depending on whether a standby PRE1 module is installed and depending on the version of Cisco IOS software being used.

```

Router# microcode reload pxf ?

bootflash: location of microcode
disk0: location of microcode
disk1: location of microcode
flash: location of microcode
ftp: location of microcode
null: location of microcode
nvram: location of microcode
rcp: location of microcode
scp: location of microcode
sec-bootflash: location of microcode
sec-disk0: location of microcode
sec-disk1: location of microcode
sec-nvram: location of microcode
sec-slot0: location of microcode
sec-slot1: location of microcode
slot0: location of microcode
slot1: location of microcode
system: location of microcode
tftp: location of microcode
<cr>
Router#

```

The following example shows how to reload the microcode on the PXF processors on the PRE1 module, using a specific image that is stored in the Flash memory:

```

Router# microcode reload pxf flash:pxf/ubr10k-1-ucode.122.1.0.4

Reload microcode? [confirm] yes

3d00h: Downloading Microcode: file=flash:pxf/ubr10k-1-ucode.122.1.0.4, version=122.1.0.4,
description=Release Software created Thu 27-Jun-02 16:05
<<list of interfaces going down or coming up>>
3d00h: !!pxf clients started, forwarding code operational!!
Router#

```

## Related Commands

| <b>microcode</b>          | Reloads the microcode software images on one or all line cards that support downloadable microcode. |
| <b>show pxf microcode</b> | Displays display identifying information for the microcode being used on the PXF processors.        |

# min-cp-duration

To configure the minimum crypto period, use the **min-cp-duration** command in the DVB scrambling ECMG override configuration mode. To void the minimum crypto period configuration, use the **no** form of this command.

**min-cp-duration** *time*

**no min-cp-duration**

|                                    |                                                      |
|------------------------------------|------------------------------------------------------|
| <b>min-cp-duration</b> <i>time</i> | Specifies the minimum crypto period in milliseconds. |
|------------------------------------|------------------------------------------------------|

**Command Default** None

**Command Modes** DVB scrambling ECMG override configuration mode (config-video-encrypt-dvb-ecmg-override)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the minimum crypto period in milliseconds. The valid range is from 1000 to 3600000.

The following is an example of how to configure the minimum crypto period in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#override
Router(config-video-encrypt-dvb-ecmg-override)#min-cp-duration 10000
```

# modular-host subslot

To specify the modular-host line card that will be used for DOCSIS 3.0 downstream or downstream channel bonding operations, use the **modular-host subslot** command in controller configuration mode. To remove the modular-host line card used for DOCSIS 3.0 downstream or downstream channel bonding operations, use the **no** form of this command.

**modular-host subslot** *slot/subslot*  
**no modular-host subslot** *slot/subslot*

## Syntax Description

|                     |                                             |
|---------------------|---------------------------------------------|
| <i>slot/subslot</i> | The location of the modular-host line card. |
|---------------------|---------------------------------------------|

## Command Default

No modular-host line card is configured for DOCSIS 3.0 downstream or downstream channel bonding operations.

## Command Modes

Controller configuration (config-controller)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router.                         |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                    |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command specifies the modular-host line card for DOCSIS 3.0 downstream or downstream channel bonding operations. This applies to the cable interface line card (for example, the Cisco uBR10-MC5X20S-D line card) that is used for these operations. The Wideband SPA itself does not support DOCSIS 3.0 downstream channel bonding operations.

**Note** A maximum of 3 SPA controllers can be hosted on a single cable interface line card.

## Examples

The following example shows how to configure the modular-host line card for DOCSIS 3.0 downstream channel bonding operations for the Wideband SPA located in slot/subslot/bay 1/0/0:

```
Router(config)# controller modular-cable 1/0/0
```

```
Router(config-controller)# modular-host subslot 7/0
```

| <b>rf-channel cable downstream channel-id</b>         | Assigns a downstream channel ID to an RF channel.                              |

# modulation

To set the QAM modulation format for a specific QAM profile, use the **annex** command in QAM profile configuration mode.

**modulation** {256 | 64}

## Syntax Description

|                              |                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>modulation</b> {256   64} | Specifies the QAM modulation format: <ul style="list-style-type: none"><li>• <b>256</b>– 256-QAM modulation.</li><li>• <b>64</b>– 64-QAM modulation.</li></ul> |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

None

## Command Modes

QAM profile configuration (config-qam-prof)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to set the QAM modulation format for a specific QAM profile.

## Examples

The following example shows how to set the QAM modulation format for a specific QAM profile:

```
Router# configure terminal
Router(config)# cable downstream qam-profile 4
Router(config-qam-prof)# modulation 256
```

## Related Commands

| Command                             | Description                                            |
|-------------------------------------|--------------------------------------------------------|
| <b>cable downstream qam-profile</b> | Set the QAM profile for the cable interface line card. |
| <b>interleaver-depth</b>            | Set the interleaver-depth.                             |
| <b>annex</b>                        | Set the MPEG framing format.                           |
| <b>spectrum-inversion</b>           | Set the spectrum-inversion on or off.                  |
| <b>symbol-rate</b>                  | Set the symbol rate.                                   |

## monitoring-basics

To specify the type of monitoring for subscriber traffic management on a Cisco CMTS router, use the **monitoring-basics** command in enforce-rule configuration mode. To disable the selected monitoring, use the **no** form of this command.

**monitoring-basics** {**legacy** | **peak-offpeak**} {**docsis10** | **docsis11**}  
**no monitoring-basics** {**legacy** | **peak-offpeak**} {**docsis10** | **docsis11**}

### Syntax Description

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <b>legacy</b>       | Provides only one threshold and one monitoring duration.              |
| <b>peak-offpeak</b> | Allows the selection of two peak durations within a day.              |
| <b>docsis10</b>     | Specifies application of the enforce-rule to DOCSIS 1.0 cable modems. |
| <b>docsis11</b>     | Specifies application of the enforce-rule to DOCSIS 1.1 cable modems. |

### Command Default

The default for this command is **legacy** and **docsis10**.

### Command Modes

Enforce-rule configuration (enforce-rule)

### Command History

| Release        | Modification                                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| 12.3(9a)BC     | This command was introduced.                                                                                       |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                 |
| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                  |

### Usage Guidelines

Legacy monitoring (using the **legacy** keyword) occurs 24 hours a day, with no distinction between peak and offpeak hours. The available monitoring duration is between 10 minutes and 31 days.

Use the **peak-offpeak** keyword to set up monitoring duration and threshold for first peak, second peak, and offpeak monitoring. Each one can be different. After setting up first peak and second peak durations, the remaining hours are treated as offpeak. Monitoring happens during offpeak hours if the offpeak duration and threshold are defined. Monitoring duration is between 60 minutes and 23 hours.

### Examples

The following example shows configuration of peak-offpeak monitoring for DOCSIS 1.1 cable modems:

```
Router(enforce-rule)# monitoring-basics peak-offpeak docsis11
```

The following example shows configuration of legacy monitoring for DOCSIS 1.1 on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)#monitoring-basics legacy docsis11
```

**Related Commands**

| <b>Command</b>                           | <b>Description</b>                                                                                                                        |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable qos enforce-rule</b>            | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode. |
| <b>debug cable subscriber-monitoring</b> | Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.                                         |
| <b>duration</b>                          | Specifies the time period and sample rate to be used for monitoring subscribers.                                                          |
| <b>peak-time1</b>                        | Specifies peak and offpeak monitoring times.                                                                                              |
| <b>qos-profile registered</b>            | Specifies the registered QoS profile that should be used for this enforce-rule.                                                           |
| <b>qos-profile enforced</b>              | Specifies a QoS profile that should be enforced when users violate the registered QoS profiles.                                           |
| <b>service-class (enforce-rule)</b>      | Identifies a particular service class for cable modem monitoring in an enforce-rule.                                                      |
| <b>show cable qos enforce-rule</b>       | Displays the QoS enforce-rules that are currently defined.                                                                                |
| <b>show cable subscriber-usage</b>       | Displays subscribers who are violating their registered QoS profiles.                                                                     |

# monitoring-duration

**Note** Effective with Cisco IOS Release 12.3(9a)BC, the **monitoring-duration** command is replaced by the **duration** command.

To specify the time period and sample rate to be used for monitoring subscribers, use the **monitoring-duration** command in enforce-rule configuration mode. To reset an enforce-rule to its default values, use the **no** form of this command.

**monitoring-duration** *minutes* [**sample-rate** *minutes*]  
**no** **monitoring-duration**

## Syntax Description

|                                   |                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------|
| <i>minutes</i>                    | Specifies the time (in minutes). The valid range is 10 to 10080, with a default of 360 (6 hours). |
| <b>sample-rate</b> <i>minutes</i> | (Optional) Rate of sampling, in minutes. The valid range is 1 to 30, with a default value of 15.  |

## Command Default

The **monitoring-duration** value defaults to 360 minutes (6 hours), and the **sample-rate** value defaults to 15 minutes.

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

| Release        | Modification                                                                                                                                                                                                                                                                         |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC1    | This command was introduced.                                                                                                                                                                                                                                                         |
| 12.2(15)BC2    | The minimum <b>sample-rate</b> was reduced to 1 minute. Also, the <b>sample-rate</b> is not allowed to be set to a value greater than the <b>monitoring-duration</b> period. If you attempt to do so, the command is ignored and both parameters remain set to their current values. |
| 12.3(9a)BC     | This command was replaced by the <b>duration</b> command.                                                                                                                                                                                                                            |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                   |

## Usage Guidelines

The **sample-rate** *minutes* must be less than or equal to the **monitoring-duration** *minutes* period.

When you enable an enforce-rule, the Cisco CMTS router periodically checks the bandwidth being used by subscribers, to determine whether any subscribers are consuming more bandwidth than that specified by their registered QoS profile. The Cisco CMTS router keeps track of the subscribers using a sliding window that begins at each sample-rate interval and continues for the monitoring-duration period.

For example, with the default sample-rate interval of 15 minutes and the default monitoring-duration window of 360 minutes, the Cisco CMTS router samples the bandwidth usage every 15 minutes and determines the total bytes transmitted at the end of each 360-minute period. Each sample-rate interval begins a new sliding window period for which the Cisco CMTS router keeps track of the total bytes transmitted.

**Note** The **sample-rate** interval must be less than or equal to the **monitoring-duration** period. If you attempt to set the sample-rate interval to a value greater than the monitor-duration period, the command is ignored and the parameters are unchanged.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by this enforce-rule.

For more information about the Subscriber Traffic Management feature and to see an illustration of a sample monitoring window, refer to the Subscriber Traffic Management for the Cisco CMTS Routers feature document on Cisco.com.

## Examples

The following example shows an enforce-rule being configured for a monitoring-duration period that is 20 minutes in length, with a sampling rate of every 10 minutes:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# monitoring-duration 20 sample-interval 10
```

The following example shows the error message that is displayed when the **sample-rate** interval is configured to be greater than the **monitoring-duration** period. In this situation, the command is ignored and the parameters remain unchanged.

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# monitoring-duration 20 sample-interval 30
```

```
Monitoring duration cannot be less than the Sampling interval -- so the values
would remain unchanged
```

## Related Commands

| Command                            | Description                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>activate-rule at-byte-count</b> | Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.                         |
| <b>cable qos enforce-rule</b>      | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode. |
| <b>enabled (enforce-rule)</b>      | Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.                                                |
| <b>penalty-period</b>              | Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.    |
| <b>qos-profile enforced</b>        | Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.                                         |
| <b>qos-profile registered</b>      | Specifies the registered QoS profile that should be used for this enforce-rule.                                                           |

| Command                            | Description                                                           |
|------------------------------------|-----------------------------------------------------------------------|
| <b>show cable qos enforce-rule</b> | Displays the QoS enforce-rules that are currently defined.            |
| <b>show cable subscriber-usage</b> | Displays subscribers who are violating their registered QoS profiles. |

# mute

To mute the port, use the **mute** command in the controller sub configuration mode. Use the **no** form of the command to unmute the port.

**[no] mute**

This command has no keywords or arguments.

|                        |                     |
|------------------------|---------------------|
| <b>Command Default</b> | Default is no mute. |
|------------------------|---------------------|

|                      |                                                        |

|-------------------------|-----------------|---------------------------------------------------|
|                         | <b>shutdown</b> | Disables or enables the interface on a line card. |

# multicast-label

To create a multicast label used for table-based session configuration when more than one multicast source [S, G] is used as backup for the sessions, use the **multicast-label** command in cable video configuration mode.

**multicast-label** *label* **group** *group-ip* **source** *source-ip* **source2** *source-ip* **source3** *source-ip* **source4** *source-ip*

## Syntax Description

|                                                                                                                                |                                                |
|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| <i>label</i>                                                                                                                   | Specifies the multicast label name.            |
| <b>group</b> <i>group-ip</i>                                                                                                   | Identifies the multicast group for the label.  |
| <b>source</b> <i>source-ip</i> <b>source2</b> <i>source-ip</i> <b>source3</b> <i>source-ip</i> <b>source4</b> <i>source-ip</i> | Specifies the multicast sources for the label. |

## Command Default

None

## Command Modes

Cable video configuration mode (config-video)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to configure a multicast label:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#multicast-label mlabel1 group 236.0.1.1 source 175.10.5.2 source2
175.10.6.20 source3 175.10.7.2
```

|--------------------------------------------|-----------------------------------------------|
| <b>cable downstream controller-profile</b> | Configures the downstream controller profile. |

# multicast-uplink

To set a TenGigabit Ethernet port for multicast traffic, use the **multicast-uplink** command in cable video configuration mode.

**multicast-uplink** *interface-name* [{**access-list** *access-list-name*}]

|                                            |                                                     |
|--------------------------------------------|-----------------------------------------------------|
| <i>interface-name</i>                      | Specifies the interface for multicast traffic.      |
| <b>access-list</b> <i>access-list-name</i> | Specifies the access list for the multicast uplink. |

## Command Default

None

## Command Modes

Cable video configuration mode (config-video)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to configure a multicast uplink:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#multicast-uplink TenGigabitEthernet4/1/2
```

The following example shows how to configure a multicast uplink with an access list:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#multicast-uplink Port-channel23 access-list all-multicasts
```

|-------------|----------------------------------------|
| cable video | Enters cable video configuration mode. |

## name

To specify the name of the CMTS tag, use the **name** command in the cmts-tag configuration mode. To remove the name, use the **no** form of this command.

**name** *tag-name*

**no name** *tag-name*

### Syntax Description

|                 |                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <i>tag-name</i> | Name of the CMTS tag. The configured name is added to the DOCSIS load balancing group and policies. |
|-----------------|-----------------------------------------------------------------------------------------------------|

### Command Default

No default behavior or values.

### Command Modes

CMTS tag mode (cmts-tag)

### Command History

| Release           | Modification                                                                      |
|-------------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC       | This command was introduced.                                                      |
| IOS-XE<br>3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows how to give name to a CMTS tag using the **name** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# name cisco
```

|                    | <b>ip</b>                                                                                                                                                                                                                                                                           | Configures the virtual ARP source IP address.                                    |
|                    | <b>source-id</b>                                                                                                                                                                                                                                                                    | Configures the source ID for virtual ARP.                                        |

# network

To configure the DHCP address pool with the specified *network-number* and subnet *mask*, which are the DHCP *yiaddr* field and Subnet Mask (DHCP option 1) field, use the **network** command in global configuration mode. To remove this configuration, use the **no** form of this command.

**network** *network-number* [*mask*]

**no network** *network-number* [*mask*]

## Syntax Description

|                       |                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>network-number</i> | The DHCP <i>yiaddr</i> field.                                                                                 |
| <i>mask</i>           | Subnet Mask (DHCP option 1). If you do not specify the <i>mask</i> value, it is supported to 255.255.255.255. |

## Command Default

DHCP settings are not configured by default.

## Command Modes

DHCP configuration

## Command History

| Release            | Modification                                                                             |
|--------------------|------------------------------------------------------------------------------------------|
| Release 12.2(4)BC1 | Supported on the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers. |
| IOS-XE 3.15.0S     | This command was implemented on the Cisco cBR Series Converged Broadband Routers.        |

## Usage Guidelines

This command requires that you first use the **dhcp ip dhcp pool name** command in global configuration mode to enter DHCP configuration mode.

**Note** To create an address pool with a single IP address, use the **host** command instead of **network**.

For additional information about DHCP support on the Cisco CMTS, refer to the following document on Cisco.com:

- *DHCP and ToD Servers on the Cisco CMTS*

## Examples

The following example illustrates use of the **network** command with the **ip dhcp pool name** command.

```
Router# configure terminal
Router(config)# ip dhcp pool name platinum
Router(dhcp-config)# network 10.10.10.0 255.255.0.0

Router(dhcp-config)#
```

# nls

To enable Network Layer signaling (NLS) functionality, use the **nls** command in global configuration mode. To disable NLS functionality, use the **no** form of this command.

**nls** [authentication]  
**no nls** [authentication]

## Syntax Description

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| <b>authentication</b> | (Optional) Enables NLS protocol security authentication. |
|-----------------------|----------------------------------------------------------|

## Command Default

Disabled.

## Command Modes

Global configuration

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(21a)BC3   | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

It is recommended that NLS message authentication is enabled all the time.

## Examples

The following example shows nls enabled on a router:

```
router (config) # nls
```

## Related Commands

| Command                   | Description                                                    |
|---------------------------|----------------------------------------------------------------|
| <b>cpd</b>                | Enables the CPD feature.                                       |
| <b>nls ag-id auth-key</b> | Configures an Authorization Group Identifier (AG ID) for CMTS. |
| <b>nls resp-timeout</b>   | Configures NLS response timeout.                               |

## nls ag-id auth-key

To configure an Authorization Group Identifier (AG ID) for CMTS, use the **nls ag-id auth-key** command in global configuration mode. To disable the AG ID, use the **no** form of this command.

**nls ag-id** *ag-id number* **auth-key** *auth-key char*  
**no nls ag-id auth-key**

### Syntax Description

|                      |                                                                              |
|----------------------|------------------------------------------------------------------------------|
| <i>ag-id number</i>  | Authorization Group Identifier. The valid range is 1- 4294967295.            |
| <i>auth-key char</i> | Authentication key provisioned on CMTS. The valid range is 20-64 characters. |

### Command Default

Disabled

### Command Modes

Global configuration

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(21a)BC3   | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows configuring the AG ID:

```
Router(config) # nls ag-id 345 auth-key aabbccddeeeeddcbbaa
```

### Related Commands

| Command                 | Description                                          |
|-------------------------|------------------------------------------------------|
| <b>cpd</b>              | Enables CPD.                                         |
| <b>nls</b>              | Enables Network Layer signaling (NLS) functionality. |
| <b>nls resp-timeout</b> | Configures NLS response timeout.                     |

## nls resp-timeout

To configure the NLS response timeout, use the **nls resp-timeout** command in global configuration mode. To disable CPD, use the **no** form of this command.

**nls resp-timeout** *timeout number*  
**no nls resp-timeout** *timeout number*

### Syntax Description

|                       |                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>timeout number</i> | Controls the time CTMS will wait before getting a response for an NLS information request. The valid range is 1-60 seconds. Upon a response timeout, the CPD message is dropped. |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

The default timeout is 1 second.

### Command Modes

Global configuration

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(21a)BC3   | This command was introduced.                                                      |
| IOS-XE 3.15.OS | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows configuring the NLS response timeout:

```
Router(config)#nls rssp-timeout 35
```

|---------------------------|----------------------------------------------------------------|
| <b>cpd</b>                | Enables CPD.                                                   |
| <b>nls</b>                | Enables Network Layer signalling (NLS) functionality.          |
| <b>nls ag-id auth-key</b> | Configures an Authorization Group Identifier (AG ID) for CMTS. |

# ofdm-freq-excl-band

To specify the range of frequencies on this port that are excluded from all OFDM channels, use the **ofdm-freq-excl-band** command in controller configuration mode. To undo the frequency range assignment, use **no** form of this command.

**ofdm-freq-excl-band start-frequency** *frequency* **width** *value*

**no ofdm-freq-excl-band start-frequency** *frequency* **width** *value*

## Syntax Description

|                  |                                                                               |
|------------------|-------------------------------------------------------------------------------|
| <i>frequency</i> | Frequency of the left edge of the exclusion band in Hz.                       |
| <i>value</i>     | Width of the exclusion band in Hz. Valid range is from 1000000 to 1110000000. |

## Command Default

None.

## Command Modes

Controller configuration (config-controller)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the range of frequencies on this port that are excluded from all OFDM channels.

## Examples

The following example shows how to specify the range of frequencies on this port that are excluded from all OFDM channels:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# ofdm-freq-excl-band start-frequency 108000000 width 1000000
```

# ofdm channel-profile

To configure the OFDM RF channel, use the **ofdm channel-profile** command in RF-channel configuration mode. To undo the configuration, use **no** form of this command.

**ofdm channel-profile** *id***start-frequency** *frequency* [**width** *value*] [**plc** *plc-spectrum-start-freq*]

**no ofdm channel-profile** *id***start-frequency** *frequency* [**width** *value*] [**plc** *plc-spectrum-start-freq*]

## Syntax Description

|                                           |                                        |
|-------------------------------------------|----------------------------------------|
| <b>ofdm channel-profile</b> <i>id</i>     | OFDM RF channel profile.               |
| <b>start-frequency</b> <i>frequency</i>   | OFDM RF channel start frequency in Hz. |
| <b>width</b> <i>value</i>                 | Channel width in Hz.                   |
| <b>plc</b> <i>plc-spectrum-start-freq</i> | PLC spectrum start frequency in Hz.    |

## Command Default

None.

## Command Modes

RF-channel configuration (config-rf-chan)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to configure the OFDM RF channel.

## Examples

The following example shows how to configure the OFDM RF channel:

```
Router# configure terminal
Router(config)# controller integrated-cable 3/0/0
Router(config-controller)# rf-chan 158
Router(config-rf-chan)# ofdm channel-profile 0 start-frequency 627000000 width 192000000
plc 720000000
```

# onid

To override the default ONID, use the **onid** command in the service distribution group configuration mode. To revert back to the default ONID, use the **no** form of the command.

**onid** *number*

| <b>Syntax Description</b>    | <i>number</i> Defines the new ONID value. By default, the system ONID is 0, which is commonly used in North America.                                                                                                                                                                                                                                                                                                     |         |              |                              |                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|----------------------------------------------------------------------------------|
| <b>Command Default</b>       | None.                                                                                                                                                                                                                                                                                                                                                                                                                    |         |              |                              |                                                                                  |
| <b>Command Modes</b>         | Service distribution group configuration mode (config-video-sdg)                                                                                                                                                                                                                                                                                                                                                         |         |              |                              |                                                                                  |

|                         | <b>show cable video service-distribution-group</b> | Displays the SDG configuration.                                   |

# oui

To configure the Organizational Unique Identifier (OUI) of the CM for the CMTS tag, use the **oui** command in the cmts-tag configuration mode. To remove the configured OUI from the CMTS tag, use the **no** form of this command.

[**exclude**] **oui** *oui-of-CM*

**no oui** *oui-of-CM*

## Syntax Description

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <b>exclude</b>   | (Optional) Configures the tag to exclude the specified OUI. |
| <i>oui-of-CM</i> | MAC address prefix of the vendor.                           |

## Command Default

None

## Command Modes

CMTS tag mode (cmts-tag)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to configure the OUI for the CMTS tag using the **oui** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# oui 00.1a.c3
```

|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | To configure a DOCSIS load balancing group on the CMTS.                                                                  |
| <b>show cable load-balance docsis-group</b> | To display real-time configuration, statistical and operational information for load balancing operations on the router. |
| <b>cable tag</b>                            | To configure a tag for a DOCSIS load balancing group on the CMTS.                                                        |

# output-rate

**Note** Starting with Cisco IOS Release 12.2(33)SCG, the **output-rate** command is not supported on the Cisco uBR10012 router.

To specify a custom-defined output line rate to a WAN interface instead of the default output line rate, use the **output-rate** command in interface configuration mode. Use the **no** form of this command to use the default output line rate.

**output-rate** *rate*  
**no output-rate**

## Syntax Description

|             |                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------|
| <i>rate</i> | Output rate to the WAN interface, in kilobits per second. Valid values range from 1 to 1,000,000. |
|-------------|---------------------------------------------------------------------------------------------------|

## Command Default

Gigabit Ethernet output line rate is 1,000,000 kbps.

## Command Modes

Interface configuration (config-if)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                       |
| 12.2(33)SCG    | Support for this command was removed for the Cisco uBR10012 router.                |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command specifies a custom-defined output line rate for the WAN interface.

Starting with Cisco IOS Release 12.2(33)SCG, the **output-rate** command is not supported and the value 10,000 is used for the output line rate on a Cisco uBR10012 router.

## Examples

The following example shows how to specify a custom-defined output line rate for the WAN interface:

```
Router# configure terminal
Router(config)
)# interface gigabitethernet 1/0/0
Router(config-if)
)# output-rate 100
```

| <b>show interfaces gigabitethernet</b> | Displays the status and configuration settings for Gigabit Ethernet interfaces. |

# override

To override the Type/Length/Value (TLV) or SNMP when assigning a restricted load balancing group (RLBG) to CM, use the **override** command in the cmts-tag configuration mode. To reenable the TLV or SNMP when assigning a RLBG to CM, use the **no** form of this command.

**override**

**no override**

## Command Default

TLV or SNMP are effective when assigning a RLBG to CM.

## Command Modes

CMTS tag mode (cmts-tag)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to override the TLV or SNMP when assigning a RLBG using the **override** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# override
```

| <b>trans-stop-delay</b>  | Specifies the transition stop delay.                         |

## overwrite-scg

To enable Scrambling Control Group (SCG) overwrite, use the **overwrite-scg** command in the DVB scrambling EIS configuration mode. To disable the SCG overwrite, use the **no** form of this command.

**overwrite-scg**  
**no overwrite-scg**

### Command Default

None

### Command Modes

DVB scrambling EIS configuration mode (config-video-encrypt-dvb-eis)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following is an example of how to enable Scrambling Control Group (SCG) overwrite:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#eis EIS-1 id 1
Router(config-video-encrypt-dvb-eis)#overwrite-scg
```

# packetcable

To enable PacketCable operations on the Cisco CMTS, use the **packetcable** command in global configuration mode. To disable PacketCable operations, use the **no** form of this command.

**packetcable**  
**no packetcable**

## Syntax Description

This command has no keywords or arguments.

## Command Default

PacketCable operation is disabled.

## Command Modes

Global Configuration (config)

## Command History

| Release        | Modification                                                                                              |
|----------------|-----------------------------------------------------------------------------------------------------------|
| 12.2(8)BC2     | This command was introduced for the Cisco uBR7200 series universal broadband router.                      |
| 12.2(11)BC1    | Support was added for automatically creating a random Element ID when PacketCable operations are enabled. |
| 12.2(15)BC1    | Support was added for the Cisco uBR10012 router.                                                          |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                         |

## Usage Guidelines

This command enables PacketCable operations on all cable interfaces and takes effect immediately. If you do not need to change any parameters from their default values, this is the only command needed to enable PacketCable operations.

In Cisco IOS Release 12.2(11)BC1 and later releases, this command also automatically creates a random Element ID for the CMTS that is in the range of 0 and 99,999. To ensure that this Element ID is unique across the entire PacketCable domain, you should use the **packetcable element-id** command.

### Note

PacketCable operations can be configured together with HCCP N+1 redundancy, but the PacketCable states are not synchronized between the Working and Protect interfaces. If a switchover occurs, existing voice calls continue, but when the user hangs up, PacketCable event messages are not generated because the Protect interface is not aware of the previous call states. However, new voice calls can be made and proceed in the normal fashion.

## Channel Width Limitations

The 200,000 Hz channel width cannot be used on upstreams that support PacketCable voice calls, or on any upstreams that use Unsolicited Grant Service (UGS) or UGS with Activity Detection (UGS-AD) service flows. Using this small a channel width with voice and other UGS/UGS-AD service flows results in calls being rejected because of “DSA MULTIPLE ERRORS”.

## Examples

The following example shows PacketCable operation being enabled:

```
Router# configure terminal
Router(config)# packetcable
Router(config)#
```

The following example shows PacketCable operation being disabled (default):

```
Router# configure terminal
Router(config)# no packetcable
Router(config)#
```

#### Related Commands

| Command                                         | Description                                                                                                                                          |

| <b>clear packetcable gate counter commit</b>    | Resets the counters that track the total number of committed gates.                                                                                  |
| <b>packetcable authorize vanilla-docsis-mta</b> | Allows Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS. |
| <b>packetcable element-id</b>                   | Configures the PacketCable Event Message Element ID.                                                                                                 |
| <b>packetcable gate maxcount</b>                | Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.                                                           |
| <b>packetcable timer</b>                        | Changes the value of the different PacketCable DQoS timers.                                                                                          |
| <b>show packetcable gate</b>                    | Displays information about one or more gates in the gate database.                                                                                   |
| <b>show packetcable gate counter commit</b>     | Displays the total number of committed gates since system reset or since the counter was last cleared.                                               |
| <b>show packetcable global</b>                  | Displays the current PacketCable configuration.                                                                                                      |

# packetcable authorize vanilla-docsis-mta

To allow Unsolicited Grant Service (UGS) service flows without a proper PacketCable gate ID when PacketCable operations are enabled on the Cisco CMTS, use the **packetcable authorize vanilla-docsis-mta** command in global configuration mode. To prevent CMs from requesting non-PacketCable UGS service flows when PacketCable operations are enabled, use the **no** form of this command.

**packetcable authorize vanilla-docsis-mta**  
**no packetcable authorize vanilla-docsis-mta**

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | This command has no keywords or arguments.                                                 |
| <b>Command Default</b>    | Non-PacketCable UGS service flows are not allowed when PacketCable operations are enabled. |
| <b>Command Modes</b>      | Global Configuration (config)                                                              |

| <b>Command History</b> | Release        | Modification                                                                         |
|------------------------|----------------|--------------------------------------------------------------------------------------|
|                        | 12.2(11)BC2    | This command was introduced for the Cisco uBR7200 series universal broadband router. |
|                        | 12.2(15)BC1    | Support was added for the Cisco uBR10012 router.                                     |
|                        | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.    |

**Usage Guidelines**

By default, when PacketCable operations are enabled (using the **packetcable** ccommand), CMs must follow the PacketCable protocol when requesting UGS service flows. This prevents DOCSIS CMs that do not support PacketCable operations from using DOCSIS-style UGS service flows.

If you have a mixed network that contains both PacketCable and non-PacketCable DOCSIS CMs, you can allow DOCSIS CMs to request UGS service flows by using the **packetcable authorize vanilla-docsis-mta** command. If, however, your CMTS is providing PacketCable services, use the **no packetcable authorize vanilla-docsis-mta** command to disable DOCSIS-style service flows. This is the default configuration when PacketCable operations are enabled, and it requires that CMs must provide a validly authorized gate ID before being granted a UGS service flow.

**Examples**

The following example shows PacketCable operation being enabled, while still allowing DOCSIS-style UGS service flows:

```
Router# configure terminal
Router(config)# packetcable
Router(config)# packetcable authorize vanilla-docsis-mta
```

The **show packetcable global** command has also been enhanced to display whether non-PacketCable DOCSIS-style UGS service flows are allowed.

The following is a sample output on the Cisco uBR10012 router:

```
Router# show packetcable global
Packet Cable Global configuration:
```

```

Enabled : Yes
Element ID: 12456
Max Gates : 1048576
Allow non-PacketCable UGS
Default Timer value -
 T0 : 30000 msec
 T1 : 300000 msec
 T2 : 2000 msec
 T5 : 500 msec
Router#

```

The following is a sample output on a Cisco cBR series router:

```

Router# show packetcable global
Packet Cable Global configuration:
Packetcable DQOS Enabled : Yes
Packetcable Multimedia Enabled : No
Element ID: 88330
Max Gates : 512000
Allow non-PacketCable UGS
Default Multimedia Timer value -
 T1 : 200000 msec
 Persistent gate : 0 hour
 Volume Limit : STOPPED
Default DQoS Timer value -
 T0 : 30000 msec
 T1 : 300000 msec
Client Accept Timer: Disabled
Client Accept Timer Expired: 0
Packetcable DQOS Gate Send SubscriberID Enabled: No
Router#

```

# packetcable element-id

To configure the PacketCable Event Message Element ID on the Cisco CMTS, use the **packetcable element-id** command in global configuration mode. To reset the counter to its default value, use the **no** form of this command.

**packetcable element-id** *n*  
**no packetcable element-id**

## Syntax Description

|          |                                                                                                                                                    |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>n</i> | PacketCable Event Message Element ID for the Cisco CMTS. The valid range is 0 through 99999, with a default that is a random number in that range. |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

A random value between 0 and 99,999.

## Command Modes

Global Configuration (config)

## Command History

| 12.2(15)BC1    | Support was added for the Cisco uBR10012 router.                                     |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.    |

## Usage Guidelines

The PacketCable Event Message specification (PKT-SP-EM-I03-011221) requires that each trusted PacketCable network element that generates an Event Message MUST identify itself with a static Element ID that is unique across an entire PacketCable domain. This command allows you to configure the CMTS with an Element ID that is unique for your particular network. If you do not manually configure this parameter with the **packetcable element-id** command, it defaults to a random value between 0 and 99,999 when PacketCable operations is enabled.

The CMTS includes the Element ID in its Event Messages, along with its timezone information. You can display the current value using the **show packetcable global** command.

## Examples

The following example shows the Event Message Element ID for this particular CMTS being set to 12456:

```
Router# configure terminal
Router(config)# packetcable element-id 12456
Pktcbl: Configured element ID 12456
Router(config)#
```

| 12.2(8)BC2     | This command was introduced for the Cisco uBR7200 series universal broadband router.                                                                                                                                                                               |
| 12.2(11)BC2    | The maximum number of possible gates and the default number of gates were doubled from 1,048,576 to 2,097,152 to accommodate a maximum of eight cable interface line cards (where each cable interface line card can use a maximum of 512*512, or 262,144, gates). |
| 12.2(15)BC1    | Support was added for the Cisco uBR10012 router.                                                                                                                                                                                                                   |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                  |

## Usage Guidelines

This command configures the number of gate IDs that the Cisco CMTS can store in its gate database. Because each PacketCable gate ID typically refers to both an upstream gate and a downstream gate, multiply this number by 2 to get the maximum number of gates that can be created on the Cisco CMTS.

**Note** Each cable interface line card on the Cisco uBR10012 and Cisco uBR7200 series routers supports a maximum of 512\*512 (262,144) PacketCable gates, so ensure that you set the maximum number of gates to accommodate all installed cable interface line cards.

## Examples

The following example shows the maximum number of gate IDs being set to 524288 on the Cisco uBR10012 router, which is sufficient for two cable interface line cards:

```
Router# configure terminal
Router(config)# packetcable gate maxcount 524288
```

The following example shows the maximum number of gate IDs being set to 10 on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# packetcable gate maxcount 10
```

# packetcable gate send-subscriberID

To include subscriber identification in GATE-OPEN and GATE-CLOSE gate control messages, use the **packetcable gate send-subscriberID** command in global configuration mode. To remove subscriber identification information from the gate control messages, use the **no** form of this command.

**packetcable gate send-subscriberID**  
**no packetcable gate send-subscriberID**

## Syntax Description

This command has no arguments or keywords.

## Command Default

No subscriber identification information is provided in the GATE-OPEN and GATE-CLOSE gate control messages.

## Command Modes

Global configuration (config)

## Command History

|                        | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                               |

**Usage Guidelines** This command sets the following timers, which are defined in the *PacketCable™ Dynamic Quality-of-Service Specification* (PKT-SP-DQOS-I03-020116):

- T0 specifies the amount of time that a gate ID can remain allocated without any specified gate parameters. The timer begins counting when a gate is allocated with a Gate-Alloc command. The timer stops when a Gate-Set command marks the gate as Authorized. If the timer expires without a Gate-Set command being received, the gate is deleted.
- T1 specifies the amount of time that an authorization for a gate can remain valid. It begins counting when the CMTS creates a gate with a Gate-Set command and puts the gate in the Authorized state. The timer stops when the gate is put into the committed state. If the timer expires without the gate being committed, the CMTS must close the gate and release all associated resources.

**Note** The new timer values apply to all gates that are created after giving the command. Existing gates are not affected.

### Examples

The following example shows the T0 timer being set to 20 seconds (20,000 milliseconds):

```
Router# configure terminal
Router(config)# packetcable timer T0 20000
```

| <b>packetcable element-id</b>                   | Configures the PacketCable Event Message Element ID.                                                                                                 |
| <b>packetcable gate maxcount</b>                | Changes the maximum number of PacketCable gate IDs in the gate database on the Cisco CMTS.                                                           |
| <b>show packetcable global</b>                  | Displays the current PacketCable configuration.<br>show packetcable global                                                                           |

# pcr-based-source-switch

To configure source switching of multicast SPTS streams to be based on PCR PID bitrate instead of stream bitrate, use the **pcr-based-source-switch** command in video configuration mode. To disable the PCR PID based source switch, use the **no** form of this command.

**pcr-based-source-switch**

**no pcr-based-source-switch**

## Command Default

None

## Command Modes

Video configuration (config-video)

## Command History

| Release             | Modification                                                                     |
|---------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE 16.8.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to enable PCR PID based source switch:

```
Router(config)#cable video
Router(config-video)#pcr-based-source-switch
```

# peak-time1

To specify peak and offpeak monitoring times on a Cisco CMTS router, use the **peak-time1** command in enforce-rule configuration mode. To disable configuration of peak monitoring times, use the **no** form of this command.

```

peak-time1 {hourhour:minutes} duration minutes avg-rate rate
peak-time2 {hourhour:minutes} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-minutes
sample-interval minutes]minutes [{penalty minutes}]{downstream | upstream}[{enforce}]
no peak-time1 {hourhour:minutes} duration minutes avg-rate rate
peak-time2 {hourhour:minutes} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-minutes
sample-interval minutes]minutes [{penalty minutes}]{downstream | upstream}[{enforce}]

```

## Cisco cBR Series Converged Broadband Routers

```

peak-time1 {hourhour:minutes} duration minutes avg-rate rate
peak-time2 {hourhour:minutes} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-minutes
sample-interval minutesminutes [{penalty-period minutes}]{downstream | upstream}[{enforce}]
no peak-time1 {hourhour:minutes} duration minutes avg-rate rate
peak-time2 {hourhour:minutes} duration minutes avg-rate rate
duration offpeak-minutes avg-rate offpeak-minutes
sample-interval minutesminutes [{penalty-period minutes}]{downstream | upstream}[{enforce}]

```

### Syntax Description

|                                        |                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>hour   hour:minutes</i>             | Specifies the time of day, in either hh or hh:mm format, during which monitoring occurs for the peak time.<br><br>If the time is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock.<br><br>If the time is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59. |
| <b>duration</b> <i>minutes</i>         | Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the first peak time, and optionally for a second peak time when used with the <b>peak-time2</b> keyword. The valid range is 60 to 1440.<br><br>For Cisco cBR Series Converged Broadband Routers, the valid range is 6 to 1440.                                    |
| <b>avg-rate</b> <i>rate</i>            | Specifies the average sampling rate in kilobits per second for the specified duration. The valid range is 1 to 400000 kilobits with no default.                                                                                                                                                                                                                            |
| <b>duration</b> <i>offpeak-minutes</i> | (Optional) Specifies the size of the sliding window (in minutes) during which the subscriber usage is monitored for the remaining offpeak time (time not specified for peak monitoring). The valid range is 60 to 1440.<br><br>For Cisco cBR Series Converged Broadband Routers, the valid range is 6 to 1440.                                                             |
| <b>avg-rate</b> <i>offpeak-rate</i>    | Specifies the average sampling rate in kilobits per second for the specified offpeak duration. The valid range is 1 to 400000 kilobits with no default.                                                                                                                                                                                                                    |

|                                       |                                                                                                                                                                                                                                                                     |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>peak-time2</b> hour   hour:minutes | (Optional) Specifies the time of day during which monitoring occurs for a second peak time. The time can be specified either in hour or hour:minutes format. The valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59. |
| <b>sample-interval</b> minutes        | Specifies how often (in minutes) the CMTS router should sample a service flow to get an estimate of subscriber usage. The valid range is 1 to 30, with a default value of 15.                                                                                       |
| <b>penalty</b> minutes                | (Optional) Specifies the period (in minutes) during which a cable modem can be under penalty. The valid range is 1 to 10080.                                                                                                                                        |
| <b>penalty-period</b> minutes         | (Optional) Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile.                                                                                              |
| <b>downstream</b>                     | Specifies monitoring of traffic in the downstream direction.                                                                                                                                                                                                        |
| <b>upstream</b>                       | Specifies monitoring of traffic in the upstream direction.                                                                                                                                                                                                          |
| <b>enforce</b>                        | (Optional) Specifies that the enforce-rule QoS profile should be applied automatically if a user violates their registered QoS profile.                                                                                                                             |

**Command Default**

Peak and offpeak monitoring is disabled. The only default value for the **peak-time1** command is the 15-minute sample interval.

**Command Modes**

Enforce-rule configuration (enforce-rule)

**Command History**

| Release        | Modification                                                                                                                                                                 |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(9a)BC     | This command was introduced.                                                                                                                                                 |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                           |
| 12.2(33)SCD2   | The <b>minute-level granularity (hh:mm) for peak-time1 and peak-time2 duration, and the penalty</b> keyword option were added.                                               |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                                           |
| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>penalty</b> keyword option was removed. The <b>penalty-period</b> option was added. |

**Usage Guidelines****Note**

This command is applicable only after the **monitoring-basics** command is configured with the keyword **peak-offpeak**.

You can monitor two peak monitoring periods using the initial **peak-time1** command and its options, followed by the **peak-time2** keyword and the corresponding options. The remaining hours are considered offpeak and can be monitored by configuring the optional **duration** keyword and the corresponding options.

The **penalty** duration, which is configured using the **peak-time1** command, is unique to weekdays, and takes precedence over the global penalty duration configured using the **penalty-period** command.

When you use the **show running-configuration** command to display the configuration, the keyword options for the **peak-time1** command are truncated. In the following example, “d” represents **duration** (a single peak and offpeak duration are configured), “avg” represents **avg-rate**, “sa” represents **sample-interval**, “pen” represents penalty, “do” represents **downstream**, and “enf” represents **enforce**:

```
Router# show running-configuration
.
.
.
peak-time1 1 d 60 avg 2 d 60 avg 40 sa 10 pen 11 do enf
```

## Examples

The following example shows an enforce-rule that defines two peak monitoring periods for upstream traffic:

```
Router(enforce-rule)# peak-time1 10:30 duration 120 avg-rate 10 peak-time2 23 duration 60
avg-rate 10 sample-interval 10 penalty 11 upstream enforce
```

The following example shows an enforce-rule being configured on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)# peak-time1 1 duration 6 avg-rate 1 sample-interval 1 penalty-period
1 downstream enforce
```

## Related Commands

| Command                                  | Description                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable qos enforce-rule</b>            | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode.                   |
| <b>debug cable subscriber-monitoring</b> | Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.                                                           |
| <b>duration</b>                          | Specifies the time period and sample rate to be used for monitoring subscribers.                                                                            |
| <b>monitoring-basics</b>                 | Specifies the type of monitoring for subscriber traffic management on a Cisco CMTS router.                                                                  |
| <b>penalty-period</b>                    | Specifies the period during which an enforced quality of service (QoS) profile should be in force for subscribers who violate their registered QoS profile. |
| <b>qos-profile enforced</b>              | Specifies a QoS profile that should be enforced when users violate their registered QoS profiles. This command is applicable for DOCSIS 1.0 cable modems    |
| <b>qos-profile registered</b>            | Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable for DOCSIS 1.0 cable modems                      |

| Command                             | Description                                                                                                                                           |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>service-class (enforce-rule)</b> | Identifies a particular service class for cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems. |
| <b>show cable qos enforce-rule</b>  | Displays the QoS enforce-rules that are currently defined.                                                                                            |
| <b>show cable subscriber-usage</b>  | Displays subscribers who are violating their registered QoS profiles.                                                                                 |
| <b>weekend peak-time1</b>           | Configures peak and offpeak subscriber monitoring over weekends on a Cisco CMTS router.                                                               |

# penalty-period

To specify the time period that an enforced quality of service (QoS) profile should be in force for subscribers that violate their registered QoS profile, use the **penalty-period** command in enforce-rule configuration mode. To reset an enforce-rule to its default penalty period, use the **no** form of this command.

**penalty-period** *minutes* [**time-of-day** *hour*]  
**no** **penalty-period** *minutes* [**time-of-day** *hour*]

## Cisco cBR Series Converged Broadband Routers

**penalty-period** *minutes* [**time-of-day** {*hourhour:minutes*} **monitoring-on**]  
**no** **penalty-period** *minutes* [**time-of-day** {*hourhour:minutes*} **monitoring-on**]

| Syntax Description |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>minutes</i>                                           | Specifies a time period (in minutes) during which a cable modem (CM) can be under penalty. The range is 1 to 10080, with a default value of 10080 (7 days).                                                                                                                                                                                                                                                                                                                                                                                       |
|                    | <b>time-of-day</b> { <i>hour</i> / <i>hour:minutes</i> } | (Optional) Specifies the time of day (in hh or hh:mm format) when: <ul style="list-style-type: none"> <li>A CM that is under penalty is released from the penalty period.</li> <li>A CM that is not under penalty has its subscriber monitoring counters reset.</li> </ul> If the time of day is specified in hour (hh), the valid range is 1 to 23 using a 24-hour clock.<br><br>If the time of day is specified in hour:minutes (hh:mm), the valid range for hour is 1 to 23 using a 24-hour clock, and the valid range for minutes is 0 to 59. |
|                    | <b>monitoring-on</b>                                     | (Optional) Specifies that monitoring should be turned on after the penalty release time. If this keyword is not specified, by default, monitoring is turned off after the release time, until the end of the day, that is 00:00 hrs.                                                                                                                                                                                                                                                                                                              |

**Command Default** The default time period is 10080 minutes (7 days).

**Command Modes** Enforce-rule configuration (enforce-rule)

| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.  |

### Usage Guidelines

When a subscriber overconsumes the maximum bandwidth that is specified in the enforce-rule, the Cisco CMTS router can automatically switch the subscriber to an enforced QoS profile for the time duration configured with the **penalty-period** command. When the penalty period expires, the Cisco CMTS router restores the subscriber to their registered QoS profile.

The penalty duration specified in the **penalty-period** command is a global configuration. This penalty duration is overridden if the individual penalty duration is already configured using the **duration**, **weekend duration**, **peaktime1** or **weekend peaktime1** commands. Similarly, if the individual penalty duration is not configured, the global penalty duration is used. The table below explains in detail the criteria for choosing the penalty duration:

*Table 32: Criteria for Choosing Penalty Duration*

| Global Penalty-Period Configured | Weekday Penalty-Period Configuration<br>(CLI: duration or peaktime1) | Weekend Penalty-Period Configuration<br>(CLI: weekend duration, or weekend peaktime1) | Applied Penalty Duration for Weekdays | Applied Penalty Duration for Weekends |
|----------------------------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------|---------------------------------------|
| Yes                              | Yes                                                                  | Yes                                                                                   | Weekday Penalty Configuration         | Weekend Penalty Configuration         |
| Yes                              | Yes                                                                  | No                                                                                    | Weekday Penalty Configuration         | Global Penalty Configuration          |
| Yes                              | No                                                                   | Yes                                                                                   | Global Penalty Configuration          | Weekend Penalty Configuration         |
| Yes                              | No                                                                   | No                                                                                    | Global Penalty Configuration          | Global Penalty Configuration          |

If the keyword monitoring-on is specified, monitoring starts immediately after the cable modems are released from penalty. However if this keyword is not specified, by default, all the cable modems using the enforce-rule are not monitored until the end of day, that is, 00:00 hrs.

The penalty period continues across reboots of the cable modem, so a user cannot avoid the enforced QoS profile by trying to reset their modem and reregister on the cable network. This allows service providers to set an appropriate penalty for users who consistently exceed the allocated maximum bandwidth.

**Note** To manually move a DOCSIS 1.0 cable modem back to its registered profile before the end of the penalty period, use the **cable modem qos profile** command. To manually move a DOCSIS 1.1(or later) cable modem back to its registered profile before the end of the penalty period, use the **cable modem {ip-address | mac-address} service-class-name** command.

When you change the configuration of a currently active enforce-rule, that rule begins using the new configuration immediately to manage the cable modems tracked by this enforce-rule.

**Note** Before making any changes to an active enforce-rule, we recommend that you first disable the enforce rule using the no enabled command.

A cable modem consists of two service flows, Primary upstream and Primary downstream. If a DOCSIS 1.0 cable modem enters the penalty period because one of its service flows has exceeded its allowed bandwidth, the QoS profile of the entire modem is changed. However, if a DOCSIS 1.1 or later cable modem enters the penalty period because its upstream or downstream service flow has exceeded the allowed bandwidth threshold, the service class name is changed only for the upstream or downstream service flow.

## Examples

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day):

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440
```

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day), but allowing the removal of the cable modems in penalty at 23:00. Monitoring will be turned off by default at 23:00, to 00:00 (1 hour):

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440 time-of-day 23
```

The following example shows an enforce-rule named “test”, which is configured with a penalty period of 1440 minutes (1 day), allowing the removal of the cable modems in penalty at 23:00. However, after the cable modems are released from penalty, fresh monitoring starts, with all the subscriber monitoring counters reset to 0:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# penalty-period 1440 time-of-day 23 monitoring-on
```

The following example shows an enforce-rule being configured with a penalty period on a Cisco cBR Series Converged Broadband Router:

```
Router(enforce-rule)# penalty-period 1 time-of-day 1 monitoring-on
```

|------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>activate-rule at-byte-count</b> | Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router. |

| Command                             | Description                                                                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable qos enforce-rule</b>       | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic monitoring, and enters the enforce-rule configuration mode.                                             |
| <b>duration</b>                     | Specifies the time period and sample rate to be used for monitoring subscribers.                                                                                                           |
| <b>enabled (enforce-rule)</b>       | Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.                                                                                                 |
| <b>qos-profile enforced</b>         | Specifies a QoS profile that should be enforced when users violate their registered QoS profiles. This command is applicable for only DOCSIS 1.0 cable modems.                             |
| <b>qos-profile registered</b>       | Specifies the registered QoS profile that should be used for this enforce-rule. This command is applicable for only DOCSIS 1.0 cable modems.                                               |
| <b>service-class (enforce-rule)</b> | Specifies a service class (enforced or registered) that should be used for the cable modem monitoring in an enforce-rule. This command is applicable for DOCSIS 1.1 or later cable modems. |
| <b>show cable qos enforce-rule</b>  | Displays the QoS enforce-rules that are defined.                                                                                                                                           |
| <b>show cable subscriber-usage</b>  | Displays subscribers who are violating their registered QoS profiles.                                                                                                                      |

## periodic-rel-pxf enable

To enable the Reload PXF in the Standby PRE Support feature, use the **periodic-rel-pxf enable** command in redundancy configuration mode. To disable the Reload PXF in the Standby PRE feature, use the **no** form of this command.

**periodic-rel-pxf enable**  
**no periodic-rel-pxf enable**

|                           |                                            |

# ping docsis

To determine whether a specific cable modem (CM) is reachable from the CMTS at the DOCSIS MAC layer, use the **ping docsis** command in privileged EXEC mode.

**ping docsis** {*mac-addr ip-addr* | **name** *fqdn*} [*count*] [**repeat** *queue-intervals*] [**verbose**]

## Cisco cBR Series Converged Broadband Routers

**ping docsis** {*mac-addr ip-addr* } [*count*] [**repeat** *queue-intervals*] [**verbose**]

### Syntax Description

|                                      |                                                                                                                                                                                                                                                          |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mac-addr</i>                      | The 48-bit hardware (MAC) address of the CM. If you specify the MAC address of a CPE device, the command will resolve it to the MAC address of the CM servicing that CPE device and send the DOCSIS ping to the CM.                                      |
| <i>ip-addr</i>                       | IPv4 or IPv6 address of the CM. If you specify the IP address of a CPE device, the command will resolve it to the IP address of the CM servicing that CPE device and send the DOCSIS ping to the CM.                                                     |
| <b>name</b> <i>fqdn</i>              | Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the <b>show cable modem domain-name</b> command has been run for the first time to update the cable DNS cache on the CMTS router. |
| <b>repeat</b> <i>queue-intervals</i> | (Optional) Specifies the number of maintenance intervals for a queue. Valid values are from 1 to 2147483647.                                                                                                                                             |
| <b>verbose</b>                       | (Optional) Specifies verbose mode for the output, giving additional details about the packets transmitted and received.                                                                                                                                  |

### Command Default

If no count is specified, five DOCSIS ping packets are sent.

### Command Modes

Privileged EXEC (#)

### Command History

| Release    | Modification                                                     |
|------------|------------------------------------------------------------------|
| 11.3 NA    | This command was introduced for the Cisco uBR7200 series router. |
| 12.0(4)XI1 | Support was added for the Cisco uBR924 cable access router.      |
| 12.1(3)XL  | Support was added for the Cisco uBR905 cable access router.      |
| 12.1(5)XU1 | Support was added for the Cisco CVA122 Cable Voice Adapter.      |
| 12.1(1a)T1 | The command output was enhanced.                                 |
| 12.1(3)XQ1 | Support was added for wireless radio modems.                     |
| 12.1(5)EC  | Support was added for the Cisco uBR7100 series routers.          |

| 12.2(33)SCC    | The <b>repeat</b> keyword was added to specify maintenance intervals for queues.                                                                                                                                                                                                                                                                                                                   |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>name</b> keyword and <i>fqdn</i> variable were removed.                                                                                                                                                                                                                                                   |

### Usage Guidelines

The DOCSIS ping is a unique Cisco patented technology that allows a cable operator to quickly diagnose the health of a channel between the CMTS router and any particular DOCSIS cable CPE device. The DOCSIS ping is similar in concept to the IP ping but uses the lower MAC layer instead of the datalink or transport layers. Using the MAC layer has two major advantages:

- A DOCSIS ping uses only 1/64 of the bandwidth of an IP ping.
- A DOCSIS ping can be used with CMs that have not yet acquired an IP address. This allows cable operators to ping CMs that were not able to complete registration or that were improperly configured at the IP layer.

In addition to providing connectivity information, the **ping docsis** command provides a real-time view and plot of requested power adjustments, frequency, timing offset adjustments, and a measure of optimal headend reception power.

If a CM responds to the **ping docsis** command, but does not respond to an IP ping, the problem could be one of the following:

- The CM is still in the registration process and has not yet come completely online. In particular, the CM could be waiting for the DHCP server to assign it an IP address.
- Severe interference or other faults on the physical layer (either the upstream or downstream).
- Significant upstream signal error, distortion, or amplitude errors, often resulting in frequent power adjustments (which are shown in the cable flap list).
- A non-DOCSIS compliant upstream carrier-to-noise power ratio (C/N) that is between 14 and 21 dB, along with a mixed modulation profile, such as ranging request/response messages being sent in QPSK mode and short and long data grants in 16-QAM mode.

#### Note

The **ping docsis** command is a DOCSIS-compliant process that can be used with any two-way DOCSIS-compliant CM; the CM does not require any special features or code. The **ping docsis** command cannot be used with telco-return CMs.

**Note** In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

The table below explains the different characters that can appear in the output for the **ping docsis** command:

**Table 33: ping docsis Command Output Characters**

| Output Character | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| !                | Indicates that a successful response was received from the ping request. This indicates that the CM is reachable from the CMTS and can respond to CMTS requests at the DOCSIS MAC layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| .                | Indicates that a DOCSIS ping request was sent out but that the ping request timed out without receiving a response. This indicates that the CM is having difficulties maintaining DOCSIS MAC layer connectivity to the CMTS.<br><br><b>Note</b> If the <b>ping docsis</b> command displays a number of periods (.) along with exclamation points (!), it strongly indicates the presence of RF noise or physical cable and plant issues that is causing a loss of MAC layer connectivity.                                                                                                                                                 |
| a                | Indicates that a response was received but that an adjustment of frequency, power, or timing was also made in the response. This indicates that, although the upstream channel is functional, some sort of problem is forcing power averaging and other misreads of the upstream received power signals.                                                                                                                                                                                                                                                                                                                                  |
| f                | Indicates that the CMTS failed to send the DOCSIS ping request because the CM is offline, and therefore MAC-layer communication is not possible. This indicates that the CM had previously registered with the CMTS, but that at some point it stopped responding to the DOCSIS station maintenance messages and that the CMTS eventually marked the CM as offline. The CM might have lost power or might have been disconnected from the coaxial cable.<br><br><b>Tip</b> Use the <b>show cable modem</b> command with the same MAC or IP address as you used with the <b>ping docsis</b> command to show the current status of this CM. |

**Note** If a CM is already in the flap list, the **ping docsis** command increments the hit, miss, and power-adjustment fields for it in the cable flap list.

## Examples

**Note** The following example shows a default **ping docsis** command that sends five packets to the CM with the MAC address of 00d0.ba77.7595, with a response being received for each:

```
Router# ping docsis 00d0.ba77.7595
```

```
Queueing 5 MAC-layer station maintenance intervals, timeout is 25 msec:
!!!!
Success rate is 100 percent (5/5)
Router#
```

The following example shows the verbose output for the same command:

```
Router# ping docsis 00d0.ba77.7595 verbose
```

```
Queueing 5 MAC-layer station maintenance intervals, timeout is 25 msec:
Reply from 00d0.ba77.7595: 2 ms, tadj=-1, padj=0.50, fadj=0
Reply from 00d0.ba77.7595: 2 ms, tadj=-1, padj=0.50, fadj=0
Reply from 00d0.ba77.7595: 2 ms, tadj=-1, padj=0.50, fadj=0
Reply from 00d0.ba77.7595: 98 ms, tadj=-1, padj=0.25, fadj=0
Reply from 00d0.ba77.7595: 2 ms, tadj=-1, padj=0.25, fadj=0
Success rate is 100 percent (5/5)
Router#
```

The following example shows that the CM at 192.168.100.10 is connected to the network and is operational, but that one ping packet was lost and that several power adjustments were made during the ping process:

```
router# ping docsis 192.168.100.10
```

```
Queueing 100 MAC-layer station maintenance intervals, timeout is 25 msec:
!!!!a!!!!!!a!a!!!!!!a!!!!!!aa!!!!!!a!!a!!a!!aa!!!!!!a!!!!a!
a!a!!!!!!aa!!!!!!aa!a
Success rate is 99 percent (99/100)
```

A CM that displays output such as that above (a higher percentage of successful pings but with a number of power-adjustment readings) is most likely experiencing a problem that is not bad enough to force the modem offline but that should be addressed.

If this problem is consistent for just a small number of CMs on an upstream receiver (such as a fiber node within a combining group), then the problem is likely related to in-home wiring at those modem locations. It could also be due to a cable TV network element that is on the same HFC segment.

If the problem occurs for all CMs on a single fiber node, then changing the upstream frequency or reducing the number of homes passed per combining group might improve conditions. If this does not help the situation, the problem could be due to a faulty cable drop, dirty optical connector on the node, or other physical plant problem.

The **ping docsis** command cannot be used with a CM that has not yet registered with the CMTS. The following example shows the responses for a CM that has not yet registered with the CMTS.

```
Router# ping docsis 192.168.100.111
```

```
Cable modem with IP address 192.168.100.111 not registered.
Please try using MAC address instead.
Router# ping docsis 0123.4567.89ab
```

```
Cable modem with MAC address 0123.4567.89ab not registered.
router#
```

The following example shows the output of the **ping docsis** command with the **repeat** keyword:

```
Router# ping docsis 192.168.100.10 repeat 22
```

```

Queueing 22 MAC-layer station maintenance intervals, timeout is 25 msec:
!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Success rate is 100 percent (22/22)

```

**Related Commands**

## ping docsis pnm

To send RxMER probes on OFDMA channel assigned to the modem, use the **ping docsis pnm** command in privileged EXEC mode.

### Cisco cBR Series Converged Broadband Routers

**ping docsis pnm** *mac-address* [ **ignore** | **upstream** *us-channel* [ **ignore** ] ]

#### Syntax Description

|                    |                                               |
|--------------------|-----------------------------------------------|
| <i>mac-address</i> | MAC address of a specific CM to be displayed. |
|--------------------|-----------------------------------------------|

#### Command Default

None.

#### Command Modes

Privileged EXEC (#)

#### Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

#### Usage Guidelines

The usage for each of the commands are listed below:

- **ping docsis pnm** *mac-address* : sends RxMER probes on each OFDMA channel assigned to the modem. If enabled, auto profile management will analyze the results and potentially change the active profile.
- **ping docsis pnm** *mac-address upstream us-channel* : sends RxMER probes on a specified OFDMA channel assigned to the modem. If enabled, auto profile management will analyze the results and potentially change the active profile.
- **ping docsis pnm** *mac-address ignore*: sends RxMER probes on each OFDMA channel assigned to the modem. Auto profile management will always **ignore** the results of the probe.
- **ping docsis pnm** *mac-address upstream us-channel ignore*: sends RxMER probes on a specified OFDMA channel assigned to the modem. Auto profile management will always **ignore** the results of the probe.

#### Examples

The following example shows how to configure the system to send RxMER probes on OFDMA channel assigned to the modem:

```
Router# ping docsis pnm 34bd.fa0c.b480
```

#### Related Commands

| Command                                    | Description                           |
|--------------------------------------------|---------------------------------------|
| <b>show cable modem prof-mgmt upstream</b> | Displays the results of RxMER probes. |

# platform power protection

To configure voltage thresholds to switch between different modes when power budget provided by AC PSMs is not sufficient to power Field Replaceable Units (FRUs), use the **platform power protection** command in global configuration mode. To use the default voltage thresholds, use the **no** form of the command.

By default, power protection action is disabled to avoid service outage. If protection action is disabled, any online FRU is not powered down in the event of insufficient power budget, but any newly installed line card is not powered up. To enable power protection action, use the **platform power protection action shutdown linecard** command.

**platform power protection ac220v** *voff* *von*

**no platform power protection ac220v**

**platform power protection action shutdown linecard**

## Syntax Description

*voff* Specifies the hysteresis threshold value. The hysteresis thresholds define when the PSM should switch modes.

For example, if the *voff* value is configured as 180V, the PSM switches to the 120V mode with 1300W capacity when input voltage drops below 180V.

*von* Specifies the hysteresis threshold value. The hysteresis thresholds define when the PSM should switch modes.

For example, if the *von* value is configured as 200V, the PSM switches to the 220V mode when input voltage increases to more than 200V.

## Command Default

The default value of *voff* is 190V while the default value of *von* is 197V.

## Command Modes

Global configuration (config)

## Command History

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.7.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform power protection ac220v 180 200
Router(config)#
```

The following example shows how to enable power protection action.

```
Router# configure terminal
Router(config)# platform power protection action shutdown linecard
```

The following example shows how to verify the voltage threshold configuration.

```
Router# configure terminal
Router(config)# sh run | i protection
platform power protection ac220v 180 200
```

# platform punt-policer

To rate-limit the aggregate punt-rate on a per-punt-cause basis, use the **platform punt-policer** command in global configuration mode. Using the **no** form of the command returns the rate to the default value.

**platform punt-policer** { **cable-snmpp** | *punt-cause\_value* } *rate\_value* [**high**]

**no platform punt-policer**

|                           |                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>punt-policer</b> <i>punt-cause_value</i> Specifies the punt cause value. <i>punt-cause_value</i> can be obtained from <b>show platform software punt-policer</b> command. |
| <b>cable-snmpp</b>        | This is the punt-cause assigned to SNMP packets destined to the CMTS.                                                                                                        |
| <b>rate_value</b>         | Specifies the rate in packets/second. The range is from 10 to 300000.                                                                                                        |

**Command Default** The default rate is 512 packets/second.

**Command Modes** Global configuration (config)

|                        |                  |                                                                                                                          |
|------------------------|------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b>   | <b>Modification</b>                                                                                                      |
|                        | IOS-XE 3.15.0S   | This command was introduced on the Cisco cBR Series Converged Broadband Routers.                                         |
|                        | IOS XE 16.12.1z1 | This command was updated. <b>cable-snmpp</b> was added as a new punt cause to rate-limit SNMP packets destined to cBR-8. |

**Usage Guidelines** In most cases, cable-snmpp punts are normal priority.

**Examples** The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform punt-policer cable-snmpp 1000
Router(config)#
```

|                         |                                                                              |                                                                                                                                                                     |

|                         | <b>show platform software punt-policer</b>                                   | Displays configuration and statistics for the per-cause punt-policer.                                                                                               |
|                         | <b>show platform hardware qfp active infrastructure punt-policer summary</b> | Displays detailed configuration data and statistics for the per-cause punt-policer.                                                                                 |
|                         | <b>show platform hardware qfp active infrastructure punt summary</b>         | Displays the punt summary statistics which includes a summary of punted packets and aggregate drop-counts from CoPP, SBRL, the punt-policer and the global policer. |
|                         | <b>show platform hardware qfp active infrastructure punt sbrrl</b>           | Displays the SBRL statistics.                                                                                                                                       |

| Command                                                                                      | Description                                                                 |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| <b>platform punt-sbri</b>                                                                    | Rate-limit packet streams identified by the Source-Based Rate-Limit (SBRL). |
| <b>show policy-map control-plane</b>                                                         | Displays configuration and statistics for the control-plane service-policy. |
| <b>clear control-plane</b>                                                                   | Clears the control-plane service-policy statistics.                         |
| <b>show platform hardware qfp active<br/>infrastructure punt statistics type global-drop</b> | Displays the global punt-policer statistics.                                |

## platform punt-sbri

To rate-limit packet streams identified by the Source-Based Rate-Limit (SBRL), use the **platform punt-sbri** command in global configuration mode. To disable the rate-limiting, use the **no** form of the command.

Subscriber-side configuration before Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri subscriber rate { rate_value | no-drop }
```

```
platform punt-sbri subscriber punt-cause punt-cause_value rate rate_value
```

Subscriber-side configuration in Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri subscriber punt-cause punt-cause_value rate-per-4-sec { no-drop | rate_value
[quarantine-time q_time burst-factor b_value] }
```

Subscriber-side configuration in Cisco IOS XE Fuji 16.9.x and later

```
platform punt-sbri subscriber punt-cause punt-cause_value rate-per-4-sec { no-drop | rate_value
[bucket-size b_size] [quarantine-time q_time burst-factor b_value] }
```

WAN-side configuration before Cisco IOS XE Fuji 16.8.x

```
platform punt-sbri wan punt-cause punt-cause_value rate rate_value [quarantine-time q_time
burst-factor b_value]
```

WAN-side configuration in Cisco IOS XE Fuji 16.8.x and later

```
platform punt-sbri wan punt-cause punt-cause_value rate-per-1-sec rate_value [quarantine-time
q_time burst-factor b_value]
```

```
no platform punt-sbri
```

### Syntax Description

|                                           |                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>punt-cause</b> <i>punt-cause_value</i> | Specifies the punt-cause value in number 1 to 107 or string.                                    |
| <b>rate</b> <i>rate_value</i>             | Specifies the rate in packet per seconds. The range is from 1 to 256, specified in powers-of-2. |
| <b>no-drop</b>                            | Disables the rate-limiting.                                                                     |
| <b>rate-per-4-sec</b> <i>rate_value</i>   | Specifies the rate in packet per 4 seconds. The range is from 1 to 255.                         |
| <b>rate-per-1-sec</b> <i>rate_value</i>   | Specifies the rate in packet per seconds. The range is from 1 to 256, specified in powers-of-2. |
| <b>quarantine-time</b> <i>q_time</i>      | Specifies the quarantine time in minutes. The range is from 1 to 60.                            |
| <b>bucket-size</b> <i>b_size</i>          | Specifies the bucket size in packets. The range is from 1 to 255.                               |
| <b>burst-factor</b> <i>b_value</i>        | Specifies the quarantine burst factor in packets. The range is from 50 to 1000.                 |

**Command Default**

The WAN-side default rate is zero, which means that rate-limiting does not occur. Using the **no** configuration returns the rate to the default value.

The default subscriber-side global rate is zero. The default subscriber-side per-cause rate for CABLE\_L3\_MOBILITY is 4 packets per second. Using the **no** configuration returns the rate to the default value.

**Command Modes**

Global configuration (config)

**Command History**

| Release            | Modification                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IOS-XE 3.15.0S     | This command was introduced on the Cisco cBR Series Converged Broadband Routers. The <b>platform punt-sbri wan</b> command replaces <b>service divert-rate-limit ip</b> and <b>service divert-rate-limit ipv6</b> commands. The <b>platform punt-sbri subscriber</b> command replaces <b>service divert-limit</b> and <b>cable divert-rate-limit</b> commands. |
| IOS XE Fuji 16.8.1 | The command <b>platform punt-sbri subscriber rate rate_value</b> was deprecated.                                                                                                                                                                                                                                                                               |
| IOS XE Fuji 16.9.1 | The keyword <b>bucket-size</b> was added in the command.                                                                                                                                                                                                                                                                                                       |

**Usage Guidelines****WAN-side configuration**

WAN configuration consists of two parts:

- 1) Configure CoPP to specify which WAN-side packet streams are subject to SBRL. The policy-map action **set qos-group 99** specifies that packets matching that class are subject to SBRL.
- 2) Configure WAN-side SBRL to specify which punt-causes are rate-limited. Trusted sites are specified by adding classes to the CoPP policy-map. ACLs are used to finely identify trusted streams. It is important to understand the CoPP applies to all punted packets, so it may be necessary to ensure that subscriber-side packets do not match the trusted-site ACLs. Quarantine can optionally be configured. When a packet-stream enters quarantine, all punts from the stream are dropped for the configured period of time. When (*burst-factor x rate*) packets arrive at a rate faster than *rate*, quarantine is activated for that stream.

For more information, see the WAN-side configuration example.

**Subscriber-side configuration**

The subscriber-side configuration is global. There is also a per-cause configuration which currently only applies to the CABLE\_L3\_MOBILITY punt-cause. All subscriber-side packets go to SBRL, regardless of the CoPP configuration.

**Examples**

The following example shows the subscriber-side configuration:

```
Router# configure terminal
Router(config)# platform punt-sbri subscriber punt-cause 99 rate 8
Router(config)#

Router# configure terminal
Router(config)# platform punt-sbri subscriber rate 64
Router(config)#
```

The following example shows a simple CoPP configuration which sends all WAN-side punts to SBRL:

```
Router# configure terminal
Router(config)# policy-map copp_policy
Router(config-pmap)# class class-default
Router(config-pmap-c)# set qos-group 99
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# control-plane
Router(config-cp)# service-policy input copp_policy
Router(config-cp)# exit
Router(config)# platform punt-sbri wan punt-cause 11 rate 64 quarantine 5 burst-factor 500
```

| <b>show policy-map control-plane</b>                                                     | Displays configuration and statistics for the control-plane service-policy.                                                                                         |
| <b>clear control-plane</b>                                                               | Clears the control-plane service-policy statistics.                                                                                                                 |
| <b>show platform hardware qfp active infrastructure punt statistics type global-drop</b> | Displays the global punt-policer statistics.                                                                                                                        |

## platform aom pending-thresh

To configure a threshold value in seconds to notify that an AOM download is stuck, use the **platform aom pending-threshold** command in the global configuration mode.

If you configure the **no** form of the command, the *seconds-to-error* and *seconds-to-warning*, revert to their default values.

**platform aom pending-thresh** { *seconds-to-error* } { *seconds-to-warning* }

**no platform aom pending-thresh** { *seconds-to-error* } { *seconds-to-warning* }

### Syntax Description

*seconds-to-error* Allows you to configure a threshold value in seconds to notify that an AOM download is stuck. The *seconds-to-error* specifies the threshold value in seconds to log an error on the console.

The valid range is 60 to 3600 seconds and the default value is 1800 seconds

*seconds-to-warning* Specifies the threshold value in seconds to log a warning in the trace log when the AOM download is stuck.

The valid range is 60 to 3600 seconds and the default value is 900 seconds

### Command Default

The default value for *seconds-to-error* is 1800 seconds and the default value for *seconds-to-warning* is 900 seconds.

If you configure the **no** form of the command, the *seconds-to-error* and *seconds-to-warning*, revert to their default values.

### Command Modes

Global configuration (config)

### Command History

| Release | Modification |
|---------|--------------|
|---------|--------------|

|         |                             |
|---------|-----------------------------|
| 17.6.1z | This command is introduced. |
|---------|-----------------------------|

### Usage Guidelines

The **platform aom pending-thresh** command allows you to configure a threshold value, in seconds, to notify that an AOM download is stuck. When the specified threshold time is reached, an error and warning notification is sent to the console and trace log, respectively. The valid range is 60–3600 seconds. Use the **no** form of the command to remove the threshold value.

### Examples

The following example shows a sample configuration:

```
Router# configure terminal
Router(config)# platform aom pending-thresh 300 180
Router(config)#
```

In this example, 300 indicates the threshold value in seconds to log an error on the console and 180 specifies the threshold value in seconds to log an warning on the console.

# pilot-scaling

To specify the value to calculate the number of continuous pilots, use the **pilot-scaling** command in OFDM channel profile configuration mode. To undo the pilot-scaling value assignment, use **no** form of this command.

**pilot-scaling** *value*

**no pilot-scaling**

## Syntax Description

|              |                                                                                |
|--------------|--------------------------------------------------------------------------------|
| <i>value</i> | Value to scale the number of continuous pilots. Valid range is from 48 to 120. |
|--------------|--------------------------------------------------------------------------------|

## Command Default

The default value is 48.

## Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the value to calculate the number of continuous pilots.

## Examples

The following example shows how to specify the value to calculate the number of continuous pilots:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# pilot-scaling 50
```

## Related Commands

| Command                                   | Description                                                              |
|-------------------------------------------|--------------------------------------------------------------------------|
| <b>cable downstream ofdm-chan-profile</b> | Define the OFDM channel profile on the OFDM channel.                     |
| <b>cyclic-prefix</b>                      | Specify the channel cyclic-prefix.                                       |
| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                      |
| <b>interleaver-depth</b>                  | Specify the channel interleaver-depth.                                   |
| <b>profile-control</b>                    | Specify default modulation or profile as the channel control profile.    |
| <b>profile-data</b>                       | Specify default modulation or profile as the channel data profile.       |
| <b>profile-ncp</b>                        | Specify default modulation or profile as the channel ncp profile.        |
| <b>roll-off</b>                           | Specify the channel roll-off value.                                      |
| <b>subcarrier-spacing</b>                 | Specify the spacing for specific subcarriers configured in this profile. |

# pme cem

To define parameters for the Cisco Edge QAM Manager server, use the **pme cem** command in the encryption configuration mode. To reset the parameters to default value, use the **no** form of this command.

**Note** There can be only one entry for VODS-ID, CEM IP, CEM Port, and Management Interface IP. Defining any configuration with newer values clears the previous configuration. The individual configurations can be cleared with the **no** form of the command.

**pme cem** *ip-address tcp-port*  
**no pme cem** *ip-address tcp-port*

## Syntax Description

|                   |                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i> | Specifies the IP address of the Cisco Edge QAM Manager server.                                             |
| <i>tcp-port</i>   | Specifies the TCP port number of the Cisco Edge QAM Manager server. The valid range is from 1024 to 65534. |

## Command Default

None

## Command Modes

Encryption configuration (config-video-encrypt)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command defines the parameters for the Cisco Edge QAM Manager server during privacy mode encryption configuration.

## Examples

The following example shows how to define parameters for the Cisco Edge QAM Manager server:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# encryption
Router(config-video-encrypt)# pme cem 172.16.1.163 1024
```

|                         | <b>encrypt</b>                              | Encrypts the virtual carrier group.                                 |
|                         | <b>pme vodsids</b>                          | Configures the VODSID of Cisco Edge QAM Manager server.             |
|                         | <b>pme cem</b>                              | Configures the parameters for the Cisco Edge QAM Manager server.    |
|                         | <b>show cable video encryption pme</b>      | Displays the privacy mode encryption information.                   |
|                         | <b>show cable video encryption linecard</b> | Displays the encryption configuration information of the line card. |

## pme vodsid

To define VODSID of the Cisco Edge QAM Manager server, use the **pme vodsid** command in the encryption configuration mode. To reset to default configuration, use the **no** form of this command.

**pme vodsid** *id*  
**no pme vodsid** *id*

### Syntax Description

|           |                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------|
| <i>id</i> | Specifies the VODSID ID of the Cisco Edge QAM Manager server. The valid range is from 2 to 2147483647. |
|-----------|--------------------------------------------------------------------------------------------------------|

### Command Default

None

### Command Modes

Encryption configuration (config-video-encrypt)

### Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command defines the VODSID for the Cisco Edge QAM Manager server.

### Examples

The following example shows how to define VODSID for the Cisco Edge QAM Manager server:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# encryption
Router(config-video-encrypt)# pme vodsid 111
```

### Related Commands

| Command                                     | Description                                                                       |
|---------------------------------------------|-----------------------------------------------------------------------------------|
| <b>encrypt</b>                              | Encrypts the virtual carrier group.                                               |
| <b>pme cem</b>                              | Configures the parameters for the Cisco Edge QAM Manager server.                  |
| <b>pme mgmt-ip</b>                          | Configures the privacy mode encryption management IP to establish CEM connection. |
| <b>show cable video encryption pme</b>      | Displays the privacy mode encryption information.                                 |
| <b>show cable video encryption linecard</b> | Displays the encryption configuration information of the line card.               |

# policy

To select modems based on the type of service flow that is balanced, use the **policy** command in the config-lb-group configuration mode. To reset the selection, use the **no** form of this command.

**policy** {pcmm | ugs | us-across-ds | pure-ds-load}  
**no policy** {pcmm | ugs | us-across-ds | pure-ds-load}

## Syntax Description

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
| <b>pcmm</b>         | Enables balancing of modems with active PCMM service flows.                                          |
| <b>ugs</b>          | Enables balancing of modems with active UGS service flows.                                           |
| <b>us-across-ds</b> | Sets load balancing on upstream (US) groups across downstream (DS) and DS group methods are ignored. |
| <b>pure-ds-load</b> | Considers DS load and not US load when calculating DS utilization.                                   |

## Command Default

None

## Command Modes

DOCSIS load balancing group mode (config-lb-group)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to select the modems on the CMTS based on the type of service flow that is balanced using the **policy** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# policy
pure-ds-load
Router(config-lb-group)#
```

## Related Commands

| Command                                     | Description                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# power-adjust

To adjust the channel's power level, use the **power-adjust** command in the RF channel sub configuration mode.

**power-adjust** *value*

|                           |                                                                          |
|---------------------------|--------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>value</i> Value for the power level. Valid range is -6.0 to 2.0 dBmV. |
|---------------------------|--------------------------------------------------------------------------|

|                        |       |
|------------------------|-------|
| <b>Command Default</b> | None. |
|------------------------|-------|

|                      |                                                    |
|----------------------|----------------------------------------------------|
| <b>Command Modes</b> | RF channel sub configuration mode (config-rf-chan) |
|----------------------|----------------------------------------------------|

|                         |                                                            |
|-------------------------|------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command is used to adjust the channel's power levels. |
|-------------------------|------------------------------------------------------------|

The following example shows how to change the channel's power level:

```

router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srates Interleaver dcid power output

|                           | <i>frequency</i>                                                               | The maximum frequency for the RF channel.                                        |
| <b>Command Default</b>    | None                                                                           |                                                                                  |
| <b>Command Modes</b>      | Controller sub configuration mode (config-controller).                         |                                                                                  |
| <b>Command History</b>    | <b>Release</b>                                                                 | <b>Modification</b>                                                              |
|                           | IOS XE Fuji 16.7.1                                                             | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |
| <b>Usage Guidelines</b>   | This command is used to configure downstream power tilt for a controller port. |                                                                                  |

The following example shows how to define the base channel power level:

```
router#configure terminal
router(config)#controller Integrated-Cable 3/0/0
router(config-controller)#max-ofdm-spectrum 192000000
router(config-controller)#max-carrier 32
router(config-controller)#base-channel-power 34
router(config-controller)#power-tilt linear 4.0 max-frequency 696000000
router(config-controller)#rf-chan 0 31
router(config-rf-chan)#type DOCSIS
router(config-rf-chan)#frequency 261000000
router(config-rf-chan)#rf-output NORMAL
router(config-rf-chan)#power-adjust -2.0
router(config-rf-chan)#qam-profile 1
router(config-rf-chan)#docsis-channel-id 1
router(config-rf-chan)#exit
router(config-controller)#rf-chan 158
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#docsis-channel-id 159
router(config-rf-chan)#ofdm channel-profile 20 start-frequency 600000000 width 96000000 plc
645000000
```

|                         |                           |                                             |
|-------------------------|---------------------------|---------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>            | <b>Description</b>                          |
|                         | <b>base-channel-power</b> | Sets the base channel power level.          |
|                         | <b>power-adjust</b>       | Adjusts the power levels of the RF channel. |

# prefix

To configure an IPv4 or IPv6 prefix in a source address verification (SAV) group, use the **prefix** command in SAV configuration mode. To disable the use of a configured prefix in a SAV group, use the **no** form of this command.

**prefix** {*ipv4\_prefix/ipv4\_prefix\_length* | *ipv6\_prefix/ipv6\_prefix\_length*}  
**no prefix** {*ipv4\_prefix/ipv4\_prefix\_length* | *ipv6\_prefix/ipv6\_prefix\_length*}

|                           |                           |                                                                                           |
|---------------------------|---------------------------|-------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ipv4_prefix</i>        | IPv4 prefix associated with a particular SAV group, specified in the X.X.X.X/X format.    |
|                           | <i>ipv4_prefix_length</i> | Length of the IPv4 prefix. The valid range is from 0 to 32.                               |
|                           | <i>ipv6_prefix</i>        | IPv6 prefix associated with a particular SAV group, specified in the X:X:X:X::X/X format. |
|                           | <i>ipv6_prefix_length</i> | Length of the IPv6 prefix. The valid range is from 0 to 128.                              |

**Command Default** None

**Command Modes** SAV Configuration (config-sav)

|                        |                |                                                                                   |
|------------------------|----------------|-----------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                               |
|                        | 12.2(33)SCC    | This command was introduced.                                                      |
|                        | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** The **prefix** command is used to configure IPv4 or IPv6 prefixes within a particular SAV groups. The Cisco CMTS uses these prefixes to authenticate a cable modem (CM). A CM may be configured with an IPv4 or IPv6 prefix belonging to a particular SAV group. The time, length, value (TLV) 43.7.2 specifies the prefix associated with the CM. The Cisco CMTS considers a packet from a CM authorized if that packet is sourced with an IP address that belongs to the configured prefix in a SAV group.

A maximum of four prefixes are supported on one SAV group. These prefixes can be either IPv4s, IPv6s, or a combination of both prefixes (maximum up to four)

**Examples** The following example shows how to configure a SAV group with one IPv4 prefixes and one IPv6 prefixes:

```
Router(config)# cable source-verify group sav1
Router(config-sav) # prefix 10.16.0.0/12
Router(config-sav) # prefix 10::/12
Router(config-sav) # exit
```

|                         |                                              |                                |
|-------------------------|----------------------------------------------|--------------------------------|
| <b>Related Commands</b> | <b>Command</b>                               | <b>Description</b>             |
|                         | <b>cable source-verify enable-sav-static</b> | Enables SAV prefix processing. |

| Command                          | Description            |
|----------------------------------|------------------------|
| <b>cable source-verify group</b> | Configures SAV groups. |

# principal

To specify the principal core of the RPD, use the **principal** command in RPD core-interface configuration mode. To void the principal core configuration, use the **no** form of this command.

**principal**

**no principal**

## Command Default

None

## Command Modes

RPD conre-interface configuration (config-rpd-core)

## Command History

| Release                     | Modification                                                                     |
|-----------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the principal core of the RPD.

The following example shows how to specify the principal core of the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# principal
```

## Related Commands

| Command               | Description                               |
|-----------------------|-------------------------------------------|
| <b>core-interface</b> | Configures the core-interface of the RPD. |

# privacy

To create a DOCSIS configuration file that enables and configures the DOCSIS Baseline Privacy Interface (BPI) option, use the **privacy** command in cable config-file configuration mode. To disable BPI for the CM, use the **no** form of this command.

```
privacy grace-time {authorization value | tek value}
privacy timeout {authorize value | operational value | re-authorize value | rekey value}
no privacy grace-time {authorization | tek}
no privacy timeout {authorize | operational | re-authorize | reject | rekey}
```

## Syntax Description

|                                   |                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>authorization</b> <i>value</i> | Authorization grace time in seconds. Valid values are 1 to 1800 seconds. Default value is 600 seconds. |
| <b>tek</b> <i>value</i>           | TEK grace time in seconds. Valid range is 1 to 1800 seconds. Default is 600 seconds.                   |
| <b>authorize</b> <i>value</i>     | Authorize wait timeout in seconds. Valid range is 1 to 30 seconds. Default value is 10 seconds.        |
| <b>operational</b> <i>value</i>   | Operational Wait timeout in seconds. Valid range is 1 to 10 seconds. Default is 1 second.              |
| <b>re-authorize</b> <i>value</i>  | Re-authorize wait timeout in seconds. Valid range is 1 to 20 seconds.                                  |
| <b>reject</b> <i>value</i>        | Authorize reject wait timeout in seconds. Valid range is 1 to 600 seconds. Default is 60 seconds.      |
| <b>rekey</b> <i>value</i>         | Rekey wait timeout in seconds. Valid range is 1 to 10 seconds. Default is 1 second.                    |

## Command Default

None

## Command Modes

Cable config-file configuration

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.1(2)EC1     | This command was introduced.                                                       |
| 12.2(11)BC2    | This command was supported on the Release 12.2 BC train.                           |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Specifying the **privacy** command without any of the keywords and arguments enables BPI encryption and decryption for the CM. In addition to this command, you must also specify the **service-class privacy** command to enable BPI operations on the cable modem.

**Note** The **privacy** command appears and is supported only in images with support for BPI or BPI+ encryption. This option configures the CM for BPI or BPI+ encryption. To use BPI encryption, the Cisco CMTS must also be configured for BPI or BPI+ encryption, using the **cable privacy** command.

## Examples

The following example shows how to set the CM privacy TEK gracetime to 1200 seconds and enables BPI operations for the cable modem.

```
router(config)# cable config-file bpi.cm
router(config-file)# privacy grace-time tek 1200
router(config-file)# service-class 1 privacy

router(config-file)# exit

router(config)#
```

| <b>cable downstream ofdm-chan-profile</b> | Define the OFDM channel profile on the OFDM channel.                 |
| <b>cyclic-prefix</b>                      | Specify the channel cyclic-prefix.                                   |
| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                  |
| <b>interleaver-depth</b>                  | Specify the channel interleaver-depth.                               |
| <b>pilot-scaling</b>                      | Specify the value used to calculate the number of continuous pilots. |
| <b>profile-data</b>                       | Specify default modulation or profile as the channel data profile.   |
| <b>profile-ncp</b>                        | Specify default modulation or profile as the channel ncp profile.    |

| Command                   | Description                                                              |
|---------------------------|--------------------------------------------------------------------------|
| <b>roll-off</b>           | Specify the channel roll-off value.                                      |
| <b>subcarrier-spacing</b> | Specify the spacing for specific subcarriers configured in this profile. |

# profile-data

To specify the data-plane profiles used for data packets, use the **profile-data** command in OFDM channel profile configuration mode. To undo the data-plane profile assignment, use **no** form of this command.

**profile-data** *id*{**modulation-default** *value* | **modulation-profile** *id*}

**no profile-data** *id*

## Syntax Description

|                                        |                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>profile-data</b> <i>id</i>          | Channel data profile ID. Valid range is from 1 to 5.                                                                  |
| <b>modulation-default</b> <i>value</i> | The default modulation. Valid values are 16-QAM, 64-QAM, 128-QAM, 256-QAM, 512-QAM, 1024-QAM, 2048-QAM, and 4096-QAM. |
| <b>modulation-profile</b> <i>id</i>    | Global modulation profile ID.                                                                                         |

## Command Default

None.

## Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the data-plane profiles used for data packets.

## Examples

The following example shows how to specify the data-plane profiles used for data packets:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# profile-data 3 modulation-default 1024-qam
```

| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                   |
| <b>interleaver-depth</b>                  | Specify the channel interleaver-depth.                                |
| <b>pilot-scaling</b>                      | Specify the value used to calculate the number of continuous pilots.  |
| <b>profile-control</b>                    | Specify default modulation or profile as the channel control profile. |
| <b>profile-ncp</b>                        | Specify default modulation or profile as the channel ncp profile.     |

| Command                   | Description                                                              |
|---------------------------|--------------------------------------------------------------------------|
| <b>roll-off</b>           | Specify the channel roll-off value.                                      |
| <b>subcarrier-spacing</b> | Specify the spacing for specific subcarriers configured in this profile. |

# profile-description

To provide a profile description for each profile in the selected cable multicast authorization profile, use the **profile-description** command in multicast authorization profile configuration mode. To remove the profile description, use the **no** form of this command.

**profile-description** *profile-description*  
**no profile-description** *profile-description*

|                           |                            |                                                                                                                   |
|---------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>profile-description</i> | Specifies profile description for the selected profile. You can use up to 128 characters to describe the profile. |
|---------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------|

**Command Default** Profile description is empty.

**Command Modes** Multicast authorization configuration—(config-mauth)

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                                |
|------------------------|----------------|------------------------------------------------------------------------------------|
|                        | 12.2(33)SCC    | This command was introduced.                                                       |
|                        | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command is available only from the cable multicast authorization profile mode.

**Examples** The following example shows how to enter a profile description for a multicast authorization profile name:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable multicast auth profile-name
Router(config)# cable multicast auth profile-name gold
Router(config-mauth)# profile-description gold-configured-may
```

| <b>Related Commands</b> | <b>Command</b>                                             | <b>Description</b>                                                                                                |
|-------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
|                         | <b>cable multicast authorization enable default-action</b> | Enables the cable multicast authorization features.                                                               |
|                         | <b>cable multicast authorization profile-name</b>          | Defines the cable multicast authorization profile.                                                                |
|                         | <b>show cable multicast authorization</b>                  | Displays the list of defined multicast authorization profiles and all CMs associated with corresponding profiles. |
|                         | <b>show running-config interface cable</b>                 | Displays the running configuration for each of the cable interfaces.                                              |

# profile-ncp

To specify the ncp profile, use the **profile-ncp** command in OFDM channel profile configuration mode. To undo the ncp profile assignment, use **no** form of this command.

**profile-ncp** {**modulation-default** *value* | **modulation-profile** *id*}

**no profile-ncp**

## Syntax Description

|                                        |                                                                    |
|----------------------------------------|--------------------------------------------------------------------|
| <b>modulation-default</b> <i>value</i> | The default modulation. Valid values are QPSK, 16-QAM, and 64-QAM. |
| <b>modulation-profile</b> <i>id</i>    | Global modulation profile ID.                                      |

## Command Default

None.

## Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the ncp profile.

## Examples

The following example shows how to specify the ncp profile:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# profile-ncp modulation-default qpsk
```

## Related Commands

| Command                                   | Description                                                              |
|-------------------------------------------|--------------------------------------------------------------------------|
| <b>cable downstream ofdm-chan-profile</b> | Define the OFDM channel profile on the OFDM channel.                     |
| <b>cyclic-prefix</b>                      | Specify the channel cyclic-prefix.                                       |
| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                      |
| <b>interleaver-depth</b>                  | Specify the channel interleaver-depth.                                   |
| <b>pilot-scaling</b>                      | Specify the value used to calculate the number of continuous pilots.     |
| <b>profile-control</b>                    | Specify default modulation or profile as the channel control profile.    |
| <b>profile-data</b>                       | Specify default modulation or profile as the channel data profile.       |
| <b>roll-off</b>                           | Specify the channel roll-off value.                                      |
| <b>subcarrier-spacing</b>                 | Specify the spacing for specific subcarriers configured in this profile. |

# protect-tunnel

To configure a Downstream External PHY Interface (DEPI) tunnel for the protect cable interface line card on a Cisco CMTS router, use the **protect-tunnel** command in global configuration mode. To disable this configuration, use the **no** form of this command.

**protect-tunnel** *protect-depi-tunnel-name*  
**no protect-tunnel** *protect-depi-tunnel-name*

|                            |                                                                                                                                               |                            |                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------|
| <b>Syntax Description</b>  | <table border="1"> <tr> <td><i>protect-tunnel-name</i></td><td>DEPI tunnel name for the protect cable interface line card.</td></tr> </table> | <i>protect-tunnel-name</i> | DEPI tunnel name for the protect cable interface line card. |
| <i>protect-tunnel-name</i> | DEPI tunnel name for the protect cable interface line card.                                                                                   |                            |                                                             |

**Command Default** The N+1 DEPI redundancy feature is disabled.

**Command Modes** Global configuration (config)

| <b>Command History</b> | Release        | Modification                                                                       |
|------------------------|----------------|------------------------------------------------------------------------------------|
|                        | 12.2(33)SCE    | This command was introduced.                                                       |
|                        | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** The protect tunnel must be explicitly configured. The working tunnel and the protect tunnel are configured using the same **depi-tunnel** command. The protect tunnel inherits L2TP class and DEPI class parameters from the working tunnel. When you configure the protect tunnel and specify the destination IP address for the protect tunnel, the protect tunnel inherits the QAM channel parameters specified for the working tunnel.

**Examples** The following example shows how to configure a DEPI tunnel for the protect cable interface line card on the Cisco uBR10012 router:

```
Router> enable
Router# configure terminal
Router(config)# depi-tunnel protect1
Router(config-depi-tunnel)# dest-ip 192.0.2.103
Router(config-depi-tunnel)# exit
Router(config)# depi-tunnel depi-tunnel working1
Router(config-depi-tunnel)# protect-tunnel protect1
Router(config-depi-tunnel)# end
```

| <b>Related Commands</b> | Command            | Description                                                  |
|-------------------------|--------------------|--------------------------------------------------------------|
|                         | <b>depi-tunnel</b> | Specifies a template for DEPI tunnel configuration settings. |

# protocol

To specify the protocol used in the logical edge device, use the **protocol** command in logical edge device configuration mode. To undo the protocol assignment, use the **no** form of this command.

```
protocol {GQI | table-based}
no protocol {GQI | table-based}
```

## Command Default

None.

## Command Modes

Logical edge device configuration mode (config-video-led)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command specifies the protocol.

## Examples

The following example shows how to specify the protocol:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# logical-edge-device vod id 1
Router(config-video-led)# protocol table-based
```

## Related Commands

| Command                                     | Description                                   |
|---------------------------------------------|-----------------------------------------------|
| <b>logical-edge-device</b>                  | Defines a logical edge device.                |
| <b>show cable video logical-edge-device</b> | Displays the logical edge device information. |

# provider-name

To specify the provider name as part of the service descriptor, use the **provider-name** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

**provider-name** *string*

|                    |                                            |
|--------------------|--------------------------------------------|
| Syntax Description | <i>string</i> Specifies the provider name. |
|--------------------|--------------------------------------------|

|                 |       |
|-----------------|-------|
| Command Default | None. |
|-----------------|-------|

|               |                                                                |
|---------------|----------------------------------------------------------------|
| Command Modes | Service descriptor configuration mode (config-video-serv-desc) |
|---------------|----------------------------------------------------------------|

| Command History | Release                         | Modification                                                                     |
|-----------------|---------------------------------|----------------------------------------------------------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to specify the provider name:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-descriptor-default
router(config-video-serv-desc)#provider-name test
```

| Related Commands | Command                    | Description                                                                     |
|------------------|----------------------------|---------------------------------------------------------------------------------|
|                  | serving-area               | Configures the serving area which enables the set tops to discover VOD content. |
|                  | service-descriptor-default | Enables the operator to specify the default values for the service descriptor.  |

# psi-interval

To override the default PSI value, use the **psi-interval** command in the service distribution group configuration mode. To revert back to the default psi-interval value, use the **no** form of the command.

**psi-interval** *number*

|                           |                                                   |
|---------------------------|---------------------------------------------------|
| <b>Syntax Description</b> | <i>number</i> Defines the new psi-interval value. |
|---------------------------|---------------------------------------------------|

|                        |       |
|------------------------|-------|
| <b>Command Default</b> | None. |
|------------------------|-------|

|                      |                                                                  |
|----------------------|------------------------------------------------------------------|
| <b>Command Modes</b> | Service distribution group configuration mode (config-video-sdg) |
|----------------------|------------------------------------------------------------------|

| Release                      | Modification                                                                     |
|------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

|                         |                                                                  |
|-------------------------|------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command is used to override the default psi-interval value. |
|-------------------------|------------------------------------------------------------------|

The following example shows how to override the default psi-interval:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdg id 1
router(config-video-sdg)#psi-interval 250
```

| Related Commands | Command                                            | Description                                                       |

|                  | <b>service-distribution-group</b>                  | Defines a service distribution group.                             |
|                  | <b>rf-port integrated-cable</b>                    | Defines the physical slot/bay/port to be used in a video service. |
|                  | <b>onid</b>                                        | Override the default ONID.                                        |
|                  | <b>show cable video service-distribution-group</b> | Displays the SDG configuration.                                   |

# show ptp clock running

To display the PTP clock, use the **show ptp clock running** command.

**show ptp clock running**

|                  |                                                    |                                                                                  |
|------------------|----------------------------------------------------|----------------------------------------------------------------------------------|
| Command Default  |                                                    |                                                                                  |
| Command Modes    |                                                    |                                                                                  |
| Command History  | Release                                            | Modification                                                                     |
|                  | Cisco IOS XE 16.8.x                                | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |
| Usage Guidelines | Use this command to display the running PTP clock. |                                                                                  |

The following example shows how to display the PTP clock.

```
router# show ptp clock running
PTP Ordinary Clock [Domain 55]
State Ports Pkts sent Pkts rcvd Redundancy
Mode
PHASE_ALIGNED 1 68938 138822 Hot standby
PORT SUMMARY
PTP Master
Name Tx Mode Role Transport State Sessions
Port Addr
slave-from-903 unicast slave Lo1588 Slave 1
10.90.3.93
```

## pxf-fail-switchover-trap enable

To enable the sending of ciscoRFSwactNotif trap which is encoded with extended switchover, that indicates the Toaster SEU error triggered PRE switchover, use the **pxf-fail-switchover-trap enable** command in the redundancy configuration mode.

**Note** This command is a hidden command.

### pxf-fail-switchover-trap enable

**Syntax Description** This command has no keywords or arguments.

**Command Default** None.

**Command Modes** Redundancy configuration mode (config-red)

| Command History | Release      | Modification                                          |
|-----------------|--------------|-------------------------------------------------------|
|                 | 12.2(33)SCJ1 | This command was introduced in Cisco uBR10012 router. |

**Usage Guidelines** Before configuring ciscoRFSwactNotif trap, use **snmp-server enable traps rf** to enable the sending of ciscoRFSwactNotif trap for cable related events.

The following example shows how to enable to send the extended switchover reason (uses private switchover reason 100) of ciscoRFSwactNotif trap:

```
router#configure terminal
router(config)#redundancy
router(config-red)#pxf-fail-switchover-trap enable
```

You need to notice the extended switchover reason is a private value (100), which is not ciscoRFSwactNotif trap standard value, the trap receive utility in customer side may need to be updated in order to understand the private switchover reason(100). The extended switchover reason will be sent out after PRE switchover when old active PRE boots up.

## qos-profile enforced

To specify a quality-of-service (QoS) profile that should be enforced when users violate their registered QoS profiles, use the **qos-profile enforced** command in enforce-rule configuration mode. To delete the enforced QoS profile from the enforce-rule, use the **no** form of this command.

**qos-profile enforced** *profile-id* [**no-persistence**]  
**no qos-profile enforced** *profile-id* [**no-persistence**]

### Syntax Description

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>profile-id</i>     | Specifies the QoS profile to be enforced. The valid range is 0 to 16383, with a default of 0.                                                                                                                                                                                                                                                                                                                                |
| <b>no-persistence</b> | (Optional) Specifies that the enforced QoS profile should not remain in force when a cable modem reboots. Instead, when a cable modem that is in the penalty period reboots, it is automatically removed from the penalty period and assigned the QoS profile that is specified in its DOCSIS configuration file.<br><br>The default behavior is that enforced QoS profiles remain in force for cable modems across reboots. |

### Command Default

The value of *profile-id* defaults to 0, and enforced QoS profiles are persistent across cable modem reboots.

### Command Modes

Enforce-rule configuration (enforce-rule)

### Command History

| Release        | Modification                                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------|

| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                 |
| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                  |

### Usage Guidelines

Both the originally provisioned QoS profile and the enforced QoS profile must be created on the Cisco CMTS router. The *profile-id* does not support QoS profiles that are created by the cable modem.

An enforce-rule can specify an enforced QoS profile, which is automatically applied to subscribers who transmit more traffic than allowed by their registered QoS profile. The enforced QoS profile remains in effect during the penalty time period (see the **penalty-period** command). At the end of the penalty period, the subscriber returns to the registered QoS profile.

If a cable modem reboots while it is in its penalty time period, it continues using the enforced QoS profile, unless the service provider has manually changed the cable modem's registered QoS profile using the **cable modem qos profile** command.

When you change the enforced QoS profile for a currently active enforce-rule, any cable modems using this rule that are currently in the penalty period continue using the previously configured enforced QoS profile. Any cable modems that enter the penalty period after this configuration change, however, use the new enforced QoS profile.

An enforced QoS profile must already have been created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message.

When the **no-persistence** option is specified, the enforced QoS profile is still automatically applied to subscribers who violate their bandwidth requirements. However, when the cable modem reboots, the Cisco CMTS router allows the cable modem to use the QoS profile that is specified in its DOCSIS configuration file.

The **no-persistence** option can be used when initially using the Subscriber Traffic Management feature to identify potential problem applications and users. When repeat offenders are identified, they can then be assigned enforce-rules that do not use the **no-persistence** option, so that they remain in the penalty period even if they reboot their cable modems.

**Note** The system automatically applies the enforced QoS profile to violators only if the **enforce** keyword has been used with the **activate-rule-at-byte-count** command.

## Examples

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# qos-profile enforced 12
```

The following example shows profile 12 being assigned as the enforced QoS profile to an enforce-rule, but with the **no-persistence** option specified, so that the enforced QoS profile does not remain in force if the cable modem reboots:

```
Router# configure terminal
Router(config)# cable qos enforce-rule residential
Router(enforce-rule)# qos-profile enforced 12 no-persistence
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# qos-profile enforced 98
```

The qos profile 98 doesn't exist or it's a cm created QoS profile

# qos-profile registered

To specify the registered quality of service (QoS) profile that should be used for this enforce-rule, use the **qos-profile registered** command in enforce-rule configuration mode. To remove the registered QoS profile from the enforce-rule, use the **no** form of this command.

**qos-profile registered** *profile-id*  
**no qos-profile registered** *profile-id*

## Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>profile-id</i> | Specifies the QoS profile to be monitored. This profile must be created on the Cisco CMTS router. If you want to manage a cable modem that uses a modem-created QoS profile, you must first create that exact QoS profile on the CMTS router before using this command. The valid range is 0 to 16383, with a default of 0. |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

The default profile ID is 0.

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

| Release        | Modification                                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------|

| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                  |

## Usage Guidelines

You must specify a registered QoS profile for each enforce-rule. The Cisco CMTS router then uses the registered profile ID to match subscribers' service flows to the proper enforce-rules.

When you change the registered QoS profile for an active rule, the cable modems that had been using the previous registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Instead, the rule begins managing those cable modems that use the new registered QoS profile.

### Note

The registered QoS profile must be created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message. If you want to manage a cable modem that is currently using a modem-created QoS profile, you must first manually create a new QoS profile on the CMTS router that has the same QoS parameters as the modem-created profile. Then allow the modem to come online using the manually created profile, before using the **qos-profile registered** command.

## Examples

The following example shows profile 50 being assigned as the registered QoS profile to an enforce-rule:

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule enforce-rule
Router(enforce-rule)# qos-profile registered 50
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
```

```
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# qos-profile registered 99
```

The qos profile 99 doesn't exist or it's a cm created QoS profile

| <b>show cable qos enforce-rule</b>       | Displays the QoS enforce-rules that are currently defined.                                                                                |
| <b>show cable subscriber-usage</b>       | Displays subscribers who are violating their registered QoS profiles.                                                                     |

# qam-profile

To define the QAM profile number, use the **qam-profile** command in the RF channel sub configuration mode.

**qam-profile** *value*

## Syntax Description

*value* Value for the QAM profile. The QAM profiles are defined before they are associated with rf-channels. Valid range is 0 to 31.

- QAM profile ID 0 to 5
- System defined 6 to 31

Once defined, the rf-channel associated with that profile must match the correct qam-profile type. For instance, qam-profile 4 is defined for video, and may be used with rf-channels of type VIDEO.

## Command Default

None.

## Command Modes

RF channel sub configuration mode (config-rf-chan)

## Usage Guidelines

This command is used to define the QAM profile number.

The following example shows how to define the QAM profile number:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#type video
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#power-adjust 0
router(config-rf-chan)#qam-profile 4
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srates Interleaver dcid power output
 5 TEST UP 723000000 VIDEO B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 VIDEO B 256 5361 I32-J4 169 34 ALT
```

| <b>Syntax Description</b> | <i>configuration_id</i> Specifies the ID of the R-DTI configuration previously created. |
|---------------------------|-----------------------------------------------------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                |
|----------------------|--------------------------------|
| <b>Command Modes</b> | RPD configuration (config-rpd) |
|----------------------|--------------------------------|

| Command History | Release                     | Modification                                                                     |
|-----------------|-----------------------------|----------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

|                         |                                                         |
|-------------------------|---------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to specify the R-DTI configuration ID. |
|-------------------------|---------------------------------------------------------|

The following example shows how to specify the R-DTI configuration ID:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# r-dti 1
```

# rcp-id

To assign a receive channel profile (RCP) ID to a receive channel configuration (RCC) template, use the **rcp-id** command in RCC template configuration mode. To remove the RCP ID, use the **no** form of this command.

**rcp-id** *rcp-id*  
**no rcp-id** *rcp-id*

## Syntax Description

|               |                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------|
| <i>rcp-id</i> | Specifies an RCP ID for the RCC template. The valid range is from 00 00 00 00 00 to FF FF FF FF. |
|---------------|--------------------------------------------------------------------------------------------------|

## Command Default

By default the RCP ID is set to 00 00 00 00 00. However, you must change the default value to a non-zero RCP ID.

## Command Modes

RCC template configuration (config-rcc-template)

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 12.2(33)SCB | This command was introduced. |

## Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry.

First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

## Examples

The following example shows how to assign an RCP ID to an RCC template:

```
Router# configure terminal
Router(config)# cable rcc-template
1
Router(config-rcc-template)# rcp-id 00 10 00 00 03
```

## Related Commands

| Command                | Description                                                       |
|------------------------|-------------------------------------------------------------------|
| <b>rcp-id</b>          | Specifies an ID for the receive channel profile.                  |
| <b>receive-module</b>  | Specifies a receive module entry in the form of a numeric value.  |
| <b>receive-channel</b> | Specifies a receive channel entry in the form of a numeric value. |

# receive-channel

To associate a receive channel to a receive module (RC), use the **receive-channel** command in RCC template configuration mode. To restore the default value, use the **no** form of this command.

**receive-channel** *index* **center-frequency** *Hz* **connected-receive-module** *index* [**primary**]  
**no receive-channel** *index* **center-frequency** *Hz* **connected-receive-module** *index*

## Syntax Description

|                                 |                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>index</i>                    | Specifies the index value for the receive channel. The valid range is 1 to 10.                                                  |
| <b>center-frequency</b>         | Specifies the center frequency for the receive channel.                                                                         |
| <i>Hz</i>                       | Specifies the center frequency value in Hz. The valid range is 55000000-858000000.                                              |
| <b>connected-receive-module</b> | Specifies a nested receive module in the RCC template.<br>Generally, only one receive module is configured for an RCC template. |
| <i>index</i>                    | Specifies the index value for the connected receive module. The valid range is 1 to 10.                                         |
| <b>primary</b>                  | (Optional) Indicates that it is a CM primary channel and an RCC can be derived from this channel.                               |

## Command Default

None

## Command Modes

RCC template configuration (config-rcc-template)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry. First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

An RCC template configures the physical layer components described by an RCP, including receive modules and receive channels to specific downstream frequencies, and specifies the interconnections among receive modules or between receive modules and receive channels.

A receive module can include multiple receive channels. So we need to specify which receive channel belongs to which receive module.

## Examples

The following example shows how to associate a receive channel to a receive module:

```
Router# configure terminal
```

```
Router(config)# cable rcc-template
1
Router(config-rcc-template)# rcp-id 00 10 00 00 03
Router(config-rcc-template)# receive-module 1 first-channel-center-frequency 555000000
Router(config-rcc-template)# receive-channel 1 center-frequency 555000000
connected-receive-module 1 primary
Router(config-rcc-template)# receive-channel 2 center-frequency 561000000
connected-receive-module 1
```

**Related Commands**

## Usage Guidelines

A valid RCC template consists of a configured RCP ID, a receive module (RM) entry, and a receive channel (RC) entry. First, you define an RCC template for an RCP, and then assign the template to a cable interface to generate RCCs based on the actual DS channel configuration.

An RCC template configures the physical layer components described by an RCP, including receive modules and receive channels to specific downstream frequencies, and specifies the interconnections among receive modules or between receive modules and receive channels.

A receive module can include multiple receive channels. So we need to specify which receive channel belongs to which receive module.

## Examples

The following example shows how to associate a receive module to an RCC template:

```
Router# configure terminal
```

```
Router(config)# cable rcc-template
1
Router(config-rcc-template)# rcp-id 00 10 00 00 03
Router(config-rcc-template)# receive-module 1 first-channel-center-frequency 555000000
Router(config-rcc-template)# receive-channel 1 center-frequency 555000000
connected-receive-module 1 primary
Router(config-rcc-template)# receive-channel 2 center-frequency 561000000
connected-receive-module 1
```

# redundancy

To configure line card redundancy, use the **redundancy** command in global configuration mode.

## redundancy

### Syntax Description

This command has no arguments or keywords.

### Command Default

None.

### Command Modes

Global configuration (config)

### Command History

| Release                | Modification                                                                     |
|------------------------|----------------------------------------------------------------------------------|
| IOS-XE Release 3.16.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Use the **redundancy** command to enter the redundancy configuration mode.

### Examples

The following example shows how to configure line card redundancy:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# description RedundancyGroup0
Router(config-red-lc)# class 1:N
Router(config-red-lc)# revertive 60
Router(config-red-lc)# member slot 1 primary
Router(config-red-lc)# member slot 0 secondary
```

|---------------------------------------|-----------------------------------------------|
| <b>linecard-group internal-switch</b> | Creates a line card group for the line card.  |
| <b>description</b>                    | Adds a description to the line card group.    |
| <b>class</b>                          | Configures redundancy class on the line card. |

# redundancy force-failover main-cpu

To force a switchover, so that the standby Performance Routing Engine (PRE1) module becomes the active PRE1 module, use the **redundancy force-failover main-cpu** command in privileged EXEC mode.

**redundancy force-failover main-cpu**

**Syntax Description** This command has no keywords or arguments.

**Command Default** None

**Command Modes** Privileged EXEC (#)

| Command History | Release        | Modification                                                                                                    |
|-----------------|----------------|-----------------------------------------------------------------------------------------------------------------|
|                 | 12.2(4)XF1     | This command was introduced for the Cisco uBR10012 router.                                                      |
|                 | 12.2(11)BC3    | The active PRE1 module checks to see if a switchover is currently in progress before implementing this command. |
|                 | 12.3(21)BC     | This command is replaced by the <b>redundancy switch-activity</b> command.                                      |
|                 | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                              |
|                 |                |                                                                                                                 |

**Usage Guidelines** The **redundancy force-failover main-cpu** command initiates a manual switchover, so that the standby PRE1 module becomes the active PRE1 module and assumes full responsibilities for router operations. This command requires that both PRE1 modules are running a Cisco IOS software image that supports the Route Processor Redundancy (RPR) feature.

**Note** The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

A manual switchover is typically done for one of the following reasons:

- You want to upgrade or replace the active PRE1 module.
- You have upgraded the Cisco IOS software on the standby PRE1 module and want the standby PRE1 module to begin using the new software image. This also allows you to upgrade the software on the former active PRE1 module without interrupting systems operations.
- You want to test switchover operation on the system.

A switchover can also be manually initiated by removing the active PRE1 module from the chassis, but using the **redundancy force-failover main-cpu** command provides a more graceful switchover, without generating hardware alarms.

**Tip** Do not perform a switchover immediately after you change the configuration and save it to the NVRAM. Instead, wait a few minutes to allow the two PRE1 modules to synchronize the new configuration, and then perform the switchover.

**Tip** Wait two to three minutes after a switchover before switching the system back to the original PRE1 module, so as to allow the system to stabilize and so that both PRE1 modules are ready for the switch. In Cisco IOS Release 12.2(11)BC3 and later releases, the active PRE1 module will not initiate a new switchover until a current switchover is complete and the system has stabilized.

## Examples

The following example shows a switchover being manually initiated:

```
Router# redundancy force-failover main-cpu

Proceed with switchover to standby PRE? [confirm] y
```

**Note** Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the current active PRE1 module.

The following example shows a switchover being attempted but failing because the standby PRE1 module is either not ready, not available, or not installed:

```
Router# redundancy force-failover main-cpu

Proceed with switchover to standby PRE? [confirm]
Standby PRE not ready, switchover aborted.
Router#
```

**Note** In some versions of Cisco IOS software, a failed software switchover will show the following message:  
Unable to communicate with standby PRE, switchover aborted.

## Related Commands

| Command                           | Description                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------|
| <b>associate</b>                  | Associates two line cards for Automatic Protection Switching (APS) redundancy protection.      |
| <b>redundancy</b>                 | Enters redundancy configuration mode so that the synchronization parameters can be configured. |
| <b>redundancy reload</b>          | Resets the standby PRE1 module, or to reset both the active and standby PRE1 modules.          |
| <b>redundancy switch-activity</b> | Forces a switchover to the standby PRE module.                                                 |

# redundancy force-switchover main-cpu

To force a standby Performance Routing Engine (PRE) to assume the role of an active PRE, use the **redundancy force-switchover main-cpu** command in privileged EXEC mode.

**redundancy force-switchover main-cpu**

**Syntax Description** None

**Command Default** None

**Command Modes** Privileged EXEC (#)

| Command History | Release        | Modification                                                                       |
|-----------------|----------------|------------------------------------------------------------------------------------|
|                 | 12.2(33)SCB    | This command was introduced.                                                       |
|                 | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** Before using this command, install the Cisco IOS software image (to ensure high availability), and configure the Route Processor Redundancy (RPR) mode on both the PRE modules.

**Note** The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

**Note** We recommend you use the **redundancy force-switchover main-cpu** command only on the active PRE module. The active PRE crashes used on the standby PRE.

## Examples

The following example shows a manual switchover:

```
Router# redundancy force-switchover main-cpu
Proceed with switchover to standby PRE? [confirm] y
Preparing to Switch Activity
```

**Note** Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the currently active PRE module.

The following example shows a switchover being attempted but failing because the standby PRE module is either not ready, not available, or not installed:

```
Router# redundancy force-switchover main-cpu

Proceed with switchover to standby PRE? [confirm] n

Standby PRE not ready, switchover aborted.

Router#
```

# redundancy linecard-group

To trigger a switchover from the working line card to the protect line card, or to revert from the protect line card to the working line card on the Cisco uBR10012 and Cisco cBR series routers, use the **redundancy linecard-group** command in privileged EXEC mode.

**redundancy linecard-group** {**lockout** | **resync** | **revertback** | **switchover from** | **unlockout**} **slot/subslot**  
 Cisco cBR Series Converged Broadband Routers  
**redundancy linecard-group switchover from** *slot*

## Syntax Description

|                        |                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>lockout</b>         | Locks a line card switchover from the specified working slot and subslot.                                                                                                                                                                                                                                                                                     |
| <b>resync</b>          | Specifies static synchronization from the working line card to the protect line card.                                                                                                                                                                                                                                                                         |
| <b>revertback</b>      | Reverts from the protect line card to the working line card.                                                                                                                                                                                                                                                                                                  |
| <b>switchover from</b> | Triggers a switchover from the working line card to the protect line card.                                                                                                                                                                                                                                                                                    |
| <i>slot</i>            | (Cisco cBR series routers) Slot number of the interface card. The range is from 0 to 3 and 6 to 9 on the Cisco cBR-8 router.                                                                                                                                                                                                                                  |
| <b>unlockout</b>       | Removes the switchover lockout from the specified working slot and subslot.                                                                                                                                                                                                                                                                                   |
| <i>slot / subslot</i>  | (Cisco uBR10012 router) Specifies the cable interface line card. <ul style="list-style-type: none"> <li><i>slot</i>—Chassis slot number of the cable interface line card. The valid range is from 5 to 8.</li> <li><i>subslot</i>—(Cisco uBR10012 router only) Secondary slot number of the cable interface line card. Valid subslots are 0 and 1.</li> </ul> |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                                                                                                                                     |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC    | This command was introduced.                                                                                                                                                                     |
| 12.2(33)SCE    | This command was modified. A new keyword, <b>resync</b> , was added to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card. |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>lockout</b> , <b>resync</b> , <b>revertback</b> , and <b>unlockout</b> keywords were removed.           |

## Usage Guidelines

The **redundancy linecard-group** command is supported only on the Cisco uBR10012 and Cisco cBR series routers.

When the normal (system initiated) static line card synchronization fails, use the **redundancy linecard-group** command with the **resync** keyword to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card.

## Examples

The following example shows how to lock a line card switchover from slot 5 and subslot 0 on the Cisco uBR10012 router using the **redundancy linecard-group** command with the **lockout** keyword:

```
Router# redundancy linecard-group lockout 5/0
HCCP LC: 5/0 Working will be locked out, this operation will prevent all kinds of switchover.
```

The following example shows how to remove the switchover lockout from slot 5 and subslot 0 on the Cisco uBR10012 router using the **redundancy linecard-group** command with the **unlockout** keyword:

```
Router# redundancy linecard-group unlockout 5/0
```

The following example shows how to enable the Cisco uBR10012 router to perform a manual synchronization from the working line card to the protect line card using the **redundancy linecard-group** command with the **resync** keyword:

```
Router# redundancy linecard-group resync 5/0

| <b>show hccp</b>           | (Not for Cisco cBR Series Routers)<br>Displays Hot Standby Connection-to-Connection Protocol (HCCP) group information for a specific cable interface.                      |
| <b>show hccp interface</b> | (Not for Cisco cBR Series Routers)<br>Displays group information for a specific cable interface on which one or more groups and authentication modes have been configured. |
| <b>show hccp linecard</b>  | (Not for Cisco cBR Series Routers)<br>Displays information about HCCP groups associated with a line card.                                                                  |

# redundancy reload

To manually reload a standby Route Processor (RP) module, use the **redundancy reload** command in privileged EXEC mode.

**redundancy reload** {peer | shelf}

## Syntax Description

|              |                                                                     |
|--------------|---------------------------------------------------------------------|
| <b>peer</b>  | Reloads only the standby PRE1 module or Supervisor card.            |
| <b>shelf</b> | Reloads both the active and standby PRE1 module or Supervisor card. |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                                                                   |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| 12.2(4)XF1     | This command was introduced for the Cisco uBR10012 router.                                                                     |
| 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                                     |
| 12.2(33)SCA    | This command was removed from Cisco IOS Release 12.2(33)SCA. It is replaced by the <b>hw-module standby-cpu reset</b> command. |
| 12.2(44)SQ     | This command was integrated into Cisco IOS Release 12.2(44)SQ. Support for the Cisco RF Gateway 10 was added.                  |
| 15.2(4)M       | This command was introduced.                                                                                                   |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                             |

## Usage Guidelines

The **redundancy reload peer** command is used to reset the standby RP module when there are any failures, tracebacks, or functionality and behavior mismatches on either one or both active and standby RP modules.

This command does not have an impact on active device operations, assuming a switchover is not required while the standby module is resetting.

The **redundancy reload shelf** command reloads the Cisco IOS software on both the active and standby RP modules. This command interrupts services on the router until all the RP modules and the line cards initialize and come back online.

## Examples

The following example shows how to manually reload the standby RP module:

```
Router# redundancy reload peer
Reload peer? [confirm] y

Preparing to reload peer
```

**Note** Pressing **enter** or **y** begins the reload. Pressing any other key cancels the reload and returns control to the active RP module.

The following is sample output when a standby RP module is not installed on a router:

```
Router# redundancy reload peer
System is running in SIMPLEX mode, reload anyway? [confirm] n

Peer reload not performed.
```

The following example shows how to reload all RP modules:

```
Router# redundancy reload shelf
Reload the entire shelf [confirm] y

Preparing to reload entire shelf
```

**Note** Pressing **enter** or **y** begins the reload. Pressing any other key cancels the reload and returns control to the current active PRE1 module.

### Cisco RF Gateway 10

The following example shows the system response when a standby Supervisor card is not installed in the Cisco RFGW-10:

```
Switch# redundancy reload peer
System is running in SIMPLEX mode, reload anyway? [confirm] n

Peer reload not performed.
```

The following example shows how to reload both Supervisor cards on the Cisco RFGW-10:

```
Switch# redundancy reload shelf
Reload the entire shelf [confirm] y

Preparing to reload entire shelf
```

**Note** Pressing **Enter** or **y** confirms the action and begins the reload of both cards. Pressing any other key cancels the reload and returns control to the current active Supervisor card.

### Related Commands

| Command               | Description                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------|
| <b>associate slot</b> | Associates slots for APS processor redundancy.                                                 |
| <b>redundancy</b>     | Enters redundancy configuration mode so that the synchronization parameters can be configured. |

| Command                                   | Description                                                                      |
|-------------------------------------------|----------------------------------------------------------------------------------|
| <b>redundancy force-failover main-cpu</b> | Forces a switchover, so that the standby RP module becomes the active RP module. |
| <b>redundancy switch-activity</b>         | Forces a switchover to the standby RP module.                                    |

# redundancy switch-activity

To force a switchover to the standby PRE module, use the **redundancy switch-activity** command in privileged EXEC mode.

**Note** The terms failover and switchover are interchangeable, but switchover is the term used across all Cisco platforms capable of high-availability operation.

## redundancy switch-activity [force]

|                           |                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>force</b> (Optional) Forces a switchover immediately, overriding any checks in the code or configuration that might prevent or delay a switchover. |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

**Command Default** None

**Command Modes** Privileged EXEC

| <b>Command History</b> | Release        | Modification                                                                       |
|------------------------|----------------|------------------------------------------------------------------------------------|
|                        | 12.2(4)XF1     | This command was introduced for the Cisco uBR10012 router.                         |
|                        | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** The **redundancy switch-activity** command is similar to the **redundancy force-failover main-cpu** command, except that it includes an option to force the switchover, overriding any configuration checks or other checks in the software that could prevent the switchover. In all cases, this command verifies that the standby PRE module is available and capable of performing the switchover before it transfers control to that PRE module. This command also synchronizes the current running-config and client data before initiating the switchover.

## Examples

The following example shows a switchover being manually initiated, overriding any checks that might prevent or delay the switchover:

```
Router# redundancy switch-activity force
Proceed with switchover to standby PRE? [confirm] y
```

**Note** Pressing **enter** or **y** confirms the action and begins the switchover. Pressing any other key cancels the switchover and returns control to the current active PRE1 module.

|-------------------------|------------------|-------------------------------------------------------------------------------------------|
|                         | <b>associate</b> | Associates two line cards for Automatic Protection Switching (APS) redundancy protection. |

| Command                                       | Description                                                                                                       |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>redundancy</b>                             | Enters redundancy configuration mode so that the synchronization parameters can be configured.                    |
| <b>redundancy reload</b>                      | Resets the standby PRE1 module or to reset both the active and standby PRE1 modules.                              |
| <b>redundancy force-failover<br/>main-cpu</b> | Forces a switchover, so that the standby Performance Routing Engine (PRE1) module becomes the active PRE1 module. |

# registered qos-profile

**Note** Effective with Cisco IOS Release 12.3(9a)BC, the **registered qos-profile** command is replaced by the **qos-profile registered** command.

To specify the registered quality of service (QoS) profile that should be used for this enforce-rule, use the **registered qos-profile** command in enforce-rule configuration mode. To remove the registered QoS profile from the enforce-rule, use the **no** form of this command.

**registered qos-profile** *profile-id*  
**no registered qos-profile** *profile-id*

## Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>profile-id</i> | Specifies the QoS profile to be monitored. This profile must be created on the Cisco CMTS router. If you want to manage a cable modem that uses a modem-created QoS profile, you must first create that exact QoS profile on the CMTS router before using this command. The range is 0 to 16383. The default of 0. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

The default profile ID is 0.

## Command Modes

Enforce-rule configuration (enforce-rule)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(15)BC1    | This command was introduced.                                                       |
| 12.3(9a)BC     | This command was replaced by the <b>qos-profile registered</b> command.            |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

You must specify a registered QoS profile for each enforce-rule. The Cisco CMTS router then uses the registered profile ID to match subscribers' service flows to the proper enforce-rules.

When you change the registered QoS profile for an active rule, the cable modems that had been using the previous registered QoS profile are no longer managed by the Subscriber Traffic Management feature. Instead, the rule begins managing those cable modems that use the new registered QoS profile.

**Note** The registered QoS profile must be created on the Cisco CMTS router before you can assign it to an enforce-rule. If the rule does not exist, the system displays an error message. If you want to manage a CM that is using a CM-created QoS profile, you must first create a QoS profile on the Cisco CMTS router that matches the CM-created profile exactly. Then use the **registered qos-profile** command to assign that profile to this enforce-rule.

## Examples

The following example shows profile 50 being assigned as the registered QoS profile to an enforce-rule:

```
Router# configure terminal
Router(config)# cable qos enforce-rule enforce-rule
Router(enforce-rule)# registered qos-profile 50
```

The following example shows the error message that is displayed when the specified QoS profile does not exist on the CMTS:

```
Router# configure terminal
Router(config)# cable qos enforce-rule test
Router(enforce-rule)# registered qos-profile 99
```

The qos profile 99 doesn't exist or it's a cm created QoS profile

## Related Commands

| Command                            | Description                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>activate-rule at-byte-count</b> | Specifies the number of bytes that a subscriber can transmit during the monitoring period on a Cisco CMTS router.                         |
| <b>cable qos enforce-rule</b>      | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode. |
| <b>duration</b>                    | Specifies the time period and sample rate to be used for monitoring subscribers.                                                          |
| <b>enabled (enforce-rule)</b>      | Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.                                                |
| <b>penalty-period</b>              | Specifies the time period that an enforced QoS profile should be in effect for subscribers that violate their registered QoS profiles.    |
| <b>qos-profile enforced</b>        | Specifies a QoS profile that should be enforced when users violate their registered QoS profiles.                                         |
| <b>show cable qos enforce-rule</b> | Displays the QoS enforce-rules that are currently defined.                                                                                |
| <b>show cable subscriber-usage</b> | Displays subscribers who are violating their registered QoS profiles.                                                                     |

## remap pid vcg

To configure custom PID remapping, use the **remap pid vcg** command in video configuration mode. PID remapping enables you to specify remap rules for all four types of processing types—data, pass-through, remap, and remux sessions.

**remap pid vcg** *vcg*

### Syntax Description

|            |                                      |
|------------|--------------------------------------|
| <i>vcg</i> | Specifies the virtual carrier group. |
|------------|--------------------------------------|

### Command Default

None.

### Command Modes

Video configuration (config)

### Command History

| Release       | Modification                                                                    |
|---------------|---------------------------------------------------------------------------------|
| IOS-XE 16.7.1 | This command was introduced on the Cisco cBR Series Converged Broadband Router. |

### Examples

The following example shows a PID remap rule for a table-based unicast session on input port number 1 with vei-ip 198.51.100.1

```
logical-edge-device led1 id 1
 protocol table-based
 virtual-edge-input-ip 198.51.100.1 input-port-number 1
 vcg vcg1
 active
table-based
 vcg vcg1
 rf-channel 20
 session unicast input-port 1 start-udp-port 49152 processing-type passthru
```

The corresponding remap rule is shown below:

```
remap pid vcg vcg1
 rf-channel 20
 vei-ip 198.51.100.1 udp-port 49152
 pid 100-200 101-201
 pid 102-130 202-230
 pid 131 240
```

## rep-period

To configure the time between two ECM packets at the output, use the **rep-period** command in the DVB scrambling ECMG overrule configuration mode. To void the ECM repetition period configuration, use the **no** form of this command.

**rep-period** *time*

**no rep-period**

|                               |                                                      |
|-------------------------------|------------------------------------------------------|
| <b>rep-period</b> <i>time</i> | Specifies the ECM repetition period in milliseconds. |
|-------------------------------|------------------------------------------------------|

**Command Default** None

**Command Modes** DVB scrambling ECMG overrule configuration mode (config-video-encrypt-dvb-ecmg-overrule)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the time between two ECM packets at the output in milliseconds. The valid range is from 0 to 30000.

The following is an example of how to configure the ECM repetition period in milliseconds:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#ecmg ECMG-7 id 7
Router(config-video-encrypt-dvb-ecmg)#overrule
Router(config-video-encrypt-dvb-ecmg-overrule)#rep-period 10000
```

### Related Commands

| Command               | Description                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------|
| <b>overrule</b>       | Enters DVB scrambling configuration mode.                                                     |
| <b>ac-start-delay</b> | Specifies the time between start of first CP after a change in AC and start of ECM broadcast. |
| <b>ac-stop-delay</b>  | Specifies the time between end of last CP preceding a change in AC and end of ECM broadcast.  |
| <b>max-comp-time</b>  | Specifies the maximum time needed by ECMG to compute an ECM.                                  |
| <b>max-streams</b>    | Specifies the maximum number of simultaneous open streams supported by the ECMG on a channel. |

| Command                  | Description                                                    |
|--------------------------|----------------------------------------------------------------|
| <b>min-cp-duration</b>   | Specifies the minimum crypto period.                           |
| <b>start-delay</b>       | Specifies the delay between the start of CP and ECM broadcast. |
| <b>stop-delay</b>        | Specifies the delay between the end of CP and ECM broadcast.   |
| <b>trans-start-delay</b> | Specifies the transition start delay.                          |
| <b>trans-stop-delay</b>  | Specifies the transition stop delay.                           |

## report-stream-error cc-error

To enable Continuity Counter (CC) error reporting on the chassis level, use the **report-stream-error cc-error** command in video configuration mode.

**report-stream-error cc-error** *[[report-interval value ] threshold value*

### Syntax Description

|                                     |                                                    |
|-------------------------------------|----------------------------------------------------|
| <b>report-interval</b> <i>value</i> | Specifies the event report interval in minutes.    |
| <b>threshold</b> <i>value</i>       | specifies the threshold value to report the event. |

### Command Default

None

### Command Modes

Video configuration (config-video)

### Command History

| Release               | Modification                                                                    |
|-----------------------|---------------------------------------------------------------------------------|
| IOS-XE Fuji<br>16.8.1 | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

### Examples

This example shows how to enable CC error reporting on the chassis level:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)# report-stream-error cc-error report-interval 10 threshold value 5
```

# report-stream-error input-stream-failure report-interval syslog

To configure a timeout value and syslog message for input stream failure trap for multicast sources, use the **report-stream-error input-stream-failure report-interval syslog** command in video configuration mode.

**report-stream-error input-stream-failure report-interval** *timeout value* **syslog** {enable | disable}

|                           |                      |                                                                                                                                                                      |
|---------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>timeout value</b> | The interval after which input stream failure trap is sent if the input source down exceeds the configured timeout value. The timeout value range is 5–1800 seconds. |
|                           | <b>syslog</b>        | Enable or disable logging for for input stream stream failure trap.                                                                                                  |

**Command Default** None

**Command Modes** Video configuration (config-video)

|                        |                     |                                                                                 |
|------------------------|---------------------|---------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b>      | <b>Modification</b>                                                             |
|                        | IOS-XE Fuji 16.8.1d | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Examples

This example shows how to configure a timeout value and syslog message:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)# report-stream-error input-stream-failure report-interval 10 syslog
enable
```

|                         |                                                 |                                                    |
|-------------------------|-------------------------------------------------|----------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                                  | <b>Description</b>                                 |
|                         | <b>showcable video snmp-alarms</b>              | Display the active alarms in the system.           |
|                         | <b>show cable video snmp-alarm-config</b>       | Display the alarm configuration in the system.     |
|                         | <b>snmp-trap input-stream-failure multicast</b> | Disable input stream failure trap for EAS stream.  |
|                         | <b>snmp-server enable traps video-cable</b>     | Enable alarm event traps for cable related events. |

# request platform hardware diagnostic load

To load the field diagnostic image and start field diagnostic test, use the **request platform hardware diagnostic load slot *slot-id* image-path [autostart]** command in Privileged EXEC mode.

**request platform hardware diagnostic load slot *slot-id* image-path [{autostart}]**

|                    |                            |                                                                                                                 |
|--------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>slot <i>slot-id</i></b> | Specifies the slot to perform field diagnostic test.                                                            |
|                    | <b>image-path</b>          | Specifies the path of the field diagnostic image, the image can be copied to hard disk, bootflash, or USB disk. |
|                    | <b>autostart</b>           | Automatically performs the default diagnostic test after loading the field diagnostic image.                    |

**Command Default** None.

**Command Modes** Privileged EXEC (#)

|                 |                |                                                                              |
|-----------------|----------------|------------------------------------------------------------------------------|
| Command History | <b>Release</b> | <b>Modification</b>                                                          |
|                 | IOS-XE 3.18.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** The **request platform hardware diagnostic load slot *slot-id* image-path [autostart]** command loads the field diagnostic image and starts field diagnostic test.

**Examples** The following example shows how to load the field diagnostic image and start field diagnostic test:

```
Router# request platform hardware diagnostic load slot 0 harddisk:field_diag autostart
Mar 2 16:00:51.933 CST: %IOSXE_OIR-6-REMCARD: Card (cc) removed from slot 0
Mar 2 16:00:51.934 CST: %CABLE_CLC-5-LOGGER_LC_REMOVED: Carrier Card 0 removed
```

|                  |                                                    |                                                        |
|------------------|----------------------------------------------------|--------------------------------------------------------|
| Related Commands | <b>Command</b>                                     | <b>Description</b>                                     |
|                  | <b>request platform hardware diagnostic unload</b> | Removes the field diagnostic image from the line card. |
|                  | <b>show platform hardware diagnostic status</b>    | Displays the field diagnostic tests status.            |

# request platform hardware diagnostic unload

To unload the field diagnostic image from the line card and reload the run-time image, use the **request platform hardware diagnostic unload slot *slot-id*** command in Privileged EXEC mode.

**request platform hardware diagnostic unload slot *slot-id***

## Syntax Description

|                               |                                                          |
|-------------------------------|----------------------------------------------------------|
| <b>slot</b><br><i>slot-id</i> | Specifies the slot to unload the field diagnostic image. |
|-------------------------------|----------------------------------------------------------|

## Command Default

None.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                 |
|----------------|------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The **request platform hardware diagnostic unload slot *slot-id*** command unloads the field diagnostic image from the line card and reloads the run-time image.

## Examples

The following example shows how to unload the field diagnostic image:

```
Router# request platform hardware diagnostic unload slot 0
Mar 2 16:04:51.860 CST: %IOSXE_OIR-6-INSCARD: Card (cc) inserted in slot 0
```

|--------------------------------------------------|--------------------------------------------------------------------|
| <b>request platform hardware diagnostic load</b> | Loads the field diagnostic image and starts field diagnostic test. |
| <b>show platform hardware diagnostic status</b>  | Displays the field diagnostic tests status.                        |

# request platform software package expand

To expand the package to bootflash, use the **request platform software package expand** command in Privileged EXEC mode.

**request platform software package expand file bootflash:[{force | to bootflash:[{force | wipe | [{force}]]} | wipe | [{force}]]]**

## Syntax Description

|                   |                                                                               |
|-------------------|-------------------------------------------------------------------------------|
| <b>bootflash:</b> | Expand the package to bootflash. Cisco cBR-8 router only boot from bootflash. |
| <b>force</b>      | Proceed despite warnings.                                                     |
| <b>wipe</b>       | Wipe destination media content first.                                         |
| <b>to</b>         | Location for contained files.                                                 |

## Command Default

None.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                 |
|----------------|------------------------------------------------------------------------------|
| IOS-XE 3.16.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **request platform software package expand** command in Privileged EXEC mode to expand the package to bootflash.

## Examples

The following example shows how to expand the package to bootflash:

```
router# request platform software package expand file
bootflash:subpkg_3_16/cbrsup-universalk9.03.16.00.S.155-3.S-std.SPA.bin
```

## Related Commands

| Command                                          | Description                          |
|--------------------------------------------------|--------------------------------------|
| <b>request platform software package install</b> | Perform single command ISSU install. |

# request platform software package install node

To install the package for upgrade process, use the **request platform software package install node** command in Privileged EXEC mode.

**request platform software package install node** {**abort** | **attach** | **file** **bootflash:**[**{linecard-delay** *delay* | [**{switchback}**]} | **noreload** | [**{linecard}**]}]} | **linecard-only**{**all** | **slot** *slot-number*} | **rollback**}

## Syntax Description

|                                    |                                                                                                                                                                                                                                                                           |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>abort</b>                       | Cancel the ISSU process.                                                                                                                                                                                                                                                  |
| <b>attach</b>                      | Enables the users to view the last run log that contains the reports of all the stages of the one-shot upgrade.                                                                                                                                                           |
| <b>file</b>                        | Consolidated package file on active bootflash.                                                                                                                                                                                                                            |
| <b>linecard-delay</b> <i>delay</i> | By default, all the line cards will be reloaded with 240s interval during the upgrade procedure. Use <b>linecard-delay</b> <i>delay</i> option to specify the linecard reload interval.                                                                                   |
| <b>switchback</b>                  | By default, the active SUP will change to standby SUP after the upgrade procedure is complete. Use the <b>switchback</b> option to switchover the active and standby SUP at the end of upgrade procedure, so that the active SUP remains to be the active SUP after ISSU. |
| <b>noreload</b>                    | With <b>noreload</b> option, both the SUP and linecard will not be reloaded during the upgrade procedure. Upgrade will take effect by the next system reboot. With <b>noreload linecard</b> option, only the linecard will not be reloaded during the upgrade procedure.  |
| <b>linecard-only</b>               | Upgrade linecard only.                                                                                                                                                                                                                                                    |
| <b>rollback</b>                    | Roll back the chassis to the previous image.                                                                                                                                                                                                                              |

## Command Default

None.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                                                                                                   |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IOS-XE 3.16.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers.                                                                                   |
| IOS-XE 3.17.0S | This command was implemented on Cisco cBR Series Converged Broadband Routers. The <b>abort</b> , <b>linecard-only</b> and <b>rollback</b> keywords were added. |

## Usage Guidelines

Use the **request platform software package install node** command in Privileged EXEC mode to install the package for upgrade process, cancel the upgrade process, or rollback the chassis.

## Examples

The following example shows how to install the package file:

```
router# request platform software package install node file
bootflash:subpkg_3_16/cbrsup-universalk9.03.16.00.S.155-3.S-std.SPA.bin
```

---

**Related Commands**

| Command                                         | Description                      |
|-------------------------------------------------|----------------------------------|
| <b>request platform software package expand</b> | Expand the package to bootflash. |

# request platform software package install rp

To rollback to old package or implement ISSU subpackages upgrade on single SUP, use the **request platform software package instal rp *rp-slot* rollback** command in Privileged EXEC mode.

**request platform software package install rp *rp-slot* {file bootflash:[{interface-module-delay *delay-seconds*}] | rollback[{as-booted}]}**

## Syntax Description

|                                                   |                                                     |
|---------------------------------------------------|-----------------------------------------------------|
| <b>interface-module-delay</b> <i>delay-second</i> | Specify the interface module restart timeout delay. |
| <b>rollback</b>                                   | Un-do a previous install.                           |
| <b>as-booted</b>                                  | Return to software provisioned at boot.             |

## Command Default

None.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                 |
|----------------|------------------------------------------------------------------------------|
| IOS-XE 3.16.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **request platform software package instal rp *rp-slot* rollback** command in Privileged EXEC mode to rollback to old package.

## Examples

The following example shows how to rollback the upgrade:

```
router# request platform software package install rp 0 rollback
```

## Related Commands

| Command                                               | Description                              |
|-------------------------------------------------------|------------------------------------------|
| <b>request platform software package install node</b> | Install the package for upgrade process. |

# request platform software process restart

To restart processes in software platform, use the **request platform software process restart** command in Privileged EXEC mode.

**request platform software process restart** [ *interval secs* | *slot slot-number* ]

## Syntax Description

|                         |                                                                                 |
|-------------------------|---------------------------------------------------------------------------------|
| <b>interval secs</b>    | The interval between line card reload in seconds. Valid range is from 0 to 500. |
| <b>slot slot-number</b> | The line card slot number. The valid range is from 0 to 9.                      |

## Command Default

This command takes effect if the new iosd and iosdb, and the us-scheduler sub-packages have been previously installed on the Supervisor. Only line cards which are both active and primary will be affected.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.16.OS | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **request platform software process restart** command only after installing new iosd, iosdb, and us-scheduler sub-packages on the Supervisor. This command will install the new sub-packages on the line cards and restarts the affected processes.

## Examples

This example shows how to restart an isod process with an interval of 10 seconds:

```
Router# request platform software process restart interval 10
Restarting the process ubrcld_k9lc_ms
SUCCESS: Finished Restarting the process ubrcld_k9lc_ms
Will automatically restart process iosdb
```

This example shows how to restart a us-scheduler process:

```
Router#request platform software process restart slot 6
Restarting the process us-scheduler on slot 6
SUCCESS: Finished Restarting the process us-scheduler on slot 6

Router#
*Jan 23 16:51:36.160 PDT: %CMCC_CBR-4-PROC_DOWN: CLC6: cmcc: Process us-sched (cdman) is
down
*Jan 23 16:51:36.506 PDT: %CMCC_CBR-4-PROC_RESTART: CLC6: cmcc: Process us-sched (cdman)

| <b>request platform software package install</b> | Upgrades a consolidated package or an individual sub-package. |

## reserve-pid-range

To configure reserved output PID range, use the **reserve-pid-range** command in video configuration mode. To delete the reserved output PID range, use the **no** form of this command.

**reserve-pid-range** *start-pid-end-pid*

**no reserve-pid-range** *start-pid-end-pid*

### Syntax Description

|                                                   |                                                                                  |
|---------------------------------------------------|----------------------------------------------------------------------------------|
| <b>reserve-pid-range</b> <i>start-pid-end-pid</i> | Specifies a range of PIDs that will not be used as output for remapped sessions. |
|---------------------------------------------------|----------------------------------------------------------------------------------|

### Command Default

None.

### Command Modes

Video configuration (config-video)

### Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command configures reserved output PID range.

### Examples

The following example shows how to configure reserved output PID range:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# reserve-pid-range 1-10
```

### Related Commands

|---------------------------------------------|-----------------------------------------------|
| <b>show cable video logical-edge-device</b> | Displays the logical edge device information. |

# reset-interval

To set the default ONID number, use the **default-onid** command in the video configuration mode.

**default-onid** *number*

| <b>Syntax Description</b>    | <i>number</i> The ONID number. By default, the system ONID is 0, which is commonly used in North America. If the default value of the ONID is used, the TSID must be unique. If you change the ONID, the TSID-ONID pair must be unique. The ONID must be in the range of 0 to 65535. |         |              |                              |                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|----------------------------------------------------------------------------------|
| <b>Command Default</b>       | None.                                                                                                                                                                                                                                                                                |         |              |                              |                                                                                  |
| <b>Command Modes</b>         | Video configuration mode (config-video)                                                                                                                                                                                                                                              |         |              |                              |                                                                                  |

| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                     |         |              |                              |                                                                                  |
| <b>Usage Guidelines</b>      | <p>This command is used to change the default system ONID.</p> <p>The following example shows how to change the default ONID number:</p> <pre>configure terminal cable video default-onid 1580</pre>                                                                                 |         |              |                              |                                                                                  |

## restart-retry

To set the retry times for cable line card process restart, use the **restart-retry** *times* command in the process restart configuration mode.

```
restart-retry times
```

### Syntax Description

|              |                                              |
|--------------|----------------------------------------------|
| <i>times</i> | Cable line card process restart retry times. |
|--------------|----------------------------------------------|

### Command Default

None

### Command Modes

Process restart configuration (config-process-restart)

### Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command sets the retry times for cable line card process restart.

The following example shows how to set the retry times for cable line card process restart.

```
Router# configure terminal
Router(config)# process-restart
Router(config-process-restart)# restart-retry 3
```

|---------------------------------|-------------------------------------------------------------------------------------|
| <b>lc-control-plane-timeout</b> | Sets the interval of monitoring cable line card control plane process restart.      |
| <b>lc-us-scheduler-timeout</b>  | Sets the interval of monitoring cable line card upstream scheduler process restart. |

# restricted

To convert a general load balancing group (GLBG) to a restricted load balancing group (RLBG) for DOCSIS load balancing, use the **restricted** command in the config-lb-group configuration mode. To revert to the general group type for DOCSIS load balancing, use the **no** form of this command.

**restricted**  
**no restricted**

**Command Default** By default, the general group type is selected for load balancing.

**Command Modes** DOCSIS load balancing group mode (config-lb-group)

| Command History | Release        | Modification                                                                      |
|-----------------|----------------|-----------------------------------------------------------------------------------|
|                 | 12.2(33)SCC    | This command was introduced.                                                      |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

**Examples** The following example shows how to convert a GLBG to a RLBG using the **restricted** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)#
```

|------------------|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
|                  | <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

# revertive

To enable the revert operation on a protect card, use the **revertive** command in line card redundancy group mode. To disable the revert operation, use the **no** form of the command.

**revertive** *time*

**no revertive** *time*

## Syntax Description

|             |                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>time</i> | Specifies the revert operation time in seconds. The valid values are 1 to 35791.<br>The valid values on the Cisco cBR series routers are 10 to 86400 seconds. |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

None

## Command Modes

Line card redundancy group (config-red-lc)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCA    | This command was introduced in Cisco IOS Release 12.2(33)SCA.                     |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following example shows how to specify the revert operation time for a protect card on a uBR10012 router:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 1 cable
Router(config-red-lc)# revertive 30
```

The following example shows how to specify the revert operation time on a Cisco cBR series router:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# revertive 30
```

## Related Commands

| Command               | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| <b>linecard-group</b> | Creates a line card group for one-to-one line card redundancy. |
| <b>redundancy</b>     | Enters redundancy mode.                                        |
| <b>member subslot</b> | Enables the redundancy role of a line card.                    |

# rf-chan

To enter the RF channel sub configuration mode to configure an individual channel or a block of channels, use the **rf-chan** command in the controller sub configuration mode.

**rf-chan** *starting QAM id ending QAM id*

## Syntax Description

|                        |                                                   |
|------------------------|---------------------------------------------------|
| <i>starting QAM id</i> | The starting QAM ID. The valid range is 0 to 127. |
| <i>ending QAM id</i>   | The ending QAM ID. The valid range is 0 to 127.   |

## Command Default

None.

## Command Modes

Controller sub configuration mode (config-controller)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command is used to enter the RF channel configuration sub-mode. If an individual channel is specified, only that channel's configuration is changed. If a block of channels is specified, the configuration change is applied to all the channels in the block.

The following example shows how to enter into the RF channel configuration sub-mode:

```
router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 0 2
router(config-rf-chan)#frequency 93000000
router(config-rf-chan)#exit
router(config-controller)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 0-2
```

| Chan | State | Admin | Frequency | Type   | Annex | Mod | srates | Interleaver | dcid | power | output |
|------|-------|-------|-----------|--------|-------|-----|--------|-------------|------|-------|--------|
| 0    | UP    | UP    | 93000000  | DOCSIS | B     | 256 | 5361   | I32-J4      | 1    | 34    | NORMAL |
| 1    | UP    | UP    | 99000000  | DOCSIS | B     | 256 | 5361   | I32-J4      | 2    | 34    | NORMAL |
| 2    | UP    | UP    | 105000000 | DOCSIS | B     | 256 | 5361   | I32-J4      | 3    | 34    | NORMAL |

|--------------------|------------------------------------------------------------------------|
| <b>cable video</b> | Enters cable video configuration mode.                                 |
| <b>table-based</b> | Enables table-based session configuration.                             |
| <b>vcg name</b>    | Specifies the virtual carrier group assigned to a logical edge device. |

## rf-channel (Virtual Carrier Group)

To specify the virtual RF channels in a virtual carrier group, use the **rf-channel** command in virtual carrier group configuration mode. To delete the virtual RF channels, use the **no** form of this command.

**rf-channel** *start-channel-end-channel* **tsid** *start-tsid-end-tsid* **output-port-number** *start-port-end-port*  
**no rf-channel** *start-channel-end-channel* **tsid** *start-tsid-end-tsid* **output-port-number** *start-port-end-port*

|                           |                                                      |                                  |
|---------------------------|------------------------------------------------------|----------------------------------|
| <b>Syntax Description</b> | <b>rf-channel</b> <i>start-channel-end-channel</i>   | Specifies the RF channel range.  |
|                           | <b>tsid</b> <i>start-tsid-end-tsid</i>               | Specifies the tsid range.        |
|                           | <b>output-port-number</b> <i>start-port-end-port</i> | Specifies the output port range. |

**Command Default** None.

**Command Modes** Virtual carrier group configuration (config-video-vcg)

|                        |                |                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                             |
|                        | IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the virtual RF channels.

**Examples** The following example shows how to specify the virtual RF channels:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# rf-channel 1-11 tsid 1-11 output-port-number 1-11
```

|                         |                                               |                                                          |
|-------------------------|-----------------------------------------------|----------------------------------------------------------|

|                         | <b>show cable video virtual-carrier-group</b> | Displays the virtual carrier group information.          |

## rf-channel (table-based vcg)

To configure the rf channel in the table-based session, use the **rf-channel** command in the table-based VCG configuration mode. To delete the configuration, use the **no** form of this command.

**rf-channel** *start\_channel* [-*end\_channel*]

|                                           |                                                                 |
|-------------------------------------------|-----------------------------------------------------------------|
| <i>start_channel</i> - <i>end_channel</i> | Specifies the range of rf channels for the table-based session. |
|-------------------------------------------|-----------------------------------------------------------------|

**Command Default** None

**Command Modes** Table-based VCG configuration mode (config-video-tb-vcg)

| Release             | Modification                                                                     |
|---------------------|----------------------------------------------------------------------------------|
| Cisco IOS-XE 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following is an example of how to configure the rf channel in the table-based session:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#vcg vcg1
Router(config-video-tb-vcg)#rf-channel 0-7
```

|--------------------------|------------------------------------------------------------------------------|
| <b>vcg (table-based)</b> | Specifies the virtual carrier group associated with the table-based session. |

## rf-channel cable downstream channel-id

To assign a downstream channel ID to an RF channel, use the **rf-channel cable downstream channel-id** command in controller configuration mode. To remove a downstream channel ID for an RF channel, use the **no** form of this command.

**rf-channel** *rf-port* **cable downstream channel-id** *channel-id*  
**no rf-channel** *rf-port* **cable downstream channel-id** *channel-id*

### Syntax Description

|                   |                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rf-port</i>    | Specifies the RF channel physical port on the Wideband SPA FPGA. Valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command.                                                          |
| <i>channel-id</i> | A unique channel ID. Valid values for releases prior to Cisco IOS Release 12.2(33)SCB are from 0 to 255 and the valid values for Cisco IOS Release 12.2(33)SCB and later are from 1 to 255 as 0 is reserved for network management. |

### Command Default

If the **rf-channel cable downstream channel-id** command is not issued, Cisco IOS software assigns a unique downstream channel ID to the RF channel.

### Command Modes

Controller configuration (config-controller)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router.                         |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                    |
| 12.2(33)SCB1   | The downstream channel ID scheme was changed.                                      |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

For the wideband channel to work correctly, each RF channel on the fiber node that the wideband channel uses must have a unique downstream channel ID. By default, Cisco IOS software assigns a unique downstream channel ID to the RF channel. Use the **rf-channel cable downstream channel-id** command to change the default channel ID.

The downstream channel ID that is assigned to the RF channel must be unique on the fiber node.

- The ID cannot be the same ID as is used for another RF channel on the fiber node.
- The ID cannot be the same ID as is used for a primary downstream channel on the fiber node.

You can check downstream channel IDs that are being used by examining the CMTS router configuration file.

Refer to **cable downstream channel-id** *id command for the updated downstream channel ID scheme table*.

**Note** If you assign a downstream channel ID that is not unique on the fiber node, the **rf-channel cable downstream channel-id** command displays an error message. The command does assign the channel ID, but the status of the fiber node becomes invalid.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command.

- For annex A and 256 QAM, each Wideband SPA supports 18 RF channels. In this case, valid values for the *rf-port* argument are 0 to 17.
- For all other cases, the SPA supports 24 RF channels. In these cases, valid values for the *rf-port* argument are 0 to 23.

**Note** Effective with Cisco IOS Release 12.3(23)BC, the **annex modulation** command is obsolete and **annex** and **modulation** are included as keyword options in the **rf-channel frequency** command. Also, for annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate or up to 24 RF channels at less than full rate.

## Examples

The following example shows how to assign a downstream channel ID of 123 to RF channel 3 on the Wideband SPA located in slot/subslot/bay 1/0/1.

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/1
Router(config-controller)# rf-channel 3 cable downstream channel-id 123
```

## Related Commands

|---------------------------------------------------|--------------------------------------------------------------------------------|
| <b>annex modulation</b>                           | Sets the annex and modulation for the Wideband SPA.                            |
| <b>cable primary</b>                              | Specifies that a wideband channel is a primary wideband channel.               |
| <b>cable rf-channel</b>                           | Associates an RF channel on a Wideband SPA with a wideband channel.            |
| <b>controller modular-cable</b>                   | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>ip-address (controller)</b>                    | Sets the IP address of the Wideband SPA FPGA.                                  |
| <b>modular-host subslot</b>                       | Specifies the modular-host line card.                                          |
| <b>rf-channel frequency</b>                       | Sets the frequency for each RF channel.                                        |
| <b>rf-channel ip-address mac-address udp-port</b> | Sets the IP address, MAC address and UDP port for each RF channel.             |
| <b>rf-channel network delay</b>                   | Specifies the CIN delay for each RF channel.                                   |

| Command                       | Description                                    |
|-------------------------------|------------------------------------------------|
| <b>rf-channel description</b> | Specifies the description for each RF channel. |

# rf-channel depi-tunnel

To bind the depi-tunnel, which inherits the configuration of the specified l2tp-class and depi-class, to an rf-channel on a shared port adapter (SPA), use the **rf-channel depi-tunnel** command in controller configuration mode. The **tsid** keyword is used to associate the logical rf-channel of the SPA to a physical quadrature amplitude modulation (QAM) on the radio frequency gateway (RFGW-10). To unbind the depi-tunnel, use the **no** form of this command.

**rf-channel** *rf-channel* **depi-tunnel** *depi-tunnel-name* **tsid** *id*  
**no** **rf-channel** *rf-channel* **depi-tunnel** *depi-tunnel-name* **tsid** *id*

## Syntax Description

|                         |                                                                                 |
|-------------------------|---------------------------------------------------------------------------------|
| <i>rf-channel</i>       | RF channel physical port on the Wideband SPA. The allowed range is from 0 to 3. |
| <i>depi-tunnel-name</i> | Name of the DEPI tunnel.                                                        |
| <b>tsid</b> <i>id</i>   | TS ID value.                                                                    |

## Command Default

None

## Command Modes

Global configuration (config)

Subinterface configuration (config-subif)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

To configure DEPI on the M-CMTS, bind the depi-tunnel to an rf-channel on a SPA using the **rf-channel depi-tunnel** command in controller configuration mode. To associate the logical rf-channel on the SPA to a QAM on the RFGW, use the **tsid** keyword.

## Examples

The following example shows how to bind the depi-tunnel SPA0 to rf-channel 0 on a SPA and associate tsid 100 to the QAM:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 depi-tunnel SPA0 tsid 100
```

|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rf-port</i>                        | Specifies the RF channel physical port on the Wideband SPA FPGA. Allowed range is 0 to 23. Valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command (see the Usage Guidelines section). |
| <b>description</b> <i>description</i> | Specifies a description for the RF channel.                                                                                                                                                                                             |

## Command Default

No default RF channel configuration values are set for the description.

## Command Modes

Controller configuration (config-controller)

## Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router.                         |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                    |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate and up to 24 RF channels at less than full rate. For all other cases, the SPA supports 24 RF channels.

**Note** In Cisco IOS Release 12.3(21)BC, annex and modulation parameters were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

## Examples

The following example shows how to configure the description of the RF channel characteristics for RF port 0:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 description Primary downstream channel
```

## Usage Guidelines

## Cisco IOS Release 12.3(21)BC and Cisco IOS Release 12.2(33)SCA

This command configures the frequency for an RF channel on a Wideband SPA.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

**Note** In Cisco IOS 12.3(21)BC and 12.3(21a)BC3 releases, **annex** and **modulation** parameters were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

## Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB

This command configures the frequency for an RF channel on a Wideband SPA. The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels at full rate. For all other cases, the SPA supports up to 24 RF channels.

For each RF channel, use the **rf-channel frequency** command in controller configuration mode to configure RF-channel characteristics. For Cisco IOS Release 12.3(21)BC, for each RF channel (*rf-port*), the frequency option *must be configured* with the **rf-channel frequency** command.

Uniqueness of frequency is required for all cable downstream channels on all cable interfaces and all Wideband SPAs on the CMTS.

**Note** Be certain to verify that the RF channel values set with **rf-channel frequency** match the values configured for the QAM outputs on the edge QAM device. The frequency value must match. If the value does not match, the Wideband SPA will not successfully communicate with the edge QAM device.

## Cisco IOS Release 12.2(33)SCE

In Cisco IOS Release 12.2(33)SCE and later, changing the frequency of a single RF channel in a controller will change the frequency of all RF channels in that controller. In the event of the frequency change, all DOCSIS 3.0 cable modems will start re-registering in downstream partial service mode (p-online).

## Examples

The following example shows how to configure RF channel frequency for RF port 0:

```
Router# configure terminal
```

```
Router(config)# controller modular-cable 1/0/0
```

```
Router(config-controller)# rf-channel 0 frequency 699000000 annex A modulation 256
interleave-depth 64
```

## Related Commands

| Command                                           | Description                                                                    |
|---------------------------------------------------|--------------------------------------------------------------------------------|
| <b>cable primary</b>                              | Specifies that a wideband channel is a primary wideband channel.               |
| <b>controller modular-cable</b>                   | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>rf-channel description</b>                     | Specifies the description for each RF channel.                                 |
| <b>rf-channel ip-address mac-address udp-port</b> | Sets the IP address, MAC address and UDP port for each RF channel.             |
| <b>rf-channel network-delay</b>                   | Configure the network delay for an RF channel.                                 |

## rf-channel group-address

To configure the DEPI multicast group address for the RF channel, use the **rf-channel group-address** command in controller configuration mode. To disable the configuration, use the **no** form of the command.

**rf-channel** *rf-number* **group-address** *ip-address*

**no rf-channel** *rf-number* **group-address**

### Syntax Description

*rf-number* RF channel number. The range is from 0 to 23.

*ip-address* DEPI multicast group IP address.

### Command Default

The DEPI multicast group address is not configured for the RF channel.

### Command Modes

Controller configuration (config-controller)

### Command History

| Release | Modification |
|---------|--------------|
|---------|--------------|

|            |                              |
|------------|------------------------------|
| 12.2(33)CX | This command was introduced. |
|------------|------------------------------|

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |
|----------------|------------------------------------------------------------------------------------|

### Usage Guidelines

The **rf-channel group-address** command provides upstream and downstream mapping information for a specific channel group.

The following example shows how to configure the DEPI multicast group address for RF channel 0:

```
Router# configure terminal
Router# controller Modular-Cable 8/1/0
Router(config-controller)# rf-channel 0 group-address 224.0.0.1
```

### Related Commands

| Command                         | Description                     |
|---------------------------------|---------------------------------|
| <b>controller modular-cable</b> | Configures the DEPI controller. |

## rf-channel ip-address mac-address udp-port

To configure the IP address, MAC address, UDP port and DEPI remote ID of an RF channel on a Wideband SPA, use the **rf-channel ip-address mac-address udp-port** command in controller configuration mode. To remove the IP address, MAC address, UDP port and DEPI remote ID configuration of an RF channel, use the **no** form of this command.

**Cisco IOS Releases 12.3(21)BC and 12.2(33)SCA**

```
rf-channel rf-port ip-address ip-address mac-address mac-address udp-port portnum
no rf-channel rf-port ip-address ip-address mac-address mac-address udp-port portnum
```

**Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB**

```
rf-channel rf-port ip-address ip-address mac-address mac-address {udp-port portnum | depi-remote-id session-id}
no rf-channel rf-port ip-address ip-address mac-address mac-address {udp-port portnum | depi-remote-id session-id}
```

### Syntax Description

|                    |                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rf-port</i>     | Specifies the RF channel physical port on the Wideband SPA FPGA. Allowed range is 0 to 23. Valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command (see the Usage Guidelines section). |
| <i>ip-address</i>  | Specifies the IP address of the Gigabit Ethernet interface on the edge QAM device for this RF channel.                                                                                                                                  |
| <i>mac-address</i> | Specifies the MAC address of the next-hop interface or of the edge QAM device for this RF channel.                                                                                                                                      |
| <i>portnum</i>     | Specifies the UDP port number for the edge QAM device that will be used for this RF channel. Allowed range is 0 to 65535.                                                                                                               |
| <i>session-id</i>  | Specifies the DEPI remote session ID to be used for encapsulation of frames in DOCSIS-MPT mode.                                                                                                                                         |

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines**

For each RF channel, use the **rf-channel ip-address mac-address udp-port** command in controller configuration mode to configure RF-channel characteristics.

The Cisco uBR10012 router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

**Note**

In the Cisco IOS Release 12.3(21)BC and 12.3(21a)BC3 releases, **annex** and **modulation** options were set globally for each SPA using the **annex modulation** command. Beginning in Cisco IOS Release 12.3(23)BC, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

For each RF channel (*rf-port*), the following items *must be configured* with **rf-channel ip-address mac-address udp-port** command:

**Cisco IOS Release 12.3(21)BC and Cisco IOS Release 12.2(33)SCA**

- IP address
- MAC address
- UDP port
- Associated wideband channel (see the **cable rf-channel** command)

**Cisco IOS Releases 12.3(23)BC and 12.2(33)SCB**

- IP address
- MAC address
- UDP port or DEPI remote ID
- Associated wideband channel (see the **cable rf-channel** command)

The value used for *mac-address* in the *mac-address* argument is as follows:

- If a Gigabit Ethernet router or Layer 3 switch is used between the Wideband SPA and the edge QAM device, the value specified for *mac-address* is the MAC address for the next-hop interface on the router or Layer 3 switch.
- If a Gigabit Ethernet router or Layer 3 switch is not used, the value specified for *mac-address* is the MAC address for the Gigabit Ethernet interface on the edge QAM device.

The UDP port number set for the RF channel allows mapping an input UDP session to a specific QAM output port. Wideband traffic from different Wideband SPAs cannot be mixed on the same QAM output ports.

**Note**

Be certain to verify that the RF channel values set with **rf-channel frequency** match the values configured for the QAM outputs on the edge QAM device. IP address, MAC address, UDP port, and DEPI remote ID must match. If any of these values do not match, the Wideband SPA will not successfully communicate with the edge QAM device.

## Examples

The following example shows how to configure the RF channel IP address, MAC address UDP port and DEPI remote ID characteristics for RF port 0:

```
Router# configure terminal
```

```
Router(config)# controller modular-cable 1/0/0
```

```
Router(config-controller)# rf-channel 0 ip-address 192.168.200.30 mac-address
0011-920e-a9ff udp-port 49152
```

## Related Commands

| Command                                       | Description                                                                    |
|-----------------------------------------------|--------------------------------------------------------------------------------|
| <b>cable primary</b>                          | Specifies that a wideband channel is a primary wideband channel.               |
| <b>cable rf-channel</b>                       | Associates an RF channel on a Wideband SPA with a wideband channel.            |
| <b>controller modular-cable</b>               | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>ip-address (controller)</b>                | Sets the IP address of the Wideband SPA FPGA.                                  |
| <b>modular-host sub-slot</b>                  | Specifies the modular-host line card for Wideband protocol operations.         |
| <b>rf-channel cable downstream channel-id</b> | Assigns a downstream channel ID to an RF channel.                              |
| <b>rf-channel description</b>                 | Specifies the description for each RF channel.                                 |
| <b>rf-channel frequency</b>                   | Sets the frequency for each RF channel.                                        |
| <b>rf-channel network delay</b>               | Configures the network delay for an RF channel.                                |

## rf-channel network-delay

To configure the network delay for an RF channel on a Wideband SPA, use the **rf-channel network delay** command in controller configuration mode. To remove the network delay configuration for an RF channel, use the **no** form of this command.

**rf-channel** *rf-port* **network-delay** *delay* [**sampling-rate** *rate*]  
**no rf-channel** *rf-port* **network-delay** *delay* [**sampling-rate** *rate*]

### Syntax Description

|                                  |                                                                                                                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rf-port</i>                   | RF channel physical port on the Wideband SPA FPGA. The allowed range is from 0 to 23. The valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command (see the Usage Guidelines section). |
| <i>delay</i>                     | Converged Interconnect Network (CIN) delay. The default value is 550 us. The allowed range is from 0 to 3000 us. The delay value auto determines the delay through DEPI Latency Measurement (DLM) packets.                             |
| <b>sampling-rate</b> <i>rate</i> | (Optional) Specifies how often the DLM is sent. The range is from 1 to 500 sec. The default value is 10 sec. This option is available only when the delay value is set to auto.                                                        |

| 12.3(23)BC     | This command was introduced for the Cisco uBR10012 universal broadband router.                              |
| 12.2(33)SCB    | This command was integrated into Cisco IOS Release 12.2(33)SCB.                                             |
| 12.2(33)SCC    | This command was modified to include <b>sampling-rate</b> <i>rate</i> to specify how often the DLM is sent. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                          |

### Usage Guidelines

The Cisco uBR10012 universal broadband router supports two Wideband SPAs. Each Wideband SPA supports up to 24 RF channels depending on how the SPA is configured with the **annex modulation** command. For annex A and 256 QAM, each Wideband SPA supports up to 18 RF channels. For all other cases, the SPA supports up to 24 RF channels.

#### Note

In Cisco IOS releases 12.3(21) BC and 12.3(21a)BC3, **annex** and **modulation** parameters were set globally for each SPA using the **annex modulation** command. From Cisco IOS Release 12.3(23)BC onwards, annex and modulation values are set for each RF channel using the **rf-channel frequency** command. The **annex modulation** command is obsolete.

## Examples

The following example shows how to configure the RF channel network delay characteristics for RF port 0:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 network-delay 1000
```

The following example shows how to configure the RF channel network delay characteristics for RF port 0 with a sampling-rate of 1sec:

```
Router# configure terminal

Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 network-delay auto sampling-rate 1
```

## Related Commands

| Command                                           | Description                                                                    |
|---------------------------------------------------|--------------------------------------------------------------------------------|
| <b>cable primary</b>                              | Specifies that a wideband channel is a primary wideband channel.               |
| <b>cable rf-channel</b>                           | Associates an RF channel on a Wideband SPA with a wideband channel.            |
| <b>controller modular-cable</b>                   | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>ip-address (controller)</b>                    | Sets the IP address of the Wideband SPA FPGA.                                  |
| <b>modular-host subslot</b>                       | Specifies the modular-host line card for Wideband protocol operations.         |
| <b>rf-channel cable downstream channel-id</b>     | Assigns a downstream channel ID to an RF channel.                              |
| <b>rf-channel description</b>                     | Specifies the description for each RF channel.                                 |
| <b>rf-channel frequency</b>                       | Sets the frequency for each RF channel.                                        |
| <b>rf-channel ip-address mac-address udp-port</b> | Sets the IP address, MAC address, and UDP port for each RF channel.            |

## rf-channel rf-power

To set the RF power output level on Cisco UBR-MC20X20V and Cisco uBR-MC88V cable interface line cards, use the **rf-channel rf-power** command in controller configuration mode. To reset the RF output power level to its default value, use the **no** form of this command.

**rf-channel** *rf-port* **rf-power** *power-level*  
**no rf-channel** *rf-port* **rf-power** *power-level*

### Syntax Description

|                    |                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rf-port</i>     | RF channel physical port on the Wideband SPA FPGA. The range is from 0 to 3. The values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command. |
| <b>power-level</b> | Desired RF output power level in dBmV. The range is dependent on the cable interface line card. The format is XY.Z. By default, .Z is added as .0.                                   |

### Command Default

None

### Command Modes

Controller configuration (config-controller)

### Command History

| 12.2(33)SCC    | This command was introduced.                                                                                                                              |
| 12.2(33)SCD    | This command was modified. Added support for the controller interface configuration on Cisco uBR7246VXR and Cisco uBR7225VXR universal broadband routers. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                        |

### Usage Guidelines

For the Cisco UBR-MC20X20V cable interface line card, all the channels within a controller must have the same RF power value. When the RF power value is changed on any one channel, the same value is applied to all the channels within the controller. The recommended RF power range depends on the mode of the upconverter. The mode of the upconverter is decided by the highest numbered channel that is enabled.

**Note** RF power value outside the recommended RF power range is accepted but is automatically adjusted. If the input value exceeds the recommended RF power range, it is adjusted to a value lower than the upper limit of the range and if it is less than the recommended range, it is adjusted to a value higher than the lower limit of the range. The RF power level can be configured in decimals too.

Table below lists the recommended RF power range for different channel settings on the Cisco UBR-MC20X20V line card.

**Table 34: RF Power Range on the Cisco UBR-MC20X20V Line Card**

| Upconverter Mode | Channel Setting           | Recommended RF Power Range |
|------------------|---------------------------|----------------------------|
| Single           | Only channel 0 is enabled | 60.0 to 52.0 dBmV          |

| Upconverter Mode | Channel Setting                                                                                             | Recommended RF Power Range |
|------------------|-------------------------------------------------------------------------------------------------------------|----------------------------|
| Dual             | Channel 0 is either enabled or disabled. Channel 1 is enabled.<br>Channel 2 and channel 3 are disabled.     | 56.0 to 48.0 dBmV          |
| Triple           | Channel 0, and channel 1 are either enabled or disabled.<br>Channel 2 is enabled and channel 3 is disabled. | 54.0 to 46.0 dBmV          |
| Quad             | Channels 0, 1, and 2 are either enabled or disabled.<br>Channel 3 is enabled.                               | 52.0 to 44.0 dBmV          |

Table below lists the recommended RF power range for different channel settings on the Cisco uBR-MC88V line card.

*Table 35: RF Power Range on the Cisco uBR-MC88V Line Card*

| Upconverter Mode | Channel Setting                                                                                                       | Recommended RF Power Range |
|------------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------|
| Single           | The RF channel stacking number equals to 1 in this mode. Channel 0 is enabled while the other channels are disabled.  | 45 to 63 dBmV              |
| Dual             | The RF channel stacking number equals to 2 in this mode. Channels 0 and 1 are enabled; channels 2 and 3 are disabled. | 48 to 56 dBmV              |
| Triple           | The RF channel stacking number equals to 3 in this mode. Channels 0, 1, and 2 are enabled; channel 3 is disabled.     | 46 to 54 dBmV              |
| Quad             | The RF channel stacking number equals to 4. Channels 0, 1, 2, and 3 are enabled.                                      | 44 to 52 dBmV              |

## Examples

The following example shows how to configure RF power for RF port 0 in modular-cable controller mode:

```
Router# configure terminal
Router(config)# controller modular-cable 1/0/0
Router(config-controller)# rf-channel 0 rf-power 50.6
```

The following example shows how to configure RF power for RF port 0 in integrated-cable controller mode:

```
Router# configure terminal
Router(config)# controller integrated-cable 1/0/0
Router(config-controller)# rf-channel 0 rf-power 50.6
```

## Related Commands

|---------------------------------------------------|--------------------------------------------------------------------------------|
| <b>cable primary</b>                              | Specifies that a wideband channel is a primary wideband channel.               |
| <b>controller modular-cable</b>                   | Enters controller configuration mode to configure the Wideband SPA controller. |
| <b>controller integrated-cable</b>                | Enters integrated-cable controller configuration mode.                         |
| <b>rf-channel description</b>                     | Specifies the description for each RF channel.                                 |
| <b>rf-channel ip-address mac-address udp-port</b> | Sets the IP address, MAC address and UDP port for each RF channel.             |
| <b>rf-channel frequency</b>                       | Configures the frequency for the RF channel.                                   |
| <b>rf-channel network-delay</b>                   | Configure the network delay for an RF channel.                                 |
| <b>rf-channel rf-shutdown</b>                     | Enables or disables RF output on a Wideband SPA.                               |

# rf-channel rf-shutdown

To disable the RF output on a wideband interface, use the **rf-channel rf-shutdown** command in controller configuration mode. To enable the RF output, use the **no** form of this command.

**rf-channel** *rf-port* **rf-shutdown**  
**no rf-channel** *rf-port* **rf-shutdown**

|                           |                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>rf-port</i> Specifies the RF channel physical port. The range is from 0 to 3. The valid values for <i>rf-port</i> depend on the configuration set with the <b>annex modulation</b> command. |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                        |
|------------------------|------------------------|
| <b>Command Default</b> | RF output is disabled. |
|------------------------|------------------------|

|                      |                                              |
|----------------------|----------------------------------------------|
| <b>Command Modes</b> | Controller configuration (config-controller) |
|----------------------|----------------------------------------------|

| <b>Command History</b> | Release        | Modification                                                                       |
|------------------------|----------------|------------------------------------------------------------------------------------|
|                        | 12.2(33)SCC    | This command was introduced.                                                       |
|                        | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** Starting with Cisco IOS Release 12.2(33)SCE, when you use the **rf-channel rf-shutdown** command, all DOCSIS 3.0 cable modems associated with the RF channel on a particular wideband interface will go offline and start re-registering in downstream partial service mode (p-online). In Cisco IOS Release 12.2(33)SCD and earlier, cable modems do not go offline while using the **rf-channel rf-shutdown** command.

For muting and unmuting the QAM on the Cisco RFGW-10, use the **rf-channel rf-shutdown** command in the M-CMTS.

**Note** This command cannot be executed on a Cisco 1 Gbps Wideband Shared Port Adapter (SPA) configured with manual DEPI.

## Examples

The following example enables RF output on the Cisco wideband SPA:

```
Router# enable

Router# configure terminal
Router(config)# controller integrated-cable 7/1/0
Router(config-controller)# no rf-channel 0 rf-shutdown
```

| <b>Related Commands</b> | Command                            | Description                                                                    |
|-------------------------|------------------------------------|--------------------------------------------------------------------------------|
|                         | <b>controller modular-cable</b>    | Enters controller configuration mode to configure the Wideband SPA controller. |
|                         | <b>controller integrated-cable</b> | Enters integrated-cable controller configuration mode.                         |

| Command                         | Description                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------|
| <b>rf-channel network-delay</b> | Configure the network delay for an RF channel.                                      |
| <b>rf-channel rf-power</b>      | Sets the RF power output level on the Cisco UBR-MC20X20V cable interface line card. |

# rf-channel stacking

To suppress a carrier or mute a radio frequency (RF) channel on the Cisco uBR-MC88V cable interface line card, use the **rf-channel stacking** command in controller configuration mode. To remove the configuration, use the **no** form of this command.

**rf-channel stacking** *stacking-number*  
**no rf-channel stacking** *stacking-number*

|                           |                                              |                                                                                    |
|---------------------------|----------------------------------------------|------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>stacking-number</i>                       | RF channel stacking number. The range is from 1 to 4. The default value is 4.      |
| <b>Command Default</b>    | The RF channel stacking number is set to 4.  |                                                                                    |
| <b>Command Modes</b>      | Controller configuration (config-controller) |                                                                                    |
| <b>Command History</b>    | <b>Release</b>                               | <b>Modification</b>                                                                |
|                           | 12.2(33)SCD                                  | This command was introduced.                                                       |
|                           | IOS-XE 3.15.0S                               | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** If you change the default stacking number configuration, traffic loss may occur on the active channels. For example, if you change the stacking number from 4 to 2, traffic is interrupted on the RF channels 0 and 1. However, traffic loss does not occur if you do not change the stacking number configuration when shutting down an RF channel using the **rf-channel rf-shutdown** command.

**Note** We recommend that you do not change the default stacking number configuration. You can change the default configuration when you want RF diagnostics performed on a particular channel. For example, if you want to perform RF diagnostics on RF channel 2, you need to change the default stacking number configuration to 2 to completely mute this channel.

## Examples

The following example shows how to configure the RF channel stacking number for the Cisco uBR-MC88V cable interface line card:

```
Router# configure terminal
Router(config)# controller integrated-cable 5/1
Router(config-controller)# rf-channel stacking 3
```

|                         |                               |                                                                                 |
|-------------------------|-------------------------------|---------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                              |
|                         | <b>rf-channel rf-shutdown</b> | Disables the RF output on a Cisco Wideband SPA, or a cable interface line card. |

# rf-output

To define the output mode for the RF channel, use the **rf-output** command in the RF channel sub configuration mode.

**rf-output** {**normal** | **alt** | **cw** | **prbs**}

## Syntax Description

|               |                                                                      |
|---------------|----------------------------------------------------------------------|
| <b>normal</b> | Normal mode for production operation.                                |
| <b>alt</b>    | Alternating symbol (two-tone). Diagnostic mode for hardware testing. |
| <b>cw</b>     | Continuous Wave. Diagnostic mode for hardware testing.               |
| <b>prbs</b>   | Pseudo Random Binary Sequence. Diagnostic mode for hardware testing. |

## Command Default

None.

## Command Modes

RF channel sub configuration mode (config-rf-chan)

## Usage Guidelines

This command is used to define the output mode for the RF channel.

The following example shows how to change the output mode:

```

router#configure terminal
router(config)#controller integrated-cable 3/0/0
router(config-controller)#rf-chan 5 10
router(config-rf-chan)#frequency 723000000
router(config-rf-chan)#rf-output alt
router(config-rf-chan)#exit
router(config-controller)#exit
router(config)#exit
router#show controller integrated-Cable 3/0/0 rf-channel 5 10
Chan State Admin Frequency Type Annex Mod srate Interleaver dcid power output
 5 TEST UP 723000000 DOCSIS B 256 5361 I32-J4 164 34 ALT
10 TEST UP 753000000 DOCSIS B 256 5361 I32-J4 169 34 ALT

```

| <b>qam-profile</b>                 | Defines the QAM profile number.               |
| <b>rf-chan</b>                     | Enters the RF channel sub configuration mode. |
| <b>type</b>                        | Defines the QAM data type.                    |
| <b>power-adjust</b>                | Defines the channel power level.              |

# rf-port integrated-cable

To define the physical slot/bay/port to be used in a video service, to define the Service Distribution Group (SDG) use the **rf-port integrated-cable** command in the service distribution group configuration mode. To delete the physical slot/bay/port, use the **no** form of the command.

**rf-port integrated-cable** *slot/bay/port*

| <b>Syntax Description</b>    | <p><i>slot</i> The line card slot number. Slot can be configured from 0-3 or 6-9. Slots 4 and 5 are the supervisor slots.</p> <p><i>bay</i> The Cisco cBR-8 chassis number. This is always configured as 0.</p> <p><i>port</i> The RF port number. This can be configured from 1-8.</p> |         |              |                              |                                                                                  |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|----------------------------------------------------------------------------------|
| <b>Command Default</b>       | None.                                                                                                                                                                                                                                                                                   |         |              |                              |                                                                                  |

| Cisco IOS-XE Release 3.18.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                        |         |              |                              |                                                                                  |

**Usage Guidelines**

This command is used to define the physical slot/bay/port to be used in a video service, to define the SDG. To configure QAM replication for service group size alignment between the DOCSIS and video services to one or more ports, you can add more ports into the service distribution group configuration. Make sure that the controller type is video for the slot/bay/port that you would use for the SDG. For more information, see the Video QAM Carriers section here: [http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b\\_cbr\\_basic\\_config\\_prov\\_construct/video\\_qam\\_carriers.html](http://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b_cbr_basic_config_prov_construct/video_qam_carriers.html).

The following example shows how to define the physical slot/bay/port :

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdgid 1
router(config-video-sdg)#rf-port integrated-cable 7/0/0
router(config-video-sdg)#rf-port integrated-cable 7/0/1
```

## rf-switch auxport enable

To enable the AUX port of the RF switch, use the **rf-switch auxport enable** command in redundancy mode. To disable the AUX port, use the **no** form of this command.

**rf-switch auxport enable**

**no rf-switch auxport**

### Syntax Description

|               |                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b> | Enables the Cisco NGRFSW-ADV. In the default configuration, the Cisco NGRFSW-ADV is disabled. When the Cisco NGRFSW-ADV is enabled, the Cisco CMTS router starts polling the Cisco NGRFSW-ADV at a set interval to check its status. |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

The AUX port of the Cisco NGRFSW-ADV is disabled by default.

### Command Modes

Redundancy mode (config-red)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCG    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows how to enable the AUX port of the Cisco NGRFSW-ADV:

```
Router> enable
Router# configure terminal
Router(config)# redundancy
Router(config-red)# linecard-group 1 cable
Router(config-red-lc)# rf-switch auxport enable
```

### Command History

The **rf-switch auxport enable** command is used to configure the Cisco uBR Advanced RF Switch (NGRFSW-ADV). See [Cisco uBR Advanced RF Switch Software Configuration Guide](#).

### Related Commands

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard-group id cable</b>  | Assigns the Hot Standby Connection-to-Connection Protocol (HCCP) group to all interfaces on the cable interface line card, or Cisco Broadband Processing Engine. |
| <b>show redundancy linecard</b> | Displays information about a redundant line card or line card group.                                                                                             |

# roll-off

To specify the channel roll-off value, use the **roll-off** command in OFDM channel profile configuration mode. To undo the channel roll-off value assignment, use **no** form of this command.

**roll-off** *value*

**no profile-control**

## Syntax Description

|              |                                                                     |
|--------------|---------------------------------------------------------------------|
| <i>value</i> | The channel roll-off value. Valid values are 64, 128, 192, and 256. |
|--------------|---------------------------------------------------------------------|

## Command Default

128

## Command Modes

OFDM channel profile configuration (config-ofdm-chan-prof)

## Command History

| Release         | Modification                                                                     |
|-----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.18.0SP | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use this command to specify the channel roll-off value.

## Examples

The following example shows how to specify the channel roll-off value:

```
Router# configure terminal
Router(config)# cable downstream ofdm-chan-profile 21
Router(config-ofdm-chan-prof)# roll-off 128
```

|-------------------------------------------|--------------------------------------------------------------------------|
| <b>cable downstream ofdm-chan-profile</b> | Define the OFDM channel profile on the OFDM channel.                     |
| <b>cyclic-prefix</b>                      | Specify the channel cyclic-prefix.                                       |
| <b>description (OFDM channel profile)</b> | Specify a user defined description for the profile.                      |
| <b>interleaver-depth</b>                  | Specify the channel interleaver-depth.                                   |
| <b>pilot-scaling</b>                      | Specify the value used to calculate the number of continuous pilots.     |
| <b>profile-data</b>                       | Specify default modulation or profile as the channel data profile.       |
| <b>profile-ncp</b>                        | Specify default modulation or profile as the channel ncp profile.        |
| <b>profile-control</b>                    | Specify default modulation or profile as the channel control profile.    |
| <b>subcarrier-spacing</b>                 | Specify the spacing for specific subcarriers configured in this profile. |

## route-ecmg

To configure the route to the ECMG server for session based scrambling, use the **route-ecmg** command in the DVB scrambling configuration mode. To void the route configuration, use the **no** form of this command.

**route-ecmg** *ip\_address netmask interface forwarding\_router\_ip*  
**no route-ecmg** *ip\_address netmask interface forwarding\_router\_ip*

|                             |                                                    |
|-----------------------------|----------------------------------------------------|
| <i>ip_address</i>           | Specifies the IP address of the ECMG server.       |
| <i>netmask</i>              | Specifies the netmask of the connection.           |
| <i>interface</i>            | Specifies the interface of the connection.         |
| <i>forwarding_router_ip</i> | Specifies the IP address of the forwarding router. |

### Command Default

None

### Command Modes

DVB scrambling configuration mode (config-video-encrypt-dvb)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following is an example of how to configure the route to the ECMG server:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#route-ecmg 1.200.1.0 255.255.255.0 TenGigabitEthernet 4/1/2
1.200.1.1
```

|-------------------------------|------------------------------------------------------|
| <b>dvb</b>                    | Enters DVB scrambling configuration mode.            |
| <b>strong-pairing-enforce</b> | Switches on the NDS strong pairing enforcement       |
| <b>check-scg-at-prov</b>      | Enables Check SCG at provision time.                 |
| <b>scramble-video-audio</b>   | Scrambles only video and audio pids.                 |
| <b>mgmt-ip</b>                | Configures the management IP for EIS/Broadcast ECMG. |
| <b>ca-interface</b>           | Configures the conditional access interface.         |
| <b>tier-based</b>             | Enters the tier-based scrambling configuration mode. |

| Command     | Description                                                |
|-------------|------------------------------------------------------------|
| <b>ecmg</b> | Enters the ECM Generator configuration mode.               |
| <b>eis</b>  | Enters the Event Information Scheduler configuration mode. |

## routing-interface-ip

To automatically configure IP addresses of line card video interfaces from a pool of IP addresses that you provide, use the **routing-interface-ip** command.

**routing-interface-ip** *ip-address ip-mask* { **secondary** *ip-address ip-mask* }

### Syntax Description

*ip-address* Specifies the starting IP address of the line card video interfaces.

*ip-mask* Specifies the IP mask IP address.

**secondary** Specifies the secondary interface of the line card video interfaces.

### Command Modes

Video configuration mode (config-video)

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Do not change the video interface IP configuration unless there are conflicts with customer subnets.

Video interface IP configuration is optional. By default, the Cisco cBR-8 uses 10.100.x.x subnets for primary IP addresses and 10.101.x.x subnets for secondary IP addresses of video interfaces. By default, all video interfaces are in the VRF *Mgmt-MPEG-video-intf*.

Configure the video interface IP before configuring any other video-specific configurations like logical edge device and virtual service group configurations. Use the **routing-interface-ip** only when the default configuration conflicts with the existing subnets in the network.

## routing-interface-vrf

To configure user-specific VRF to line card video interfaces, use the **routing-interface-vrf** command in video configuration mode. To remove the user-specific VRF configuration, use the **no** form of this command.

**routing-interface-vrf** *slot* **vrf-name** *vrf-name*

|                           |                                                                                                                                                                                                    |                                                                                   |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>slot</i>                                                                                                                                                                                        | Slot where the line card resides. The valid range is 0–3 and 6–9.                 |
|                           | <i>vrf-name</i>                                                                                                                                                                                    | Name of the user-specific VRF                                                     |
| <b>Command Modes</b>      | Video configuration mode (config-video)                                                                                                                                                            |                                                                                   |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                     | <b>Modification</b>                                                               |
|                           | Cisco IOS XE Amsterdam 17.3.1x                                                                                                                                                                     | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |
| <b>Usage Guidelines</b>   | Virtual routing and forwarding configuration is optional. Use the <b>routing-interface-vrf</b> only when the video interface participates in NX-MVPN profile 12 or profile 14.                     |                                                                                   |
|                           | Do not use the <b>routing-interface-vrf</b> command for legacy L3VPN.                                                                                                                              |                                                                                   |
|                           | By default, all video interfaces are in the VRF <i>Mgmt-MPEG-video-intf</i> .                                                                                                                      |                                                                                   |
|                           | Configure VRF separately for each line card that is participating in NX-MVPN.                                                                                                                      |                                                                                   |
|                           | Configure virtual routing and forwarding before configuring any other video-specific configurations like logical edge device, virtual carrier group, or service distribution group configurations. |                                                                                   |

# rpd-ds downstream-cable

To configure the downstream controller in the RPD, use the **rpd-ds downstream-cable** command in RPD core-interface configuration mode. To void the downstream controller configuration in the RPD, use the **no** form of this command.

**rpd-ds 0 downstream-cable** *slot/subslot/port* **profile** *id*

**no rpd-ds 0 downstream-cable** *slot/subslot/port*

|                           |                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>slot/subslot/port</i> Specifies the slot, subslot and port of the downstream controller. |
|---------------------------|---------------------------------------------------------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                                                    |
|----------------------|----------------------------------------------------|
| <b>Command Modes</b> | RPD core-interface configuration (config-rpd-core) |
|----------------------|----------------------------------------------------|

| Command History | Release                     | Modification                                                                     |
|-----------------|-----------------------------|----------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

|                         |                                                                     |
|-------------------------|---------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to configure the downstream controller in the RPD. |
|-------------------------|---------------------------------------------------------------------|

The following example shows how to configure the downstream controller in the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-cable 9/0/0 profile 0
```

| Related Commands | Command                      | Description                                    |
|------------------|------------------------------|------------------------------------------------|
|                  | <b>core-interface</b>        | Configures the core-interface of the RPD.      |
|                  | <b>rpd-us upstream-cable</b> | Configures the upstream controller in the RPD. |

## rpd-ds downstream-oob-vom

To specify the downstream virtual OM and OOB profile, use the **rpd-ds downstream-oob-vom** command in RPD core-interface configuration mode. To void the downstream virtual OM and OOB profile assignment, use the **no** form of this command.

**rpd-ds 0 downstream-oob-vom** *o-id* **profile** *dp-id*

**no rpd-ds 0 downstream-oob-vom**

### Syntax Description

|              |                                                                       |
|--------------|-----------------------------------------------------------------------|
| <i>o-id</i>  | Specifies the ID of the virtual OM previously configured.             |
| <i>dp-id</i> | Specifies the ID of the downstream OOB profile previously configured. |

### Command Default

None

### Command Modes

RPD core-interface configuration (config-rpd-core)

### Command History

| Release                     | Modification                                                                     |
|-----------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Use this command to specify the downstream virtual OM and OOB profile.

The following example shows how to specify the downstream virtual OM and OOB profile:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-oob-vom 1 profile 3
```

|------------------------|-----------------------------|----------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>                                                              |
|                        | Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Description

Specifies a description for the upstream controller profile. The maximum length is 20 characters. This field is set to NULL by default. Different upstream controller profiles on the RPD ports can be easily distinguished if a description is specified.

|                         |                                                                   |
|-------------------------|-------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to configure the upstream controller in the RPD. |
|-------------------------|-------------------------------------------------------------------|

The following example shows how to configure the upstream controller in the RPD:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-us 0 upstream-cable 9/0/0 profile 122
```

|------------------|--------------------------------|--------------------------------------------------|
|                  | <b>core-interface</b>          | Configures the core-interface of the RPD.        |
|                  | <b>rpd-ds downstream-cable</b> | Configures the downstream controller in the RPD. |

## rpd-us upstream-oob-varpd

To specify the upstream virtual ARPD and OOB profile, use the **rpd-us upstream-oob-varpd** command in RPD core-interface configuration mode. To void the upstream virtual ARPD and OOB profile assignment, use the **no** form of this command.

**rpd-us port upstream-oob-varpd***a-id* **profile** *up-id*

**no rpd-us port upstream-oob-varpd**

### Syntax Description

|              |                                                                     |
|--------------|---------------------------------------------------------------------|
| <i>a-id</i>  | Specifies the ID of the virtual ARPD previously configured.         |
| <i>up-id</i> | Specifies the ID of the upstream OOB profile previously configured. |

### Command Default

None

### Command Modes

RPD core-interface configuration (config-rpd-core)

### Command History

| Release                     | Modification                                                                     |
|-----------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Use this command to specify the upstream virtual ARPD and OOB profile.

The following example shows how to specify the upstream virtual ARPD and OOB profile:

```
Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tengigabitethernet 3/1/0
Router(config-rpd-core)# rpd-us 0 upstream-oob-varpd 1 profile 3
```

### Related Commands

|---------------------------------------------|-------------------------------------------------|
| <b>virtual-arpd</b>                         | Defines a virtual ARPD configuration.           |
| <b>controller upstream-oob 55d1-profile</b> | Configures the OOB upstream controller profile. |

# rpd downstream-cable

To specify the RPD in the SDG, use the **rpd downstream-cable** command in SDG configuration mode. To void the RPD assignment in the SDG, use the **no** form of this command.

**rpd downstream-cable** *slot/bay/port*

**no rpd downstream-cable** *slot/bay/port*

|                           |                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>slot/bay/port</i> Specifies the slot, bay and port of the downstream cable interface. |

|                  | <b>rpd-us upstream-cable</b> | Configures the upstream controller in the RPD. |

# sbfd

To configure the SBFD, use the **sbfd** command in RPD configuration mode. To void the SBFD configuration, use the **no** form of this command.

**sbfd** {**sbfd** | **interval** *milliseconds* **multiplier** *value*}

**no sbfd** {**enable** | **interval**}

|                           |                                                                                                                                                                                                                                |                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>milliseconds</i>                                                                                                                                                                                                            | Specifies interval in milliseconds.                                              |
|                           | <i>value</i>                                                                                                                                                                                                                   | Specifies the value to multiply the interval.                                    |
| <b>Command Default</b>    | None                                                                                                                                                                                                                           |                                                                                  |
| <b>Command Modes</b>      | RPD configuration (config-rpd)                                                                                                                                                                                                 |                                                                                  |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                 | <b>Modification</b>                                                              |
|                           | Cisco IOS XE Everest 16.5.1                                                                                                                                                                                                    | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |
| <b>Usage Guidelines</b>   | <p>Use this command to configure SBFD.</p> <p>The following example shows how to configure SBFD:</p> <pre>Router# <b>configure terminal</b> Router(config)# <b>cable rpd 1</b> Router(config-rpd)# <b>no sbfd enable</b></pre> |                                                                                  |

# scramble-video-audio

To scramble only video and audio pids, use the **scramble-video-audio** command in the DVB scrambling configuration mode. To scramble all elementary streams, use the **no** form of this command.

**scramble-video-audio**  
**no scramble-video-audio**

## Command Default

None

## Command Modes

DVB scrambling configuration mode (config-video-encrypt-dvb)

| Release       | Modification                                                                     |
|---------------|----------------------------------------------------------------------------------|
| IOS-XE 16.4.1 | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

When **scramble-video-audio** is configured, the elementary streams other than video and audio are not scrambled.

The following is an example of how to scramble only video and audio pids:

```
Router>enable
Router#configure terminal
Router(config)#cable video
Router(config-video)#encryption
Router(config-video-encrypt)#dvb
Router(config-video-encrypt-dvb)#scramble-video-audio
```

| <b>mgmt-ip</b>                | Configures the management IP for EIS/Broadcast ECMG.       |
| <b>ca-interface</b>           | Configures the conditional access interface.               |
| <b>tier-based</b>             | Enters the tier-based scrambling configuration mode.       |
| <b>ecmg</b>                   | Enters the ECM Generator configuration mode.               |
| <b>eis</b>                    | Enters the Event Information Scheduler configuration mode. |

## secondary aux

To enable the auxiliary port on the standby PRE1 module, use the **secondary aux** command in redundancy configuration (main-cpu) mode. To disable the auxiliary port, use the **no** form of this command.

**secondary aux**  
**no secondary aux**

### Syntax Description

This command has no keywords or arguments.

### Command Default

The auxiliary port on the standby PRE1 module is disabled.

### Command Modes

Redundancy configuration, main-cpu mode

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(11)BC3    | This command was introduced for the Cisco uBR10012 router.                         |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows how to enable the auxiliary port on the standby PRE1 module.

```
Router# config t

Router(config)# redundancy

Router(config-r)# main-cpu

Router(config-r-mc)# secondary aux
Router(config-r-mc)# exit

Router(config-f)# exit

Router(config)#
```

### Related Commands

| Command                                   | Description                                                                                                                                                       |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>main-cpu</b>                           | Enters main-CPU redundancy configuration mode, so that you can configure the synchronization of the active and standby Performance Routing Engine (PRE1) modules. |
| <b>redundancy</b>                         | Configures the synchronization of system files between the active and standby PRE1 modules.                                                                       |
| <b>redundancy force-failover main-cpu</b> | Forces a manual switchover between the active and standby PRE1 modules.                                                                                           |

## server

To define the server IP address of the session resource manager, use the **server** command in the logical edge device protocol configuration mode. To reset to default configuration, use the **no** form of this command.

```
server ip-address
no server ip-address
```

| Syntax Description                   | <table><tr><td>ip-address</td><td>Specifies the server IP address of the session resource manager.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  | ip-address | Specifies the server IP address of the session resource manager. |                     |                                                                                 |          |                                                         |         |                                                                    |             |                                                    |     |                                                                          |                       |                               |                                      |                                               |                                  |                                                                                                       |

|--------------------------------------------------|-----------------------------------------------|
| <b>show diag all eeprom detail   include MAC</b> | Displays the chassis MAC address information. |

## service divert-limit

To set the layer 3 mobility threshold limit, use the **service divert-limit** command in global configuration mode. To set the default value, use the **no** form of this command.

```
service divert-limit {l3-mobility-counter limit | l3-mobility-timeslot timeslot }
no service divert-limit {l3-mobility-counter limit | l3-mobility-timeslot timeslot }
```

### Syntax Description

|                             |                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>l3-mobility-counter</b>  | Sets the layer 3 CPE mobility counter threshold.                                                          |
| <i>limit</i>                | Specifies the mobility counter threshold limit in packets. The range is from 1 to 127. The default is 16. |
| <b>l3-mobility-timeslot</b> | Sets the layer 3 CPE mobility time slot configuration.                                                    |
| <i>timeslot</i>             | Specifies the mobility time slot in milliseconds. The range is from 1 to 4095. The default is 300.        |

### Command Default

This **divert-limit l3-mobility-counter** default value is 16 packets and **divert-limit l3-mobility-timeslot** default value is 300 ms.

### Command Modes

Global configuration (config)

### Command History

|                |                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCH2   | The command was introduced.                                                                                                        |
| IOS-XE 3.15.0S | This command was replaced by the <b>platform punt-sbrl subscriber</b> command on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

If the **cable l3-mobility** command is enabled, the **service divert-limit** command is also enabled by default. This command is usually used to modify the default value.

**Note** This command does not work if **cable l3-mobility** command is disabled.

### Examples

The following example shows how to set the CPE mobility threshold and time slot:

```
Router # enable
Router # configure terminal
Router (config) # service divert-limit l3-mobility-counter 127
Router (config) # service divert-limit l3-mobility-timeslot 4095
```

### Related Commands

| Command                  | Description                                            |
|--------------------------|--------------------------------------------------------|
| <b>cable l3-mobility</b> | Enables mobility for a particular IPv4 or IPv6 subnet. |

# service divert-rate-limit

**Note** Effective with Cisco IOS Release 12.2(33)SCB, the **service divert-rate-limit fib-rp-glean** command is replaced on the WAN-side by the **service divert-rate-limit ip fib-rp-glean** command. See the **service divert-rate-limit ip** command for more information. The **service divert-rate-limit fib-rp-glean** command is replaced on the WAN-side non-IP by **service divert-rate-limit non-ip fib-rpf-glean** command. See the **service divert-rate-limit non-ip** command for more information. For cable-side DRL configuration, see the **cable divert-rate-limit** command.

To configure PXF Divert-Rate-Limit, use the **service divert-rate-limit** command in global configuration mode. To reset this feature to the default parameters, use the no form of this command.

**service divert-rate-limit** *divert-code* *rate* [**limit** *limit*]  
**no service divert-rate-limit** *divert-code*

## Syntax Description

|                                   |                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>divert-code</i><br><i>rate</i> | Configures the PXF Divert-Rate-Limit for the any of the following packets: <ul style="list-style-type: none"> <li>• fwd-glean—Packets that hit a glean adjacency in the FIB.</li> <li>• rpf-glean—Packets that hit a glean adjacency during the RPF check.</li> </ul> <p>The range is from 1 to 255 packet-per-second.</p> <p>The default rate is 20 packets-per-second.</p> |
| <b>limit</b> <i>limit</i>         | (Optional) Sets the limit for the number of packets that will be diverted in an initial burst of packets. <p>The range is from 4 to 255 packets.</p> <p>The default limit is 5 packets.</p> <p><b>Note</b> Setting the limit has a limited effect on the behavior of the algorithm, so this part of the CLI is hidden.</p>                                                   |

## Command Default

Divert-Rate-Limit contains the following default behavior and values:

- Divert-Rate-Limit is always active.
- The default rate is 20 packets-per-second.
- The default limit is 5 packets.

## Command Modes

Global configuration (config)

## Command History

|             |                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| 12.3(17a)BC | The command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.                |
| 12.2(33)SCA | This command was integrated into Cisco IOS release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |

|                |                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was replaced by the <b>service divert-rate-limit ip</b> <i>fib-rp-glean</i> command and <b>service divert-rate-limit non-ip</b> <i>fib-rpf-glean</i> command. |
| IOS-XE 3.15.0S | This command was replaced by the <b>platform punt-sbri subscriber</b> command on the Cisco cBR Series Converged Broadband Routers.                                         |

### Usage Guidelines

The **service divert-rate-limit** command is used to configure the PXF Divert-Rate-Limit for fwd-glean and rpf-glean packets in order to identify packet streams that will cause congestion of the FP-to-RP interface.

### Examples

The following example shows how to configure rate-limiting for fib-rp-glean, with a rate of 10 packets-per-second and a limit of 20 packets:

```
Router(config-if)# service divert-rate-limit fib-rp-glean 10 limit 20
```

The following example shows how to return rate-limiting for fib-rp-glean to the default values:

```
Router(config-if)# no service divert-rate-limit fib-rp-glean
```

Pass and fail counters are kept for fwd-glean, rpf-glean, and cable-ARP packets. To show the statistics for the pass and fail counter, use the **show pxf cpu statistics drl** command:

```
Router(config-if)# show pxf cpu statistics drl
Divert-Rate-Limit statistics
 code total diverted dropped
fib_rpf_glean 500 59 441
fib_rp_glean 500 54 446
arp_filter 0 0 0
```

**Note** The arp\_filter stats shown above are global stats for PXF ARP Filtering. These stats cannot be cleared by the CLI. However, they will reset to zero upon reload.

Packets dropped by Divert-Rate-Limit and the ARP Filter will be recorded in the regular PXF drop statistics:

```
Router(config-if)# show pxf cpu statistics drop c5/0/0

FP drop statistics for Cable5/0/0
 packets bytes
vcci undefined 0 0
vcci C
...
divert_rate_limit 441 28224
arp_filter_reply 0 0
arp_filter_request 0 0
```

### Related Commands

|------------------------------|---------------------------------------------------------------------------|
| <b>show cable arp-filter</b> | Displays the total number of Address Resolution Protocol (ARP) offenders. |

## service divert-rate-limit ip

To set DRL rate and limit for WAN-side IP packet streams, use the **service divert-rate-limit ip** command in global configuration mode. To reset the *rate* and *limit* to the default values for all IP divert-codes, use the **no** form of this command. Using **no service divert-rate-limit ip divert-code** will reset rate and limit to the default values for the specified divert code.

**service divert-rate-limit ip divert-code rate rate limit limit**  
**no service divert-rate-limit ip**

### Syntax Description

|                    |                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>divert code</i> | Specifies the applicable divert code.                                                                                                                                                                        |
| <i>rate</i>        | Specifies the divert rate in packets per second. Minimum rate is 1 packet per second. Maximum rate is 65535 packets per second.<br><br>For WAN-side IP packets, the default rate is 4000 packets per second  |
| <i>limit</i>       | Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets.<br><br>For WAN-side IP packets, the default limit is 4000 packets. |

### Command Default

For WAN-side IP packet streams, the default rate is 4000 packets per second and default limit is 4000 packets. These defaults apply to each uniquely identified IP packet stream.

### Command Modes

Global configuration (config)

### Command History

| Release        | Modification                                                                                                                                                                                |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.<br><br>The <b>service divert-rate-limit ip fib-rp-glean</b> command is the WAN-side replacement for the <b>service divert-rate limit fib-rp-glean</b> command. |
| IOS-XE 3.15.0S | This command was replaced by the <b>platform punt-sbri wan</b> command on the Cisco cBR Series Converged Broadband Routers.                                                                 |

### Usage Guidelines

You can configure a rate and limit for a particular IP divert-code for WAN-side IP packets. However, each IP packet-stream is uniquely identified (using a hash of the VRF, the IP source address, and the divert-code), and then packets in that stream are sent through a rate-limiter with the configured rate and limit.

### Examples

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit ip fib-rp-glean rate 1 limit 4
```

## service divert-rate-limit ipv6

To set the divert rate limit (DRL) rate and limit for WAN-side IPv6 packet streams, use the **service divert-rate-limit ipv6** command in global configuration mode.

**service divert-rate-limit ipv6** *divert-code* **rate** *rate* **limit** *limit*  
**no service divert-rate-limit ipv6**

### Syntax Description

|                    |                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>divert-code</i> | Specifies the applicable divert code.                                                                                                                                                                          |
| <i>rate</i>        | Specifies the divert rate in packets per second. Minimum rate is 1 packet per second. Maximum rate is 65535 packets per second.<br><br>For WAN-side IPv6 packets, the default rate is 4000 packets per second. |
| <i>limit</i>       | Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets.<br><br>For WAN-side IPv6 packets, the default limit is 4000 packets. |

### Command Default

For WAN-side IPv6 packet streams, the default rate is 4000 packets per second and default limit is 4000 packets.

### Command Modes

Global configuration (config)

### Command History

| Release        | Modification                                                                                                                |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCE    | This command was introduced.                                                                                                |
| IOS-XE 3.15.0S | This command was replaced by the <b>platform punt-sbri wan</b> command on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

You can configure rate and limit for a particular IPv6 divert-code for WAN-side IP packets. However, each IP packet-stream is uniquely identified (using a hash of the VRF, the IP source address, and the divert-code), and then packets in that stream are sent through a rate-limiter with the configured rate and limit.

This command is supported only on PRE4.

Use the **diversion** option of the **show pxf cpu statistics** command to troubleshoot the divert code, before configuring the DRL.

To configure the correct divert code, refer to the list of divert codes.

**Table 36: List of divert codes**

| Divert Code       | Description       |
|-------------------|-------------------|
| 6pe_dst_linklocal | 6PE dst linklocal |
| 6pe_dst_mcast     | 6PE dst multicast |

| Divert Code          | Description                     |
|----------------------|---------------------------------|
| 6pe_ttl              | 6PE ttl                         |
| icmpv6               | IPv6 ICMP                       |
| ipv6_cable_filter_ds | ipv6 cable filter ds            |
| ipv6_dhcp_ucast      | IPv6 unicast DHCP               |
| ipv6_hopopts         | IPv6 HopOpts                    |
| ipv6_lng_ext_hdr     | IPv6 long extension hdr         |
| ipv6_mcast_rsvd      | IPv6 multicast                  |
| ipv6_nd_na_mcast     | IPv6 ND NA (multicast)          |
| ipv6_nd_na_ucast     | IPv6 ND NA (unicast)            |
| ipv6_nd_ns_mcast     | IPv6 ND NS (multicast)          |
| ipv6_nd_ns_ucast     | IPv6 ND NS (unicast)            |
| ipv6_nd_rs_mcast     | IPv6 ND RS (multicast)          |
| ipv6_rp_dest         | IPv6 receive adjacency          |
| ipv6_rp_glean        | IPv6 glean adjacency            |
| ipv6_rp_pbr          | IPv6 RP PBR                     |
| ipv6_rp_punt         | IPv6 punt adjacency             |
| ipv6_src_linklocal   | IPv6 SRC LinkLocal              |
| ipv6_src_ver_lq_req  | IPv6 src ver leasequery request |
| ipv6_src_ver_mac_req | IPv6 src ver MAC request        |

**Note** To reset the *rate* and *limit* to the default values for all IPv6 divert-codes, use the no form of this command. Using **no service divert-rate-limit ipv6 divert-code** will reset *rate* and *limit* to the default values for the specified divert code.

## Examples

The following example shows how to set the rate and limit for the specified divert code:

```
Router(config)# service divert-rate-limit ipv6 ipv6_rp_glean rate 20 limit 10
Router(config)#
```

**Related Commands**

| Command                                            | Description                                                |
|----------------------------------------------------|------------------------------------------------------------|
| <b>service divert-rate-limit trusted-site</b>      | Adds IPv4-specific entries to the trusted site list.       |
| <b>service divert-rate-limit non-ip</b>            | Configures DRL for WAN-side non-IP packet streams.         |
| <b>service divert-rate-limit trusted-site-ipv6</b> | Adds IPv6-specific entries to the trusted site list.       |
| <b>show pxf cpu statistics</b>                     | Displays Parallel eXpress Forwarding (PXF) CPU statistics. |

## service divert-rate-limit ip trusted-site

To add entries to the trusted site list, use the **service divert-rate-limit ip trusted-site** command in the global configuration mode. To remove all entries from the trusted site list, use the **no** form of this command.

```
service divert-rate-limit ip trusted-site ip-address mask ip-address tos tos-value mask tos-mask
vrf vrf-name
no service divert-rate-limit ip trusted-site ip-address mask ip-address tos tos-value mask tos-mask
vrf vrf-name
```

### Syntax Description

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>                | Specifies the source IP address that should be matched.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>mask</b><br><i>ip-address</i> | The mask to apply to the source IP address of the packet before testing if it matches. There are no restrictions on the mask value.                                                                                                                                                                                                                                                                                                                   |
| <b>tos</b> <i>tos-value</i>      | The ToS value of the trusted site. There are no restrictions on the <i>tos_value</i> . Example: 0xD0                                                                                                                                                                                                                                                                                                                                                  |
| <b>mask</b> <i>tos-mask</i>      | The mask to apply to the IP ToS value and the trusted-site <i>tos_value</i> before testing if it matches. There are no restrictions on the <i>tos_mask</i> value.<br><br>Example: 0xF3<br><br><b>Note</b> The ToS value can be wild-carded by setting the <i>tos_mask</i> to 0x00                                                                                                                                                                     |
| <b>vrf</b> <i>vrf-name</i>       | The VRF that this trusted site applies to.<br><br>For the global VRF, use the <b>global</b> keyword. |----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

The **service divert-rate-limit ip trusted-site** command is used to configure trusted site list that contains a source IP address and mask, IP ToS value and mask, and a VRF. If no IP address is specified, the entire trusted site list is cleared. The trusted site list contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list applies only to WAN-IP IPv4 packets. There is a limitation of four trusted sites.

### Examples

The following example shows how to configure trusted site list:

**service divert-rate-limit ip trusted-site**

```
Router(config)
)# service divert-rate-limit trusted-site 192.0.13.2 255.255.255.0
 tos 0xD0 mask 0xF3 vrf name1
```

|-----------------------------------------|---------------------------------------------------------------------------|
| <b>service divert-rate-limit non-ip</b> | This command sets and limit default values for the specified divert code. |

## service divert-rate-limit max-rate us-cable

To set per-divert-code rate limit on the upstream cable interface, use the **service divert-rate-limit max-rate us-cable** command in global configuration mode. To reset the divert-rate-limit parameters to the default values for all divert-codes, use the no form of this command.

**service divert-rate-limit max-rate us-cable** *divert-code* **rate** *rate* **limit** *limit*

### Syntax Description

*divert-code* Configures the divert-rate-limit for any of the following packets:

- *mfib\_224\_0\_0\_x*—The Packet whose destination IP is 224.0.0.x.
- *icmpv6*—IPv6 ICMP
- *mfib\_igmp*—IGMP protocol packet
- *ipv6\_nd\_na\_mcast*—IPv6 ND NA (multicast)
- *ipv6\_nd\_na\_ucast*—IPv6 ND NA (unicast)
- *ipv6\_nd\_ns\_mcast*—IPv6 ND NS (multicast)
- *ipv6\_nd\_ns\_ucast*—IPv6 ND NS (unicast)
- *fib\_rp\_dest*— IPv4 packets targeting to CMTS.
- *fib\_rp\_dest\_precedence*—The packet whose destination is RP and has non-zero precedence value in IP header.
- *fib\_rp\_glean*—FIB glean adjacency used for IPv4 adjacency resolving.
- *fib\_rp\_punt*—FIB punt adjacency used for IPv4 adjacency resolving.
- *src\_ver\_leasequery\_req*—Divert to RP due to zero MD and sid value and need to send lease query to DHCP server for those packets.
- *src\_ver\_unknown\_ip\_addr*—Divert to RP due to zero MD and sid value and no adjacency information for source IP address of those packets.
- *ipv6\_rp\_dest*—IPv4 packets targeting to CMTS.
- *ipv6\_rp\_dest\_precedence*—The packet whose destination is RP and has non-zero precedence value in IPV6 header.
- *ipv6\_rp\_glean*—IPv6 receive adjacency used for IPv4 adjacency resolving.
- *ipv6\_rp\_punt*—IPv6 punt adjacency used for IPv4 adjacency resolving.
- *ipv6\_src\_linklocal*—IPv6 SRC LinkLocal
- *ipv6\_src\_ver\_mac\_req*—Divert to RP due to zero MD and sid value.

*rate* Specifies the divert rate in packets/sec. The range is from 1 to 65535. The default value is 4194.

*limit* Specifies the limit for the number of packets that will be diverted in an initial burst of packets. The range is from 4 to 4194. The default value is 4194.

| <b>show pxf cpu statistics drlmax-rate us-cable</b> | Verifies the drop counters for the DRL max-rate on the upstream cable interface. |

## service divert-rate-limit max-rate wan

To set per-divert-code rate limit on the WAN interface, use the **service divert-rate-limit max-rate wan** command in global configuration mode. To reset the divert-rate-limit parameters to the default values for all divert-codes, use the no form of this command.

**service divert-rate-limit max-rate wan** *divert-code* **rate** *rate* **limit** *limit*

### Syntax Description

*divert-code* Configures the divert-rate-limit for any of the following packets:

- *fib\_rp\_dest*—IPv4 packets targeting to CMTS.
- *fib\_rp\_glean*—FIB glean adjacency used for IPv4 adjacency resolving.
- *fib\_rp\_punt*—FIB punt adjacency used for IPv4 adjacency resolving.
- *ipv6\_rp\_dest*—IPv4 packets targeting to CMTS.
- *ipv6\_rp\_glean*—IPv6 receive adjacency used for IPv4 adjacency resolving.
- *ipv6\_rp\_punt*—IPv6 punt adjacency used for IPv4 adjacency resolving.
- *mfib\_224\_0\_0\_x*—The Packet whose destination IP is 224.0.0.x.
- *icmpv6*—IPv6 ICMP
- *mfib\_igmp*—IGMP protocol packet
- *ipv6\_nd\_na\_mcast*—IPv6 ND NA (multicast)
- *ipv6\_nd\_na\_ucast*—IPv6 ND NA (unicast)
- *ipv6\_nd\_ns\_mcast*—IPv6 ND NS (multicast)
- *ipv6\_nd\_ns\_ucast*—IPv6 ND NS (unicast)
- *ipv6\_rp\_dest\_precedence*—The packet whose destination is RP and has non-zero precedence value in IPV6 header.
- *ipv6\_src\_linklocal*—IPv6 SRC LinkLocal
- *fib\_rp\_dest\_precedence*—The packet whose destination is RP and has non-zero precedence value in IP header.

*rate* Specifies the divert rate in packets/sec. The range is from 1 to 65535. The default value is 4194.

*limit* Specifies the limit for the number of packets that will be diverted in an initial burst of packets. The range is from 4 to 4194. The default value is 4194.

| <b>show pxf cpu statistics drlmax-rate wan</b> | Verifies the drop counters for the DRL max-rate on the WAN interface. |
| <b>clear pxf statistics drl max-rate</b>       | Clears the DRL max-rate statistics on the WAN interface.              |

## service divert-rate-limit non-ip

To set DRL for WAN-side non-IP packet streams, use the **service divert-rate-limit non-ip** command in global configuration mode. To reset the *rate* and *limit* to the default values for all non-IP divert-codes, use the **no** form of this command. Using **no service divert-rate-limit non-ip divert-code** will reset rate and limit to the default values for the specified divert-code.

**service divert-rate-limit non-ip divert-code rate rate limit limit**  
**no service divert-rate-limit non-ip**

### Syntax Description

|                    |                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>divert-code</i> | Specifies the applicable divert code.                                                                                                                                                                       |
| <i>rate</i>        | Specifies the rate in packets per second. Minimum rate is one packet per second. Maximum rate is 65535 packets per second.<br><br>For WAN-side non-IP packets, the default rate is 2000 packets per second. |
| <i>limit</i>       | Specifies the number of packets to be diverted in an initial burst of packets. Minimum limit is 4 packets. Maximum limit is 4194 packets.<br><br>For WAN-non-IP packets, the default limit is 2000 packets. |

### Command Default

For WAN-side non-IP packets, the default rate is 2000 packets per second and default limit is 2000 packets.

### Command Modes

Global configuration (config)

### Command History

| Release        | Modification                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.<br><br>The <b>service divert-rate-limit non-ip fib-rpf-glean</b> command is the WAN-side non-IP replacement for the <b>service divert-rate-limit fib-rpf-glean</b> command. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                                                                                                       |

### Usage Guidelines

You can configure a rate and limit for a particular non-IP divert-code, and all packets arriving with that divert-code are sent through a single rate-limiter with the configured rate and limit. but the explanation is fairly straightforward: there is a single rate-limiter for each non-IP divert-code. No attempt is made to uniquely identify the source of the attacking packet stream.

### Examples

The following example shows how to set and limit default values for the specified divert code:

```
Router(config)# service divert-rate-limit non-ip fib-rp-glean 10 rate 1 limit 4
```

### Related Commands

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCB    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

The **service divert-rate-limit ip trusted-site** command is used to configure trusted site list that contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list contains a source IP address and mask, IP ToS value and mask, and a VRF. The trusted site list applies only to WAN-IP IPv4 packets. There is a limitation of four trusted sites.

To remove specified entry from the trusted site list, use **no service divert-rate-limit trusted-site** *ip-address mask ip-address tos tos-value mask tos-mask* [**global** | **vrf vrf-name** ]. If no IP address is specified, the entire trusted site list is cleared.

## Examples

The following example shows how to configure trusted site list:

```
Router(config)
)# service divert-rate-limit trusted-site 192.0.13.0 255.255.255.0
 tos 0xD0 mask 0xF3 vrf name1
```

## Related Commands

| Command                                 | Description                                                               |
|-----------------------------------------|---------------------------------------------------------------------------|
| <b>service divert-rate-limit non-ip</b> | This command sets and limit default values for the specified divert code. |

## service divert-rate-limit trusted-site-ipv6

To add IPv6-specific entries to the trusted site list, use the **service divert-rate-limit trusted-site-ipv6** command in the global configuration mode. To remove all entries from the trusted site list, use the **no** form of this command.

**service divert-rate-limit trusted-site-ipv6** *ip-address* **traffic-class** *tc\_value* **mask** *tc-mask* [**global** | **vrf** *vrf-name* ]]  
**no service divert-rate-limit trusted-site-ipv6**

### Syntax Description

|                                      |                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>                    | The source IPv6 address that should be matched.                                                                                                                                                                                                        |
| <b>traffic-class</b> <i>tc_value</i> | The 8-bit traffic-class of the trusted site. There are no restrictions on the <i>tc_value</i> . Example: 0xD0                                                                                                                                          |
| <b>mask</b> <i>tc-mask</i>           | The mask to apply to the packet traffic-class and the trusted-site <i>tc_value</i> before testing if it matches. There are no restrictions on the <i>tc-mask</i> value. Example: 0xF3                                                                  |
| <b>vrf</b> <i>vrf-name</i>           | The virtual route forwarding (VRF) instance to which this trusted site is being applied. For the global VRF, use the global keyword. To apply the trusted-site to all VRFs (including the global VRF), hit enter after specifying the <i>tc-mask</i> . |

### Command Default

Disabled

### Command Modes

Global configuration (config)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCE    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

This command is used to configure trusted site list that contains an IPv6 source-address/prefix-length, a traffic-class value and mask, and a VRF. There is a limitation of four trusted sites.

#### Note

The **no** form of the command is used to remove all entries from the trusted site list. To remove a specific entry you should specify the matching source IP address. For example: **no service divert-rate-limit trusted-site-ipv6** *ip-address* **traffic-class** *tc\_value* **mask** *tc-mask* [**global** | **vrf** *vrf-name* ].

### Examples

The following example shows how to configure IPv6 trusted site list:

```
Router(config)# service divert-rate-limit trusted-site-ipv6 2001:420:3800:800:21F:29FF::1/128
2001:420:3800:800:21F:29FF::1/128 traffic-class 0x3 mask 0xFF global
Router(config)#
```

**Related Commands**

|---------------------------------------------|-------------------------------------------------------------------------------|
| <b>show pxf cpu statistics drl us-cable</b> | Displays the number of upstream cable packets that are dropped from the CMTS. |
| <b>show pxf cpu statistics drl ipv6</b>     | Verifies the drop counters for WAN-IPv6 packets.                              |
| <b>show pxf cpu statistics drl ipv4</b>     | Verifies the drop counters for WAN-IPv4 packets.                              |

## service instance

To configure an Ethernet service instance, use the **service instance** command in Layer 2 VPN configuration mode. To disable this configuration, use the **no** form of this command.

**service instance** *id* *service-type*  
**no service instance** *id* *service-type*

### Syntax Description

|                     |                                |
|---------------------|--------------------------------|
| <i>id</i>           | Service instance ID.           |
| <i>service-type</i> | Service type for the instance. |

### Command Default

None

### Command Modes

Layer 2 VPN configuration (config-l2vpn)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                       |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

You must provision a Multiprotocol Label Switching (MPLS) pseudowire before configuring an Ethernet service instance in Layer 2 VPN configuration mode.

### Examples

The following example shows how to configure an Ethernet service instance on a Cisco uBR10012 router:

```
Router # configure terminal
Router(config) # cable l2vpn 001e.6bfb.0f9e customer2
Router(config-l2vpn) # service instance 7000 ethernet
```

|--------------------------------------|-----------------------------------------------------------------|
| <b>cable l2-vpn-service xconnect</b> | Enables the use of Layer 2 tunnels based on an MPLS pseudowire. |

## service udp-small-servers max-servers no-limit

To enable use of minor servers that use the UDP protocol (such as ToD, echo, chargen, and discard), use the **service udp-small-servers max-servers no-limit** command in global configuration mode. To remove this configuration, use the **no** form of this command.

```
service udp-small-servers max-servers no-limit
no service udp-small-servers max-servers no-limit
```

**Command Default** DHCP or ToD servers are not configured by default.

**Command Modes** Global configuration

| Command History | Release        | Modification                                                                      |
|-----------------|----------------|-----------------------------------------------------------------------------------|
|                 | 12.1 EC        | Command support introduced on the Cisco CMTS.                                     |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** Disabling the ping option can speed up address assignment when a large number of modems are trying to connect at the same time. However, disabling the ping option can also result in duplicate IP addresses being assigned if users assign unauthorized static IP addresses to their CPE devices.

**Examples** The following example illustrates configuration of this command:

```
Router# configure terminal
Router(config)# service udp-small-servers max-servers no-limit
Router(config)#
```

The following example shows a typical ToD server configuration:

```
service udp-small-servers max-servers no-limit
cable time-server
```

These are the only commands required to enable the ToD server.

**Usage Guidelines** The **max-servers no-limit** option allows a large number of cable modems to obtain the ToD server at one time, in the event that a cable or power failure forces many cable modems offline. When the problem has been resolved, the cable modems can quickly reconnect.

**Note** Do not disable the minor UDP servers if you are also enabling the other DHCP or TFTP servers.

For additional information about DHCP configuration on the Cisco CMTS, refer to the following documents on Cisco.com:

- *Filtering Cable DHCP Lease Queries on the Cisco CMTS*
- *DHCP and Time-of-Day Services on the Cisco CMTS*

**Related Commands**

| Command                                                | Description                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable dhcp-giaddr policy</b>                        | Sets the DHCP <i>giaddr</i> field of DHCP request packets to the primary address for cable modems and the secondary address for CPE devices, allowing the use of separate address pools for the different clients. |
| <b>cable dhcp-parse option</b> (for uBR series router) | Enables the parsing of certain DHCP options.                                                                                                                                                                       |
| <b>cable helper-address</b>                            | Enables load-balancing of DHCP requests from cable modems and CPE devices by specifying different DHCP servers according to the cable interface or subinterface.                                                   |
| <b>ip dhcp ping packet 0</b>                           | Instructs the DHCP server to assign an IP address from its pool without first sending an ICMP ping to test whether a client is already currently using that IP address.                                            |
| <b>ip dhcp relay information option</b>                | Configures the DHCP server to validate the relay agent information option in forwarded BOOTREPLY messages.                                                                                                         |
| <b>ip dhcp smart-relay</b>                             | Enables the DHCP relay agent on the CMTS to automatically switch a cable modem or CPE device to a secondary DHCP server or address pool if the primary DHCP server does not respond to three successive requests.  |

## service-class

To create a DOCSIS configuration file that specifies the quality-of-service (QoS) service-class options for the CM configuration file, use the **service-class** command in cable config-file configuration mode. To disable the specification, use the **no** form of this command.

**service-class** {**guaranteed-upstream** *us-bandwidth* | **max-burst** *burst-size* | **max-downstream** *max-dsbandwidth* | **max-upstream** *max-usbandwidth* | **priority** *priority-num* | **privacy**}  
**no service-class**

### Syntax Description

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>class</i>                                                      | Specifies service class number. The range is 1 to 16. Default value is 1.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>guaranteed-upstream</b><br><i>us-bandwidth</i>                 | Specifies the guaranteed upstream bandwidth in kbps. Valid range for <i>us-bandwidth</i> is 0 to 100000 kbps. Default value is 0.                                                                                                                                                                                                                                                                                                                                           |
| <b>max-burst</b>                                                  | Specifies the maximum upstream burst size in bytes. Valid range for <i>burst-size</i> is 0 to 65535. Default value is 0, unlimited burst length. Recommended value range is 1600 to 1800 bytes. Using a value of 0 or greater than 1800 bytes can cause latency issues for Voice-over-IP. A value of less than 1500 bytes prevents upstream transmission of large Ethernet frames for any modem or CMTS not implementing fragmentation (an optional feature in DOCSIS 1.0). |
| <i>burst-size</i> <b>max-downstream</b><br><i>max-dsbandwidth</i> | Specifies the downstream bandwidth in kbps. Valid range for <i>max-dsbandwidth</i> is 0 to 100000 kbps. Default value is 0.                                                                                                                                                                                                                                                                                                                                                 |
| <b>max-upstream</b><br><i>max-usbandwidth</i>                     | Specifies the upstream bandwidth in kbps. Valid range for <i>max-usbandwidth</i> is 0 to 100000 kbps. Default value is 0.                                                                                                                                                                                                                                                                                                                                                   |
| <b>priority</b> <i>priority-num</i>                               | Specifies the service class priority. Valid range for <i>priority-num</i> is 0 to 7, where 7 is the highest-priority service-class setting.                                                                                                                                                                                                                                                                                                                                 |
| <b>privacy</b>                                                    | Enables baseline privacy interface (BPI).                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Command Default

Service-class is not set by default. A CM cannot register on a Cisco CMTS unless at least one parameter in a service class is specified.

### Command Modes

Cable config-file (config-file)

### Command History

| Release        | Modification                                                                                                       |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| 12.1(2)EC1     | This command was introduced.                                                                                       |
| 12.2(4)BC1     | This command was integrated into Cisco IOS Release 12.2(4)BC1.                                                     |
| 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                         |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                 |

## Usage Guidelines

Default values can be used only if **service-class** class is specified. A single configuration file should not contain multiple service-class ID numbers. Thus, all parameters should be set using a single service-class ID. However, different configuration files can reuse the same service-class ID.

**Note** To enable Baseline Privacy Interface (BPI) operations on the cable command, you must specify both the **service-class privacy** and **privacy** commands for the cable modem's DOCSIS configuration file.

## Examples

The following example shows how to specify the **service-class** command for a DOCSIS configuration file:

```
router(config)# cable config-file upgrade.cm
router(config-file)# service-class 1 priority 0
router(config-file)# service-class 1 max-upstream 3247
router(config-file)# service-class 1 max-downstream 10000
router(config-file)# service-class 1 max-burst 1600
router(config-file)# service-class 1 privacy
router(config-file)# privacy

router(config-file)# exit
```

## Related Commands

| Command                  | Description                                                                 |
|--------------------------|-----------------------------------------------------------------------------|
| <b>cable config-file</b> | Creates a DOCSIS configuration file and enters configuration file mode.     |
| <b>access-denied</b>     | Disables access to the network.                                             |
| <b>channel-id</b>        | Specifies upstream channel ID.                                              |
| <b>cpe max</b>           | Specifies CPE information.                                                  |
| <b>download</b>          | Specifies download information for the configuration file.                  |
| <b>frequency</b>         | Specifies downstream frequency.                                             |
| <b>option</b>            | Specifies vendor-specific information fields and other config-file options. |
| <b>privacy</b>           | Specifies privacy options for baseline privacy images.                      |
| <b>snmp manager</b>      | Specifies SNMP options.                                                     |
| <b>timestamp</b>         | Enables time-stamp generation.                                              |

## service-class (cmts-tag)

To configure the specified service class name for the CMTS tag, use the **service-class** command in the cmts-tag configuration mode. To remove the configured service class name from the CMTS tag, use the **no** form of this command.

[**exclude**] **service-class** *service-class-name*  
**no service-class** *service-class-name*

|                           |                           |                                                                                   |
|---------------------------|---------------------------|-----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>exclude</b>            | (Optional) Configures the CMTS tag to exclude the specified service class name.   |
|                           | <i>service-class-name</i> | Service class name with matching rule                                             |
| <b>Command Default</b>    | None                      |                                                                                   |
| <b>Command Modes</b>      | CMTS tag mode (cmts-tag)  |                                                                                   |
| <b>Command History</b>    | <b>Release</b>            | <b>Modification</b>                                                               |
|                           | 12.2(33)SCC               | This command was introduced.                                                      |
|                           | IOS-XE 3.15.0S            | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows how to configure the specified service class name for the CMTS tag using the **service-class** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# service-class uBR
```

|                         |                                             |                                                                                                                          |
|-------------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                              | <b>Description</b>                                                                                                       |
|                         | <b>cable load-balance docsis-group</b>      | To configure a DOCSIS load balancing group on the CMTS.                                                                  |
|                         | <b>show cable load-balance docsis-group</b> | To display real-time configuration, statistical and operational information for load balancing operations on the router. |
|                         | <b>cable tag</b>                            | To configure a tag for a DOCSIS load balancing group on the CMTS.                                                        |

## service-class (enforce-rule)

To identify a particular service class for cable modem monitoring in an enforce-rule, use the **service-class (enforce-rule)** command in enforce-rule configuration mode. To remove the service class from the enforce-rule, use the **no** form of this command.

**service-class** {**enforced** | **registered**} *name*  
**no service-class** {**enforced** | **registered**} *name*

### Cisco cBR Series Converged Broadband Routers

**service-class** { {**enforced** *name* [**no-persistence**] | {**registered** *name* } }  
**no service-class** { {**enforced** *name* [**no-persistence**] | {**registered** *name* } }

| Syntax Description | <b>enforced</b>       | Specifies an enforced service class.                                                                      |
|--------------------|-----------------------|-----------------------------------------------------------------------------------------------------------|
|                    | <b>registered</b>     | Specifies enforcing of QoS profiles for the registered service class.                                     |
|                    | <i>name</i>           | Specifies the name of the service class.                                                                  |
|                    | <b>no-persistence</b> | (Optional) Specifies that the enforced QoS profile should not remain in force when a cable modem reboots. |

**Command Default** None

**Command Modes** Enforce-rule configuration (enforce-rule)

| Command History | Release        | Modification                                                                                                       |
|-----------------|----------------|--------------------------------------------------------------------------------------------------------------------|
|                 | 12.3(9a)BC     | This command was introduced.                                                                                       |
|                 | 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added. |
|                 | IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                 |
|                 | IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                  |

**Usage Guidelines** The **service-class (enforce-rule)** command allows operators to identify the name of the initial registered service class for a CM in an enforce-rule, and also the name of a new service class to be enforced if the CM violates its registered service parameters.

**Examples** The following example shows specification of the enforced service class called “test” in an enforce-rule:

```
Router(enforce-rule)# service-class enforced test
```

The following example shows service class being enforced with **no-persistence** option on a Cisco cBR Series Converged Broadband Routers:

```
Router(enforce-rule) # service-class enforced test1 no-persistence
```

### Related Commands

| Command                                               | Description                                                                                                                               |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable qos enforce-rule</b> (for uBR series router) | Creates an enforce-rule to enforce a particular QoS profile for subscriber traffic management and enters enforce-rule configuration mode. |
| <b>debug cable subscriber-monitoring</b>              | Displays enforce-rule debug messages for subscriber traffic management on the Cisco CMTS routers.                                         |
| <b>duration</b>                                       | Specifies the time period and sample rate to be used for monitoring subscribers.                                                          |
| <b>enabled (enforce-rule)</b>                         | Activates an enforce-rule and begins subscriber traffic management on a Cisco CMTS router.                                                |
| <b>monitoring-basics</b>                              | Specifies the type of monitoring desired for subscriber traffic management on a Cisco CMTS router.                                        |
| <b>peak-time1</b>                                     | Specifies peak and offpeak monitoring times on a Cisco CMTS router.                                                                       |
| <b>qos-profile registered</b>                         | Specifies the registered QoS profile that should be used for this enforce-rule.                                                           |
| <b>show cable qos enforce-rule</b>                    | Displays the QoS enforce-rules that are currently defined.                                                                                |
| <b>show cable subscriber-usage</b>                    | Displays subscribers who are violating their registered QoS profiles.                                                                     |

# service-descriptor-default

To enable the operator to specify the default values for the service descriptor that will be encoded as part of the serving area table at chassis level, use the **service-descriptor-default** command in the video configuration mode. To disable the feature, use the **no** form of the command.

## service-descriptor-default

### Command Default

None.

### Command Modes

Video configuration mode (config-video)

### Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to enable the feature:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-descriptor-default
router(config-video-serv-desc)#
```

### Related Commands

|---------------------|---------------------------------------------------------------------------------|
| <b>serving-area</b> | Configures the serving area which enables the set tops to discover VOD content. |
| <b>cable video</b>  | Enters the video configuration mode.                                            |

# service-distribution-group

To define a service distribution group, use the **service-distribution-group** command in video configuration mode. To delete a service distribution group, use the **no** form of this command.

```
service-distribution-group name
id id
no service-distribution-group name
id id
```

## Syntax Description

|                                               |                                                      |
|-----------------------------------------------|------------------------------------------------------|
| <b>service-distribution-group</b> <i>name</i> | Specifies the service distribution group name.       |
| <b>id</b> <i>id</i>                           | Specifies the service distribution group identifier. |

## Command Default

None.

## Command Modes

Video configuration (config-video)

## Command History

| Release        | Modification                                                                    |
|----------------|---------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

This command defines a service distribution group.

## Examples

The following example shows how to define a service distribution group:

```
Router#configure terminal
Router(config)#cable video
Router(config-video)#service-distribution-group west-region id 1
```

## Related Commands

|------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>rf-port integrated-cable</b>                                  | Specifies the RF port in a service distribution group.                               |
| <b>onid</b>                                                      | Specifies the original network identifier in a service distribution group.           |
| <b>psi-interval</b>                                              | Specifies the program specific information interval in a service distribution group. |
| <b>show cable video</b><br><b>service-distribution-group all</b> | Displays the service distribution group information.                                 |

# service-id

To specify the service ID as part of the service descriptor, use the **service-id** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

**service-id** *value*

## Syntax Description

*value* Specifies the service ID.

## Command Default

None.

## Command Modes

Service descriptor configuration mode (config-video-serv-desc)

## Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to specify the service ID:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-descriptor-default
router(config-video-serv-desc)#service-id 1
```

## Related Commands

| Command                           | Description                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------|
| <b>serving-area</b>               | Configures the serving area which enables the set tops to discover VOD content. |
| <b>service-descriptor-default</b> | Enables the operator to specify the default values for the service descriptor.  |

## service-name

To specify the service name as part of the service descriptor, use the **service-name** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

**service-name** *string*

### Syntax Description

*string* Specifies the service name.

### Command Default

None.

### Command Modes

Service descriptor configuration mode (config-video-serv-desc)

### Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to specify the service name:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-descriptor-default
router(config-video-serv-desc)#service-name test
```

### Related Commands

| Command                           | Description                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------|
| <b>serving-area</b>               | Configures the serving area which enables the set tops to discover VOD content. |
| <b>service-descriptor-default</b> | Enables the operator to specify the default values for the service descriptor.  |

## service-type (service descriptor)

To specify the service type as part of the service descriptor, use the **service-type** command in the service descriptor configuration mode. To revoke the configuration, use the **no** form of the command.

**service-type** *value*

### Syntax Description

*value* Specifies the service type.

### Command Default

None.

### Command Modes

Service descriptor configuration mode (config-video-serv-desc)

### Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to specify the service type:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-descriptor-default
router(config-video-serv-desc)#service-type 2
```

### Related Commands

| Command                           | Description                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------|
| <b>serving-area</b>               | Configures the serving area which enables the set tops to discover VOD content. |
| <b>service-descriptor-default</b> | Enables the operator to specify the default values for the service descriptor.  |

## service-type (virtual carrier group)

To specify the service type of a virtual carrier group, use the **service-type** command in virtual carrier group configuration mode. To undo the service type assignment, use the **no** form of this command.

**service-type** {**narrowcast** | **broadcast**}

**no service-type** {**narrowcast** | **broadcast**}

|                   |                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>narrowcast</b> | Specifies video on demand and/or switched digital video service type. These narrowcast service types can share the same virtual carrier group. |
| <b>broadcast</b>  | Specifies the broadcast service type.                                                                                                          |

**Command Default** Narrowcast service type

**Command Modes** Virtual carrier group configuration (config-video-vcg)

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                             |
|------------------------|----------------|---------------------------------------------------------------------------------|
|                        | IOS-XE 3.18.0S | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** This command specifies the service type of a virtual carrier group to be enabled on the linecard.

**Examples** The following example shows how to specify the service type of a virtual carrier group:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# virtual-carrier-group vod id 1
Router(config-video-vcg)# service-type broadcast
```

| <b>Related Commands</b> | <b>Command</b>                                | <b>Description</b>                                            |
|-------------------------|-----------------------------------------------|---------------------------------------------------------------|
|                         | <b>virtual-carrier-group</b>                  | Defines a virtual carrier group.                              |
|                         | <b>virtual-edge-input-ip</b>                  | Defines a virtual edge input.                                 |
|                         | <b>encrypt</b>                                | Enables encryption on the virtual carrier group.              |
|                         | <b>rf-channel</b>                             | Specifies the virtual RF channels in a virtual carrier group. |
|                         | <b>show cable video virtual-carrier-group</b> | Displays the virtual carrier group information.               |

## service-type-id (load-balance)

To add a service type ID that is compared against the cable modem provisioned service type ID, to determine an appropriate restricted load balancing group (RLBG), use the **service-type-id** command in the config-lb-group configuration mode. To remove the service type ID, use the **no** form of this command.

**service-type-id** *string*

**no service-type-id** *string*

### Syntax Description

|               |                                                                             |
|---------------|-----------------------------------------------------------------------------|
| <i>string</i> | Identifier of the service type that gets added to the load balancing group. |
|---------------|-----------------------------------------------------------------------------|

### Command Default

No default behavior or values.

### Command Modes

DOCSIS load balancing group mode (config-lb-group)

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

You can use the **service-type-id** command to add a service type ID only to a RLBG.

### Examples

The following example shows how to add a service type ID on the CMTS, using the **service-type-id** command.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable load-balance docsis-group 1
Router(config-lb-group)# restricted
Router(config-lb-group)# service-type-id commercial
Router(config-lb-group)# no service-type-id commercial
Router(config-lb-group)#
```

### Related Commands

| Command                                     | Description                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>      | Configures a DOCSIS load balancing group on the CMTS.                                                                   |
| <b>show cable load-balance docsis-group</b> | Displays real-time configuration, statistical, and operational information for load balancing operations on the router. |

## service-type-id (cmts-tag)

To configure the specified service type ID for the CMTS tag, use the **service-type-id** command in the cmts-tag configuration mode. To remove the service type ID, use the **no** form of this command.

[**exclude**] **service-type-id** *service-type-id*  
**no service-type-id** *service-type-id*

| Syntax Description | <b>exclude</b>         | (Optional) Configures the CMTS tag to exclude the specified service type ID. |
|--------------------|------------------------|------------------------------------------------------------------------------|
|                    | <i>service-type-id</i> | Sets a matching rule with the specified service type ID.                     |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                          |
|----------------------|--------------------------|
| <b>Command Modes</b> | CMTS tag mode (cmts-tag) |
|----------------------|--------------------------|

| Command History | Release        | Modification                                                                      |
|-----------------|----------------|-----------------------------------------------------------------------------------|
|                 | 12.2(33)SCC    | This command was introduced.                                                      |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following example shows how to configure the specified service type ID for the CMTS tag using the **service-type-id** command:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable tag 1
Router(cmts-tag)# service-type-id commercial
```

|------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|                  | <b>cable load-balance docsis-group</b>      | To configure a DOCSIS load balancing group on the CMTS.                                                                  |
|                  | <b>show cable load-balance docsis-group</b> | To display real-time configuration, statistical and operational information for load balancing operations on the router. |
|                  | <b>cable tag</b>                            | To configure a tag for a DOCSIS load balancing group on the CMTS.                                                        |

## serving-area

To configure the serving area which enables the set tops to discover VOD content, use the **serving-area** command in the service distribution group configuration mode. To revoke the configuration, use the **no** form of the command.

**serving-area** *value*

### Syntax Description

*value* Specifies the serving-area at SDG level.

### Command Default

None.

### Command Modes

Service distribution group configuration mode (config-video-sdg)

### Command History

| Release                         | Modification                                                                     |
|---------------------------------|----------------------------------------------------------------------------------|
| Cisco IOS XE Gibraltar 16.10.1c | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The following example shows how to configure the serving area:

```
router#configure terminal
router(config)#cable video
router(config-video)#service-distribution-group sdg id 1
router(config-video-sdg)#serving-area 100
```

### Related Commands

| Command                                            | Description                           |
|----------------------------------------------------|---------------------------------------|
| <b>service-distribution-group</b>                  | Defines a service distribution group. |
| <b>show cable video service-distribution-group</b> | Displays the SDG configuration.       |

# session

To configure a table based video session, use the **session** command in session configuration mode. To disable the configuration, use the **no** form of this command.

**Note** Before configuring the table-based video sessions, you must configure the physical and virtual constructs for Cisco cBR-8. You must also configure the Logical Edge Device (LED), Service Distribution Group (SDG), binding and Virtual Carrier Group (VCG).

```
session sess-name {input-port number | bundle-id number} start-udp-port number num-sessions-per-qam
number processing-type {programdata} start-program program-num [{repeat}] jitter ms [{cbr | vbr}]
no session sess-name {input-port number | bundle-id number} start-udp-port number
num-sessions-per-qam number processing-type {programdata} start-program program-num [{repeat}]
jitter ms [{cbr | vbr}]
```

## Cisco cBR Series Converged Broadband Routers

```
session sess-name multicast-label multicast label input-port vei-number group group_ip source source_ip
processing-type {remappassthrudataremux} start-program program-num [{bit-rate bit-rate_number
}] [{jitter ms}] [{cbr | vbr}] input-program-num num output-program-num num
no session sess-name multicast-label multicast label input port vei-number group group_ip source source_ip
processing-type {remappassthrudataremux} start-program program-num [{bit-rate bit-rate_number
}] [{jitter ms}] [{cbr | vbr}] input-program-num num output-program-num num
```

## Syntax Description

|                                           |                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------|
| <i>sess-name</i>                          | Specifies the session name for the table-based session.                    |
| <i>multicast label</i>                    | Specifies the multicast label name.                                        |
| <b>input-port</b> <i>vei-number</i>       | Specifies the virtual edge input port number.                              |
| <b>group</b> <i>group-ip</i>              | Specifies the group name for the table-based session.                      |
| <b>input-port</b> <i>number</i>           | Specifies the input port number for the table-based session.               |
| <b>bundle-id</b> <i>number</i>            | Specifies the virtual edge input bundle ID.                                |
| <b>start-udp-port</b> <i>number</i>       | Specifies the UDP port number.                                             |
| <b>num-sessions-per-qam</b> <i>number</i> | Specifies the number of sessions per QAM. The valid range is from 1 to 80. |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>processing-type</b>                  | Specifies the processing type of session.<br><b>program</b> —Configures video session as program.<br><b>data</b> —Configures video streams that are not dejittered, and remapped.<br><b>remap</b> —Configures video streams that are remapped.<br><b>passthru</b> —Configures video streams that are passthrough.<br><b>remux</b> —Configures video streams that are remultiplexed. This processing type allows you to specify a program in a multi-program transport stream (MPTS) input session, renumber it, and send it to an output session. |
| <b>start-program</b> <i>program-num</i> | Specifies the starting program number. The valid range is from 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>bit-rate</b> <i>bit-rate-number</i>  | Specified the bits per second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>jitter</b> <i>ms</i>                 | Specifies the jitter value in milliseconds. The valid range is from 10 to 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>input-program-num</b> <i>num</i>     | Specifies the input program number. This is applicable only for remux sessions. The allowed range of program numbers is 1–65535.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>output-program-num</b> <i>num</i>    | Specifies the output program number. This is applicable for remap and remux sessions. The allowed range of program numbers is 1–65535.                                                                                                                                                                                                                                                                                                                                                                                                            |

**Command Default** None

**Command Modes** Session configuration (config-video-tb-vcg-sess)

| Command History | Release         | Modification                                                                    |
|-----------------|-----------------|---------------------------------------------------------------------------------|
|                 | IOS-XE 3.18.0S  | This command is introduced on the Cisco cBR Series Converged Broadband Routers. |
|                 | IOS-XE 3.18.0SP | This command was modified on the Cisco cBR Series Converged Broadband Routers.  |
|                 | IOS-XE 16.8.1   | The <b>remux</b> and the <b>input-program-num</b> keywords were added.          |

**Usage Guidelines** This command configures a table based video session.

**Examples** The following example shows how to configure the virtual carrier group and service distribution group for replication:

```
Router# configure terminal
Router(config)# cable video
Router(config-video)# table-based
Router(config-video-tb)# vcg pme_tbv
Router(config-video-tb-vcg)# rf-channel 20-22
Router(config-video-tb-vcg-sess)# session bago_tbv input-port 10 start-udp-port 1
num-sessions-per-qam 2 processing-type remap start-program 1 jitter 100 cbr
```

The following example shows how to configure the virtual carrier group with passthru processing type:

```

Router#configure terminal
Router(config)#cable video
Router(config-video)#table-based
Router(config-video-tb)#multicast-label a2 group 232.5.6.7 source 175.2.5.6
Router(config-video-tb)#multicast-label exampleLabel group 232.2.1.6 source 175.6.1.13
source2 175.6.1.12 source3 180.1.1.1 source4 175.6.1.14
Router(config-video-tb)#vcg VCG_PME4
Router(config-video-tb-VCG_PME4)#rf-channel 24
Router(config-video-tb-VCG_PME4-sess)#session SESS_PME4 group 232.5.6.15 source 175.2.6.7
processing-type passthru

```

The following example shows how to configure a session with remux processing type:

```

Router# session remux1 group 209.165.200.225 source 192.0.2.1 processing-type remux
input-program-num 1 output-program-num 1

```

The following example shows how to see the remux sessions with input and output program numbers:

```

Router#sh cable video session log id 31
Total Sessions = 80

```

| Session Id | Output Port | Frequency Hz | Streaming Output Bitrate | Encrypt Type | Sess Encrypt Type   | Session Source Low PMV | UDP Port | Input Program | Output Program | Input State |

|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>virtual-carrier-group</b>      | Defines a virtual carrier group.                                                                                                |
| <b>service-distribution-group</b> | Defines a service distribution group.                                                                                           |
| <b>rf-port integrated-cable</b>   | Specifies the RF ports in a service distribution group.                                                                         |
| <b>rf-channel</b>                 | Specifies the virtual RF channels in a virtual carrier group.                                                                   |
| <b>bind-vcg</b>                   | Binds a set of virtual RF-channels defined in the virtual carrier group to the physical port in the service distribution group. |

## session name multicast-label

The Cisco cBR Series Converged Broadband Routers supported two clock recovery modes: VBR and CBR. Both VBR and CBR modes use one phase-locked loop (PLL) to recover the program clock, using all the PCR packet identifiers (PIDs) found in content. Hence, for MPTS sessions with a large number of programs, the PCRs may have different clock frequencies and be of poor quality. This lead to excessive overdue drops and bad output video quality.

The *Clock Recovery Mechanism* is a new third clock recovery mode, supported from Cisco IOS XE Gibraltar 17.3.1x, and can handle this type of content with better results. The Clock Recovery Mechanism uses one phase-locked loop (PLL) to recover the program clock, using only one PCR PID as the primary. All the other PCR PIDs are subordinates and are re-timed using the clock recovered from the primary PCR PID. The output will be good if the primary PCR is of good quality.

**session** *name* **multicast-label** *label* **processing-type** *type* **primary-subordinate** [{ **pcr-pid** <pid> }]

| Syntax Description | Parameter            | Description                                                                                                  |
|--------------------|----------------------|--------------------------------------------------------------------------------------------------------------|
|                    | <i>name</i>          | Specifies the session name                                                                                   |
|                    | <i>label</i>         | Specifies the multicast label name                                                                           |
|                    | <i>type</i>          | Specifies the processing type of session.                                                                    |
|                    | <i>pcr-pid</i> <pid> | This is an optional parameter, and allows you to select a desired PCR-pid to be used for the primary PCR PID |

**Command Default** None

**Command Modes** Service distribution group configuration mode (config-video-sdg)

| Command History | Release                        | Modification                                                                                             |
|-----------------|--------------------------------|----------------------------------------------------------------------------------------------------------|
|                 | Cisco IOS XE Gibraltar 17.3.1x | The Clock Recovery Mechanism command was introduced on the Cisco cBR Series Converged Broadband Routers. |

The keyword *primary-subordinate* selects primary-subordinate Clock Recovery Mechanism for the session. One of the PCR PIDs is selected to serve as the primary PID. The selected PID is the first PCR PID found in the content, or first one found after a buffer overflow or underflow handling. The Clock Recovery Mechanism is available for both unicast and multicast sessions, for session of processing types remap, passshtru and remux. They are not available for data-piping sessions.

**Note** If the primary PCR PID is not configured, or is absent in the content, one of the PCR PIDs is selected to serve as the primary PID. The selected PID is the first PCR PID found in the content, or first one found after a buffer overflow or underflow handling.

**Usage Guidelines** To recover the overdue drops, you can configure the Clock Recovery Mechanism.

## Examples

The following example shows how to configure the Clock Recovery Mechanism under cable video configuration:

```
Router# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# cable video
Router(config-video)# table-based
Router(config-video-tb)# $source3 175.10.3.2 source4 175.10.4.2
Router(config-video-tb)# vcg v2
Router(config-video-tb-vcg)# rf-channel 68
Router(config-video-tb-vcg-sess)# $ session check input-port 1 start-udp-port 1523
processing-type remux input-program-num 1 output-program-num 1 primary-subordinate pcr-pid
50
Router(config-video-tb-vcg-sess)# exit
Router(config-video-tb-vcg)# exit
Router(config-video-tb)# exit
Router(config-video)# exit
Router(config)#
```

# session-range

To identify the multicast QoS group session range, use the **session-range** command in multicast QoS configuration mode. To disable the QoS group session range, use the **no** form of this command.

**session-range** *ip-address ip-mask*  
**no session-range** *ip-address ip-mask*

## Syntax Description

|                   |                                                      |
|-------------------|------------------------------------------------------|
| <i>ip-address</i> | Specifies the IP address of the multicast QoS group. |
| <i>ip-mask</i>    | Specifies the IP mask of the multicast QoS group.    |

## Command Default

A session range IP address and IP mask are not defined for a specific multicast QoS group.

## Command Modes

Multicast QoS configuration (config-mqos)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCA    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **session-range** command to configure the session range to specify the number of multicast sessions to be admitted on a particular service flow. CMTS does not admit new sessions (no forwarding) if the current number of sessions has reached the defined limit, and waits until a session ends to free up a slot for new sessions. You can configure multiple session ranges.

## Examples

The following example defines a session range IP address and IP mask using the **session-range** command:

```
Router(config)# cable multicast qos group 20 priority 55 global
Router(config-mqos)# session-range 224.10.10.01 255.255.255.254
```

## Related Commands

| <b>show interface cable multicast-sessions</b>  | Displays multicast session information for a specific cable interface.      |

# set clock

To set the system clock on the Cisco CMTS, use the **set clock** command in global configuration mode.

**set clock** *time-date*

## Syntax Description

|                  |                                                             |
|------------------|-------------------------------------------------------------|
| <i>time-date</i> | Time and date for which to set the clock on the Cisco CMTS. |
|------------------|-------------------------------------------------------------|

## Command Default

Time-of-Day, DHCP, and TFTP server configuration not defined on the Cisco CMTS by default.

## Command Modes

Global configuration

## Command History

| Release        | Modification                                                                          |
|----------------|---------------------------------------------------------------------------------------|
| 12.0(4)XI      | This feature was introduced for the Cisco uBR7200 series routers.                     |
| 12.1(5)EC      | This feature was supported on the Cisco uBR7100 series routers.                       |
| 12.2(4)BC1     | This feature was supported on the Release 12.2 BC train for all Cisco CMTS platforms. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.    |

## Usage Guidelines

To supply an accurate clock, the system clock on the Cisco CMTS should be configured for the correct time, either by using the **set clock** command or by configuring the Cisco CMTS to act as a Network Time Protocol (NTP) or Simple Network Time Protocol (SNTP) client.

For proper operation of the DOCSIS network, especially a DOCSIS 1.1 network using BPI+ encryption and authentication, the system clock on the Cisco CMTS must be set accurately. You can achieve this by manually using the **set clock** command, or by configuring the CMTS to use either the Network Time Protocol (NTP) or the Simple Network Time Protocol (SNTP).

For additional information about the **set clock** command, refer to the following documents on Cisco.com:

# show application-buckets

To displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS, use the **show application-buckets** command in privileged EXEC mode. The configured rules for any given bucket are displayed in order of precedence in the Rule field.

**show application-buckets** [**bucket-no** *n*]

## Syntax Description

|                           |                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bucket-no</b> <i>n</i> | You may specify a specific bucket number on the Cisco CMTS to display parameters for that bucket and no others. Valid range is 1 to 8, or all buckets if no specific bucket is designated. |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

No default behavior or values for this command. However, Cisco IOS Release 12.3(21)BC supports default operation and non-default configuration for feature on the Cisco CMTS.

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                               |
|----------------|--------------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced for the Cisco uBR10012 router and the Cisco uBR7246VXR router. |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.         |

## Usage Guidelines

For additional information for Service Flow Admission Control, commencing in Cisco IOS Release 12.3(21)BC, refer to the following document on Cisco.com:

- Service Flow Admission Control for the Cisco Cable Modem Termination System

## Examples

The following example illustrates sample output of the show application-buckets command.

```
Router# show cable application-type

For bucket 1, Name PktCable
 Packetcable normal priority gates
 Packetcable high priority gates
For bucket 2, Name PCMM-Vid
 PCMM gate app-id = 30
For bucket 3, Name Gaming
 PCMM gate app-id = 40
For bucket 4, Name
For bucket 5, Name
For bucket 6, Name
For bucket 7, Name
For bucket 8, Name HSD
 Best-effort (CIR) flows
```

## Related Commands

| Command                                                   | Description                                                                                                                                                                                                    |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable admission-control ds-bandwidth</b>               | Sets minor, major and exclusive thresholds for downstream voice or data bandwidth for each or all interfaces on the Cisco CMTS                                                                                 |
| <b>cable admission-control preempt priority-voice</b>     | Changes the default PacketCable Emergency 911 call preemption functions on the Cisco CMTS, supporting throughput and bandwidth requirements for Emergency 911 calls above all other buckets on the Cisco CMTS. |
| <b>cable admission-control us-bandwidth</b>               | Configures global or interface-level upstream bandwidth thresholds and exclusive or non-exclusive resources on the Cisco CMTS.                                                                                 |
| <b>cable application-type include</b>                     | Associates an application type with a specific and prioritized bucket on the Cisco CMTS.                                                                                                                       |
| <b>cable application-type name</b>                        | Assigns an alpha-numeric name for the specified bucket.                                                                                                                                                        |
| <b>debug cable admission-control flow-categorization</b>  | Displays service flow categorization results, enabled when a service flow is classified.                                                                                                                       |
| <b>show application-buckets</b>                           | Displays rules for any or all buckets supporting Service Flow Admission Control on the Cisco CMTS.                                                                                                             |
| <b>show interface cable admission-control reservation</b> | Displays service flows, categorizations, and bandwidth consumption on the Cisco CMTS, for the specified interface, and the specified service flow direction.                                                   |

# show bridge cable-modem

To display bridging information for the router's cable interface, use the **show bridge cable-modem** command in privileged EXEC mode.

**Cisco uBR904, uBR905, uBR924, uBR925 cable access routers, Cisco CVA122 Cable Voice Adapter**

**show bridge cable-modem** *number*

## Syntax Description

|               |                                            |
|---------------|--------------------------------------------|
| <i>number</i> | Identifies the cable interface (always 0). |
|---------------|--------------------------------------------|

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC

## Command History

| Release    | Modification                                                          |
|------------|-----------------------------------------------------------------------|
| 11.3(4)NA  | This command was introduced for the Cisco uBR904 cable access router. |
| 12.0(4)XI1 | Support was added for the Cisco uBR924 cable access router.           |
| 12.1(3)XL  | Support was added for the Cisco uBR905 cable access router.           |
| 12.1(5)XU1 | Support was added for the Cisco CVA122 Cable Voice Adapter.           |
| 12.2(2)XA  | Support was added for the Cisco uBR925 cable access router.           |

## Examples

The following example shows sample output for this **show bridge cable-modem** command:

```
Router#

show bridge cable-modem 0

Total of 300 station blocks, 298 free
Codes: P - permanent, S - self
Bridge Group 59:
```

**Table 37: show bridge cable-modem Field Descriptions**

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total of 300 station blocks | Total number of forwarding database elements in the system. The memory to hold bridge entries is allocated in blocks of memory sufficient to hold 300 individual entries. When the number of free entries falls below 25, another block of memory sufficient to hold another 300 entries is allocated. Thus, the total number of forwarding elements in the system is expanded dynamically, as needed, limited by the amount of free memory in the router. |
| Bridge Group                | The number of the bridge group to which this interface is assigned.                                                                                                                                                                                                                                                                                                                                                                                        |

**Tip** In Cisco IOS Release 12.2(8)T and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                            | Description                                                      |
|------------------------------------|------------------------------------------------------------------|
| <b>show dhcp</b>                   | Displays the current DHCP settings on point-to-point interfaces. |
| <b>show interfaces cable-modem</b> | Displays information about the cable interface.                  |

# show cable acfe controller

To display fairness across DOCSIS interfaces controller statistics, use the **show cable acfe controller** command in privileged EXEC mode.

**show cable acfe controller modular-cable** *slot/subslot/unit* [{**cluster** *cluster-index*}]

## Cisco cBR Series Converged Broadband Routers

**show cable acfe controller Integrated-Cable** *slot/subslot/unit* [{**cluster** *cluster-index*}]

| Syntax Description                                  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>modular-cable</b><br><i>slot/subslot/unit</i>    |  | Displays information for all controllers on the specified modular cable interface on a Cisco uBR10012 router, where: <ul style="list-style-type: none"> <li>• <i>slot</i>—Controller slot number. The range is from 0 to 8.</li> <li>• <i>subslot</i>—Controller subslot number. The range is from 0 to 3.</li> <li>• <i>unit</i>—Controller unit number. ## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                                                                                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCF    | This command was introduced.                                                                                                                                                  |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>Integrated-Cable</b> keyword was added and <b>modular-cable</b> keyword was removed. |

## Usage Guidelines

Use the **show cable acfe controller** command to show fairness across DOCSIS interfaces status and statistics for each controller interface.

## Examples

The following example shows a sample output of the **show cable acfe controller** command on a Cisco uBR10012 router:

```
Router# show cable acfe controller modular-Cable 1/0/0
```

```

EIR Rebalance invoked: 76476
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
Total clusters: 2
RF FlexBW
0 28687
1 28687
RF FlexBW
2 28687
3 28687

```

The following example shows a sample output of the **show cable acfe controller** command with the **cluster** keyword on a Cisco uBR10012 router:

```

Router# show cable acfe controller modular-Cable 1/0/0 cluster 1
EIR Rebalance invoked: 1810
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
Total clusters: 2
RF FlexBW
2 28687
3 28687

```

The following example shows a sample output of the **show cable acfe controller** command on a Cisco cBR-8 router:

```

Router# show cable acfe controller integrated-Cable 1/0/0
EIR Rebalance invoked: 450963
Adaptive CIR granted: 20
Adaptive CIR rejected: 1
Total clusters: 9
RF FlexBW
8 36376
9 36376
10 32625

```

The following example shows a sample output of the **show cable acfe controller** command with the **cluster** keyword on a Cisco cBR-8 router:

```

Router# show controllers integrated-Cable 1/0/0 acfe cluster 0
Integrated-Cable 1/0/0 status:

# show cable acfe interface

To display the fairness across DOCSIS interfaces statistics of a specific interface, use the **show cable acfe interface** command in privileged EXEC mode.

## Cisco uBR Series Router

**show cable acfe interface** {**modular-cable** | **wideband-cable** | **integrated-cable**}*slot/subslot/port:interface-num* [{**verbose**}]

## Cisco cBR Series Router

**show cable acfe interface** {**wideband-cable** | **integrated-cable**}*slot/subslot/port:interface-num* [{**verbose**}]

### Syntax Description

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Command Modes

Privileged EXEC (#)

### Command History

| Release        | Modification                                                                                                            |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCF    | This command was introduced.                                                                                            |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>modular-cable</b> was removed. |

## Usage Guidelines

Use the **show cable acfe interface** command to display the fairness across DOCSIS interfaces statistics on a specific interface. For uBR series router, the command output also displays the route processor Service Flow Admission Control (SFAC) shadow with thresholds and reservations.

For uBR series router, the **integrated-cable** option works only on the Cisco UBR-MC20X20V cable interface line cards.

## Examples

The following examples show sample outputs of the **show cable acfe interface** command in uBR series router:

```
Router# show cable acfe interface modular-Cable 1/0/0:1
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
EIR Demand (raw/scale): 0/1
EIR Per-Flow BW (kbps): 18991
Guar Bonus BW (kbps): 18991
Non-guar Bonus BW (kbps): 9696
Reserved Bonus BW (kbps): 0
Router# show cable acfe interface wideband-Cable 1/0/0:1
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
EIR Demand (raw/scale): 0/1
EIR Per-Flow BW (kbps): 18991
Guar Bonus BW (kbps): 19391
Non-guar Bonus BW (kbps): 37983
Reserved Bonus BW (kbps): 400
Router# show cable acfe interface integrated-Cable 6/1/0:0
Adaptive CIR granted: 0
Adaptive CIR rejected: 0
EIR Demand (raw/scale): 0/1
EIR Per-Flow BW (kbps): 20028
Guar Bonus BW (kbps): 20028
Non-guar Bonus BW (kbps): 10009
Reserved Bonus BW (kbps): 0
```

The following examples show sample outputs of the **show cable acfe interface** command in cBR series router:

```
Router# show cable acfe interface integrated-Cable 1/0/0:16
EIR Demand (raw/scale): 1/1000
Per-Flow EIR BW (kbps): 7200
Guar Bonus BW (kbps): 7200
Non-guar Bonus BW (kbps): 0
Reserved Bonus BW (kbps): 0
Cir total (kbps): 0
Cir unicast (kbps): 0
Cir multicast (kbps): 0
Router# show cable acfe interface wideband-Cable 1/0/0:1
EIR Demand (raw/scale): 1/1000
Per-Flow EIR BW (kbps): 94800
Guar Bonus BW (kbps): 94800
Non-guar Bonus BW (kbps): 60302
Reserved Bonus BW (kbps): 0
Cir total (kbps): 224
Cir unicast (kbps): 224
Cir multicast (kbps): 0
```

This table describes the significant fields shown in the display.

*Table 39: show cable acfe interface Field Descriptions*

| Field                    | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| Adaptive CIR granted     | For uBR series router, number of adaptive CIRs granted.                  |
| Adaptive CIR rejected    | For uBR series router, number of adaptive CIRs rejected.                 |
| EIR Demand (raw/scale)   | Total EIR demand.                                                        |
| EIR Per-Flow BW (kbps)   | Expected saturated throughput of a priority 0 BE flow on this interface. |
| Guar Bonus BW (kbps)     | Guaranteed bonus bandwidth, in kilobytes per second.                     |
| Non-guar Bonus BW (kbps) | Non-guaranteed bonus bandwidth, in kilobytes per second.                 |
| Reserved Bonus BW (kbps) | Reserved bonus bandwidth, in kilobytes per second.                       |

| Release        | Modification                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCF    | This command was introduced.                                                                                                                             |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>CIR Oversubscriptions</b> item was added in the command output. |

## Usage Guidelines

The **show cable acfe summary** command displays the global fairness across DOCSIS interfaces status and statistics.

## Examples

The following example shows a sample output of the **show cable acfe summary** command for uBR series router:

```
Router# show cable acfe summary

ACFE state: Enabled
EIR Rebalance period (secs): 5
EIR Rebalance invocations: 32416
CIR Acquire invocations: 1
CIR Acquire rate/limit: 100/100
CIR Acquire throttled: 0
Maximal EIR ratio: 16
```

The following example shows a sample output of the **show cable acfe summary** command for cBR series router:

```
Router# show cable acfe summary

ACFE state: Enabled
EIR Rebalance period (secs): 5
EIR Rebalance invocations: 153243
CIR Acquire rate/limit: 100/100
CIR Acquire invocations: 0
CIR Acquire throttled: 0
CIR Oversubscriptions: 8
Maximal EIR ratio: 10
```

This table describes the significant fields shown in the display.

*Table 40: show cable acfe summary Field Descriptions*

| Field                       | Description                                                                 |
|-----------------------------|-----------------------------------------------------------------------------|
| ACFE state                  | Fairness across DOCSIS interfaces state, enabled or disabled.               |
| EIR Rebalance period (secs) | EIR rebalance period, in seconds.                                           |
| EIR Rebalance invocations   | Number of EIR rebalance invocations.                                        |
| CIR Acquire invocations     | Number of CIR acquire invocations.                                          |
| CIR Acquire rate/limit      | CIR acquire rate and limit.                                                 |
| CIR Acquire throttled       | Number of CIR acquisitions that failed because they reached the rate limit. |
| Maximal EIR ratio           | Maximum EIR ratio.                                                          |
| CIR Oversubscriptions       | For cBR series router, number of CIR oversubscription times.                |

**Related Commands**

| <b>cable acfe enable</b> | Enables Fairness Across DOCSIS Interfaces feature on the CMTS router. |

## show cable active-reman

To display the line card high availability information, use the `show cable active-reman` command in privileged EXEC mode.

**show cable active-reman** {*allslot/subslot*}

### Syntax Description

|                |                                                                      |
|----------------|----------------------------------------------------------------------|
| <b>all</b>     | Displays high availability information for all line card interfaces. |
| <i>slot</i>    | Cable interface line card slot. The valid range is from 5 to 8.      |
| <i>subslot</i> | Cable interface line card subslot. The valid range is 0 and 1.       |

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

| Release        | Modification                                                                       |
|----------------|------------------------------------------------------------------------------------|
| 12.2(33)SCF    | This command was introduced in Cisco IOS Release 12.2(33)SCF.                      |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following is a sample output of the `show cable active-reman` command that shows high availability information for all cable interfaces on the Cisco uBR10012 router:

```
Router# show cable active-reman all

```

The following is a sample output of the show cable active-reman command that shows high availability information for slot 5 and subslot 0 on the Cisco uBR10012 router:

```
Router# show cable active-reman 5/0
```

```

Active Reman info on LC 5/0:

```

# show cable admission-control

To display the current admission control (AC) configuration and status on a Cisco CMTS router, or on a specified interface, use the **show cable admission-control** command in privileged EXEC mode.

**show cable admission-control** [{**global** | **interface** | {*slot/port slot/subslot/port* }}] [{**all** | **verbose**}]

## Cisco IOS Release 12.2(33)SCE and later

**show cable admission-control** {**global** | **interface** | {**cable** *slot/subslot/cable-interface-index* | {**integrated-cable** | **modular-cable** | **wideband-cable**}}} *slot/subslot/port:interface-num* [{**all** | **verbose**}]

## Cisco cBR Series Router

**show cable admission-control interface** {**cable** *slot/subslot/cable-interface-index* | {**integrated-cable** | **wideband-cable**}} *slot/subslot/port:interface-num* **all**

| Syntax Description                                                 |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Command History

| Release        | Modification                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC    | This command was introduced on the Cisco uBR10012 router and the Cisco uBR7246VXR router.                                                                                                                |
| 12.3(23)BC     | This command was modified; new fields were added to the output.                                                                                                                                          |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                       |
| 12.2(33)SCC    | This command was modified to display DS threshold values and reservations per bucket on a modular cable, interface cable, or DS channel bonding.                                                         |
| 12.2(33)SCE    | This command was modified. The port parameter was changed to <i>cable-interface-index</i> to indicate the MAC domain index for the Cisco uBR-MC20X20V and Cisco uBR-MC3GX60V cable interface line cards. |
| 12.2(33)SCF    | This command was modified to display guaranteed and non-guaranteed bonus bandwidth from the ACFE functionality.                                                                                          |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>global</b> , <b>modular-cable</b> and <b>verbose</b> keywords are removed.                                      |

## Usage Guidelines

The **show cable admission-control** command offers flexible syntax that enables display of the AC as specifically configured on the Cisco CMTS. See the examples for additional information.

## Examples

The following example displays upstream and downstream AC information for the specified cable interface:

```
Router# show cable admission-control interface cable 7/0/0
```

```
Interface Cable7/0/0
```

```
Resource - Upstream Bandwidth
```

```

```

Thresholds applicable to upstream ports with no interface level configurations in place

| Bucket No | Minor Level | Major Level | Exclusive Level | Non-Excls Level |
|-----------|-------------|-------------|-----------------|-----------------|
| 1         | 0           | 0           | 0               | 0               |
| 2         | 0           | 0           | 0               | 0               |
| 3         | 0           | 0           | 0               | 0               |
| 4         | 0           | 0           | 0               | 0               |
| 5         | 0           | 0           | 0               | 0               |
| 6         | 0           | 0           | 0               | 0               |
| 7         | 0           | 0           | 0               | 0               |
| 8         | 0           | 0           | 0               | 0               |

Downstream Bit Rate (bits per second) = 24273316

```

```

Interface Total (Kbps) Reservable (Kbps) Allocated (Kbps)
Mo1/0/0:0 19405 12424 3100

```

Effective from Cisco IOS Release 12.2(33)SCF, the **show cable admission-control** command output for wideband cable interface was modified.

The following example displays the upstream and downstream AC information for the wideband-cable interface:

**Router# show cable admission-control interface wideband-Cable 1/0/0:1**

Interface Wideband-Cable1/0/0:1

Configured AC Max Reservable Bandwidth = 600000 bps

The **verbose** keyword is not applicable to integrated-cable and modular-cable interfaces.

Effective from Cisco IOS Release 12.2(33)SCF, the **show cable admission-control** command output for modular cable interface was modified.

The following example displays upstream and downstream AC information for the specified modular cable interface:

```

Router# show cable admission-control interface modular-Cable 1/0/0:1
Interface Mo1/0/0:1
Configured AC Max Reservable Bandwidth = 3000000 bps
Resource - Downstream Bandwidth

Bkt Name Minor # of Major # of Excls # of Non-Ex Curr. Curr. Conf # of

This table describes the significant fields for the show cable admission-control command for upstream and downstream throughput.

**Table 41: show cable admission-control Field Descriptions**

| Field       | Description                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bucket No   | Specific bucket number.                                                                                                                              |
| Names       | Bucket name.                                                                                                                                         |
| Minor Level | Minor threshold as currently defined in a percentage on the Cisco CMTS.                                                                              |
| # of Times  | Number of times traffic has crossed this threshold since the counters on the Cisco CMTS were last cleared.                                           |
| Major Level | Major threshold as currently defined in a percentage on the Cisco CMTS.                                                                              |
| Excls Level | Percentage of exclusive throughput that is reserved for the corresponding traffic type on the Cisco CMTS. Applies to downstream or upstream traffic. |

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Non-Ex Level          | Percentage of non-exclusive throughput configured on the Cisco CMTS. Commonly used with Best Effort (lowest priority) traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Curr Resv             | Percentage of throughput reserved exclusively for the corresponding flow type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Conf Level            | Configuration level that indicates the scope of configuration is actually applied for that US/ DS (whether the global, interface, or the upstream level is applied). The values in this field can be as follows: <ul style="list-style-type: none"> <li>• U—Upstream</li> <li>• I—Interface</li> <li>• G—Global</li> </ul>                                                                                                                                                                                                                                         |
| # of Rejec            | Number of rejections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Sched Type            | Available for upstream only. This field displays the following information: <ul style="list-style-type: none"> <li>• UGS—UGS thresholds configured and traffic rates.</li> <li>• RTPS—RTPS thresholds configured and traffic rates.</li> <li>• BE—Best Effort thresholds configured and traffic rates.</li> </ul>                                                                                                                                                                                                                                                  |
| Flow Type             | Available for Downstream only. This field displays voice and data information: <ul style="list-style-type: none"> <li>• voice—Voice thresholds configured and traffic rates.</li> <li>• data—Data thresholds configured and traffic rates.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Class Name            | Available for upstream only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CM-Registration event | Counter increments once for every cable modem that crosses a threshold during its registration. For example, if the minor, major, and critical thresholds on the Cisco CMTS are 60%, 70%, and 80% respectively, and a cable modem tries to register when the current value is 80%, then the cable modem is allowed to register, but the counters for minor, major and critical thresholds are each incremented by one.                                                                                                                                             |
| Voice-Call event      | Counter increments if the resource check fails when a voice-call is made. For example, assume both the MTAs are on the same Cisco CMTS, and minor, major, and critical thresholds for I/O memory are 50%, 60%, and 70%, respectively. Then assume the current I/O memory value is 75%. In this scenario, before the gate creation, AC performs an I/O memory check. This results in the counters for minor, major, and critical thresholds each being incremented by one, and the voice call fails. No packetcable gates are created because the voice calls fail. |

The following example displays the upstream and downstream AC information for the wideband-cable interface:

```
Router# show cable admission-control interface wideband-Cable 8/0/0:0

Interface Wideband-Cable8/0/0:0

Resource - Downstream Bandwidth

Max Reserved BW = 18000000 bps
Total Current Reservation = 1000000 bps
```

```
Guaranteed Bonus BW = 0 bps
Non-guaranteed Bonus BW = 0 bps
```

The following example displays the reserved and reservable bandwidth for a particular interface:

```
Router#show cable admission-control interface wideband-Cable 2/0/0:1
```

```
Interface Wi2/0/0:1
BGID: 8194
```

```
Resource - Downstream Bandwidth

```

| App-type | Name | Reservation/bps | Maximum | Rejected |
|----------|------|-----------------|---------|----------|
| 1        |      | 4000            | 90%     | 0        |
| 2        |      | 0               | N/A     | 0        |

**Note** Effective with Cisco IOS-XE Release 3.18.0SP, if an OFDM channel has both Control Profile (profile A) and Data Profiles (profile B, C, and so on) configured, the lowest Data Profile rate is used for admission control calculation. Otherwise, the Control Profile rate is used.

| <b>debug cable admission-control</b>                  | Enables automatic AC troubleshooting processes.                                                                    |

# show cable admission-control fiber-node

To display Service Group Admission Control (SGAC) configuration information for a fiber-node, use **show cable admission-control fiber-node** command in privileged EXEC mode.

**show cable admission-control fiber-node** *node-id*

## Syntax Description

|                |                                                        |
|----------------|--------------------------------------------------------|
| <i>node-id</i> | The cable fiber-node id. Valid range is from 1 to 512. |
|----------------|--------------------------------------------------------|

## Command Default

None.

## Command Modes

Privileged EXEC(#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.16.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **show cable admission-control fiber-node** command to verify admission-control configuration.

## Examples

The following example displays SGAC configuration information for an fiber-node:

```
Router# show cable admission-control fiber-node 2
Constraint Name Limit
1 15%
```

Router#

# show cable arp-filter

To display the total number of Address Resolution Protocol (ARP) replies and requests that have been sent and received, including the number of requests that have been filtered, use the **show cable arp-filter** command in privileged EXEC mode.

## Cisco uBR7246VXR Router

```
show cable arp-filter cable slot/port [{ip-requests-filtered number}] [{requests-filtered number |
replies-filtered number}]
```

## Cisco uBR10012 Router

```
show cable arp-filter cable slot/subslot/port [{ip-requests-filtered number}] [{requests-filtered
number | replies-filtered number}]
```

## Cisco cBR-8 Router

```
show cable arp-filter {cable slot/subslot/port | bundle number} [{ip-requests-filtered number}]
[{requests-filtered number | replies-filtered number}]
```

| Syntax Description                   |  |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable slot/port</b>               |  | Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7246VXR router.<br><br>On the Cisco uBR7246VXR router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.                                                                                                                                                                       |

|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC2    | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers.                                                           |
| 12.2(15)BC2b   | The <b>ip-requests-filtered</b> option was added to display the specific Service IDs (SIDs) that are generating or forwarding a minimum number of ARP packets. |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value ranges for the <i>slot/subslot/port</i> variables were changed.    |

## Usage Guidelines

The **cable arp filter** command enables the filtering of ARP request and reply packets on a cable interface. ARP packets might need to be filtered when a user on the cable network generates a large volume of ARP traffic as part of a theft-of-service or denial-of-service attack, or when a virus is using ARP requests to find other computers that it might infect.

The **show cable arp-filter** command displays the total number of ARP reply packets that have been received and the number of ARP request packets that have been sent on the cable interface, as well as the number of such packets that have been filtered.

**Tip** To clear the counters on all interfaces, use the **clear counters** command. To clear the counters on a specific interface, use the **clear counters cable interface** command.

## Examples

The following example shows the typical output from the **show cable arp-filter** command on a Cisco uBR10012 router. The displays for other Cisco CMTS platforms are similar.

```
Router# show cable arp-filter Cable6/0/0

ARP Filter statistics for Cable6/0/0:
 Replies Rcvd: 177387 total, 1869 unfiltered, 8824 filtered
 Requests Sent For IP: 68625 total, 964 unfiltered, 36062 filtered
 Requests Forwarded: 7969175 total, 7213 unfiltered, 366167 filtered
Router#
```

**Table 42: show cable arp-filter Field Descriptions in Cisco uBR10012 Router**

| Field        | Description                                                                       |
|--------------|-----------------------------------------------------------------------------------|
| Replies Rcvd | Total number of ARP reply packets received on the cable interface since power-on. |
| Total        |                                                                                   |

| Field                | Description                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unfiltered           | Number of ARP reply packets that the cable interface received and accepted while filtering was enabled using the <b>cable arp filter reply-accept</b> command.                                                                                                   |
| Filtered             | Number of ARP reply packets that the cable interface dropped while filtering was enabled, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the <b>cable arp filter reply-accept</b> command. |
| Requests Sent For IP | Total number of ARP request packets that the cable interface was asked to forward since power-on.                                                                                                                                                                |
| Total                |                                                                                                                                                                                                                                                                  |
| Unfiltered           | Number of ARP request packets that the cable interface sent while filtering was enabled using the <b>cable arp filter request-send</b> command.                                                                                                                  |
| Filtered             | Number of ARP request packets that the cable interface dropped, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the <b>cable arp filter request-send</b> command.                           |
| Requests Forwarded   | Total number of ARP request packets that the cable interface was asked to forward to the ARP proxy since power-on.                                                                                                                                               |
| Total                |                                                                                                                                                                                                                                                                  |
| Unfiltered           | Number of ARP request packets that the cable interface sent to the ARP proxy while filtering was enabled using the <b>cable arp filter request-send</b> command.                                                                                                 |
| Filtered             | Number of ARP request packets for the ARP proxy that the cable interface dropped, because they would have otherwise exceeded the allowable threshold value that was configured for the interface using the <b>cable arp filter request-send</b> command.         |
| <b>Note</b>          | All counters are 16-bit counters, with a maximum value of 65,535 packets. If the number of packets exceeds this amount, the counter wraps back to zero and begins incrementing again.                                                                            |

**Note** The Total counts in the **show cable arp-filter** command continue to increment, regardless of whether ARP filtering has been enabled. The Unfiltered and Filtered counts increment only when ARP filtering has been enabled using the **cable arp filter** command. When cable ARP filtering is disabled, these counters retain their current values until manually reset, using the **clear counters** command.

The following example shows how to display the devices that are generating or filtering more than 100 ARP requests per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 requests-filtered 100

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
1 0006.2854.72d7 50.3.81.4 12407 0 0
Router# show cable arp-filter c6/0/0 requests-filtered 100

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
1 0006.2854.72d7 50.3.81.4 14597 0 0
Router#
```

The following example shows how to display the devices that are generating or filtering more than 200 ARP replies per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 replies-filtered 200

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
2 0006.53b6.562f 50.3.81.6 0 0 2358
Router# show cable arp-filter c6/0/0 replies-filtered 200

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
2 0006.53b6.562f 50.3.81.6 0 0 4016
Router#
```

The following example shows how to display the devices that are generating or filtering more than 10 ARP requests for IP packets per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c6/0/0 ip-requests-filtered 10

Sid MAC Address IP Address Req-Filtered Req-For-IP-Filtered Rep-Filtered
2 0006.2854.71e7 50.3.72.4 0 1926 0

**Table 43: show cable arp-filter Detail Field Descriptions in Cisco uBR10012 Router**

| Field       | Description                                                    |
|-------------|----------------------------------------------------------------|
| SID         | Service ID (SID) of the device.                                |
| MAC Address | Hardware (MAC-layer) address of the cable modem or CPE device. |
| IP Address  | IP address of the cable modem or CPE device.                   |

| Field               | Description                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Req-Filtered        | Total number of ARP requests that the device has generated or forwarded.                                                                                                                                          |
| Req-For-IP-Filtered | Total number of ARP requests that the device has generated or forwarded for IP packets.                                                                                                                           |
| Rep-Filtered        | Total number of ARP replies that the device has generated or forwarded.                                                                                                                                           |
| <b>Note</b>         | The Req-Filter and Rep-Filtered counters are 16-bit counters, with a maximum value of 65,535 packets. If the number of packets exceeds this amount, the counter wraps back to zero and begins incrementing again. |

The following example shows the typical output from the **show cable arp-filter** command on a Cisco cBR-8 router.

```
Router# show cable arp-filter c9/0/0 requests-filtered 100

May 8 16:28:17.252 CST: %IP-4-ZERO_ADDR: Zero MAC address for 30.140.2.1 in ARP cache
Interface Cable9/0/0
SID CPE Mac CPE IP Modem Mac Modem IP M/S Rate Pro REQ
6 0000.af0e.26e4 30.141.0.2 c8fb.26a5.5954 30.140.1.3 MAC - RP 10849
6 0000.af0e.26e4 30.141.0.2 c8fb.26a5.5954 30.140.1.3 MAC - PXF 59705
```

The following example shows how to display the devices that are generating or filtering more than 200 ARP replies per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c9/0/0 requests-filtered 200

Interface Cable9/0/0
SID CPE Mac CPE IP Modem Mac Modem IP M/S Rate Pro REQ
6 0000.af0e.26e4 30.141.0.2 c8fb.26a5.5954 30.140.1.3 MAC - RP 10849
6 0000.af0e.26e4 30.141.0.2 c8fb.26a5.5954 30.140.1.3 MAC 934 PXF 352036
```

The following example shows how to display the devices that are generating or filtering more than 10 ARP requests for IP packets per reporting period. Repeat the command to see how quickly the device is generating ARP packets.

```
Router# show cable arp-filter c9/0/0 ip-requests-filtered 100

Interface Cable9/0/0
SID CPE Mac CPE IP Modem Mac Modem IP M/S Rate Pro IP
1 0000.af0e.26e4 30.141.0.2 c8fb.26a5.5954 30.140.1.3 MAC - RP 1203
```

Table 44: show cable arp-filter Field Descriptions in Cisco cBR-8 Router

| Field           | Description                                                                         |
|-----------------|-------------------------------------------------------------------------------------|
| SID             | Service ID (SID) of the device.                                                     |
| CPE MAC         | Hardware (MAC-layer) address of the cable CPE device.                               |
| CPE IP          | IP address of the CPE device.                                                       |
| Modem MAC       | Hardware (MAC-layer) address of the cable modem.                                    |
| Modem IP        | IP address of the Cable Modem                                                       |
| M/S             | Type of filtering, M means per MAC filtering, S means per Sid filtering.            |
| Rate            | The rate of filtered packets, only hardware assist filtering has the value.         |
| Pro             | Where is the filtering performed, with options RP and PXF(FP).                      |
| [REQ REP REQIP] | REQ means arp request packets, REP means arp reply, REQIP means arp request for IP. |

### Clearing the ARP Packet Counters

The following example shows the cable ARP counters being cleared by the **clear counters cable interface** command. This can be useful because the ARP counters are 16-bit counters that can wrap around to zero relatively quickly when large amounts of ARP traffic is being generated. Also, the ARP packet counters could include SIDs that had forwarded large amounts of ARP traffic in the past, but that are not currently forwarding such traffic. Clearing the counters allows you to clearly see the SIDS that are currently forwarding the ARP traffic that is triggering the ARP filters.

For uBR series router:

```
Router# show cable arp cable 6/0/0
```

```
ARP Filter statistics for Cable6/0/0:
```

```
Replies Rcvd: 3278 total. 84 unfiltered, 3194 filtered
```

```
Requests Sent For IP: 941 total. 30 unfiltered, 911 filtered
```

```
Requests Forwarded: 941 total. 37 unfiltered, 904 filtered
```

```
Router# show cable arp-filter cable 6/0/0 requests-filtered 10
```

| Sid | MAC Address    | IP Address | Req-Filtered | Req-For-IP-Filtered | Rep-Filtered |
|-----|----------------|------------|--------------|---------------------|--------------|

|------------------------------------|---------------------------------------------------------------------------|
| <b>cable bgsync</b>                | Sets the data intervals for background synchronization on the Cisco CMTS. |
| <b>cable bgsync active</b>         | Activates background synchronization process on the Cisco CMTS.           |
| <b>clear cable bgsync counters</b> | Clears the background synchronization counters on the Cisco CMTS.         |

# show cable bgsync sync-info cable

To display all the SNMP background synchronization data on supervisor side (when executed on supervisor IOSd) or line card side (when executed on line card IOSd), use the **show cable bgsync sync-info cable slot/subslot/port** command in privileged EXEC mode.

**show cable bgsync sync-info cable slot/subslot/port**

## Syntax Description

|                                |                                |
|--------------------------------|--------------------------------|
| <b>cable slot/subslot/port</b> | Specifies the cable interface. |
|--------------------------------|--------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| IOS-XE 3.18.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **show cable bgsync sync-info cable slot/subslot/port** command to view all the SNMP background synchronization data on supervisor or line card side.

## Examples

The following is sample output of the **show cable bgsync sync-info cable slot/subslot/port** command on the Cisco cBR-8 router:

```
Router# show cable bgsync sync-info cable 9/0/1

| <b>clear cable bgsync counters</b> | Clears the background synchronization counters on the Cisco CMTS.         |

# show cable bundle

To display the forwarding table for the specified interface, use the **show cable bundle** in user EXEC or privileged EXEC mode.

**show cable bundle** *n* [{**forwarding-table** | **mobility**}]

## Syntax Description

|                         |                                                                |
|-------------------------|----------------------------------------------------------------|
| <i>n</i>                | Specifies the bundle identifier. Valid range is from 1 to 255. |
| <b>forwarding-table</b> | Displays the forwarding table for the specified interface.     |
| <b>mobility</b>         | Displays the mobility subnet in the bundle interface.          |

## Command Modes

User EXEC or Privileged EXEC

## Command History

| Release                 | Modification                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.0(7)XR2              | This command was introduced.                                                                                                                                                                                                                                                                                                                                             |
| 12.0(8) SC              | This command was supported.                                                                                                                                                                                                                                                                                                                                              |
| 12.1(2) EC1             | This command was supported.                                                                                                                                                                                                                                                                                                                                              |
| 12.2(4)BC1              | Support was added to the Release 12.2 BC train.                                                                                                                                                                                                                                                                                                                          |
| 12.1(13)EC, 12.2(11)BC1 | The Flags, Location, link, and sublink fields were added to the display to aid in debugging.                                                                                                                                                                                                                                                                             |
| 12.3(21)BC              | All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all. |
| 12.2(33)SCH2            | This command was modified. The <b>mobility</b> parameter was added.                                                                                                                                                                                                                                                                                                      |
| IOS-XE 3.15.0S          | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                                                                                                        |

## Usage Guidelines

- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, all cable bundles are automatically converted and configured to be in a virtual bundle after loading the software image.
- For uBR series router, in releases prior to Cisco IOS Release 12.3(21)BC, if you delete the virtual bundle interface, the virtual bundle disappears.
- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly.
- The virtual bundle interface accumulates the counters from members; counters on member links are not cleared when they are added to the bundle. If a bundle-only counter is desired, clear the bundle counter on the members before adding them to the bundle, or before loading the image (for Cisco IOS Release 12.3(21)BC and later).

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- [Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS](#)

## Examples

The following is a typical example of the **show cable bundle** command:

```
Router# show cable bundle 1 forwarding-table
MAC address Interface Flags Location link sublink
00c0.5e01.0203 Cable8/0/0 3 64E5BF60 0 64E5BE00
00c0.5e01.0203 Cable7/0/0 3 64E5BE00 0 0
00c0.5e01.0101 Cable8/0/0 3 64E5BEE0 0 64E5BE40
00c0.5e01.0101 Cable7/0/0 3 64E5BE40 0 0
00c0.a375.cc1c Cable8/0/0 1 64E5BEC0 0 0
00c0.0e01.a835 Cable8/0/0 1 64E5BEA0 0 0
00c0.0e01.a799 Cable8/0/0 1 64E5BDE0 0 0
00c0.0e01.a405 Cable8/0/0 1 64E5BF00 0 0
00c0.0e01.a5d1 Cable7/0/0 1 64E5BE20 0 0
00c0.0e01.a5d9 Cable8/0/0 1 64E5BE60 0 0
00c0.0e01.a5e1 Cable7/0/0 1 64E5BF40 0 0
00c0.0e01.a5f1 Cable7/0/0 1 64E5BE80 0 0
00c0.0eb4.0a41 Cable5/0/0 1 63704D1C 0 0
00c0.f03b.ed59 Cable6/1/0 1 6370427C 0 0
00c0.f03b.ed97 Cable6/1/0 1 63703F3C 0 0
00c0.0eb4.1373 Cable5/0/0 1 6370479C 0 0
00c0.f03b.edd3 Cable6/1/0 1 637042BC 0 0
00c0.7371.6df6 Cable5/0/0 1 63703DFC 0 0
```

The table describes the fields shown in the **show cable bundle** command display.

**Table 45: show cable bundle Command Field Descriptions**

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC address | Identifies the MAC (hardware) address for each interface in the bundle.                                                                                                                                                                                                                                                                                                                 |
| Interface   | Identifies the cable interface slot and port number.                                                                                                                                                                                                                                                                                                                                    |
| Flag        | <p>The current value of the flag byte for this bundle entry. The following bits can be set:</p> <ul style="list-style-type: none"> <li>• Bit 0 (0x01) = Bundle is active.</li> <li>• Bit 1 (0x02) = Bundle is a static multicast group.</li> </ul> <p><b>Note</b> If more than one bit is set, add the values together. For example, 3 indicates an active, static multicast group.</p> |
| Location    | The location in the router's memory for the flags byte for this bundle entry. This value is useful only to TAC engineers during debugging.                                                                                                                                                                                                                                              |
| link        | The value of the link pointer for this bundle entry. This value is useful only to TAC engineers during debugging.                                                                                                                                                                                                                                                                       |
| sublink     | The value of the sublink pointer for this bundle entry. This value is useful only to TAC engineers during debugging.                                                                                                                                                                                                                                                                    |

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows typical output for the **show cable bundle forwarding-table** command, supporting virtual interface bundling on the Cisco CMTS in later 12.3 BC Cisco IOS releases:

```
Router# show cable bundle 1 forwarding-table
MAC address Interface Flags
Location link sublink
00c0.5e01.0203 Cable8/0/0 3 64E5BF60 0 64E5BE00
00c0.5e01.0203 Cable7/0/0 3 64E5BE00 0 0
00c0.5e01.0101 Cable8/0/0 3 64E5BEE0 0 64E5BE40
00c0.5e01.0101 Cable7/0/0 3 64E5BE40 0 0
00c0.a375.cc1c Cable8/0/0 1 64E5BEC0 0 0
00c0.0e01.a835 Cable8/0/0 1 64E5BEA0 0 0
00c0.0e01.a799 Cable8/0/0 1 64E5BDE0 0 0
00c0.0e01.a405 Cable8/0/0 1 64E5BF00 0 0
00c0.0e01.a5d1 Cable7/0/0 1 64E5BE20 0 0
00c0.0e01.a5d9 Cable8/0/0 1 64E5BE60 0 0
00c0.0e01.a5e1 Cable7/0/0 1 64E5BF40 0 0
00c0.0e01.a5f1 Cable7/0/0 1 64E5BE80 0 0
00c0.0eb4.0a41 Cable5/0/0 1 63704D1C 0 0
00c0.f03b.ed59 Cable6/1/0 1 6370427C 0 0
00c0.f03b.ed97 Cable6/1/0 1 63703F3C 0 0
00c0.0eb4.1373 Cable5/0/0 1 6370479C 0 0
00c0.f03b.edd3 Cable6/1/0 1 637042BC 0 0
00c0.7371.6df6 Cable5/0/0 1 63703DFC 0 0
Total = 18, sublink total = 2
Free = 1016, low_mark = 1016
```

The following example shows typical output for the **show cable bundle mobility** command:

```
Router# show cable bundle 1 mobility

Interface IP/IPv6 Subnet

Bundle1 ---
Bundle1.1 192.0.3.0/16
 192.0.3.1/16
 192.0.4.1/16
 2001:DB:5:4:100::1/32
 2001:DB:5:4:101::1/32
Bundle1.2 192.0.3.1/16
```

#### Related Commands

| Command                                       | Description                                                                                                                                                 |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable bundle</b>                           | Creates an interface bundle.                                                                                                                                |
| <b>show ip interface brief</b>                | Displays a brief summary of an interface's IP information and status, to include virtual interface bundle information.                                      |
| <b>show pxf cable</b> (for uBR series router) | Displays multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles. |

# show cable bundle multicast

To display Multicast information for the specified virtual interface bundle, based on IGMPv3, use the **show cable bundle multicast** command in privileged EXEC mode:

```
show cable bundle bundle#multicast group
show cable bundle bundle#multicast [{MAC addr IP addr}]
```

## Syntax Description

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| <i>bundle#</i>  | The alphanumeric identifier for the virtual interface bundle.                 |
| <i>group</i>    | Multicast group membership identifier.                                        |
| <i>MAC addr</i> | Optional parameter specifies the MAC address for which to return information. |
| <i>IP addr</i>  | Optional parameter specifies the IP address for which to return information.  |

User EXEC or Privileged EXEC

## Command History

| Release        | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(21)BC     | This command was introduced to support virtual interface bundling on the Cisco CMTS. All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all. |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                                                                                                                                                                                             |

## Usage Guidelines

- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, all cable bundles are automatically converted and configured to be in a virtual bundle after loading the software image.
- For uBR series router, in releases prior to Cisco IOS Release 12.3(21)BC, if you delete the virtual bundle interface, the virtual bundle disappears.
- For uBR series router, beginning with Cisco IOS Release 12.3(21)BC, standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly.
- The virtual bundle interface accumulates the counters from members; counters on member links are not cleared when they are added to the bundle. If a bundle-only counter is desired, clear the bundle counter on the members before adding them to the bundle, or before loading the image (for Cisco IOS Release 12.3(21)BC and later).

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

## Examples

The following example illustrates this new command. This command translates the bundle's multicast MAC address to Multicast IP address information, including the associated multicast source.

```
Router# show cable bundle bundle1.1 multicast
CableBundle Interface Source IP Multicast IP MAC Address
1 Bundle1.1 * 230.1.1.1 0100.5e00.0001
```

The following example illustrates multicast information for the specified virtual bundle:

```
Router# sh cable bundle 1 multicast
CableBundle Interface Source IP Multicast IP MAC Address
1 Bundle1 * 239.0.0.100 0100.5e00.0001
```

To translate a MAC address back to Multicast IP address, use the following optional syntax:

**show cable bundle** *bundle#* **multicast** [ <MAC addr | IP addr > ]

The following example illustrates this enhanced **show** command:

```
Router# show cable bundle bundleID multicast 0100.5e00.0001
MAC address Interface Flags Location link sublink
0100.5e00.0001 Bundle1 1 646FE4D8 0 646FE4EC
0100.5e00.0001 Cable6/0/0 1 646FE4EC 0 0
^^^^^^^^^^^^^^^^
```

## Related Commands

|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable bundle</b>                           | Creates an interface bundle.                                                                                                                                |
| <b>show ip interface brief</b>                | Displays a brief summary of an interface's IP information and status, to include virtual interface bundle information.                                      |
| <b>show pxf cable</b> (for uBR series router) | Displays multicast echo, packet intercept, or source-verify features for one or all cable interfaces, to include information for virtual interface bundles. |

# show cable burst-profile

To display the upstream data burst profiles used to configure the upstream PHY, use the **show cable burst-profile** command in privileged EXEC mode.

**show cable burst-profile**

**Note** This command has been deprecated and removed in the current versions of the Cisco IOS software for all Cisco CMTS routers.

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release                                     | Modification                                                                                 |
|-----------------|---------------------------------------------|----------------------------------------------------------------------------------------------|
|                 | 11.3 NA                                     | This command was introduced.                                                                 |
|                 | 11.3(5)NA, 12.0(5)T1, 12.0(6)SC, 12.1(2)EC1 | This command was removed and replaced with the <b>show cable modulation-profile</b> command. |
|                 | IOS-XE 3.15.0S                              | This command is not supported on the Cisco cBR Series Converged Broadband Routers.           |

**Usage Guidelines** This command displayed configuration of the cable burst profiles, which were what DOCSIS initially used to control the data, ranging, and station maintenance bursts. The Cisco CMTS routers now support a more comprehensive set of modulation profiles, which are displayed by the **show cable modulation-profile** command.

**Note** The **show cable burst-profile** command displayed fields and values that were supported only in the initial versions of the DOCSIS specification. The current DOCSIS 1.0 and 1.1 specifications use different parameters and values, as shown by the **show cable modulation-profile** command.

## Examples

The following example shows typical output from the **show cable burst-profile** command:

Router# **show cable burst-profile**

| Burst number | Type | Preamb | Diff | FEC err | FEC length | Scrambl | Max size | Guard size | Last shortened | Scrambl profile |
|--------------|------|--------|------|---------|------------|---------|----------|------------|----------------|-----------------|
| 1            | 1    | 48     | no   | 0x0     | 0x6        | 0x152   | 1        | 16         | 1              | yes             |
| 2            | 1    | 48     | no   | 0x0     | 0x6        | 0x152   | 1        | 12         | 1              | no              |
| 3            | 1    | 48     | no   | 0x5     | 0x2C       | 0x152   | 0        | 48         | 1              | yes             |
| 4            | 1    | 48     | no   | 0x5     | 0x2C       | 0x152   | 0        | 48         | 1              | yes             |

**Table 46: show cable burst-profile Field Descriptions**

| Field                   | Description                                                |
|-------------------------|------------------------------------------------------------|
| Burst profile number    | The number of the burst profile.                           |
| Type                    | Type of burst profile.                                     |
| Preamb length           | Length of the preamble.                                    |
| Diff encode             | Shows if there is a diff encode.                           |
| FEC err correct         | Shows the forward error correction.                        |
| FEC codeword length     | Shows the length of the forward error correction codeword. |
| Scrambl seed            | Shows the seed of the scrambler.                           |
| Max size                | Designates the maximum burst size.                         |
| Guard size              | Indicates the guard time size.                             |
| Last codeword shortened | Shows the last codeword shortened.                         |
| Scrambl                 | Indicates whether scramble is enabled (yes) or not (no).   |

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                                  | Description                                               |
|------------------------------------------|-----------------------------------------------------------|
| <b>cable upstream modulation-profile</b> | Configures a spectrum group to use a specified frequency. |
| <b>show cable hop</b>                    | Displays CM configuration settings.                       |
| <b>show cable modulation-profile</b>     | Displays the currently defined modulation profiles.       |
| <b>show interface cable sid</b>          | Displays cable interface information.                     |

## show cable calls

To display voice call history information and status for PacketCable Emergency 911 Services Listing and History, use the **show cable calls** command in privileged EXEC mode. This command displays voice call history information that is enabled with the **cable high-priority-call-window** command in global configuration mode.

**show cable calls** [{*slot slot/subslot*}]

### Syntax Description

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b>    | Selects the interface for which to enable PacketCable E911 call history.                                                                                                                                                                                                                                                                                                                                                                          |
| <i>slot</i>         | Designates the slot or slot and port for a particular cable interface on the Cisco router.<br>The following are the valid values for the Cisco uBR7246VXR router: <ul style="list-style-type: none"> <li>• <i>slot</i> can range from 3 to 6</li> </ul>                                                                                                                                                                                           |

| Release        | Modification                                                                                                                                                                                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC    | This command was introduced supporting PacketCable Emergency 911 Services Listing and History on the Cisco CMTS: <ul style="list-style-type: none"> <li>• Cisco uBR7246VXR router</li> <li>• Cisco uBR10012 router</li> </ul> |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The value ranges for <i>slot/subslot</i> variables were changed.                                                                            |

### Usage Guidelines

This command supports the PacketCable Emergency 911 Services Listing and History feature on the Cisco CMTS. Cisco IOS release 12.3(13a)BC introduces enhanced informational support for PacketCable Emergency 911 calls on the Cisco CMTS, to include the following information and related history:

- active Emergency 911 calls
- recent Emergency 911 calls
- regular voice calls
- voice calls made after recent Emergency 911 calls

To set the call window (in minutes) during which the Cisco CMTS maintains records of Emergency 911 calls, use the **cable high-priority-call-window** command. For more information on the **cable high-priority-call-window** command, see [Cisco IOS CMTS Cable Command reference](#).

Additional information for voice call support with PacketCable and PacketCable MultiMedia (PCMM) is available in the following document on Cisco.com:

[Cisco CMTS PacketCable and PacketCable Multimedia Features Configuration Guide, Release 12.2SC](#)

## Examples

The following example illustrates call status on the Cisco CMTS:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCMs RecentHiPriCMs
Cable3/0 0 0 0 1
Cable3/1 0 0 0 0
Cable4/0 0 0 0 1
Cable4/1 0 0 0 0
Total 0 0 0 2
Router #
```

The following command example illustrates that one Emergency 911 call was made on the Cable8/1/1 interface on the Cisco uBR10012 router during the window set for high priority calls:

```
Router# show cable calls
Interface ActiveHiPriCalls ActiveAllCalls PostHiPriCallCMs RecentHiPriCMs
Cable5/0/0 0 0 0 0
Cable5/0/1 0 0 0 0
Cable5/1/0 0 0 0 0
Cable5/1/1 0 0 0 0
Cable5/1/2 0 0 0 0
Cable5/1/3 0 0 0 0
Cable5/1/4 0 0 0 0
Cable6/0/0 0 0 0 0
Cable6/0/1 0 0 0 0
Cable7/0/0 0 0 0 0
Cable7/0/1 0 0 0 0
Cable8/1/0 0 0 0 0
Cable8/1/1 1 1 0 0
Cable8/1/2 0 0 0 0
Cable8/1/3 0 0 0 0
Cable8/1/4 0 0 0 0
Total 1 1 0 0
```

## Related Commands

| Command                                | Description                                                                                             |

| {driver [MG device instance]} | {errors [MG device instance]]}}
```

### Syntax Description

|                        |                                                                                      |
|------------------------|--------------------------------------------------------------------------------------|
| <i>slot/sub-slot</i>   | The slot/sub-slot number. The slot value ranges from 0 to 9 and sub-slot value is 0. |
| <b>ds-mac</b>          | Specifies the ds-mac information.                                                    |
| <b>all</b>             | Specifies all ds-mac information.                                                    |
| <b>bg</b>              | Specifies ds-mac bg alloc information.                                               |
| <b>index</b>           | Specifies ds-mac hw-flow, DSID and BPI index allocation information.                 |
| <b>links</b>           | Specifies ds-mac links information.                                                  |
| <b>resources</b>       | Specifies ds-mac resources (free/used jib/spr grps).                                 |
| <b>state</b>           | Specifies ds-mac state information.                                                  |
| <b>ds-phy</b>          | Specifies DSPHY commands to collect and display DSPHY related information.           |
| <b>display</b>         | Specifies DSPHY information collected from hardware.                                 |
| <b>trigger</b>         | Specifies DSPHY hardware information collection trigger.                             |
| <b>memory</b>          | Specifies memory information.                                                        |
| <b>summary</b>         | (Optional) Specifies memory statistics information.                                  |
| <b>pro-cpu</b>         | Specifies CPU information.                                                           |
| <b>history</b>         | (Optional) Displays CPU history in graph format.                                     |
| <b>sorted</b>          | (Optional) Displays sorted output based on percentage of utilization.                |
| <b>qam-repl</b>        | Specifies card level qam-repl information.                                           |
| <b>config-validate</b> | Specifies validate configuration for QAM replication                                 |

|                                |                                                                         |
|--------------------------------|-------------------------------------------------------------------------|
| <b>group</b>                   | Displays qam-repl group information.                                    |
| <i>group-id</i>                | (Optional) The qam-repl group ID. The value ranges from 24576 to 25599. |
| <b>counters</b>                | (Optional) Displays counters for QAM replication group.                 |
| <b>verbose</b>                 | (Optional) Displays detailed QAM replication group information.         |
| <b>pilot</b>                   | Specifies the pilot channels on the card.                               |
| <b>port</b>                    | Specifies the downstream port.                                          |
| <i>downstream port number</i>  | The downstream port number. The value ranges from 0 to 7.               |
| <b>rf-channel</b>              | Displays RF channel information.                                        |
| <i>group list</i>              | The list of rf-channels and range of rf-channels.                       |
| <b>tech-support</b>            | Displays technical support information.                                 |
| <b>us-mac</b>                  | Specifies important us-mac information.                                 |
| <b>config</b>                  | Specifies us-mac configuration information.                             |
| <b>bpi</b>                     | Specifies us-mac BPI configuration information.                         |
| <i>BPI index number</i>        | The BPI index number. The value ranges from 0 to 32767.                 |
| <i>segment value</i>           | The segment value. The value ranges from 1 to 14.                       |
| <b>bwr</b>                     | Specifies us-mac bw request configuration information.                  |
| <i>physical channel number</i> | The physical channel number. The value ranges from 0 to 127.            |
| <b>gs</b>                      | Specifies us-mac gs configuration information.                          |
| <i>MAC domain number</i>       | The MAC domain number. The value ranges from 0 to 127.                  |
| <b>hwflow</b>                  | Specifies us-mac HW flow configuration information.                     |
| <i>SID value</i>               | The SID value. The value ranges from 0 to 16383.                        |
| <b>swflow</b>                  | Specifies us-mac SW flow configuration information.                     |
| <i>HW flow value</i>           | The HW flow value. The value ranges from 0 to 131071.                   |
| <b>counts</b>                  | Displays us-mac count information.                                      |
| <b>all</b>                     | Displays all us-mac information.                                        |
| <b>ccf</b>                     | Displays us-mac ccf information.                                        |
| <b>esi</b>                     | Displays us-mac esi information.                                        |
| <b>frag</b>                    | Displays us-mac fragment proc information.                              |
| <b>frame</b>                   | Displays us-mac frame proc information.                                 |

|                               |                                                           |
|-------------------------------|-----------------------------------------------------------|
| <b>global</b>                 | Displays us-mac global information.                       |
| <b>ilk</b>                    | Displays us-mac ilk information.                          |
| <b>interrupt</b>              | Displays us-mac interrupt information.                    |
| <b>pkt</b>                    | Displays us-mac packet proc information.                  |
| <b>uepi</b>                   | Displays us-mac uepi/sgmii information.                   |
| <b>us-phy</b>                 | Specifies us-phy related information.                     |
| <b>channel</b>                | Specifies 3142 channel counters.                          |
| <i>MG device instance</i>     | The MG device instance. The value ranges from 0 to 7.     |
| <b>clear</b>                  | Clears the channel counters.                              |
| <b>logical channel number</b> | The logical channel number. The value ranges from 0 to 1. |
| <b>get</b>                    | Specifies get IUC from Mg's.                              |
| <b>show IUC number</b>        | Displays dump IUC's.                                      |
| <b>fec-summary</b>            | Displays all channels FEC errors.                         |
| <b>driver</b>                 | Displays internal driver information.                     |
| <b>errors</b>                 | Specifies 3142 error counters.                            |

**Command Default** None.

**Command Modes** Privileged EXEC (#)

| <b>Command History</b> | <b>Release</b> | <b>Modification</b>                                                          |
|------------------------|----------------|------------------------------------------------------------------------------|
|                        | IOS-XE 3.15.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

**Usage Guidelines** The **show cable card** command is used for debugging downstream related issues.

**Examples** The following example shows a typical display for the **show cable card** command:

```
Router# sh cab card 3/0 ds-mac ?
all show all ds-mac information
bg show ds-mac bg alloc information
index show ds-mac hw-flow index alloc information
links show ds-mac links information
resources show ds-mac resources (free/used jib/spr grps)
state show ds-mac state information
```

## show cable cgd-associations

To display the Channel Group Domain (CGD) downstream associations on the Cisco CMTS, use the **show cable cgd-associations** command in privileged EXEC mode.

**show cable cgd-associations**

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC(#)

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCG    | This command was introduced.                                                      |
| 12.2(33)SCG4   | This command was modified.                                                        |
| 12.2(33)SCH    | The output field Active Remote DS was modified to Active DS                       |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Examples

The following is a sample output of the **show cable cgd-associations** command displaying the Cisco Wideband SPA downstream association with Cisco uBR-MC3GX60V and Cisco uBR-MC20X20V line cards:

```
Router# show cable cgd-associations
CGD Host Resource DS Channels Upstreams (AllUS) Active DS
Ca7/1/0 7/1/0 4 0-3 Yes 4
```

**Note** In the AllUS field, Yes indicates all the upstream channels are associated with the downstream channels in the MAC domain. If the AllUS field is blank, all the upstream channels are not associated with the downstream channels.

This table describes the fields shown in the **show cable cgd-associations command** display.

**Table 47: show cable cgd-associations Field Descriptions**

| Field       | Description                                         |
|-------------|-----------------------------------------------------|
| CGD Host    | MAC domain interface for CGD.                       |
| Resource    | Downstream cable interface line card.               |
| DS Channels | Downstream RF channels.                             |
| Upstreams   | Association of upstream channels in the MAC domain. |

| Field            | Description                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| (AllUS)          | Association of all upstream channels with downstream channels in the MAC domain.                                                                         |
| Active Remote DS | Active downstream channels.<br><br><b>Note</b> Effective with Cisco IOS Release 12.2(33)SCG4, the field Active Remote DS has been modified to Active DS. |
| Active DS        | Effective with Cisco IOS Release 12.2(33)SCG4, this field displays active downstream channels.                                                           |

**Related Commands**

| Command                                                     | Description                                                                                    |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>show cable mac-domain cable cgd-associations</b>         | Displays the summary of the CGD associations for all cable MAC domains.                        |
| <b>show cable mac-domain cable downstream-service-group</b> | Displays the MAC Domain Downstream Service Group information for a primary downstream channel. |

# show cable channel-group

To display the channel group information, use the **show cable channel-group** command in privileged EXEC mode.

**show cable channel-group** {all *group-id*}

| <b>Syntax Description</b>    | <p><b>all</b> Displays the channel group information for all channel groups.</p> <p><i>group-id</i> Channel group ID. The valid range is from 1 to 1000.</p>                                                                                                                       |         |              |                              |                              |                |                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|----------------|------------------------------------------------------------------------------------|
| <b>Command Default</b>       | None                                                                                                                                                                                                                                                                               |         |              |                              |                              |                |                                                                                    |
| <b>Command Modes</b>         | Privileged EXEC (#)                                                                                                                                                                                                                                                                |         |              |                              |                              |                |                                                                                    |

```

The table below describes the significant fields in the output of the **show cable channel-group** command.

**Table 48: show cable channel-group Field Descriptions**

| Field                                                         | Description                                           |
|---------------------------------------------------------------|-------------------------------------------------------|
| Channel Group                                                 | Channel group ID.                                     |
| State                                                         | State of the channel group.                           |
| Host                                                          | Host name for the channel group.                      |
| Upstream channels (total <i>number</i> )                      | Upstream channel information.                         |
| Downstream channels (total <i>number</i> )                    | Downstream channel information.                       |
| Associated CMC List (total/registered: <i>number/number</i> ) | Information on the associated Cisco CMCs.             |
| MAC Address                                                   | MAC address of the Cisco CMC.                         |
| Registered                                                    | Indicates if the Cisco CMC is registered.             |
| Offset                                                        | Internal index of the Cisco CMC in the channel group. |

**Related Commands**

| Command                    | Description               |

| <b>cmc</b>                                 | Configures Cisco CMC in a channel group.                            |

# show cable clock

To display clock reference status information for the clock card and to display information about displaying Timing, Communication and Control (TCC) card DOCSIS Timing Interface (DTI) client and server statistic counts, use the **show cable clock** command in user EXEC or privileged EXEC mode.

## Cisco uBR Series Router

**show cable clock** [*slot*] {**client** *port id* | **server** *port id* | **counters**}

## Cisco cBR Series Router

**show cable clock dti** {**client** | **server**} *slot/subslot*

### Syntax Description

|                              |                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------|
| <i>slot</i>                  | (Optional) Identifies a TCC interface on the Cisco RF Gateway 10. Valid TCC slots are 13 and 14. |
| <b>client</b> <i>port id</i> | Specifies the DTI client port ID. Valid port values are 1 and 2.                                 |
| <b>server</b> <i>port id</i> | Specifies the DTI server port ID. Valid port values are 1 and 2.                                 |
| <b>counters</b>              | Specifies the DTI client counters.                                                               |
| <i>slot/subslot</i>          | Specifies the slot and subslot location of the DTCC ports. Valid values are 4/1 or 5/1.          |

### Command Default

Information on the TCC DTI client and server is displayed. Counters are not displayed.

### Command Modes

User EXEC or Privileged EXEC

### Command History

| Release                | Modification                                                                                                                                                                            |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(1a)T1             | This command was introduced.                                                                                                                                                            |
| 12.1(2)EC1             | This command was supported on the EC train.                                                                                                                                             |
| 12.2(1)XF1, 12.2(4)BC1 | This command was supported for the Cisco uBR10012 universal broadband router.                                                                                                           |
| 12.3(23)BC             | This command was supported for DTI mode.                                                                                                                                                |
| 12.2(44)SQ             | This command was modified in Cisco IOS Release 12.2(44)SQ to support the Cisco RF Gateway 10. The <i>slot</i> , <b>client</b> , <b>server</b> , and <b>counters</b> options were added. |
| IOS-XE 3.15.0S         | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The <b>dti</b> keyword was added.                                                                     |

### Usage Guidelines

This command supports the Cisco CMTS clock feature set, which provides a synchronized clock for improved Voice-over-IP (VoIP) operations. The clock feature set requires one of the following configurations:

- A Cisco uBR10012 router with one or two TCC+ cards that are connected to an external national clock source.

**Note** Beginning in Cisco IOS Release 12.3(23)BC, TCC+ is replaced with DOCSIS Timing and Control Card (DTCC).

- A Cisco uBR7246 VXR router using a Cisco uBR-MC16S, Cisco uBR-MC16E, Cisco uBR-MC28C, or Cisco uBR-MC28C-BNC cable interface line card. The router must also be equipped with a Cisco cable clock card and be running Cisco IOS 12.1(1a)T1, 12.1(2)EC1, or a later release. The Cisco cable clock card should be connected to an external national clock source.

Only these cable interface cards support the external clock card reference from a clock card to distribute that signal to CMs or set-top boxes (STBs) attached to the specific network segments. You can use other cable interface cards, such as the Cisco uBR-MC16C, with the clock card, but these other cable interfaces will not synchronize their downstream SYNC messages with the external clock source.

Each CM or STB must also support VoIP applications and the clock feature set. For example, the Cisco uBR924, running Cisco IOS Release 12.0(7)T or later, supports clock card feature automatically.

**Note** This command does not appear if a clock card is not installed in the system.

## Examples

The following sample output from the **show cable clock** command on a Cisco uBR7246VXR router shows that both external sources are available and the clock card is providing the clock reference:

```
Router# show cable clock

Clockcard primary input is present
Clockcard secondary input is present
Cable clock reference is clockcard primary input
Cable3/0 Timestamp clock reference is from Clockcard
Cable4/0 Timestamp clock reference is from Clockcard
```

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that both external sources are available and that the TCC+ card in slot 1/1 is providing the clock reference:

```
Router# show cable clock

Number of TCCplus Cards in the Chassis: 2
Active TCCplus Card is in slot: 1 subslot: 1
Backup TCCplus Card is in slot: 2 subslot: 1
Clock reference used by the active card is Primary T1
External T1 References:
Card: 1/1
Primary T1 : Available
Secondary T1: Available
Card: 2/1
Primary T1 : Available
Secondary T1: Available
```

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that the TCC+ card in slot 1/1 is in maintenance mode, and that the TCC+ card in slot 2/1 is providing the clock reference:

```
Router# show cable clock

Number of TCCplus Cards in the Chassis: 2
TCCplus card in 1/1 under maintenance
Active TCCplus Card is in slot: 2 subslot: 1
Clock reference used by the active card is Primary T1
External T1 References:
Card: 2/1
Primary T1 : Available
Secondary T1: Available
```

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following sample output from the **show cable clock** command on a Cisco uBR10012 router shows that the DTCC card in slot 1/1 is in DTI mode.

```
Router# show cable clock

Number of TCC Cards in the Chassis: 1
Active TCC Card is in slot: 1 subslot: 1, (DTCC Eightbells card)
Clock reference used by the active card is DTI
Active TCC card in slot 1/1
TCC Card 1/1 DTI status:

 Active Client port : 2
 Active Client status : normal
 Active Client Server status : freerun
 Active Client frame error rate : < 2%
 Active Client CRC error count : 0xAD
 Standby Client Signal detected : yes
No card in slot 2/1
```

### Cisco RF Gateway 10

The following example shows the TCC DTI client and server statistic counts information:

```
Router# show cable clock
DTI Client status: TCC 13

Client status : normal
Client clock type : ITU type 1
Client firmware version : 7
Client dti version : 0
Client timestamp : 657519453
Client phase correction : 65535
Client normal time : 65535
Client holdover time : 0
Client transition t3 count : 0
Client transition t4 count : 1
Client transition t6 count : 0
Client transition t7 count : 0
Client port switch count : 1
Client Integral Frequency Term : 64518
Client EFC Value : 63282
DTI Client Port 1 Status:
```

```

Port Status : Active
Signal detected : yes
CRC error count : 2
Frame error rate : < 2%
Cable advance : 2560
-- Connected server information ---
Server status : Active free-run
Root Server clock type : ITU type 3
Root Server source : none
Server Type : Root
Client Performance Stable : yes
Client Cable advance Valid : yes
DTI Client Port 2 Status:

Port Status : Inactive
Signal detected : no
CRC error count : 66
Frame error rate : > 5%
Cable advance : 0
DTI Client status: TCC 14

Client status : normal
Client clock type : ITU type 1
Client firmware version : 7
Client dti version : 0
Client timestamp : 672169320
Client phase correction : 65535
Client normal time : 65535
Client holdover time : 0
Client transition t3 count : 0
Client transition t4 count : 1
Client transition t6 count : 0
Client transition t7 count : 0
Client port switch count : 1
Client Integral Frequency Term : 64760
Client EFC Value : 63832
DTI Client Port 1 Status:

Port Status : Inactive
Signal detected : no
CRC error count : 26
Frame error rate : > 5%
Cable advance : 0

DTI Client Port 2 Status:

Port Status : Active
Signal detected : yes
CRC error count : 2
Frame error rate : < 2%
Cable advance : 1792
-- Connected server information ---
Server status : Active free-run
Root Server clock type : ITU type 3
Root Server source : none
Server Type : Root
Client Performance Stable : yes
Client Cable advance Valid : yes

```

The following is sample output of a TCC card in slot 13 on a Cisco RF Gateway 10:

```

Router#show cable clock 13 client 1
DTI Client Port 1 Status:

```

```

Port Status : Inactive
Signal detected : no
CRC error count : 63006
Frame error rate : > 5%
Cable advance : 0x0000

```

**Table 49: show cable clock client Field Descriptions**

| Field           | Description                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Port status     | Indicates the current status of the DTI port on the TCC card.                                                                         |
| Signal detected | Indicates whether the DTI signal was detected.                                                                                        |
| CRC error count | The number of cyclic redundancy check (CRC) errors. It can indicate intermittent upstream, laser clipping, or common-path distortion. |

The following example shows the server status of the TCC card in slot 13 on a Cisco RFGW-10:

```

Router#show cable clock 13 server 2
TCC Card 13 port 2 DTI Server status:

Server signal detected : yes
Server status : free-run
Root Server clock type : ITU type 3
Root Server source : none
Server Type : Root
Client Performance Stable : yes
Client Cable advance Valid : yes
TOD Setting Mode : Short
TOD gpssec : 902825745
TOD leap seconds : 14

```

**Table 50: show cable clock server Field Descriptions**

| Field                  | Description                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Server signal detected | Indicates whether the server was detected.                                                                                                   |
| Server status          | Indicates the state in which the server is functioning. The states are warm-up, free-run state, fast mode, normal, holdover, or bridge mode. |
| Root server source     | The server source such as internal, external, GPS or none.                                                                                   |
| Root server clock type | The clock type. The types are 1, 2, 3 or ITU Stratum 3 or DTI Min. clock.                                                                    |
| TOD setting mode       | Displays the time (user time, NTP, GPS) mode such as short or long.                                                                          |

The following is a sample output showing the counters on TCC card 13 on Cisco RFGW-10:

```

Router#show cable clock 13 counters
TCC Card 13 DTI counters:

Client Normal time : 0x1EB6
Client Holdover time : 0x0000
Client Phase Correction : 0
Client Freq Correction : 63213

```

```
Client EFC Correction : 61039
Client transition count t3 : 0
Client transition count t4 : 1
Client transition count t6 : 0
Client transition count t7 : 0
Client port switch count : 1
```

| Command                                 | Description                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------|
| <b>show controllers clock-reference</b> | Displays hardware information, register values, and current counters for the cable clock card. |
| <b>show cable clock dti status</b>      | Displays information on the DOCSIS Timing Interface (DTI) Client status.                       |
| <b>cable clock free-run</b>             | Allows the clock to be in free-run mode.                                                       |
| <b>clear cable clock counters</b>       | Clears DTI client transition counters of a TCC DTI client and server.                          |

# show cable clock dti counters

To display DTI counters for the clock card, use the **show cable clock dti counters** command in user EXEC or privileged EXEC mode.

**show cable clock dti counters** *slot/subslot*

## Syntax Description

|                     |                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------|
| <i>slot/subslot</i> | Specifies the slot and subslot location of the DTCC ports. Valid values are 1/1 or 2/1. |
|---------------------|-----------------------------------------------------------------------------------------|

## Command Modes

User EXEC or Privileged EXEC

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(23)BC     | This command was supported for DTI mode.                                          |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following is a sample output from the **show cable clock dti counters** command in user EXEC mode:

```
Router> show cable clock dti counters 1/1
TCC Card 1/1 DTI counters:

Client Normal time : 0xFFFF
Client Holdover time : 0x0000
Client Phase Correction : 0x0000
Client Freq Correction : 0xFBD7
Client EFC Correction : 0xF7AD
Client transition count t3 : 0x00
Client transition count t4 : 0x01
Client transition count t6 : 0x00
Client transition count t7 : 0x00
```

## Related Commands

|---------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>cable clock dti clear-counters</b> | Resets the counters that are displayed with the <b>show cable clock dti counters</b> command. |
| <b>show cable clock dti status</b>    | Displays information on the DOCSIS Timing Interface (DTI) Client status.                      |

# show cable clock dti status

To display information on the DOCSIS Timing Interface (DTI) Client status, use the `show cable clock dti status` command in privileged EXEC mode.

## show cable clock dti status

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC

### Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(23)BC     | This command was introduced for the Cisco uBR10012 router.                        |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

### Usage Guidelines

Use this command to display information on the DTI Client status.

### Examples

The following is a sample output from the `show cable clock dti` command:

```
Router# show cable clock dti status
Status of DTI component:
Active TCC card in slot 1/1
TCC Card 1/1 DTI status:

Active Client port : 2
Active Client status : normal
Active Client Server status : freerun
Active Client frame error rate : < 2%
Active Client CRC error count : 0x06
Standby Client Signal detected : no
No card in slot 2/1
```

|                                                                          | Cisco IOS Release 12.2(33)CX | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                |

| Release                      | Modification                                                                                                                   |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS Release 12.2(33)CY | This command was modified. The <b>dom</b> and <b>spec-analysis</b> keyword was added, the <b>verbose</b> keyword was modified. |
|                              | <b>Note</b> Cisco CMC image cmc-16x4-os-1.2.bin is required to use these command options.                                      |
| IOS-XE 3.15.0S               | This command is not supported on the Cisco cBR Series Converged Broadband Routers.                                             |

The following is a sample output of the **show cable cmc** command:

Router# **show cable cmc**

|                |             |        |       |        |       |         |         |
|----------------|-------------|--------|-------|--------|-------|---------|---------|
| MAC Address    | IP Address  | State  | Group | Offset | CMCID | Conn ID | IF      |
| 0010.2024.7035 | 192.168.0.4 | online | 710   | 1      | 2     | 0xF0000 | Gi7/1/0 |

The table below describes the significant fields in the output of the **show cable cmc** command.

**Table 51: show cable cmc Field Descriptions**

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address | MAC address of the Cisco CMC.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP Address  | IP address assigned to the Cisco CMC.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| State       | Current state of the Cisco CMC. <ul style="list-style-type: none"> <li>• Offline: CMC is not operational</li> <li>• Reject(i): IP assign failed</li> <li>• Init(d): DHCP discovery</li> <li>• Init(g): GCP connection establishing</li> <li>• Init(est): GCP connection established</li> <li>• Init(c): Get CMC Capability</li> <li>• Init(s): Download configuration to CMC</li> <li>• Reject(c): Get CMC Capability failed</li> <li>• Online: CMC is operational</li> </ul> |
| Group       | Channel group ID to which the Cisco CMC is assigned.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Offset      | Internal index of the Cisco CMC in the channel group.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CMC ID      | Cisco CMC ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field   | Description                                              |
|---------|----------------------------------------------------------|
| Conn ID | GCP connection ID per Cisco uBR-MC3GX60V-RPHY line card. |
| IF      | Interface to which the Cisco CMC is connected.           |

The following is a sample output of the **show cable cmc summary** command:

```
Router# show cable cmc summary
```

```
Gi7/1/0 :1
```

The following is a sample output of the **show cable cmc** command, which displays the capability information for the Cisco CMC with MAC address 0010.2024.7035:

```
Router# show cable cmc 0010.2024.7035 cap
```

```
cmcDsChanNum : 16
cmcUsChanNum : 4
IsFRxEmbedded : 0
```

The table below describes the significant fields in the output of the **show cable cmc cap** command.

**Table 52: show cable cmc cap Field Descriptions**

| Field         | Description                                         |
|---------------|-----------------------------------------------------|
| cmcDsChanNum  | Number of downstream channels on the Cisco CMC.     |
| cmcUsChanNum  | Number of upstream channels on the Cisco CMC.       |
| IsFRxEmbedded | Indicates if the FRx is installed in the Cisco CMC. |

The following is a sample output of the **show cable cmc** command, which displays the digital diagnostic monitoring information for the Cisco CMC with MAC address 0004.9f01.9100:

```
Router# show cable cmc 0004.9f01.9100 dom
```

|       | Temperature | Voltage | Current | Optical Tx Power | Optical Rx Power |
|-------|-------------|---------|---------|------------------|------------------|

```

The table below describes the significant fields in the output of the **show cable cmc dom** command.

**Table 53: show cable cmc dom Field Descriptions**

| Field                | Description                                             |
|----------------------|---------------------------------------------------------|
| Temperature          | Internally measured transceiver temperature.            |
| Voltage              | Internally measured transceiver supply voltage.         |
| Current              | Measured transmitter bias current in $\mu$ A.           |
| Optical Tx Power     | Measured transmitter output power in mW.                |
| Optical Rx Power     | Measured receiver received average optical power in mW. |
| High Alarm Threshold | Upper limit to trigger alarm.                           |
| High Warn Threshold  | Upper limit to trigger warning.                         |
| Low Alarm Threshold  | Lower limit to trigger alarm.                           |
| Low Warn Threshold   | Lower limit to trigger warning.                         |

The following is a sample output of the **show cable cmc** command, which displays the downstream counter information for the Cisco CMC with ID 2:

```

Router# show cable cmc 2 ds_cnt

The table below describes the significant fields in the output of the **show cable cmc ds\_cnt** command.

**Table 54: show cable cmc ds\_cnt Field Descriptions**

| Field                          | Description                                                      |
|--------------------------------|------------------------------------------------------------------|
| IpVerErr                       | Number of IP version errors.                                     |
| IpLenErr                       | Number of IP length errors.                                      |
| IpChsmErr                      | Number of checksum errors in the IP header.                      |
| QamChanMismatchErr             | Number of QAM channel mismatch errors.                           |
| SeqMismatchErr                 | Number of sequence mismatch errors.                              |
| MpegLenErr                     | Number of MPEG length errors.                                    |
| L2TPv3HdrErr                   | Number of L2TPv3 header errors.                                  |
| DLMPacketCounter               | Number of DEPI Latency Measurement (DLM) packets.                |
| DепiCtrlPacketCounter          | Number of DEPI control packets.                                  |
| NonDепiPacketCounter           | Number of non-DEPI control packets.                              |
| GCPPacketCounter               | Number of GCP packets.                                           |
| DепiChanPacketCounter QAMchaID | Number of DEPI channel packets for the specified QAM channel ID. |
| DепiPacketCounter              | Number of DEPI packets.                                          |

The following is a sample output of the **show cable cmc** command, which displays the FRx information for the Cisco CMC with ID 1

```
Router# show cable cmc 1 frx_info

FrxCtrlType : 8581
FrxCtrlNumber : ABCDEFGHIJK
FrxCtrlPID : 12345678
FrxCtrlVID : V01
FrxCtrlHWVer : 0.1
FrxCtrlSWId : FRx_0.00.06
FrxCtrlTemp : 14.5 Celsius Degree
FrxCtrlTimeInSvc : 300 day
FrxCtrlOptStatus : No optical input
FrxCtrlAgcStatus : Out of range
FrxCtrlOptLevel : -16.0 dBm
FrxCtrlAtt : 0 dB
FrxCtrlEQ : 3 dB
```

The table below describes the significant fields in the output of the **show cable cmc frx\_info** command.

**Table 55: show cable cmc frx\_info Field Descriptions**

| Field            | Description                                        |
|------------------|----------------------------------------------------|
| FrxCtrlType      | Controller used to identify the FRx.               |
| FrxCtrlNumber    | Serial number of the FRx.                          |
| FrxCtrlPID       | Product Identifier (PID) of the FRx.               |
| FrxCtrlVID       | Version Identifier (VID) of the FRx.               |
| FrxCtrlHWVer     | Hardware version of the FRx.                       |
| FrxCtrlSWId      | Software version of the FRx.                       |
| FrxCtrlTemp      | Temperature of the FRx.                            |
| FrxCtrlTimeInSvc | Time for which the FRx is in service.              |
| FrxCtrlOptStatus | Status of the optical input power on the FRx.      |
| FrxCtrlAgcStatus | Status of Automatic Gain Control (AGC) on the FRx. |
| FrxCtrlOptLevel  | Optical input power level of the FRx.              |
| FrxCtrlAtt       | FRx attenuation value in dB.                       |
| FrxCtrlEQ        | FRx equalization value in dB.                      |

The following is a sample output of the **show cable cmc** command, which displays the information for the Cisco CMC with MAC address 0010.2024.7035:

```
Router# show cable cmc 0010.2024.7035 info

Load for five secs: 5%/0%; one minute: 6%; five minutes: 6%
Time source is NTP, 04:06:39.772 UTC Mon Feb 24 2014
```

**show cable cmc**

```

cmcModeName : DOCSIS-CMC-4P-FN
cmcDescription : 0
cmcVendorName : 0
cmcSerialNumber : CSJ13152101
cmcHWVersion : 1.0
cmcSWVersion : 0.10(Feb 18 10:40:03 CST 2014)
cmcTimeInService : 237616

```

The table below describes the significant fields in the output of the **show cable cmc info** command.

**Table 56: show cable cmc info Field Descriptions**

| Field            | Description                                 |
|------------------|---------------------------------------------|
| cmcModeName      | Product number of the Cisco CMC.            |
| cmcDescription   | Description of the Cisco CMC.               |
| cmcVendorName    | Vendor name for the Cisco CMC.              |
| cmcSerialNumber  | Serial number of the Cisco CMC.             |
| cmcHWVersion     | Version number of the Cisco CMC hardware.   |
| cmcSWVersion     | Version number of the Cisco CMC software.   |
| cmcTimeInService | Time for which the Cisco CMC is in service. |

The following is a sample output of the **show cable cmc** command, which displays the modem information for the Cisco CMC with MAC address 0010.2024.7035:

```

Router# show cable cmc 0010.2024.7035 modem

```

| MAC Address    | IP Address  | I/F       | MAC State    | Prim Sid | RxPwr (dBmv) | Timing Offset | Num CPE | D |
|----------------|-------------|-----------|--------------|----------|--------------|---------------|---------|---|
| e448.c7bf.80aa | 192.168.0.2 | C7/1/0/UB | w-online(pt) | 1        | !-3.00       | 2089          | 0       | N |

The table below describes the significant fields in the output of the **show cable cmc modem** command.

**Table 57: show cable cmc modem Field Descriptions**

| Field        | Description                                      |
|--------------|--------------------------------------------------|
| MAC Address  | MAC address of the cable modem.                  |
| IP Address   | IP address assigned to the cable modem.          |
| I/F          | Interface to which the cable modem is connected. |
| MAC State    | State of the cable modem.                        |
| Prim Sid     | Primary service ID assigned to the cable modem.  |
| RxPwr (dBmv) | Power received at the cable modem in dBmV.       |

| Field         | Description                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timing Offset | Timing offset for the cable modem, in ticks, as recognized on the Cisco CMTS. A tick is 6.25/64 microseconds. This is the delay between the time when the cable modem is scheduled to make a transmission and when the Cisco CMTS actually receives it. |
| Num CPE       | Number of Customer Premises Equipments (CPE).                                                                                                                                                                                                           |

The following is a sample output of the **show cable cmc** command, which displays the spectrum monitoring information for the Cisco CMC with MAC address 0004.9f01.9100:

```
Router# show cable cmc 0004.9f01.9100 spec-analysis 1 5000 85000

The table below describes the significant fields in the output of the **show cable cmc verbose** command.

**Table 58: show cable cmc verbose Field Descriptions**

| Field               | Description                                                       |
|---------------------|-------------------------------------------------------------------|
| Primary MAC Address | MAC address of the Cisco CMC.                                     |
| IP Address          | IP address assigned to the Cisco CMC.                             |
| Last IP Address     | Previous IP address assigned to the Cisco CMC.                    |
| IP Mode             | IP mode of the Cisco CMC.                                         |
| State               | State of the Cisco CMC.                                           |
| Next Hop Hw Address | The hardware address of the CMTS's next hop between CMTS and CMC. |
| Next Hop IP Address | The IP address of the CMTS's next hop between CMTS and CMC.       |
| Online Time         | Time, in seconds, for which the Cisco CMC is online.              |
| ARP Enabled         | Indicates if ARP is enabled.                                      |
| Reason              | Reason for the previous reset of the Cisco CMC.                   |

**Related Commands**

| Command                | Description                                                  |
|------------------------|--------------------------------------------------------------|
| <b>cable cmc</b>       | Configures the downstream RF power and FRx on the Cisco CMC. |
| <b>clear cable cmc</b> | Clears the information on the Cisco CMC.                     |

# show cable cmts-id

To display the configured CMTS ID, use the **show cable cmts-id** command in privileged EXEC mode.

**show cable cmts-id**

|                    |                                            |                                                                                  |
|--------------------|--------------------------------------------|----------------------------------------------------------------------------------|

|------------------------|--------------------------------|---------------------------------------------------------------------------------------------------|
|                        | Cisco IOS XE Bengaluru 17.6.1z | This <b>counter</b> statement is introduced for the Cisco cBR Series Converged Broadband Routers. |
|                        | Cisco IOS XE Fuji 16.7.1       | This command is introduced for the Cisco cBR Series Converged Broadband Routers.                  |

**Usage Guidelines** Use this command to display the DEPI multicast information.

The following example shows the IPv6 multicast DEPI pool:

```
Router#show cable depi multicast pool ipv6
Load for five secs: 8%/2%; one minute: 7%; five minutes: 8%
No time source, *06:57:11.898 UTC Sun Oct 22 2017
POOL ID IPv6 DESCRIPTION
22 FF3B::8000:0/100
50 FF3A::8000:0/126 zyq
100 FF39::8000:0/120 zyq

Infra_C05#show cable depi multicast pool ipv6 id 22
Load for five secs: 8%/2%; one minute: 8%; five minutes: 8%
No time source, *07:00:03.577 UTC Sun Oct 22 2017
POOL ID IPv6 DESCRIPTION
```

```
22 FF3B::8000:0/100
```

The following example shows the assigned IPv6 multicast address:

```
Router#show cable depi multicast ipv6 all
Load for five secs: 10%/3%; one minute: 8%; five minutes: 8%
No time source, *07:01:33.659 UTC Sun Oct 22 2017
IPv6 POOL ID CONTROLLER
FF3A::8000:0 50 9/0/2 (291)
FF3A::8000:1 50 9/0/28 (317)
FF39::8000:0 100 9/0/29 (318)
FF3A::8000:2 50 9/0/30 (319)
```

The following example shows the statistics information of each group:

```
Router#show cable depi multicast counter
IP POOL ID pps bps IF
Controller 1 4686 39335848 Te3/1/0
225.225.225.0
DS3/0/1
```

# show cable device access-group

To display a list of CMs and their customer premises equipment (CPE) devices, along with their access groups, use the **show cable device access group** command in privileged EXEC mode.

**show cable device** [*ip-address*] **access-group**

**Note** The **show cable device access-group** command is not supported on the Cisco uBR10012 universal broadband router.

## Syntax Description

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <i>ip-address</i> | (Optional) Specifies the IP address for a particular CM or host. |
|-------------------|------------------------------------------------------------------|

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                                                                                                                                              |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.NA          | This command was introduced.                                                                                                                                                                              |
| 12.1(3a)EC1    | Support was added to the Release 12.1 EC train.                                                                                                                                                           |
| 12.2(4)BC1     | Support was added to the Release 12.2 BC train for the Cisco uBR7100 series and Cisco uBR7200 series routers. (This command might appear in the CLI for the Cisco uBR10012 router but is not functional.) |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                         |

## Usage Guidelines

This command displays information about both CMs and their associated CPE devices. To display information only for hosts and other CPE devices, use the **show cable host access-group** command. To display information only for CMs, use the **show cable modem access-group** command.

If an SNMP manager is requesting information about CM or CPE devices at the same time that this command is given, the command displays the following error message:

```
No information is available, please try later.
```

Wait until the SNMP retrieval is done and retry the CLI command.

## Examples

The following example shows how to display a list of the CMs and their hosts:

```
Router# show cable device access-group
```

| MAC address    | IP address     | Type  | Access-group |
|----------------|----------------|-------|--------------|
| 00d0.ba77.7595 | 10.20.114.34   | modem | resident     |
| 0020.4065.828c | 10.27.29.128   | modem | resident     |
| 0080.c6f9.b42e | 24.168.220.52  | host  |              |
| 0020.7806.defe | 192.168.28.134 | host  |              |
| 0020.4066.5c5c | 10.27.33.128   | modem | resident     |

**show cable device access-group**

This table describes the fields that are shown in the **show cable device access-group** display:

**Table 59: Descriptions for the show cable device access-group Fields**

| Field        | Description                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address  | The MAC address for the CM or CPE device.                                                                                           |
| IP Address   | The IP address that the DHCP server has assigned to the CM or CPE device.                                                           |
| Type         | Identifies the type of device: <ul style="list-style-type: none"> <li>• host = CPE device</li> <li>• modem = cable modem</li> </ul> |
| Access-group | Displays the access group name or number in use (if any) for this CM or CPE device.                                                 |

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                              | Description                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------|
| <b>cable device</b>                  | Configures the access list for a CM device or host.                               |
| <b>cable host access-group</b>       | Configures the access list for the specified hosts.                               |
| <b>clear cable host</b>              | Clears the host from the table.                                                   |
| <b>show cable host access-group</b>  | Displays the hosts behind the CMs in the network, along with their access groups. |
| <b>show cable modem access-group</b> | Displays the access groups for the CMs on a particular cable interface.           |

# show cable downstream controller-profile

To display the cable downstream controller profile, use the **show cable downstream controllerprofile** command in privileged EXEC mode.

**Cisco cBR Series Converged Broadband Router**  
**show cable downstream controller profile** *id*

| <b>Syntax Description</b> | <b>profile</b> <i>id</i> Profile identifier.                                                                                                                                                          |         |              |                          |                                                                                  |

|--------------------------|-----------------------------------------------------------|
| <b>show cable dp pfg</b> | Displays cable dataplane packet filter group information. |

# show cable dp pfg

To display cable dataplane packet-filter-group information, use **show cable dp pfg** command in Privileged EXEC mode.

**show cable dp pfg group** { *group-id* | **all** }

## Syntax Description

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| <b>pfg</b>      | Specifies cable dataplane packet-filter-group information. |
| <b>group</b>    | Specifies cable filter group number.                       |
| <i>group-id</i> | Specifies the group-id. The valid range is from 1 to 255.  |
| <b>all</b>      | Display information for all group-id values.               |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                 |
|----------------|------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was introduced on Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The **show cable dp pfg** command displays packet-filter-group information.

## Examples

The following example shows a typical display for the **show cable dp pfg** command:

```
CBR8#show cable dp pfg group 1
Extended IP access list CMTS_PKT_FILTER_GROUP_1
 51200 permit ip any any (8 matches)
IPv6 access list CMTS_PKT_FILTER_GROUP_IPV6_1 (TCAM loaded) (hidden) (refcount: 1)
 permit tcp any range 0 65535 any range 0 65535 flow-label 1111 sequence 200
 permit udp any range 0 65535 any range 0 65535 flow-label 1111 sequence 201
 permit ipv6 any any sequence 51200
```

# show cable dsg

To display the current DOCSIS Set-Top Gateway (DSG) tunneling parameters, use the **show cable dsg** command in privileged EXEC mode.

**show cable dsg** {stats | tunnel} [{vendor CA-vendor-name | tunnel-mac-address}]

## Syntax Description

|                              |                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stats</b>                 | Displays configuration and run-time statistics about the currently-defined DSG tunnels.                                                                                                                                          |
| <b>tunnel</b>                | Displays the mapping of DSG tunnels to vendors or well-known MAC addresses.                                                                                                                                                      |
| <b>vendor</b> CA-vendor-name | (Optional) Displays information about a specific Conditional Access (CA) vendor. This parameter can be any arbitrary string up to 8 characters in length.                                                                        |
| tunnel-MAC-address           | (Optional) Displays information for the specified well-known MAC address for the DSG tunnel. If you specify a MAC address of 0000.0000.0000, the command displays information for all DSG tunnels, which is the default display. |

## Command Default

Displays information for all DSG tunnels.

## Command Modes

Privileged EXEC (#)

## Command History

| 12.3(13a)BC    | This command is obsolete and replaced by the <b>show cable dsg tunnel</b> command.     |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Routers.     |

## Examples

The following example shows a typical display for the **show cable dsg tunnel** form of the command:

```
Router# show cable dsg tunnel
```

| Group-ip  | Src-ip | Tunnel-MAC     | Interface | Packets  | CA-vendor |
|-----------|--------|----------------|-----------|----------|-----------|
| 225.2.2.2 | *      | 0001.0002.0003 | Cable3/0  | 1589     | BBB       |
| 230.6.6.6 | *      | 000d.000d.000d | Cable3/0  | 12868464 | abc       |
| 230.7.7.7 | *      | 000e.000e.000e | Cable3/0  | 24330138 | abc       |
| 230.4.4.4 | *      | 000b.000b.000b | Cable3/0  | 22008648 | cisco     |
| 230.5.5.5 | *      | 000c.000c.000c | Cable3/0  | 6424012  | abc       |
| 229.1.1.1 | *      | 0009.0009.0009 | Cable3/0  | 12868440 | cisco     |
| 228.1.1.1 | *      | 0008.0008.0008 | Cable3/0  | 6424012  | cisco     |
| 230.1.1.1 | *      | 000a.000a.000a | Cable3/0  | 24370812 | cisco     |
| 230.8.8.8 | *      | 000f.000f.000f | Cable3/0  | 23035116 | abc       |

```
Router#
```

The following example shows a typical display for the **show cable dsg stats** command:

```

Router# show cable dsg stats

DSG statistics information
DSG keepalive is set
Vendor: DDD, Tunnel count: 1
Vendor: BBB, Tunnel count: 2
Vendor name is DDD, tunnel MAC is 0001.0002.0003
Group address is 226.2.2.2, source address is *
 Interface is Cable5/1, mapping entry is used 1
 Received 5968 packets, forwarded 5289 packets
 Dropped 679 packets, last second rate 16878 bits/sec
Vendor name is BBB, tunnel MAC is 0009.0010.0011
Group address is 227.2.2.2, source address is *
 Interface is Cable3/0, interface Cable3/0 is bundle master
 mapping entry is used 2
 Received 0 packets, forwarded 0 packets
 Dropped 0 packets, last second rate 0 bits/sec
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
 Interface is Cable5/1, mapping entry is used 2
 Received 5970056 packets, forwarded 400333 packets
 Dropped 5569723 packets, last second rate 96768 bits/sec
Router#

```

The following example shows a typical display for the **show cable dsg stats** command for an individual vendor:

```

Router# show cable dsg stats vendor CCC

DSG statistics information
DSG keepalive is set
Vendor: CCC, Tunnel count: 1
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
 Interface is Cable5/1, mapping entry is used 2
 Received 5970056 packets, forwarded 400333 packets
 Dropped 5569723 packets, last second rate 96768 bits/sec
Router#

```

---

**Note** The packet counters for both the **stats** and **tunnel** options for a particular DSG tunnel continue to increase as long as traffic is received over that tunnel. If the tunnel does not receive any traffic for three minutes or more, the counters are automatically reset to 0.

---

The following example shows a typical display for the **show cable dsg stats** command for an individual vendor when the associated cable interface is shut down. The Received, Forwarded, and Dropped counters are not displayed when an interface is shut down.

```

Router(config)# interface c5/1

Router(config-if)# shutdown

Router(config-if)# exit

Router(config)# exit

Router# show cable dsg stats vendor CCC

```

```

DSG statistics information
DSG keepalive is set
Vendor: CCC, Tunnel count: 1
Vendor name is CCC, tunnel MAC is 0005.0006.0007
Group address is 228.3.3.3, source address is *
 Interface is Cable5/1, mapping entry is used 2
Router#

```

Table 0-1 describes the major fields shown in the **show cable dsg** command:

**Table 60: show cable dsg Field Descriptions**

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSG keepalive is set   | If keepalive messages have been enabled for an IP multicast group, using the <b>cable dsg keepalive</b> command, this message is displayed.                                                                                                                                                                                                                                                                                     |
| Dest-ip, Group address | Multicast group IP address for the DSG stream.                                                                                                                                                                                                                                                                                                                                                                                  |
| Src-ip, Source address | Source IP address for the DSG stream. If an asterisk (*) appears as the source IP address, it indicates that the source IP address is 0.0.0.0, which allows any IP address as the source IP address.                                                                                                                                                                                                                            |
| Mapped-MAC, Tunnel-MAC | Well-known MAC address used for the DSG tunnel. If you configured the DSG tunnel with a MAC address of 0000.0000.0000 using the <b>cable dsg</b> command, this field shows the MAC address that the CMTS derived using the MAC to IP multicast addressing mapping that is specified in RFC 1112.                                                                                                                                |
| Interface              | Cable interface on which this DSG tunnel is configured.                                                                                                                                                                                                                                                                                                                                                                         |
| mapping entry is used  | Number of times that this particular DSG tunnel mapping has been used to resolve the well-known MAC address from the tunnel's group address. This can be used as a very rough approximation of the number set-top boxes (STBs) that have been mapped to this DSG tunnel since the last time the counter was cleared.<br><br><b>Note</b> Use the <b>clear cable dsg</b> command to clear this counter.                           |
| Packets                | Number of packets transmitted over the DSG tunnel.                                                                                                                                                                                                                                                                                                                                                                              |
| CA-vendor              | Name for the Conditional Access (CA) vendor that owns this tunnel.                                                                                                                                                                                                                                                                                                                                                              |
| Received               | Number of packets received by the multicast group. This counter includes all interfaces that are receiving traffic for the multicast group. The field is not shown when an interface is shut down, but the counter continues to increase as long as the multicast group is receiving traffic. When the interface is reenabled, the counter shows the latest number of packets received.                                         |
| Forwarded              | Number of packets forwarded on the cable interface for the multicast group. This counter is reset to 0 whenever an interface is shut down and reenabled. The field is not shown when an interface is shut down.                                                                                                                                                                                                                 |
| Dropped                | Number of packets that were dropped that were for the multicast group. This counter includes all interfaces that are receiving traffic for the multicast group. The field is not shown when an interface is shut down, but the counter continues to increase as long as the multicast group is receiving traffic and dropping packets. When the interface is reenabled, the counter shows the latest number of packets dropped. |

**Note** The Received and Dropped counters reflect activity for the multicast group and are not affected when a cable interface is shut down and reenabled, as long as the multicast group continues to receive traffic. The Forwarded counter reflects activity for the particular cable interface and is reset to zero whenever the interface is shut down and reenabled. All packet counters are also automatically reset to zero if the DSG tunnel does not receive traffic for three minutes or more.

**Related Commands**

| Command                    | Description                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>cable dsg</b>           | Enables the DOCSIS Set-Top Gateway (DSG) on a cable interface, and configures its tunnel-mapping parameters. |
| <b>cable dsg keepalive</b> | Enables keepalive messages over DOCSIS Set-Top Gateway (DSG) tunnels on a cable interface.                   |
| <b>clear cable dsg</b>     | Resets counters related to DOCSIS Set-Top Gateway (DSG) tunnels.                                             |
| <b>debug cable dsg</b>     | Enables the display of debugging messages for the operation of the DOCSIS Set-Top Gateway (DSG) feature.     |

# show cable dsg cfr

To display DOCSIS Set-Top Gateway (DSG) classifier details, such as the classifier state, source, and destination IP addresses, use the **show cable dsg cfr** command in privileged EXEC mode.

**show cable dsg cfr** [*index*] [*verbose*]

## Syntax Description

|                |                                                                    |
|----------------|--------------------------------------------------------------------|
| <b>index</b>   | DSG classifier identification. The valid range is from 1 to 65535. |
| <b>verbose</b> | Provides detailed output for DSG classifiers.                      |

## Command Default

Displays details of all DSG classifiers.

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCG    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Examples

The following is a sample output of the **show cable dsg cfr** command that shows details of all DSG classifiers:

```
Router# show cable dsg cfr
cfr id state resolved applied conflict dest-ip src-ip

1000 en yes yes no 232.10.10.0 dsg-server-a
(40.0.0.30)
1010 en yes yes no 232.10.10.10 dsg-server-b
(40.0.0.40)
2000 en yes yes no 232.10.11.0 dsg-server-c
(40.0.0.50)
2010 en no no no 232.10.11.10 non-exist-hostnam
(----)
```

The following is a sample output of the **show cable dsg cfr** command that shows details of a specified DSG classifier:

```
Router# show cable dsg cfr 1010
cfr id state resolved applied conflict dest-ip src-ip

1010 en yes yes no 232.10.10.10 dsg-server-b
(40.0.0.40)
```

The following is a sample output of the **show cable dsg cfr** command with the verbose keyword that shows detailed output for all DSG classifiers:

```
Router# show cable dsg cfr verbose
Cfr Id : 1000
State : enable
```

This table describes the significant fields shown in the **show cable dsg cfr** command display:

**Table 61: show cable dsg cfr Field Description**

| Field             | Description                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cfr id            | DSG classifier ID.                                                                                                                                                                                                      |
| state             | DSG classifier state shown either as “enable” or “disable.”                                                                                                                                                             |
| resolved          | Indicates whether the destination and source IP addresses of a hostname are resolved or not.                                                                                                                            |
| applied           | Indicates that a hostname is configured without any error.                                                                                                                                                              |
| conflict          | Indicates that the IP address of the hostname is changed after the hostname is configured, and the DSG classifier cannot be updated due to an error.                                                                    |
| dest-ip           | IP address configured as the destination IP address or the resolved hostname IP address. This IP address might differ from the destination hostname IP address if the classifier is not applied or in a conflict state. |
| src-ip            | IP address configured as the source IP address or the resolved hostname IP address. This IP address might differ from the source hostname IP address if the classifier is not applied or in a conflict state.           |
| Conflict Cfr Id   | Indicates the classifier ID that conflicts with the new classifier due to an identical MAC address or classifier ID.                                                                                                    |
| Error Code        | Indicates why the classifier is resolved but cannot be applied.                                                                                                                                                         |
| Tunnel Id         | DSG tunnel ID.                                                                                                                                                                                                          |
| Dest Hostname     | The hostname configured as the destination IP address.                                                                                                                                                                  |
| Dest Hostname IP  | Resolved IP address of the destination hostname.                                                                                                                                                                        |
| Src Hostname      | The hostname configured as the source IP address.                                                                                                                                                                       |
| Src Hostname IP   | Resolved IP address of the source hostname.                                                                                                                                                                             |
| Src Prefix Length | Source prefix length of the source IP address.                                                                                                                                                                          |
| Dest Port Start   | Start range for the Destination TCP/UDP port.                                                                                                                                                                           |
| Dest Port End     | End range for the Destination TCP/UDP port.                                                                                                                                                                             |
| Priority          | DSG classifier priority.                                                                                                                                                                                                |
| In DCD            | Indicates whether the DSG classifier is included or excluded from the downstream channel descriptor (DCD) message.                                                                                                      |
| Forwarded         | Forwarded statistics.                                                                                                                                                                                                   |

 show cable dsg cfr

| 12.2(33)SCG    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The show cable dsg host command is used for debugging of host IP addresses.

## Examples

The following is a sample output of the **show cable dsg host** command that shows the mapping of the host names and IP addresses on a Cisco CMTS router:

```
Router# show cable dsg host
Host IP Address Reference Last Update Time
dsgserver1 232.1.1.10 2 21:41 08/01/2011
dsgserver2 234.3.2.1 1 21:41 08/01/2011
dsgserver3 ---- 1 never
dsgserver4 ---- 1 never
dsgserver5 ---- 1 never
dsgserver6 235.5.5.5 1 21:41 08/01/2011
dsgserver7 235.0.0.2 1 21:41 08/01/2011
```

The following is a sample output of the **show cable dsg host** command with the **verbose** keyword on a Cisco CMTS router:

```
Router# show cable dsg host verbose
Host IP Address Reference Last Update Time
dsgserver1 232.1.1.10 2 21:41 08/01/2011
 Cfrs:
 cable dsg cfr 2 dest-ip 232.1.1.125 tunnel 1 priority 0 src-ip a.b.c.d d...
 cable dsg cfr 3 dest-ip 232.1.1.125 tunnel 1 priority 10 src-ip a.b.c.d ...
dsgserver2 234.3.2.1 1 21:41 08/01/2011
 Cfrs:
 cable dsg cfr 4 dest-ip aaabbccc priority 0 src-ip cccdddeee disable
dsgserver3 ---- 1 never
 Cfrs:
 cable dsg cfr 4 dest-ip aaabbccc priority 0 src-ip cccdddeee disable
dsgserver4 235.0.0.2 1 21:41 08/01/2011
 Cfrs:
 cable dsg cfr 24 dest-ip g2 priority 0 disable
dsgserver5 235.0.0.3 1 21:41 08/01/2011
```

**show cable dsg host**

```
Cfrs:
cable dsg cfr 30 dest-ip g3 tunnel 1 priority 0 disable
```

This table describes the significant fields shown in the **show cable dsg host** command display:

**Table 62: show cable dsg host Field Description**

| Field            | Description                                                                |
|------------------|----------------------------------------------------------------------------|
| Host             | Hostname of the DSG classifier.                                            |
| IP Address       | IP address that is mapped to the hostname.                                 |
| Reference        | DSG classifiers that use the host as a fully-qualified domain name (FQDN). |
| Last Update Time | Last updated time of the DSG server.                                       |

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.2(33)SCG    | This command was introduced.                                                      |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

The IGMP static group IP address created automatically under a bundle interface at the time of DSG configuration is not displayed in the **show running-config interface command output** in Cisco IOS Release 12.2(33)SCG and later. To display the DSG static groups configured under a bundle interface, use the **show cable dsg static-group bundle** command in privileged EXEC mode in Cisco IOS Release 12.2(33)SCG and later.

## Examples

The following is a sample output of the show cable dsg static-group bundle command that lists the DSG static groups configured under a bundle interface on the Cisco uBR10012 router:

```
Router# show cable dsg static-group bundle 2
Bundle Interface Group Source
Bundle2 228.0.0.1 0.0.0.0
Bundle2 228.0.0.1 1.2.3.4
Bundle2 232.1.1.1 2.3.4.5
```

This table describes the significant fields shown in the **show cable dsg static-group bundle** command display:

**Table 63: show cable dsg static-group bundle Command Field Description**

| Field            | Description                                                       |
|------------------|-------------------------------------------------------------------|
| Bundle Interface | Bundle interface number.                                          |
| Group            | DSG static group configured under the specified bundle interface. |
| Source           | SSM source address.                                               |

show cable dsg static-group bundle

| 12.2(33)SCD5                    | This command was modified. The output of the <b>show cable dsg tg</b> command was changed.                         |
| 12.2(33)SCG                     | The command output was changed.                                                                                    |
| IOS-XE 3.15.0S                  | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                  |
| Cisco IOS-XE Gibraltar 16.10.1f | This command was enhanced to support DSG configuration under mac-domain with OPS md-profile.                       |

## Usage Guidelines

This command displays information about all DSG tunnel groups. Beginning with Cisco IOS Release 12.2(33)SCG, the “TG state” field in the **show cable dsg tg** command output was replaced by “Channel state” to indicate that a channel belonging to a tunnel group is either enabled or disabled. It is possible that a tunnel group is enabled but a particular channel in that tunnel group is disabled.

## Examples

The following is a sample output from the **show cable dsg tg** command with the configured parameters for all DSG tunnel groups in Cisco IOS Release 12.2(33)SCG and later:

```
Router# show cable dsg tg
TG Chan Chan Rule Vendor UCID
id id state I/F pri Param list

10 1 en C6/0 0
```

**show cable dsg tg**

```

10 2 en C6/0 0
10 3 en C6/1 0
10 4 en 0
10 5 en 0
10 6 en 0

```

The following is a sample output from the **show cable dsg tg** command with the configured parameters for all DSG tunnel groups in Cisco IOS Release 12.2(33)SCE and earlier:

```

Router# show cable dsg tg
TG Chan TG Rule Vendor UCID
id id state I/F pri Param list
1 1 en C5/0 16 1 1 2 3 4
1 2 en 0
2 1 en C5/0 11 2
 C5/1
2 2 en 0

```

The following is a sample output from the **show cable dsg tg** command with the configured parameters for all DSG tunnel groups in Cisco cBR 16.10.1f and later:

```

Router# show cable dsg tg
TG Chan TG Rule Vendor UCID Service-group Profile
id id state I/F pri Param list profile chan state

2000 1 en C1/0/0 0 SG1 en
4500 1 en C1/0/0 2 2 1 2 SG1 dis
4500 2 en 0 - -

```

The following is a sample output from the **show cable dsg tg 1 channel 1** command with the configured parameters for all DSG tunnel groups for the specified tunnel group and channel.

```

Router# show cable dsg tg 1 channel 1
TG Chan Chan Rule Vendor UCID
id id state I/F pri Param list
1 1 en C5/0 16 1 1 2 3 4

```

The following is a sample output from the **show cable dsg tg 1 channel 1 verbose** command with the detailed information for the specified tunnel group.

```

Router# show cable dsg tg 1 channel 1 verbose
TG: 1 Chan: 1 state: en pri: 16 Vendor: 1 UCID: 1 2 3 4
 rule tunnel
I/F id state id state mac-addr id state dest-ip In-DCD listId
C7/0/0 1 en 1 en 0101.5e01.0001 1 en 230.1.0.1 yes 1
 6 en 231.1.1.6 no
 7 en 231.1.1.7 no

| Release        | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(13a)BC    | This command was introduced to support A-DSG 1.1 on the Cisco uBR10012 router and Cisco uBR7200 series routers.                                                                                                                                                                                                                                                                                                                                   |
| 12.3(17a)BC    | The output was modified to support A-DSG 1.2. <ul style="list-style-type: none"> <li>The “TG id” field was added to the <b>show cable dsg tunnel</b> and <b>verbose</b> forms of the command.</li> <li>The “State” and “MAC Addr” fields switched places in the <b>show cable dsg tunnel verbose</b> form of the command.</li> <li>The “vendor group” field was added to the <b>show cable dsg tunnel clients</b> form of the command.</li> </ul> |
| 12.2SB         | This command was integrated into Cisco IOS Release 12.2SB. Support for the Cisco uBR7225VXR router was added.                                                                                                                                                                                                                                                                                                                                     |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Routers.                                                                                                                                                                                                                                                                                                                                                                 |

## Usage Guidelines

This command replaces the **show cable dsg** form of command available in Cisco IOS Release 12.3(9a)BC.

## Examples

The following example displays CLI help for `show cable dsg tunnel` command syntax.

```
Router# show cable dsg tunnel 1 ?
cfrs Show DSG tunnel classifiers
clients Show DSG tunnel clients
```

```

interfaces Show DSG tunnel interfaces
statistics Show DSG tunnel statistics
verbose Show DSG tunnel detail information
| Output modifiers
<cr>

```

### Examples: Displaying information about all A-DSG Tunnels

The following command displays tunnel MAC address, state, associated classifiers, and state information for Advanced-mode DSG version 1.1 tunnels on a Cisco CMTS router. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```

Router# show cable dsg tunnel

```

| tunnel id | tunnel state | tunnel mac-addr | cfr id | cfr state | tunnel in interface | rule id | rule state | client listId | service class |
|-----------|--------------|-----------------|--------|-----------|---------------------|---------|------------|---------------|---------------|
| 1         | en           | 0100.5e01.0114  | 1      | en        | Cable6/0            | 1       | en         | 2             | SI            |
|           |              |                 | 5      | en        |                     | 7       | en         | 10            |               |

### Examples: Displaying Information for a Specified A-DSG Tunnel

The following example displays the same information as the **show cable dsg tunnel** command, but for a specified tunnel. The following example shows sample output for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```
Router# show cable dsg tunnel 1
tunnel tunnel tunnel cfr cfr tunnel in rule rule client service
id state mac-addr id state interface id state listId class
1 en 0100.5e01.0114 1 en Cable6/0 1 en 2 SI
 5 en 7 en 10
 11 en 8 en 2
 14 en 20 en 2
 Cable6/1 1 en 4
 3 en 3
 4 en 4
 11 en 2
```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the tunnel group ID ("TG id") field in support of A-DSG version 1.2 as shown below:

```
Router# show cable dsg tunnel 1
 tunnel TG
 cfr tunnel rule client service
id state mac-addr id
 id state I/F id state listId class
1 en 0100.5e01.0001 1 1 en C5/0 1 en 1 DSG-Rate1
 6 en
 7 en
 8 en
```

### Examples: Displaying Information for A-DSG Tunnel Classifiers

The following example displays detailed information about all A-DSG classifiers associated with the specified tunnel.

```
Router# show cable dsg tunnel 1 cfrs
tunnel cfr cfr cfr destination ip source ip srcPre d_port d_port
id id state pri address address length start end
1 1 en 1 230.1.1.20 0.0.0.0 32 0 65535
 5 en 1 230.1.1.60 0.0.0.0 32 0 65535
 11 en 1 224.25.25.134 0.0.0.0 32 0 65535
 14 en 0 230.1.1.20 0.0.0.0 32 1000 2000
```

### Examples: Displaying Information for A-DSG Tunnel Clients

The following example displays detailed information about all the clients associated with the specified tunnel for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```
Router# show cable dsg tunnel 1 clients
tunnel client client client client
id listId id id type address
```

```

1 2 1 CA System ID 0X951
 3 Broadcast
 8 MAC Addr 1111.1111.1111
3 1 Application ID 0X1
4 1 CA System ID 0X701
10 1 Application ID 0X6

```

Beginning in Cisco IOS Release 12.3(17a)BC, this output was modified to add the “vendor group” field in support of A-DSG version 1.2 as shown below:

```

Router# show cable dsg tunnel 1 clients
tunnel client client client vendor
id listId id id type address group
1 1 1 MAC Addr 0100.5e00.0001
 2 Application ID 0x0951
 3 Broadcast Unspecified
 4 Broadcast 4

```

### Examples: Displaying Information for A-DSG Tunnel Interfaces

The following example displays all the interfaces and rules associated with a specified tunnel.

```

Router# show cable dsg tunnel 1 interfaces
tunnel downstream rule
id interface id
1 Cable6/0 1 7 8 20
 Cable6/1 1 3 4 11

```

### Examples: Displaying Information for A-DSG Tunnel Statistics

The following example displays the packets statistics information about the specified tunnel.

```

Router# sh cab dsg tunnel 1 statistics
tunnel cfr cfr destination ip source ip total total

### Examples: Displaying Detailed Information for a Specified A-DSG Tunnel

The following example shows all the detailed information about a specified tunnel for A-DSG version 1.1. This output was changed in Cisco IOS Release 12.3(17a)BC for A-DSG version 1.2 (see following example).

```

Router# show cable dsg tunnel 1 verbose
Tunnel ID : 1
MAC Addr : 0100.5e01.0114
State : enable
Cfr Id : 1
State : enable
Priority : 1
Dest IP : 230.1.1.20
Src IP : 0.0.0.0

```

|--------------------------------------------|--------------------------------------------------------------------------------|
| <b>debug cable dsg</b>                     | Enables general, DCD or packet-related debugging.                              |
| <b>show cable dsg tg</b>                   | Displays information about A-DSG tunnel groups on a Cisco CMTS router.         |
| <b>show interface</b>                      | Displays general interface information for the specified or all interfaces.    |
| <b>show interface cable dsg downstream</b> | Displays A-DSG configuration and status information for downstream interfaces. |

# show cable dynamic-qos trace

To display the number of subscribers for whom call trace is enabled on the Cisco CMTS router, use the **show cable dynamic-qos trace** command in privileged EXEC mode.

**show cable dynamic-qos trace**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                                                                                                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS Release 12.2(33)SCF | This command was introduced.                                                                                             |
| IOS-XE 3.15.0S                | This command was implemented on the Cisco cBR Series Converged Broadband Routers. The output of the command was changed. |

## Usage Guidelines

Use the **show cable dynamic-qos trace** command after enabling the call trace functionality for PacketCable or PacketCable Multimedia (PCMM) service subscribers using the **cable dynamic-qos trace** command.

## Examples

The following is a sample output of the **show cable dynamic-qos trace** command that shows the number of subscribers for whom call trace is enabled on the Cisco uBR10012 router in Cisco IOS Release 12.2(33)SCF:

```
Router# show cable dynamic-qos trace
Total number of subscribers: 0
Max configured number of subscribers: 12
```

The following is a sample output of the **show cable dynamic-qos trace** command that shows the number of subscribers for whom call trace is enabled on the Cisco cBR-8 router:

```
Router# show cable dynamic-qos trace
Total number of subscribers: 0
```

This table describes the significant fields shown in the show packetcable cms command display.

**Table 65: show packetcable cms Field Descriptions**

| Field                                | Description                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Total number of subscribers          | Number of subscribers for whom call trace is enabled. The number ranges from 0 to the maximum configured number of subscribers. |
| Max configured number of subscribers | Maximum number of subscribers for whom call trace can be enabled at any point of time.                                          |

**Related Commands**

## Usage Guidelines

Use the **show cable dynamic-bonding-group** command to check the dynamic bonding group configuration details.

## Examples

The following is a sample output of the **show cable dynamic-bonding-group summary** command that shows the details of the dynamically created bonding groups:

```
Router# show cable dynamic-bonding-group summary
Dynamic bonding group: Enable
DBG operation with Registration: Enable
DBG operation with Load-Balance: Enable
BG ID BG Name BG Size CMs ServFlows Create Time Create Client BG State RFid list
33026 Wi6/0/1:1 33 2 2 Dec 22 16:03 MODEM_ONLINE OPERATIONAL 33024-33055
33282 Wi6/0/2:1 33 2 2 Dec 22 16:05 MODEM_ONLINE OPERATIONAL 33280-33311
```

The following is a sample output of the **show cable dynamic-bonding-group slot** command:

```
Router# show cable dynamic-bonding-group slot 6
Dynamic bonding group: Enable
BG ID BG Name BG Size CMs ServFlows Create Time Create Client BG State RFid list
33026 Wi6/0/1:1 33 2 2 Dec 22 16:03 MODEM_ONLINE OPERATIONAL 33024-33055
33282 Wi6/0/2:1 33 2 2 Dec 22 16:05 MODEM_ONLINE OPERATIONAL 33280-33311
```

The following is a sample output of the **show cable dynamic-bonding-group controller** command:

```
Router# show cable dynamic-bonding-group controller 6/0/1
Dynamic bonding group: Enable
```

**show cable dynamic-bonding-group**

```

BG ID BG Name BG Size CMs ServFlows Create Time Create Client BG State RFid list
33026 Wi6/0/1:1 33 2 2 Dec 22 16:03 MODEM_ONLINE OPERATIONAL 33024-33055

```

```
Router# show cable dynamic-bonding-group controller 6/0/2
```

```
Dynamic bonding group: Enable
```

```

BG ID BG Name BG Size CMs ServFlows Create Time Create Client BG State RFid list
33282 Wi6/0/2:1 33 2 2 Dec 22 16:05 MODEM_ONLINE OPERATIONAL 33280-3331

```

The following is a sample output of the **show cable dynamic-bonding-group quota controller** command that shows the usage of bonding group resource:

```
Router# show cable dynamic-bonding-group quota controller 6/0/2
```

```

slot/subslot/ctrlr: 6/0/2
 Total BG number: 128
 Used BG number (static/dynamic): 2(1/1)
 Available BG number: 126
 Available BG list port: 2-127

```

```
Router# show cable dynamic-bonding-group quota controller 6/0/1
```

```

This table describes the significant fields shown in the show cable dynamic-bonding-group command display.

**Table 66: show cable dynamic-bonding-group summary — Field Descriptions**

| Field         | Description                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| BG ID         | Bonding group ID.                                                                                                              |
| BG Name       | Name of the bonding group.                                                                                                     |
| BG Size       | Size of the bonding group.                                                                                                     |
| CMs           | Total number of CMs associated with the dynamic bonding group.                                                                 |
| ServFlows     | The total number of service flows used on the dynamic bonding group.                                                           |
| Create Time   | The time when the dynamic bonding group was created.                                                                           |
| Create Client | Client that creates the dynamic bonding group. Client can be modem registration, static load balance, or dynamic load balance. |
| BG State      | Current state of the dynamic bonding group.                                                                                    |
| RFid list     | RF ID associated to a specific bonding group.                                                                                  |

# show cable entropy status

To view the status of the cBR-8 entropy sources, use the **show cable entropy status** command in user EXEC or privileged EXEC mode. This command is only supported on SUP IOSd.

## show cable entropy status

**Syntax Description** This command has no keywords or arguments.

**Command Default** None

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                     | Modification                                                               |
|-----------------|-----------------------------|----------------------------------------------------------------------------|
|                 | Cisco IOS XE Dublin 17.12.1 | This command is introduced on the Cisco cBR-8 Converged Broadband Routers. |

**Usage Guidelines** The command displays the status of the cBR-8 entropy sources.

**Examples** The following example shows typical output:

```
Router#show cable entropy status
Load for five secs: 2%/0%; one minute: 4%; five minutes: 5%
Time source is NTP, 13:02:40.227 EDT Fri Apr 14 2023
```

```
Entropy source successes failures
=====
RD RAND 473 0
CPU Jitter 457 0
ACT2 0 0
```

Here, ACT2 is the backup source for CPU jitter.

# show cable fiber-node

To display information about a fiber node, use the **show cable fiber-node** command in privileged EXEC mode.

**show cable fiber-node** *fiber-node-id* [**spectrum** | **mapping** | **derived**]

## Syntax Description

|                      |                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>fiber-node-id</i> | Specifies a fiber node ID. Valid values range from 1 to 256.<br>The valid values for the Cisco cBR router is 1 to 512. |
| <b>spectrum</b>      | Displays upstream channel frequency assignment information and the spectrum group number.                              |
| <b>mapping</b>       | Displays upstream and downstream channel mapping information.                                                          |
| <b>derived</b>       | Displays MAC domain and wideband interfaces associated to this fiber-node.                                             |

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                          |
|----------------|---------------------------------------------------------------------------------------|
| 12.3BC         | This command was introduced                                                           |
| 12.2(33)SCC    | This command was integrated into Cisco IOS Release 12.2(33)SCC.                       |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router.      |
| IOS-XE 3.17.0S | This command was modified. The <b>mapping</b> and <b>derived</b> keywords were added. |

## Usage Guidelines

For each fiber node, a traditional DOCSIS downstream channel on a Cisco uBR10-MC5X20 cable interface line card is used to carry MAC management and signaling messages. This traditional DOCSIS downstream channel used for a MAC domain is called the *primary downstream channel*. The associated traditional DOCSIS upstream channel is used for return data traffic and signaling.

## Examples

The following is a sample output of the **show cable fiber-node** command:

```
Router# show cable fiber-node 2
Fiber-Node Config Status
Fiber-Node 2
 downstream Modular-Cable 1/0/0: 0-3
 downstream Cable 7/1/0
 upstream Cable 7/1: 10-19
 FN Config Status: Configured (status flags = 0x01)
 MDD Status: Valid
Router#
```

The following is a sample output of the **show cable fiber-node** command on the Cisco cBR router:

```
Router# show cable fiber-node 1

```

**show cable fiber-node**

```

Fiber-Node 1
Channel(s) : downstream Integrated-Cable 7/0/0: 0-23
Channel ID(s): 1 2 3 4 5 6 7 8 9 10 11 12 13 14
15 16 17 18 19 20 21 22 23 24
Upstream-Cable 7/0/0
FN Config Status: Configured (status flags = 0x01)
MDD Status: Valid
Router#

```

This table describes the fields shown in the **show cable fiber-node** command display.

**Table 67: show cable fiber-node Field Descriptions**

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fiber-Node    | Displays the fiber nodes configured on the CM.                                                                                                                                                                                                                                                                                                                                                                      |
| Config Status | Displays the configuration status of the fiber node. Status flags are as follows: <ul style="list-style-type: none"> <li>• 0x01 - CMTS_FN_CONFIG</li> <li>• 0x02 - CMTS_FN_FREQ_INVALID</li> <li>• 0x04 - CMTS_FN_CHID_INVALID</li> <li>• 0x08 - CMTS_FN_BUNDLE_INVALID</li> <li>• 0x10 - CMTS_FN_BOND_CHID_INVALID</li> <li>• 0x20 - CMTS_FN_US_FREQ_INVALID</li> <li>• 0x40 - CMTS_FN_NO_US_CONFIGURED</li> </ul> |
| MDD Status    | Displays the MAC Domain Descriptor (MDD) status. MDD status of a fiber node is set as invalid in the following cases: <ul style="list-style-type: none"> <li>• Frequency is not unique.</li> <li>• Channel ID is not unique.</li> <li>• Bonding group ID is not unique.</li> <li>• Bundle is mismatched.</li> </ul>                                                                                                 |

```
Router# show cable fiber-node 2 spectrum
```

| Fiber<br>Node No. | Upstream<br>Port | Physical<br>Port | Frequency<br>(MHz) | Spectrum<br>Group No. |
|-------------------|------------------|------------------|--------------------|-----------------------|
| 2                 | Cable7/1/0 U0    | 10               | 21.939 [1.6]       | 1                     |
| 2                 | Cable7/1/0 U1    | 11               | 10.695 [1.6]       | 1                     |
| 2                 | Cable7/1/0 U2    | 12               | 5.834 [1.6]        | 1                     |
| 2                 | Cable7/1/0 U3    | 13               | 9.055 [1.6]        | 1                     |
| 2                 | Cable7/1/4 U0    | 16               | unassigned         | No                    |
| 2                 | Cable7/1/4 U1    | 17               | unassigned         | No                    |
| 2                 | Cable7/1/4 U2    | 18               | unassigned         | No                    |
| 2                 | Cable7/1/4 U3    | 19               | unassigned         | No                    |

This example shows the output of the **spectrum** keyword on the Cisco cBR router:

```
Router# show cable fiber-node 2 spectrum
```

| Fiber<br>Node No. | Upstream<br>Port | Physical<br>Port | Frequency<br>(MHz) | Spectrum<br>Group No. |
|-------------------|------------------|------------------|--------------------|-----------------------|
|-------------------|------------------|------------------|--------------------|-----------------------|

|   |             |   |              |    |
|---|-------------|---|--------------|----|
| 2 | UC3/0/1:U0  | 1 | 13.200 [6.4] | No |
| 2 | UC3/0/1:U1  | 1 | 19.600 [6.4] | No |
| 2 | UC3/0/1:U2  | 1 | 26.000 [6.4] | No |
| 2 | UC3/0/1:U3  | 1 | 32.400 [6.4] | No |
| 2 | UC3/0/1:U4  | 1 | unassigned   | No |
| 2 | UC3/0/1:U5  | 1 | unassigned   | No |
| 2 | UC3/0/1:U6  | 1 | unassigned   | No |
| 2 | UC3/0/1:U7  | 1 | unassigned   | No |
| 2 | UC3/0/1:U8  | 1 | unassigned   | No |
| 2 | UC3/0/1:U9  | 1 | unassigned   | No |
| 2 | UC3/0/1:U10 | 1 | unassigned   | No |
| 2 | UC3/0/1:U11 | 1 | unassigned   | No |

This table describes the fields shown in the **show cable fiber-node** command display when the **spectrum** keyword is used.

**Table 68: show cable fiber-node Field Descriptions**

| Field              | Description                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upstream Port      | Displays the upstream port associated with the fiber node.                                                                                                                                                                 |
| Physical Port      | Displays the physical port of the upstream channel.                                                                                                                                                                        |
| Frequency          | Displays the upstream channel frequency of the CM.                                                                                                                                                                         |
| Spectrum Group No. | Displays the spectrum group number of the fiber node. A spectrum group is a list of upstream frequencies and nominal power levels. Spectrum groups ranging from 1 to 32 can be created for each cable modem upstream port. |

This example shows the output of the **mapping** keyword on the Cisco cBR router:

```
Router# show cable fiber-node 2 mapping
```

```
Fiber-node 2:
Upstream:
Sg chan Us-chan Op state

This table describes the fields shown in the **show cable fiber-node** command display when the **mapping** keyword is used.

**Table 69: show cable fiber-node Field Descriptions**

| Field      | Description                                                    |
|------------|----------------------------------------------------------------|
| Sg chan    | Display the service group channel ID in service group profile. |
| Us-chan    | Physical upstream channel.                                     |
| Op state   | Displays the state of the channel.                             |
| Ds-rf-chan | Physical downstream RF channel                                 |

This example shows the output of the **derived** keyword on the Cisco cBR router:

```

Router# show cable fiber-node 2 derived

Fiber-node 2:
Assoc succeeded
mac-domain 0 interface Cable3/0/0 Y
Wideband 1 Wideband-Cable3/0/0:0 Y

```

This table describes the fields shown in the **show cable fiber-node** command display when the **derived** keyword is used.

**Table 70: show cable fiber-node Field Descriptions**

| Field     | Description                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Assoc     | Display the association information of mac domain and wideband interface in service group profile which is associated to this fiber-node. |
| succeeded | Shows if all configuration of these interfaces are generated successfully.                                                                |

**Related Commands**

|----------------------------------|------------------------------------------------------------------------------------------------------|
| <b>show cable modem</b>          | Displays information for registered and unregistered cable modems (including wideband cable modems). |
| <b>show cable modem wideband</b> | Displays information for registered and unregistered wideband cable modems.                          |

# show cable filter

To display the DOCSIS 1.1 filter groups that are currently defined, use the **show cable filter** command in user EXEC or privileged EXEC mode.

**show cable filter** [**group** *group-index* [**index** *index-num*]] [**verbose**]

| Syntax Description            |                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group</b> <i>group-id</i>  | (Optional) Specifies the filter group to be displayed. The valid range is 1 to 256.<br>For Cisco cBR-8 routers, the valid range is 1 to 254                                                                                            |
| <b>index</b> <i>index-num</i> | (Optional) Specifies the index of the particular filter within a group to be displayed. The valid range is 1 to 128 on a uBR7200 series router and 1 to 256 on a uBR10012 router.<br>For Cisco cBR-8 routers, valid range is 1 to 256. |
| <b>verbose</b>                | (Optional) Displays complete information about the filter groups in a format that is easier to read than the default display.                                                                                                          |

## Command History

| Release               | Modification                                                                                                                                                                                                                                       |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(6)EC1            | This command was introduced on the Cisco uBR7100 series and Cisco uBR7200 series routers.                                                                                                                                                          |
| 12.2(2)XF, 12.2(4)BC1 | This command was supported on the Cisco uBR10012 routers.                                                                                                                                                                                          |
| 12.2(8)BC2            | An option was added to the <b>cable filter group</b> command to allow filter groups to be activated and deactivated without removing the filter group's configuration.                                                                             |
| 12.2(33)SCA           | The output was changed to add fields for IPv6 information, including the "v6" field in the <b>show cable filter</b> command, and the "Source IPv6 Address," and "Destination IPv6 Address" fields of the <b>show cable filter verbose</b> command. |
| IOS-XE 3.15.0S        | This command was implemented on the Cisco cBR Series Converged Broadband Router.                                                                                                                                                                   |

## Examples

The following example shows a typical display of the **show cable filter** command:

```
Router# show cable filter
 Filter SrcAddr/Mask DestAddr/Mask Prot ToS SPort DPort TCP Action Status
 Grp Id
1 1
1 2 10.37.11.151/24 6
1 3 17 68 67 0,0 drop active
1 4 256 161 0,0 drop active
1 5 256 53 0,0 drop active
1 6 10.37.11.151/29 256
1 7 10.37.11.196/29 10.11.0.98/32 256
1 8 10.37.11.195/32 10.11.0.98/32 6
 accept active
 drop active
```

**show cable filter**

```

1 9 10.37.11.195/32 10.11.0.98/32 256 accept active
1 10 10.37.11.194/32 10.11.0.98/16 6 accept active
1 11 10.37.11.193/32 10.11.0.98/8 17 drop active
1 12 10.37.11.192/32 10.11.0.98/32 6 F,F accept active
1 13 10.37.11.191/32 10.11.0.98/32 17 F,F accept active
1 14 10.37.11.190/32 10.11.0.98/24 17 8,F accept active
1 15 10.37.11.189/32 10.11.0.98/32 256 F,8 drop active
1 16 10.37.11.189/32 10.11.0.98/32 256 F,8 accept active
1 17 10.37.11.188/32 10.11.0.98/8 17 accept active
1 18 10.37.11.188/32 10.11.0.98/32 6 drop active
1 19 10.37.11.187/32 10.11.0.98/30 256 accept active
1 20 10.11.0.98/0 256 drop active
Router#

```

The following shows typical output for the verbose form of this command:

```
Router# show cable filter group 10 index 10 verbose
```

```

Filter Group : 1
Filter Index : 1
Matches : 0
 Match action : accept
 Status : active
Filter Group : 10
Filter Index : 10
Matches : 0
 Source IP Address : 10.7.7.7/16
 Destination IP Address : 10.8.8.8/16
 IP Protocol type : 256
 IP ToS (Mask, Value) : 1, 2
 TCP/UDP Source Port : 2000
 TCP/UDP Destination Port : 3000
 TCP Flags (mask, value) : 0, 0
 Match action : accept
 Status : active
Router#

```

**IPv6 Examples**

The following examples show examples of output for the **show cable filter** commands with changes beginning in Cisco IOS Release 12.2(33)SCA in support of IPv6 cable filter groups.

```

Router# show cable filter
Filter SrcAddr/Mask DestAddr/Mask Prot ToS SPort DPort TCP Action Status
Grp Id v6 Flags
254 128Y Use Verbose Use Verbose drop active
Router# show cable filter group 254
Filter SrcAddr/Mask DestAddr/Mask Prot ToS SPort DPort TCP Action Status
Grp Id v6 Flags
254 128Y Use Verbose Use Verbose drop active
Router# show cable filter group 254 index 128
Filter SrcAddr/Mask DestAddr/Mask Prot ToS SPort DPort TCP Action Status
Grp Id v6 Flags
254 128Y Use Verbose Use Verbose drop active

```

Table 71: show cable filter Field Descriptions

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Gp     | ID number of the filter group. Defined by the <i>group-id</i> argument of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                            |
| Filter Id     | Index number of the filter group. Defined by the <i>index-num</i> argument of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                        |
| v6            | IP version 6 filter group type indicator. Defined by the <b>ip-version</b> keyword of the <b>cable filter group</b> command. Possible values are Y or N.                                                                                                                                                                                                                                                                                    |
| SrcAddr/Mask  | <ul style="list-style-type: none"> <li>IP version 4—Filter source IP address and mask to be matched by the filter. Defined by the <b>src-ip</b> and <b>src-mask</b> keywords of the <b>cable filter group</b> command..</li> <li>IP version 6—"Use Verbose" appears because IPv6 addresses will not fit in the output display area; need to use the <b>show cable filter group verbose</b> command to view IPv6 addresses.</li> </ul>       |
| DestAddr/Mask | <ul style="list-style-type: none"> <li>IP version 4—Filter destination IP address and mask to be matched by the filter. Defined by the <b>dest-ip</b> and <b>dest-mask</b> keywords of the <b>cable filter group</b> command.</li> <li>IP version 6—"Use Verbose" appears because IPv6 addresses will not fit in the output display area; need to use the <b>show cable filter group verbose</b> command to view IPv6 addresses.</li> </ul> |
| Prot          | IP protocol number(s) to be matched by the filter. Defined by the <b>ip-proto</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                         |
| ToS           | Type of Service mask and value to be matched by the filter. Defined by the <b>ip-tos</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                  |
| SPort         | TCP/UDP source port number to be matched by the filter. Defined by the <b>src-port</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                    |
| DPort         | TCP/UDP destination port number to be matched by the filter. Defined by the <b>dest-port</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                              |
| TCP Flags     | TCP flag mask and value to be matched by the filter. Defined by the <b>tcp-flags</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                      |
| Action        | Action to be taken on packet (accept or drop) when filter match occurs. Defined by the <b>match-action</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                |
| Status        | Filter group status (active or inactive). Defined by the <b>status</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                    |

Table 72: show cable filter verbose Field Descriptions

| Field                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Filter Group                                                            | ID number of the filter group. Defined by the <i>group-id</i> argument of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                                          |
| Filter Index                                                            | Index number of the filter group. Defined by the <i>index-num</i> argument of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                                      |
| Filter Version                                                          | IP version of the filter group. Defined by the <b>ip-version</b> keyword of the <b>cable filter group</b> command. Possible values are IPv4 or IPv6.                                                                                                                                                                                                                                                                                                                      |
| Matches: Source IP address or<br>Matches: Source IPv6 address           | <ul style="list-style-type: none"> <li>Source IP address—IPv4 source IP address and mask to be matched by the filter. Defined by the <b>src-ip</b> and <b>src-mask</b> keywords of the <b>cable filter group</b> command.</li> <li>Source IPv6 address—IPv6 source IP address and prefix to be matched by the filter. Defined by the <b>v6-src-address</b> and <b>v6-src-pfxlen</b> keywords of the <b>cable filter group</b> command.</li> </ul>                         |
| Matches: Destination IP address or<br>Matches: Destination IPv6 address | <ul style="list-style-type: none"> <li>Destination IP address—IPv4 destination IP address and mask to be matched by the filter. Defined by the <b>dest-ip</b> and <b>dest-mask</b> keywords of the <b>cable filter group</b> command.</li> <li>Destination IPv6 address—IPv6 destination IP address and prefix to be matched by the filter. Defined by the <b>v6-dest-address</b> and <b>v6-dest-pfxlen</b> keywords of the <b>cable filter group</b> command.</li> </ul> |
| Matches: IP Protocol type                                               | IP protocol number(s) to be matched by the filter. Defined by the <b>ip-proto</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                       |
| Matches: IP ToS (Mask, Value)                                           | Type of Service mask and value to be matched by the filter. Defined by the <b>ip-tos</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                |
| Matches: TCP/UDP Source Port                                            | TCP/UDP source port number to be matched by the filter. Defined by the <b>src-port</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                  |
| Matches: TCP/UDP Destination Port                                       | TCP/UDP destination port number to be matched by the filter. Defined by the <b>dest-port</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                            |
| Matches: TCP Flags (mask, value)                                        | TCP flag mask and value to be matched by the filter. Defined by the <b>tcp-flags</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                    |
| Matches: Match action                                                   | Action to be taken on packet (accept or drop) when filter match occurs. Defined by the <b>match-action</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                              |
| Matches: Status                                                         | Filter group status (active or inactive). Defined by the <b>status</b> keyword of the <b>cable filter group</b> command.                                                                                                                                                                                                                                                                                                                                                  |

This example shows the output for the **show cable filter** command on the Cisco cBR-8 router:

```
Router#show cable filter
```

```
Grp Id v6 SrcAddr/Mask DestAddr/Mask Prot ToS Action Status
255 1 N DestAddr/Mask Prot ToS drop active
Router#
```

**Related Commands**

| Command                   | Description                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>cable filter group</b> | Creates, configures, and activates a DOCSIS 1.1 filter group that filters packets on the basis of the TCP/IP and UDP/IP headers. |

# show cable flap-list

To display the cable flap-list on a Cisco CMTS, use the **show cable flap-list** command in user EXEC or privileged EXEC mode.

**show cable flap-list**

**show cable flap-list sort-interface** [{**sort-flap** | **sort-int** | **sort-mac** | **sort-time**}]

**Cisco cBR Series Converged Broadband Router**

**show cable flap-list**

**show cable flap-list** [**cable slot/subslot/cable-interface-index**] [{**sort-flap** | **sort-interface** | **sort-time**}]

## Syntax Description

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b> <i>slot/port</i>                          | (Optional) Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7100 series and Cisco uBR7200 series routers: <ul style="list-style-type: none"> <li><i>slot</i>—Chassis slot number of the cable interface line card.</li> <li><i>port</i>—Downstream port number.</li> </ul> Valid values for these arguments are dependent on your CMTS router and cable interface line card. Refer to the hardware documentation for your router chassis and cable interface line card for supported slot and port numbering. |
| <b>cable</b> <i>slot/subslot/port</i>                  | (Optional) Displays information for all CMs on the specified cable interface on a Cisco uBR10012 router: <ul style="list-style-type: none"> <li><i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 5 to 8.</li> <li><i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li><i>port</i>—Downstream port number. Valid ports are 0 to 4, depending on the cable interface line card.</li> </ul>                                                                              |
| <b>cable</b> <i>slot/subslot/cable-interface-index</i> | (Optional) Displays information for all CMs on the specified cable interface on a Cisco cBR router: <ul style="list-style-type: none"> <li><i>slot</i>—Chassis slot number of the cable interface line card. Valid slots are from 0 to 3, and 6 to 9.</li> <li><i>subslot</i>—Secondary slot number of the cable interface line card. Valid subslot is 0.</li> <li><i>cable-interface-index</i>—cable interface index number. Valid index numbers are 0 to 15.</li> </ul>                                                                                          |
| <b>upstream</b> <i>port</i>                            | (Optional) Displays the flap list for a particular upstream on the selected cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>sort-interface</b>                                  | (Optional) Displays the flap list for all cable interfaces, sorted by interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>sort-flap</b>                                       | (Optional) Sorts the list by the number of times the CM has flapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                  |                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sort-int</b>  | (Optional) Sorts the list first by the Cisco CMTS cable interface.<br>This keyword is not supported on Cisco cBR-8 router                                           |
| <b>sort-mac</b>  | (Optional) Sorts the list first by the Cisco CMTS cable interface and then by the CM MAC (hardware) address.<br>This keyword is not supported on Cisco cBR-8 router |
| <b>sort-time</b> | (Optional) Sorts the list by the most recent time the CM is detected to have flapped.                                                                               |

|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.3 NA                  | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                              |
| 12.0(3)T                 | This command was supported on the Cisco mainline release.                                                                                                                                                                                                                                                                                                                                                                 |
| 12.0(7)XR and 12.1(1a)T1 | The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular CM and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the CM has reached its maximum power transmit level and cannot increase its power level further. |
| 12.3(9a)BC               | The <b>sort-int</b> and <b>sort-mac</b> options were added.                                                                                                                                                                                                                                                                                                                                                               |
| 12.2(33)SCA              | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                                                                                                                                                                                                                        |
| 12.2(33)SCC              | The output of this command was modified to show the aggregated data across all upstream channels for each flap detector for CMs in the Multiple Transmit Channel (MTC) mode on a Cisco uBR10012 router.                                                                                                                                                                                                                   |
| IOS-XE 3.15.0S           | This command was implemented on the Cisco cBR-8 Converged Broadband Router. The <b>upstream</b> and <b>sort-mac</b> keywords were removed.                                                                                                                                                                                                                                                                                |

### Usage Guidelines

The **sort** options operate differently on the different Cisco CMTS routers. On the Cisco uBR7100 series and Cisco uBR7200 series routers, the **sort** options apply to all cable interface line cards and merge the output into a single display.

On the Cisco uBR10012 router, the sort options apply to individual cable interfaces. For example, the **sort-time** option sorts all of the flap entries on the first cable interface (c5/0/0), then the entries on the second cable interface (c5/0/1), and so forth.

**Note** Occasionally, the **show cable flap-list** command might temporarily show duplicate entries for the same cable modem. This can occur after a cable modem has gone offline and before it has completed the registration process and come back online. When the cable modem does reach the online state, the duplicate entries disappear.

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

## Examples

The following example shows the output of the **show cable flap-list** command:

```
router# show cable flap-list
MAC Address Upstream Ins Hit Miss CRC P-Adj Flap Time
0010.7bb3.fd19 Cable5/0/U1 0 2792 281 0 *45 58 Jul 27 16:54:50
0010.7bb3.fcfc Cable5/0/U1 0 19 4 0 !43 43 Jul 27 16:55:01
0010.7bb3.fcdd Cable5/0/U1 0 19 4 0 *3 3 Jul 27 16:55:01
```

**Note** The asterisk (\*) in the P-Adj field indicates that a power adjustment has been made for that CM. The exclamation point (!) indicates that the CM has reached its maximum power transmit level and cannot increase its power level further.

The following example shows the display of flap-list tables sorted by MAC address:

```
router# show cable flap-list sort-flap
Mac Addr CableIF Ins Hit Miss CRC P-Adj Flap Time
0010.1eab.2c0b C6/0 U0 108 318 27 0 0 108 Sep 10 15:26:56
0010.1eb2.bb07 C6/0 U0 0 293 31 1 1 1 Sep 10 15:15:49
0010.7b6b.71cd C6/0 U0 1 288 32 0 0 1 Sep 10 15:12:13
0010.1eb2.bb8f C6/0 U0 1 295 30 0 0 1 Sep 10 15:11:44
```

The following example shows the display of flap-list tables sorted by time:

```
Router# show cable flap-list sort-time
Mac Addr CableIF Ins Hit Miss CRC P-Adj Flap Time
00e0.2222.2202 C4/0 U0 464 2069 242 0 421 885 Oct 16 22:47:23
0010.7b6b.57e1 C4/0 U0 0 2475 43 0 1041 1041 Oct 16 22:47:04
```

The following sample output of the **show cable flap-list** command provides the aggregated data across all upstream channels for CMs in the MTC mode on a uBR10012 router in Cisco IOS Release 12.2(33)SCC:

```
router# show cable flap-list
MAC Address Upstream Ins Hit Miss CRC P-Adj
Flap Time
001e.6bfb.0f9e C5/0/0/UB 0 62539 0 0 2 2 Apr 18 03:53:00
0050.f110.b277 C5/0/0/UB 0 10965 211 0 0 9 Apr 18 03:53:00
```

Table 73: show cable flap-list Command Field Descriptions

| Field    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Mac Addr | The MAC address for the CM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CableIF  | The cable interface line card, including upstream, for this CM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Ins      | <p>The number of times the CM comes up and inserts itself into the network. This counter indicates the number of times the RF link was abnormally reestablished into the network. This counter is increased when the time between initial link establishment and a reestablishment was less than the threshold parameter configured using the <b>cable flap-list insertion-time</b> command.</p> <p>Normal modem activity uses the following sequence:</p> <ul style="list-style-type: none"> <li>• Initial link insertion is followed by a station maintenance message between the CMTS and cable modem.</li> <li>• Power on</li> <li>• Initial maintenance</li> <li>• Station maintenance</li> <li>• Power off</li> </ul> <p>When the link is broken, initial maintenance is repeated to reestablish the link.</p> <ul style="list-style-type: none"> <li>• Initial maintenance @ Time T1</li> <li>• Station maintenance</li> <li>• Initial maintenance @ Time T2</li> </ul> <p>The Ins and Flap counters in the flap list are incremented whenever <math>T2 - T1 &lt; N</math> where <math>N</math> is the insertion-time parameter configured in the <b>cable flap-list insertion-time</b> command.</p> <p>This count may indicate intermittent downstream synchronization loss or DHCP or modem registration problems. In the latter case, the Ins count tends to track the Flap count. If the downstream is unstable (levels move outside the modem's range occasionally), insertions can occur. If the modem cannot provision correctly, many insertions occur.</p> <p>If link reestablishment happens too frequently, the modem usually has a registration problem. To check for this potential problem, check to see if the insertion counter is the same order of magnitude as the Flap counter.</p> |
| Hit      | The number of times the CM responds to MAC-layer station maintenance (keepalive) messages. (The minimum hit rate is once per 30 seconds. It can indicate intermittent upstream, laser clipping, or common-path distortion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Field | Description                                                                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Miss  | The number of times the CM misses and does not respond to a MAC-layer station maintenance (keepalive) message. An 8 percent miss rate is normal for the Cisco cable interface line cards. It can indicate intermittent upstream, laser clipping, or common-path distortion. |

| Field                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <p><b>Note</b> The Hit and Miss columns are keepalive polling statistics between the CMTS and the cable modem. The station maintenance process occurs for every modem approximately every 25 seconds. When the CMTS receives a response from the modem, the event is counted as a hit. If the CMTS does not receive a response from the cable modem, the event is counted as a miss.</p> <p>Ideally, the hit count should be much greater than the miss count. If a modem has a hit count much less than its miss count, then registration is failing. Noisy links cause the miss or hit ratio to deviate from a nominal 10 percent or less. High miss counts can indicate:</p> <ul style="list-style-type: none"> <li>• Intermittent upstream possibly due to noise</li> <li>• Laser clipping</li> <li>• Common-path distortion</li> <li>• Ingress or interference</li> <li>• Too much or too little upstream attenuation</li> </ul> <p>A cable modem fails to respond either because of noise or if it is down. Modems that log only misses and zero hits are assumed to be powered off. If noise caused a poll to be missed, then the transition from miss to hit is detected as a flap condition. The poll rate is increased to 1 per second whenever the modem misses a poll. This is used to accelerate the offline state detection and decrease station maintenance overhead.</p> <p>Misses are not desirable, because they usually indicate a return path problem; however, having a small number of misses is normal. After 16 misses, the modem is assumed to have powered off and the link is broken.</p> <p>The flap count is incremented if there are M consecutive misses, where M is</p> |             |

| Field                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <p>configured in the <b>cable flap miss-threshold</b> command. The parameter value ranges from 1 to 12, with a default of 6.</p> <p>Hit and miss analysis could be done after the Ins count stops incrementing. In general, if the hit and miss counts are about the same order of magnitude, and the CRC count is low or nonexistent, then the upstream is experiencing noise.</p> <p>If the miss count is greater, then the modem is probably experiencing common-path distortion and is dropping out frequently or not completing registration. Check grounding connections and if you see noise disappear after breaking a cable connection, but build back up again later, check the end-of-line terminators. You may be using a substandard frequency translator instead of a Digital Signal Processor. If the line is simply noisy, but not too noisy, you see an increase in the percentage of misses. If it is very noisy, then more than 80% of the ranging responses (RNG-RSP) are missed and the modem has many insertions.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CRC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The number of cyclic redundancy check (CRC) errors for this cable modem. CRC errors are calculated on per modem basis and refer to upstream impairments. Cable modems with high CRC errors either have bad upstream paths, or have in-home wiring problems.</p> <p>The CRC counter field indicates:</p> <ul style="list-style-type: none"><li>• Intermittent upstream</li><li>• Laser clipping</li><li>• Common-path distortion</li><li>• Impulsive noise or interference</li></ul> |

| Field | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P-Adj | <p>The number of times the headend instructed the CM to adjust transmit (TX) power more than 3 dB. It can indicate amplifier degradation, poor connections, or thermal sensitivity.</p> <p>* means the noise power-adjustment method is active for this modem.</p> <p>! means the modem has reached its maximum transmit power.</p> <p>The station maintenance poll in the CMTS constantly adjusts the modem transmit power, frequency, and timing. The power-adjustment (P-Adj) column indicates the number of times the modem's power adjustment exceeded the threshold value. The power adjustment threshold may be set using the <b>cable flap-list power-adjust threshold</b> command with a value range of 0 to 10 dB and a default value of 2 dB. Tuning this threshold is recommended to decrease irrelevant entries in the flap list. Power-adjustment values of 2 dB and below continuously increment the P-Adj counter. The modem transmitter step size is 1.5 dB, whereas the headend may command 0.25 dB step sizes.</p> <p>Power-adjustment flap strongly suggests upstream plant problems such as:</p> <ul style="list-style-type: none"> <li>• Amplifier degradation</li> <li>• Poor connections</li> <li>• Thermal sensitivity</li> <li>• Attenuation problem</li> </ul> <p>The P-Adj column is often watched as an indicator of plant stability. It may give a forewarning of a future plant outage. If the upstream path contains too much or too little loss, the modem is undergoing many power adjustments.</p> |
| Flap  | <p>The total number of times a modem has flapped, which is the sum of P-Adj and Ins values. This counter is incremented when one of the following events is detected:</p> <ul style="list-style-type: none"> <li>• Unusual modem insertion or re-registration attempts. The Flap and the Ins counters are incremented when the modem tries to reestablish the RF link with the CMTS within a period of time that is less than the user-configured insertion interval value.</li> <li>• Abnormal miss or hit ratio. The Flap counter is incremented when N consecutive misses are detected after a hit where N can be user-configured with a default value of 6.</li> <li>• Unusual power adjustment. The Flap and P-Adj counters are incremented when the modem's upstream power is adjusted beyond a user-configured power level.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time  | <p>Time is the most recent time that the modem dropped the connection or flapped. The value is based on the clock configured on the local CMTS. If no time is configured, this value is based on the current uptime of the CMTS. When a cable modem meets one of the three flap list criteria, the Flap counter is incremental and Time is set to the current time.</p> <p><b>Note</b> This field displays a value in brackets in the output of the show cable modem flap command to indicate the duration (milliseconds) between the cable interface to become active and the first ranging success after a line card switchover (cable modem recovery time).</p> |

### Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable flap-list** command on the Cisco cBR router:

```
Router#show cable flap-list
MAC Address Upstream Ins Hit Miss CRC P-Adj Flap Time
b0c2.87c2.830b C9/0/0/UB 0 3734 16 0 3 5 Jan 4 02:38:40
0010.18de.8134 C9/0/0/UB 0 4139 11 0 0 2 Jan 4 00:26:45
0025.2e2d.74e4 C9/0/0/U2 *** No data available *** Jan 3 23:33:00

|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>cable flap-list aging</b>                  | Specifies the number of days to keep a CM in the flap-list table before aging it out of the table.        |
| <b>cable flap-list insertion-time</b>         | Sets the insertion time interval that determines whether a CM is placed in the flap list.                 |
| <b>cable flap-list miss-threshold</b>         | Specifies the miss threshold for recording a flap-list event.                                             |
| <b>cable flap-list power-adjust threshold</b> | Specifies the power-adjust threshold for recording a CM flap-list event.                                  |
| <b>cable flap-list size</b>                   | Specifies the maximum number of CMs that can be listed in the flap-list table.                            |
| <b>clear cable flap-list</b>                  | Clears all the entries in the flap-list table.                                                            |
| <b>debug cable flap</b>                       | Displays information about the operation of the CM flap list that is maintained for the cable interfaces. |
| <b>ping docsis</b>                            | Sends a DOCSIS ping to a CM and increments the flap-list counters as appropriate.                         |
| <b>show cable modem</b>                       | Displays information about all CMs on an interface or about a particular CM.                              |
| <b>show cable modem flap</b>                  | Displays flap list statistics for one or more cable modems.                                               |

# show cable flap-list reset-cm-list

To display the Docsis 3.1 cable modem list that was reset by the partial service reset timer, use the **show cable flap-list reset-cm-list** command in privileged EXEC mode.

**show cable flap-list reset-cm-list**

### Usage Guidelines

None

### Examples

This example shows the output of the **show cable flap-list wb-rf** command:

```
router# show cable flap-list wb-rf
```

| RF      | Timeout | Recover | Failure | Recover | Flaps | CM | Percent |
|---------|---------|---------|---------|---------|-------|----|---------|
| 3/0/0 1 | 1       | 1       | 0       | 0       | 1     | 3  | 33      |
| 2       | 0       | 0       | 1       | 0       | 1     | 3  | 33      |

### Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable flap-list wb-rf** command on the Cisco cBR router:

```
Router#show cable flap-list wb-rf
```

| RF        | Timeout | Recover | Failure | Recover | Flaps | CM | Percent |
|-----------|---------|---------|---------|---------|-------|----|---------|
| 1/0/0 158 | 0       | 0       | 1       | 0       | 0     | 2  | 0       |

```
Router#
```

**Related Commands**

| Command                      | Description                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>show cable flap-list</b>  | Displays the cable flap-list on a Cisco CMTS.                                                             |
| <b>clear cable flap-list</b> | Clears all the entries in the flap-list table.                                                            |
| <b>debug cable flap</b>      | Displays information about the operation of the CM flap list that is maintained for the cable interfaces. |
| <b>show cable modem flap</b> | Displays flap list statistics for one or more cable modems.                                               |

# show cable freq-profile

To display information about the frequency profile, use the **show cable freq-profile** command in privileged EXEC mode.

**show cable freq-profile** *freq-profile-id*

## Syntax Description

|                        |                                                               |
|------------------------|---------------------------------------------------------------|
| <i>freq-profile-id</i> | Specifies a freq-profile ID. Valid values range from 0 to 15. |
|------------------------|---------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| IOS-XE 3.15.0S | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

## Usage Guidelines

Use the **show cable freq-profile** command to display information about a qam-profile. If you specify the *freq-profile-id*, the command displays the frequency profile with the specified ID.

## Examples

The following is a sample output of the **show cable freq-profile** command:

```
Router# show cable freq-profile
Frequency Profile ID 0 annex-b-low:
 Lane 1 start-freq 90000000hz
 Block 1 start-freq 90000000hz
 Block 2 start-freq 138000000hz
 Block 3 start-freq 186000000hz
 Block 4 start-freq 234000000hz
 Lane 2 start-freq 282000000hz
 Block 1 start-freq 282000000hz
 Block 2 start-freq 330000000hz
 Block 3 start-freq 378000000hz
 Block 4 start-freq 426000000hz
 Lane 3 start-freq 474000000hz
 Block 1 start-freq 474000000hz
 Block 2 start-freq 522000000hz

|--------------------------------------|--------------------------------------------------------------|
| <b>cable downstream freq-profile</b> | Set the frequency profile for the cable interface line card. |

# show cable hop

To display cable-hop statistics on a Cisco CMTS, use the **show cable hop** command in privileged EXEC mode.

**show cable hop** [{**cable slot/port**}] [{**upstream uport**}] [{**history**}] [{**threshold**}]  
**show cable hop** [{**cable slot/subslot/port**}] [{**upstream uport**}] [{**history**}] [{**threshold**}]

## Cisco cBR-8 Converged Broadband Router

**show cable hop** [{**upstream-cable slot/subslot/controller**}] [{**upstream uport**}] [{**history**}] [{**threshold**}]

### Syntax Description

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable slot/port</b>                        | (Optional) Specifies a cable interface on the Cisco uBR7100 series and Cisco uBR7200 series routers.<br><br>On the Cisco uBR7100 series router, the only valid value is <b>1/0</b> . On the Cisco uBR7200 series router, <i>slot</i> can range from 3 to 6, and <i>port</i> can be 0 or 1, depending on the cable interface.                                                                                                                                                                        |
| <b>cable slot/subslot/port</b>                | (Optional) Specifies a cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> <li>• <i>slot</i> —Chassis slot number of the cable interface line card. Valid slots are from 5 to 8.</li> <li>• <i>subslot</i> —Secondary slot number of the cable interface line card. Valid subslots are 0 or 1.</li> <li>• <i>port</i> —Downstream port number. Valid ports are from 0 to 4, depending on the cable interface line card.</li> </ul> |
| <b>upstreamuport</b>                          | (Optional) Specifies an upstream port for which to display the frequency hop status.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>upstream-cable slot/subslot/controller</b> | (Optional) Specifies a cable interface on the Cisco cBR router. | Command History | Release        | Modification                                                                                                                                                                                                                                                      |
|-----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | 12.0(4)XI      | This command was introduced.                                                                                                                                                                                                                                      |
|                 | 12.3(13a)BC    | This command was enhanced with the addition of two new keywords, <b>history</b> and <b>threshold</b> .                                                                                                                                                            |
|                 | 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                                                                                |
|                 | 12.3(23)BC7    | The output of the <b>show cable hop history</b> command is modified to include more information in the 'change from' and 'change to' fields of the output. Now, the modulation profile number is displayed when a change occurs, instead of the modulation order. |
|                 | 12.2(33)SCC    | This command was integrated into Cisco IOS Release 12.2(33)SCC.                                                                                                                                                                                                   |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <b>summary</b> and <b>upstream-cable</b> keywords were added.                                                                                                                |

## Examples

The following example shows typical output from the **show cable hop** command:

```
Router# show cable hop
```

```
Upstream Port Poll Missed Min Missed Hop Hop Corr Uncorr
Port Status Rate Poll Poll Poll Thres Period FEC FEC
 (ms) Count Sample Pcnt Pcnt (sec) Errors Errors
Cable4/0/U0 down 1000 * * * frequency not set * * * 0 0
Cable4/0/U1 down 1000 * * * frequency not set * * * 0 0
Cable4/0/U2 down 1000 * * * frequency not set * * * 0 0
Cable4/0/U3 down 1000 * * * frequency not set * * * 0 0

```

**Table 74: show cable hop Command Field Descriptions**

| Field         | Description                                  |
|---------------|----------------------------------------------|
| Upstream Port | The upstream port for this information line. |

| Field             | Description                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Status       | Lists the status of the port. Valid states are down if frequency is unassigned or admin down if the port is shut down. If the port is up, this column shows the center frequency of the channel.                                                |
| Poll Rate         | The rate that station maintenance polls are generated (in milliseconds).                                                                                                                                                                        |
| Missed Poll Count | The number of missing polls, per codeword/FEC block.                                                                                                                                                                                            |
| Min Poll Sample   | The number of polls in the sample, per codeword/FEC block.                                                                                                                                                                                      |
| Missed PollPcnt   | The ratio of missing polls to the number of polls, expressed as a percentage.                                                                                                                                                                   |
| Hop Thres Pcnt    | The level that the missed poll percentage must exceed to trigger a frequency hop, expressed as a percentage.                                                                                                                                    |
| Hop Period        | The maximum rate that frequency hopping will occur (in seconds).                                                                                                                                                                                |
| Corr FEC Errors   | The number of correctable forward error corrections (FEC) errors on this upstream port, per codeword/FEC block.                                                                                                                                 |
| Uncorr FEC Errors | The number of uncorrectable FEC errors on this upstream port, per codeword/FEC block.                                                                                                                                                           |
| <b>Note</b>       | The <b>show cable hop</b> and <b>show controllers cable</b> commands display FEC errors per codewords, while the <b>show interface cable upstream</b> command displays FEC errors per packets, where a packet could contain multiple codewords. |

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

The following example shows typical output from the **show cable hop threshold** command:

```
Router# show cable hop c6/0/0 threshold
Upstream SNR(dB) CNR(dB) CorrFEC% UncorrFEC% MissedSM%
Port Val Thre1 Thre2 Val Thre1 Thre2 Pcnt Thre Pcnt Thre Pcnt Thre
Ca6/0/0/U0 27 25 15 39 35 25 0 3 0 1 75 75
Ca6/0/0/U1 31 25 15 51 35 25 0 3 0 1 90 75
Ca6/0/0/U2 -- 35 25 -- 35 25 0 3 0 1 0 75
Ca6/0/0/U3 -- 35 25 -- 35 25 0 3 0 1 0 75
```

**Table 75: show cable hop threshold Command Field Descriptions**

| Field             | Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| Upstream Port     | The upstream port for this information line.                                                                    |
| SNR (dB)          | The signal-to-noise ratio (SNR) for a particular cable modem (CM), in decibels (dB).                            |
| CNR (dB)          | The current upstream carrier-to-noise ratio (CNR) for a particular cable modem (CM), in decibels (dB).          |
| Corr FEC Errors   | The number of correctable forward error corrections (FEC) errors on this upstream port, per codeword/FEC block. |
| Uncorr FEC Errors | The number of uncorrectable FEC errors on this upstream port, per codeword/FEC block.                           |
| Missed SM         | The number of missing station maintenance polls, per codeword/FEC block.                                        |

The following example shows typical output from the **show cable hop history** command:

```
Router# show cable hop c8/1/1 upstream 0 history
F = Frequency Hop, M = Modulation Change, C = Channel Width Change
Upstream Action Chg Chg Action
Port Time Code From To Reason
C8/1/1 U0 Feb 20 12:21:29 M 142 141 SNR 28>=28 CFEC 0<=3 UnCFEC 0<=1
Feb 20 12:09:08 F 0.000 24.000 Configuration changed
```

**Table 76: show cable hop history Command Field Descriptions**

| Field         | Description                                           |
|---------------|-------------------------------------------------------|
| Upstream Port | The upstream port for this information line.          |
| Action Time   | The time of the spectrum management action.           |
| Code          | The code associated with the type of hop.             |
| Chg From      | The previous state of the spectrum management action. |
| Chg To        | The current state of the spectrum management action.  |
| Action Reason | The reason for changing the frequency.                |

This example shows the output of the **show cable hop upstream-cable** command on the Cisco cBR-8 Converged Broadband Router.

```
Router# show cable hop upstream-cable 1/0/0
Upstream Channel Poll Missed Min Missed Hop Hop Corr Uncorr
Channel Status Rate Poll Poll Poll Thres Period FEC FEC

## Related Commands

| Command                                    | Description                                                                                                                           |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable spectrum-group hop period</b>     | Changes the minimum time between frequency hops.                                                                                      |
| <b>cable spectrum-group hop threshold</b>  | Specifies a frequency hop threshold for a spectrum group.                                                                             |
| <b>cable upstream hop-priority</b>         | Configures the priority of the corrective actions to be taken when a frequency hop is necessary due to ingress noise on the upstream. |
| <b>cable upstream modulation-profile</b>   | Configures up to three modulation profiles to an upstream port to activate Dynamic Upstream Modulation.                               |
| <b>cable upstream threshold</b>            | Configures the upstream for the CNR and FEC threshold values to be used in determining the allowable noise levels.                    |
| <b>cable upstream threshold hysteresis</b> | Configures a hysteresis value to be used in conjunction with the dynamic modulation upgrade thresholds.                               |
| <b>clear cable hop</b>                     | Clears the forward error corrections (FEC) hop counters on one or all cable interfaces on a Cisco CMTS.                               |
| <b>show cable host access-group</b>        | Displays the statistics for the host behind the CM.                                                                                   |
| <b>show cable modem</b>                    | Displays CM configuration settings.                                                                                                   |

# show cable host access-group

To display the hosts and other customer premises equipment (CPE) devices behind the CMs in the network, along with their access groups, use the **show cable host access-group** command in privileged EXEC mode.

**show cable host** [{*ip-address**mac-address*}] **access-group**

**Note** The **show cable host** command is not supported on the Cisco uBR10012 universal broadband router.

## Syntax Description

|                    |                                                                               |
|--------------------|-------------------------------------------------------------------------------|
| <i>mac-address</i> | (Optional) Specifies the 48-bit hardware address for a particular CM or host. |
| <i>ip-address</i>  | (Optional) Specifies the IP address for a particular CM or host.              |

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                                                                                                                                              |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.NA          | This command was introduced.                                                                                                                                                                              |
| 12.1(3a)EC1    | Support was added to the Release 12.1 EC train.                                                                                                                                                           |
| 12.2(4)BC1     | Support was added to the Release 12.2 BC train for the Cisco uBR7100 series and Cisco uBR7200 series routers. (This command also appears in the CLI for the Cisco uBR10012 router but is not functional.) |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router.                                                                                                                          |

## Usage Guidelines

This command displays information only for hosts and other CPE devices. To display information for CMs and their associated CPE devices, use the **show cable device access-group** command. To display information only for CMs, use the **show cable device access-group** command.

If an SNMP manager is requesting information about CM or CPE devices at the same time that this command is given, the command displays the following error message:

```
No information is available, please try later.
```

Wait until the SNMP retrieval is done and retry the CLI command.

## Examples

The following example shows how to display all the hosts behind the CMs in the network:

```
Router# show cable host access-group
MAC address IP address Type Access-group
0080.c6f9.b42e 24.168.220.52 host
0020.7806.defe 192.168.28.134 host
0050.baa0.5ccd 24.168.223.251 host
0050.046f.f4cf 192.168.33.25 host
```

**show cable host access-group**

```

0050.bacf.5d89 192.168.37.113 host

Router#

```

This table describes the fields that are shown in the **show cable host access-group** display:

**Table 77: show cable host access-group Field Descriptions**

| Field        | Description                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address  | The MAC address for the CPE device.                                                                                                                                                                                                        |
| IP Address   | The IP address that the DHCP server has assigned to the CPE device.                                                                                                                                                                        |
| Type         | Identifies the type of device. With this command, this field should always be host to indicate a CPE device. Use the <b>show cable device access-group</b> or <b>show cable modem access-group</b> command to display information for CMs. |
| Access-group | Displays the access group name or number in use (if any) for this CPE device.                                                                                                                                                              |

**Tip** In Cisco IOS Release 12.1(12)EC, Release 12.2(8)BC1, and later releases, you can add a timestamp to **show** commands using the **exec prompt timestamp** command in line configuration mode.

**Related Commands**

| Command                               | Description                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------|
| <b>cable device</b>                   | Configures the access list for a CM device or host.                           |
| <b>cable host access-group</b>        | Configures the access list for the specified hosts.                           |
| <b>clear cable host</b>               | Clears the host from the table.                                               |
| <b>show cable device access-group</b> | Displays a list of CMs and their CPE devices, along with their access groups. |
| <b>show cable modem access-group</b>  | Displays the access groups for the CMs on a particular cable interface.       |

# show cable ib-ipc

To display the status of local IB IPC server and information on participating line cards, use the show cable ib-ipc command in privileged EXEC mode.

**show cable ib-ipc {status | ports}**

## Syntax Description

|               |                                                   |
|---------------|---------------------------------------------------|
| <b>status</b> | Displays status of local IB IPC server.           |
| <b>ports</b>  | Displays information on participating line cards. |

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                      |
|----------------|-----------------------------------------------------------------------------------|
| 12.3(23)BC     | This command was introduced for the Cisco uBR10012 router.                        |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Router. |

## Examples

The following is sample output from the **show cable ib-ipc** command. The command **show cable ib-ipc ports** displays the internal virtual channel identifiers and internal service flows for Ironbus based IPC.

```
Router# show cable ib-ipc ports
6/0: LCP High Priority VCCI 135, SFID 32891
LCP Normal Priority VCCI 135, SFID 135
8/0: LCP High Priority VCCI 153, SFID 32909
LCP Normal Priority VCCI 153, SFID 153
```

# show cable ipc-stats

To display statistics of all IPC messages on a Cisco CMTS router, use the **show cable ipc-stats** command in privileged EXEC mode.

**show cable ipc-stats**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Privileged EXEC (#)

| Command History | Release           | Modification                                                                                   |
|-----------------|-------------------|------------------------------------------------------------------------------------------------|
|                 | 12.2(33)SCC       | This command was introduced in Cisco IOS Release 12.2(33)SCC.                                  |
|                 | 12.2(33)SCF       | The command output displays the IPC port information such as service type of the IPC messages. |
|                 | IOS-XE<br>3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Router.              |
|                 |                   |                                                                                                |

**Usage Guidelines** You must enable the Cable IPC Statistics Collection tool using the cable ipc-stats command before using the show cable ipc-stats command. When you use this show command, a separate shadow database buffer is allocated, and the contents of the active database are copied into the shadow database to display the IPC statistics. This ensures that all the statistics are frozen at the same time for easy comparison and analysis.

## Examples

The following is a sample output of the show cable ipc-stats command that shows statistics of all IPC messages on a Cisco CMTS router:

```
Router# show cable ipc-stats

This table describes the fields displayed by the **show cable ipc-stats** command.

**Table 78: show cable ipc-stats Command Field Descriptions**

| Field  | Description                                                                     |
|--------|---------------------------------------------------------------------------------|
| entity | Route processor-to-line card connection or a line card-to-line card connection. |
| app    | Message group.                                                                  |
| io     | Send request or a send response, or a receiver request or a receiver response.  |
| s/s    | Slot/subslot                                                                    |

| Field           | Description                                                                         |
|-----------------|-------------------------------------------------------------------------------------|
| reqid           | Nonsequential message ID for the original request.                                  |
| idx             | Sequential message index for the original request.                                  |
| pkts            | Number of messages.                                                                 |
| bytes           | Number of bytes.                                                                    |
| lastEvt (sec)   | Seconds since the last send or receive event.                                       |
| totalDur (msec) | Total time in milliseconds for the blocked send wait or received request process.   |
| maxDur (msec)   | Maximum time in milliseconds for the blocked send wait or received request process. |
| lastMax (sec)   | Seconds since the last maxDur is recorded.                                          |

**Related Commands**

| IOS-XE 3.15.0S     | This command was implemented on the Cisco cBR Series Converged Broadband Router.                                                                                                                                                                                                                                                                         |         |              |                |                                                                                  |
| Usage Guidelines   | To view the leasequery filter statistics for a specific cable interface, use the <i>cableslot/subslot/cable-interface-index</i> option.                                                                                                                                                                                                                  |         |              |                |                                                                                  |

## Example for Cisco cBR router

This example shows the output for the **show cable ipv6 leasequery-filter** command on the Cisco cBR router:

```
Router#show cable ipv6 leasequery-filter
Lease Query IPv6 Filter statistics for Unknown Sid
 Requests Sent : 0 total. 0 unfiltered, 0 filtered

Router#
```

This example shows the output for the **show cable ipv6 leasequery-filter** command for a specific cable interface on the Cisco cBR router:

```
Router#show cable ipv6 leasequery-filter cable 1/0/0
Lease Query IPV6 Filter statistics for Cable1/0/0:
 Requests Sent : 0 total. 0 unfiltered, 0 filtered

Router#
```

## show cable ipv6 leasequery-stats

To display the IPv6 cable leasequery packet processing statistics. Counters collect statistics and show the queries that are sent to the DHCP server and the replies received by the cBR-8 routers. Use the **show cable ipv6 leasequery-stats** command in the privileged EXEC mode.

**show cable ipv6 leasequery-stats** [ **clear** ]

**Cisco cBR Series Converged Broadband Router**

**show cable ipv6 leasequery-stats** [ **clear** ]

### Syntax Description

|              |                                                                    |
|--------------|--------------------------------------------------------------------|
| <b>clear</b> | (Optional) Resets all DHCPv6 counters on the cBR-8 router to zero. |
|--------------|--------------------------------------------------------------------|

### Command Modes

Privileged EXEC (#)

| Release  | Modification                 |
|----------|------------------------------|
| 17.6.1zl | This command was introduced. |

### Usage Guidelines

The **show cableipv6 leasequery-stats** command displays the IPv6 cable leasequery packet processing statistics. The counters are grouped by queries and replies.

### Examples

The following example shows the IPv4 cable leasequery statistics output on the cBR-8 router:

```
Router# show cable ipv6 leasequery-stats
IPv4 Source Verify LeaseQuery Statistics:
Queries: 1 sent, 0 timed out
Replies: 1 allowed, 0 rogues, 0 dropped
```

**Table 79: show cable leasequery-stats Field Descriptions**

| Field          | Description                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------|
| <b>Queries</b> |                                                                                                        |
| Sent           | Number of leasequeries sent by cBR-8.                                                                  |
| Timed out      | Number of leasequeries timed out before receiving replies.                                             |
| <b>Replies</b> |                                                                                                        |
| Allowed        | Number of replies that are valid, so that the CPE traffic is allowed.                                  |
| Rogue          | Number of replies that indicate a CPE is a rogue device, so that the CPE is added into the rogue list. |
| Dropped        | No of replies that are invalid, so they are dropped without further processing.                        |

# show cable l2-vpn dot1q-nsi-redundancy

The **show cable l2-vpn dot1q-nsi-redundancy** command in privileged EXEC mode displays the following information:

- Configured primary and the backup DOT1Q Ethernet Network System Interface (NSI).
- Current active NSI, through which the traffic flows.
- Time elapsed from latest switchover.

## show cable l2-vpn dot1q-nsi-redundancy

|                 |                     |                                                                                  |
|-----------------|---------------------|----------------------------------------------------------------------------------|
| Command Default | None                |                                                                                  |
| Command Modes   | Privileged EXEC (#) |                                                                                  |
| Command History | Release             | Modification                                                                     |
|                 | 12.2(33) SCJ        | This command was introduced on the Cisco uBR Series Universal Broadband Routers  |
|                 | IOS-XE 3.18.0S      | This command was introduced on the Cisco cBR Series Converged Broadband Routers. |

Usage Guidelines

The following conditions trigger a restart as indicated by the Elapsed-after-SW field:

- When the backup pair is created for the first time.
- When the Active-NSI in the pair fails and triggers a switchover.
- When you manually switch over the current active uplink NSI port.

## Example

The following example shows the DOT1Q NSI port backup pair details:

```
Router# show cable l2-vpn dot1q-nsi-redundancy
Primary-NSI Backup-NSI Active-NSI Elapsed-after-SW
Te4/0/1 Te4/0/7 Te4/0/1 31m9s
Te4/0/2 Te4/0/3 Te4/0/2 59s
```

When two uplink DOT1Q NSI ports are UP, you can manually switch over an active uplink port from current active uplink port to another using **cable l2-vpn dot1q-nsi-redundancy force-switchover from Te4/0/1** command. The following example shows the current NSI uplink active port after switchover:

```
Router# show cable l2-vpn dot1q-nsi-redundancy
Primary-NSI Backup-NSI Active-NSI Elapsed-after-SW
```

|         |         |         |        |
|---------|---------|---------|--------|
| Te4/0/1 | Te4/0/7 | Te4/0/7 | 41m27s |
| Te4/0/2 | Te4/0/3 | Te4/0/2 | 10m17s |

# show cable l2-vpn dot1q-vc-map

To display the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the router's Ethernet interfaces, use the **show cable l2-vpn dot1q-vc-map** command in privileged EXEC mode.

**show cable l2-vpn dot1q-vc-map** [*mac-address* [**vpn** *vpnid*] [**verbose**]] [**customer** *cust-name*] [**vpn** *vpnid*]

## Syntax Description

|                                  |                                                                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mac-address</i>               | (Optional) Displays the mapping for the cable modem with the specified hardware MAC address.                                                             |
| <b>vpn</b> <i>vpnid</i>          | (Optional) Displays Layer 2 VPN information on a cable modem with the specified MAC address, or for the specified VPN ID across all cable modems.        |
| <b>verbose</b>                   | (Optional) Displays additional information about the Layer 2 mapping, including the number of packets and bytes received on the upstream and downstream. |
| <b>customer</b> <i>cust-name</i> | (Optional) Displays the VLAN mappings for this particular customer name.                                                                                 |

## Command Default

Displays information for all cable modems that have a defined IEEE 802.1Q VLAN mapping.

## Command Modes

Privileged EXEC

## Command History

| Release        | Modification                                                                                                                                                                                                                                                                                 |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC2    | This command was introduced for Cisco uBR7246VXR universal broadband routers.                                                                                                                                                                                                                |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA on the Cisco uBR7246VXR and Cisco uBR10012 universal broadband routers. Support for the Cisco uBR7225VXR router was added. The <b>vpn</b> keyword was added and the output fields were modified to display L2VPN information. |
| 12.2(33)SCF    | This command is obsolete for Cisco uBR10012 Series Universal Broadband Routers.                                                                                                                                                                                                              |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Router.                                                                                                                                                                                                            |

## Usage Guidelines

This command displays the cable modem to VLAN mappings that have been defined using the **cable dot1q-vc-map** command. It displays the MAC address, service ID (SID), and cable interface being used by the cable modem, and the interface and VLAN ID to which it has been mapped.

**Tip** The **customer** option displays only those VLAN mappings that have been configured with a particular customer name, using the **cable dot1q-vc-map** command.

The command also displays L2VPN information for cable modem traffic and service flows on CMTS router Ethernet interfaces that have been defined using the **cable l2-vpn-service default-nsi** command.

## TLS in Cisco IOS Release 12.2BC Examples

The following example shows typical output for the **show cable l2-vpn dot1q-vc-map** command for all cable modems that are mapped to IEEE 802.1Q VLANs:

```
Router# show cable l2-vpn dot1q-vc-map
MAC Address Ethernet Interface VLAN ID Cable Intf SID Priv Bits
0010.7bed.9c95 FE0/0.2 3 Cable4/0 3 0
0007.0e03.69f9 FE0/0.1 4 Cable4/0 1 0
Router#
```

The following example shows typical output for a particular cable modem with the MAC address of 0001.0203.0405:

```
Router# show cable l2-vpn dot1q-vc-map 0001.0203.0405

MAC Address Ethernet Interface VLAN ID Cable Intf SID Priv Bits
0010.7bed.9c91 GE2/0 5 Cable5/0 7 0
Router#
```

The following example shows a typical example for the **verbose** option:

```
Router# show cable l2-vpn dot1q-vc-map 0001.0203.0405 verbose

MAC Address : 0010.7bed.9c91
Prim Sid : 7
Cable Interface : Cable5/0
Ethernet Interface : GigabitEthernet2/0
DOT1Q VLAN ID : 5
Total US pkts : 6
Total US bytes : 1402
Total DS pkts : 71
Total DS bytes : 21975
```

This table describes the fields shown in the display.

**Table 80: show cable l2-vpn dot1q-vc-map Field Descriptions**

| Field              | Description                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
| MAC Address        | Hardware (MAC) address for the CM being mapped.                                                                    |
| Ethernet Interface | Destination interface (Ethernet, Fast Ethernet, or Gigabit Ethernet) for the VLAN being used for the mapping.      |
| VLAN ID            | Destination VLAN on the Ethernet, Fast Ethernet, or Gigabit Ethernet interface for the traffic coming from the CM. |
| Cable Intf         | Cable interface to which the CM is connected.                                                                      |
| SID                | Primary service ID (SID) for this cable modem.                                                                     |

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priv Bits           | <p>Identifies the current settings of the two privacy bits in the extended header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> <li>• First bit = Enable bit. Set to 1 when BPI or BPI+ is enabled.</li> <li>• Second bit = Toggle bit. Matches the least-significant bit (LSB) of the key sequence number (KSN) in the EH.</li> </ul> <p>For example, a value of “0” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p><b>Note</b> For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p> |
| Total US pkts/bytes | Total number of packets and bytes sent on the upstream to the Layer 2 tunnel by this cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Total DS pkts/bytes | Total number of packets and bytes received on the downstream from the Layer 2 tunnel by this cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## L2VPN over Cable in Cisco IOS Release 12.2SB Examples

The following example shows sample output of VLAN information for all cable modems configured for L2VPN support:

```
Router# show cable l2-vpn dot1q-vc-map
MAC Address Ethernet Interface VLAN ID Cable Intf SID Customer Name/VPN ID
0014.f8c1.fd66 GigabitEthernet4/0/0 68 Cable6/0/0 3 0234560001
```

The following example shows sample output of VLAN information for a VPN with ID 0234560001:

```
Router# show cable l2 dot1q-vc-map vpn 0234560001
MAC Address Ethernet Interface VLAN ID Cable Intf SID Customer Name/VPNID
0014.f8c1.fd66 GigabitEthernet4/0/0 68 Cable6/0/0 3 0234560001
```

The following example shows sample output of VLAN information for a VPN with ID 0234560001 on the cable modem with MAC address 0014.f8c1.fd66:

```
Router# show cable l2-vpn dot1q-vc-map 0014.f8c1.fd66 vpn 0234560001
MAC Address Ethernet Interface VLAN ID Cable Intf SID Customer Name/VPNID
0014.f8c1.fd66 GigabitEthernet4/0/0 68 Cable6/0/0 3 0234560001
```

The following example shows sample output of detailed VLAN information for a VPN with ID 0234560001 on the cable modem with MAC address 0014.f8c1.fd66:

```
Router# show cable l2-vpn dot1q-vc-map 0014.f8c1.fd66 vpn 0234560001 verbose
MAC Address : 0014.f8c1.fd66
Prim Sid : 3
Cable Interface : Cable6/0/0
VPN ID : 0234560001
L2VPN SAID : 12294
```

```

Upstream SFID : 23
Downstream CFRID[SFID] : 2[24]

Total DS pkt Discards : 0
Total DS byte Discards : 0

```

This table describes the fields shown in the display.

**Table 81: show cable l2-vpn dot1q-vc-map with L2VPN Field Descriptions**

| Field              | Description                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------|
| MAC Address        | Hardware (MAC) address for the CM being mapped.                                                |
| Prim Sid           | Primary service ID for the CM.                                                                 |
| Cable Interface    | Cable interface to which the CM is connected.                                                  |
| L2VPNs provisioned | Number of L2VPNs supported by the CM.                                                          |
| DUT Control/CMIM   | State of Downstream Unencrypted Traffic (DUT) filtering and Cable Modem Interface Mask (CMIM). |
| VPN ID             | Identification number of the Layer 2 VPN tunnel.                                               |
| L2VPN SAID         | Layer 2 VPN Security Association Identifier (SAID).                                            |
| Upstream SFID      | Upstream Service Flow Identifier (SFID).                                                       |

| Field                      | Description                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| Downstream CFRID [SFID]    | Downstream classifiers (classifier identifiers) and corresponding downstream service flows identifiers for this L2VPN. |
| CMIM                       | Cable Modem Interface Mask.                                                                                            |
| Ethernet Interface         | Ethernet Network System Interface (NSI).                                                                               |
| DOT1Q VLAN ID              | Destination VLAN on the Ethernet, Fast Ethernet, or Gigabit Ethernet interface for the traffic coming from the CM.     |
| Total US pkts/bytes        | Total number of packets and bytes sent on the upstream to the Layer 2 tunnel by this CM.                               |
| Total US pkt/byte Discards | Total number of packets and bytes dropped on the upstream to the Layer 2 tunnel by this CM.                            |
| Total DS pkts/bytes        | Total number of packets and bytes received on the downstream from the Layer 2 tunnel by this CM.                       |
| Total DS pkt/byte Discards | Total number of packets and bytes dropped on the downstream from the Layer 2 tunnel by this CM.                        |

**Related Commands**

| Command                                 | Description                                                                                                                                                                                                        |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable l2-vpn-service dot1q</b>       | Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems so that individual CPE traffic can be routed over a particular Virtual Local Area Network (VLAN). |
| <b>cable dot1q-vc-map</b>               | Maps a cable modem to a particular VLAN on a local outbound Ethernet interface.                                                                                                                                    |
| <b>cable l2-vpn-service default-nsi</b> | Configures an Ethernet Network System Interface for Layer 2 VPN support over cable.                                                                                                                                |
| <b>debug cable l2-vpn</b>               | Displays debugging messages for the Layer 2 mapping of cable modems to particular PVCs or VLANs.                                                                                                                   |

## show cable l2-vpn vc-map

To display the mapping of one or all cable modems to permanent virtual connections (PVC) on Asynchronous Transfer Mode (ATM) interfaces, use the **show cable l2-vpn vc-map** command in privileged EXEC mode.

**show cable l2-vpn vc-map** [*mac-address*] [**customer** *cust-name*]

### Syntax Description

|                                  |                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------|
| <i>mac-address</i>               | (Optional) Displays the mapping for the cable modem with the specified hardware (MAC). |
| <b>customer</b> <i>cust-name</i> | (Optional) Displays the PVC mappings for this particular customer name.                |

### Command Default

Displays information for all cable modems that have a defined ATM PVC mapping.

### Command Modes

Privileged EXEC

### Command History

| Release        | Modification                                                                                           |
|----------------|--------------------------------------------------------------------------------------------------------|
| 12.2(11)BC3    | This command was introduced for Cisco uBR7100 series and Cisco uBR7246VXR universal broadband routers. |
| 12.2(15)BC2    | Support was added for the <b>customer</b> option.                                                      |
| IOS-XE 3.15.0S | This command is not supported on the Cisco cBR Series Converged Broadband Router.                      |

### Usage Guidelines

This command displays the cable modem to ATM PVC mappings that have been defined using the **cable vc-map** command. It displays the MAC address, service ID (SID), and cable interface being used by the cable modem, and the ATM interface and PVC/PVI to which it has been mapped.

#### Tip

The **customer** option displays only those PVC mappings that have been configured with a particular customer name, using the **cable vc-map** command.

### Examples

The following example shows typical output for the **show cable l2-vpn vc-map** command for all cable modems that are mapped to ATM PVCs:

```
Router# show cable l2-vpn vc-map
MAC Address ATM Intf VPI/VCI Cable Intf SID Priv Bits
0010.7bed.9c95 ATM2/0.2 1/2 Cable4/0 3 0
0007.0e03.69f9 ATM2/0.1 1/1 Cable4/0 1 0
Router#
```

The following example shows typical output for a particular cable modem with the MAC address of 0001.0203.0405:

```
Router# show cable l2-vpn vc-map 0001.0203.0405
```

## show cable l2-vpn vc-map

```

MAC Address ATM Intf VPI/VCI Cable Intf SID Priv Bits
0001.0203.0405 ATM3/0.2 1/2 Cable5/0 3 0
Router#

```

Table 82: show cable l2-vpn vc-map Field Descriptions

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address | Hardware (MAC) address for the CM being mapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ATM Intf    | Destination ATM interface that contains the VPI/VCI being used for the mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VPI/VCI     | Destination VPI/VCI on the ATM interface for the traffic coming from the CM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Cable Intf  | Cable interface to which the CM is connected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SID         | Primary service ID (SID) for this cable modem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Priv Bits   | <p>Identifies the current settings of the two privacy bits in the extended header (EH) that is used for BPI-encrypted packets.</p> <ul style="list-style-type: none"> <li>• First bit = Enable bit. Set to 1 when BPI or BPI+ is enabled.</li> <li>• Second bit = Toggle bit. Matches the least-significant bit (LSB) of the key sequence number (KSN) in the EH.</li> </ul> <p>For example, a value of “0” indicates that BPI is not enabled. A value of “10” indicates that BPI is enabled and that the KSN is an even number. A value of “11” indicates that BPI is enabled and that the KSN is an odd number.</p> <p><b>Note</b> For more information on these bits, see the DOCSIS Baseline Privacy Interface Plus Interface Specification (SP-BPI+-I08-020301 or later).</p> |

|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable l2-vpn-service atm-vc</b> | Enables the use of Layer 2 tunnels for the Customer Premises Equipment (CPE) traffic that is behind cable modems, so that individual CPE traffic can be routed to a particular PVC on an ATM interface. |
| <b>cable vc-map</b>                | Maps a cable modem to a particular PVC on an ATM interface.                                                                                                                                             |
| <b>debug cable l2-vpn</b>          | Displays debugging messages for the Layer 2 mapping of cable modems to particular PVC on an ATM interface.                                                                                              |

## show cable l2-vpn xconnect

To display details about the mapping between a Multiprotocol Label Switching (MPLS) pseudowire and its virtual circuits, use the **show cable l2-vpn xconnect** command in privileged EXEC mode.

**show cable l2-vpn xconnect** {dot1q-vc-map | mpls-vc-map}[ **customer** *customer-name* | *mac-address* | **vpn** *vpn-id* [**verbose**]

| Syntax Description | dot1q-vc-map                  | Specifies the mapping of one or all cable modems to IEEE 802.1Q Virtual Local Area Networks (VLANs) on the Ethernet interfaces of a router.        |
|--------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | mpls-vc-map                   | Specifies the mapping between an MPLS pseudowire and its virtual circuits.                                                                         |
|                    | mac-address                   | (Optional) MAC address for a cable modem.                                                                                                          |
|                    | customer <i>customer-name</i> | (Optional) Specifies the customer name.                                                                                                            |
|                    | state                         | (Optional) Specifies the state of all virtual circuits.                                                                                            |
|                    | vpn <i>vpn-id</i>             | (Optional) Displays Layer 2 VPN information on a cable modem with the specified MAC address, or for the specified VPN ID across all cable modems.  |
|                    | verbose                       | (Optional) Specifies verbose mode for the output, giving additional details about the mapping between an MPLS pseudowire and its virtual circuits. |

**Command Default** None

**Command Modes** Privileged EXEC (#)

| Command History | Release        | Modification                                                                     |
|-----------------|----------------|----------------------------------------------------------------------------------|
|                 | 12.2(33)SCC    | This command was introduced in Cisco IOS Release 12.2(33)SCC.                    |
|                 | 12.2(33)SCF    | This command was modified. The verbose keyword option was added.                 |
|                 | IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. |

### Examples

#### Example of the show cable l2-vpn xconnect Command for the Mapping Between an MPLS Pseudowire and All Virtual Circuits

The following is a sample output of the **show cable l2-vpn xconnect** command that shows the mapping between an MPLS pseudowire and all virtual circuits on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map
MAC Address Peer IP Address VCID CktID Cable Intf SID Customer
Name/VPNID
0000.396e.6a68 101.1.1.0.2 221 Bu254:221 Cable7/0/0 1 customer1
```

**show cable l2-vpn xconnect**

|                |           |      |            |            |   |            |
|----------------|-----------|------|------------|------------|---|------------|
| 0014.f8c1.fd66 | 10.76.1.1 | 2004 | Bu254:5121 | Cable7/0/0 | 8 |            |
| 0019.474a.d566 | 10.76.1.1 | 2001 | Bu254:5122 | Cable7/0/0 | 4 | 0234560002 |
| 0019.474a.d42e | 10.76.1.1 | 2002 | Bu254:2003 | Cable7/0/0 | 5 | 0234560003 |

**Example of the show cable l2-vpn xconnect Command for a Particular MAC Address**

The following sample output displays the mapping between an MPLS pseudowire and the virtual circuit for a particular MAC address of a cable modem on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map 0000.396e.6a68
MAC Address Peer IP Address VCID CktID Cable Intf SID Customer
Name/VPNID
0000.396e.6a68 101.1.0.2 221 Bu254:221 Cable7/0/0 1 customer1
```

**Example of the show cable l2-vpn xconnect Command for a Particular Customer**

The following sample output displays the mapping between an MPLS pseudowire and all virtual circuits configured for a particular customer on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map customer1
MAC Address Peer IP Address VCID CktID Cable Intf SID Customer
Name/VPNID
0000.396e.6a68 101.1.0.2 221 Bu254:221 Cable7/0/0 1 customer1
```

**Example of the show cable l2-vpn xconnect Command that Shows Information About the State of All Virtual Circuits**

The following sample output displays the state of all virtual circuits associated with an MPLS pseudowire on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map state
Peer IP Address VCID STATE MAC Address Customer Name/VPNID STATE
101.1.0.2 22 DOWN 0000.396e.6a68 customer1 UP
10.76.1.1 2004 UP 0014.f8c1.fd66 customer1 UP
10.76.1.1 2001 UP 0019.474a.d566 0234560002 UP
10.76.1.1 2002 UP 0019.474a.d42e 0234560003 UP
```

**Example of the show cable l2-vpn xconnect Command for the Mapping Between an MPLS Pseudowire and All Virtual Circuits in Cisco IOS Release 12.2(33)SCF**

The following is a sample output of the **show cable l2-vpn xconnect** command that shows the details of the mapping between an MPLS pseudowire and all virtual circuits on a Cisco uBR10012 router:

```
Router# show cable l2-vpn xconnect mpls-vc-map

# show cable leasequery-filter

To display the number of Dynamic Host Configuration Protocol (DHCP) LEASEQUERY request messages that have been filtered for all cable modems (CMs) or for a particular cable interface, use the **show cable leasequery-filter** command in privileged EXEC mode.

**show cable leasequery-filter** [{**cable** | {*slot/portslot/subslot/port* } | [{**requests-filtered** [*{minimum-requests}*]}]]

## Cisco cBR Series Converged Broadband Router

**show cable leasequery-filter cable** *slot/subslot/cable-interface-index* [{**requests-filtered** [*{minimum-requests}*]}]]

### Syntax Description

|                                                         |                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cable</b> <i>slot/port</i>                           | (Optional) Displays information for all CMs on the specified cable interface and downstream port on the Cisco uBR7200 series routers. <ul style="list-style-type: none"> <li>• <i>slot</i> —3 to 6</li> <li>• <i>port</i> —0 or 1 (depending on the cable interface)</li> </ul>                                                                                                                             |
| <b>cable</b> <i>slot/subslot/port</i>                   | (Optional) Displays information for all CMs on the specified cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> <li>• <i>slot</i> —5 to 8</li> <li>• <i>subslot</i> —0 or 1</li> <li>• <i>port</i> —0 to 4 (depending on the cable interface)</li> </ul>                                                                                  |
| <b>cables</b> <i>slot/subslot/cable-interface-index</i> | (Optional) Displays information for all CMs on the specified cable interface on the Cisco uBR10012 router. The following are the valid values: <ul style="list-style-type: none"> <li>• <i>slot</i> —0 to 3 and 6 to 9</li> <li>• <i>subslot</i> —0</li> <li>• <i>cable-interface-index</i> — 0 to 15</li> </ul>                                                                                            |
| <b>requests-filtered</b>                                | (Optional) Displays the number of DHCP LEASEQUERY requests that have been filtered for each particular cable modem on a cable interface. <ul style="list-style-type: none"> <li>• <i>minimum-requests</i> —(Optional) Displays only those cable modems for which the router has filtered at least this minimum number of lease queries. The valid range is from 1 to 65535, with a default of 1.</li> </ul> |

|----------------------------|------------------------------|
| 12.2(15)BC1d, 12.2(15)BC2b | This command was introduced. |

| Release        | Modification                                                                                                                         |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 12.3BC         | This command was integrated into Cisco IOS Release 12.3BC.                                                                           |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA.                                                                      |
| 12.2(33)SCF1   | This command was modified. The command output has been augmented to display IPv6 data.                                               |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <i>cable-interface-index</i> variable is added. |

### Usage Guidelines

The **show cable leasequery-filter** command displays the total number of DHCP LEASEQUERY requests that have been filtered on a Cisco Cable Modem Termination System (CMTS) router and on a particular cable interface. This command can also optionally display details for each particular cable modem on an interface that has had DHCP lease queries filtered.

### Examples

The following examples show how to display the total number of DHCP LEASEQUERY requests that have been filtered on the router and on a particular cable interface:

```
Router# show cable leasequery-filter
Lease Query Filter statistics for Unknown Sid
Requests Sent : 138 total. 41 unfiltered, 97 filtered
Router# show cable leasequery-filter cable 8/1/0

Lease Query Filter statistics for Cable8/1/0:
Requests Sent : 35 total. 25 unfiltered, 10 filtered
```

The following examples show how to display the total number of DHCP LEASEQUERY requests that have been filtered on the router and on a particular cable interface in Cisco IOS Release 12.2(33)SCF1:

```
Router# show cable leasequery-filter
IPv4 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered
Router# show cable leasequery-filter cable 7/0/0

IPv4 Lease Query Filter statistics for Cable7/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Cable7/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
```

The following example shows how to display a list of cable modems on a cable interface and the number of DHCP LEASEQUERY messages that have been filtered for each interface:

```
Router# show cable leasequery-filter cable 8/1/0 requests-filtered

Sid MAC Address IP Address Req-Filtered
1 0050.7366.1243 92.1.1.20 0
2 0007.0e06.953b 95.1.1.24 0
3 0007.0e06.97b5 93.1.1.24 2
4 00d0.ba45.4bd5 91.1.1.35 0
```

**show cable leasequery-filter**

```

5 0007.0e06.9773 95.1.1.23 12
6 0001.42aa.737d 94.1.1.23 645
7 0001.42aa.738b 95.1.1.22 0
8 00d0.ba45.4955 92.1.1.23 0
9 0007.0e06.51ef 94.1.1.25 0
10 00d0.ba77.743b 91.1.1.36 3
11 0001.42aa.6e6f 93.1.1.22 2
12 0007.0e06.512f 91.1.1.23 2
13 0007.0e06.5137 92.1.1.25 0
14 0007.0e06.9be7 92.1.1.24 0
15 0002.b970.0027 92.1.1.22 1
16 0001.42aa.738d 91.1.1.21 10

```

The following example shows how to display a list of cable modems on a cable interface and the number of DHCP LEASEQUERY messages that have been filtered for each interface in Cisco IOS Release 12.2(33)SCF1:

```
Router# show cable leasequery-filter cable 8/1/0 requests-filtered
```

```

Sid MAC Address IP Address Req-Filtered
1 0018.6835.2756 0.0.0.0 0
2 0025.2e2d.7440 0.0.0.0 0
Sid MAC Address IP Address Req-Filtered
1 0018.6835.2756 2001:DB8:1::1 0
2 0025.2e2d.7440 2001:DB8:1::2 0

```

The following example shows how to display a list of cable modems on a cable interface that have had ten or more DHCP LEASEQUERY messages that have been filtered:

```

Router# show cable leasequery-filter cable 8/1/0 requests-filtered 10
Sid MAC Address IP Address Req-Filtered
5 0007.0e06.9773 95.1.1.23 12
6 0001.42aa.737d 94.1.1.23 645
16 0001.42aa.738d 91.1.1.21 10

```

This example shows the output of the **show cable leasequery-filter** command for the Cisco cBR Series Converged Broadband Router:

```

Router#show cable leasequery-filter cable 1/0/0
IPv4 Lease Query Filter statistics for Cable1/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered
IPv6 Lease Query Filter statistics for Cable1/0/0:
Requests Sent : 0 total. 0 unfiltered, 0 filtered

```

```

Router#show cable leasequery-filter
IPv4 Lease Query Filter statistics for Unknown Sid
Requests Sent : 0 total. 0 unfiltered, 0 filtered

```

**Table 84: show cable leasequery-filter Field Descriptions**

| Field       | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| Sid         | Service ID (SID) of the device.                                           |
| MAC Address | Hardware (MAC-layer) address of the cable modem or CPE device.            |
| IP Address  | IP address of the cable modem (CMs) or customer premises equipment (CPE). |

| Field        | Description                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------|
| Req-Filtered | Total number of Address Resolution Protocol (ARP) requests that the device has generated or forwarded. |

**Usage Guidelines** The **show cable leasequery-stats** command displays the IPv4 cable leasequery packet processing statistics. The counters are grouped by queries and replies.

**Examples** The following example shows the IPv4 cable leasequery statistics output on the cBR-8 router:

```
Router# show cable leasequery-stats
IPv4 Source Verify LeaseQuery Statistics:
Queries: 1 sent, 0 timed out
Replies: 1 allowed, 0 rogues, 0 dropped
```

Table 85: show cable leasequery-stats Field Descriptions

| Field          | Description                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------|
| <b>Queries</b> |                                                                                                        |
| Sent           | Number of leasequeries sent by cBR-8.                                                                  |
| Timed out      | Number of leasequeries timed out before receiving replies.                                             |
| <b>Replies</b> |                                                                                                        |
| Allowed        | Number of replies that are valid, so that the CPE traffic is allowed.                                  |
| Rogue          | Number of replies that indicate a CPE is a rogue device, so that the CPE is added into the rogue list. |
| Dropped        | No of replies that are invalid, so they are dropped without further processing.                        |

# show cable licenses all

To view license information as applied to RF channels on the CMTS chassis, use the `show cable licenses all` command in the privileged EXEC mode.

**show cable licenses all**

|                           |                                            |

## Examples

The following example indicates information about licenses applied to RF channels on the CMTS chassis.

```
Router# show cable licenses all
Load for five secs: 0%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *05:40:06.005 UTC Mon May 3 2010
Subslot 6/0 : License Configuration : 20X20
Subslot 7/0 : Downstream Licenses : Installed : 72 Consumed : 8 Available : 64
Subslot 7/0 : Upstream Licenses : Installed : 60 Consumed : 52 Available : 8
Subslot 7/1 : Downstream Licenses : Installed : 72 Consumed : 0 Available : 72
Subslot 7/1 : Upstream Licenses : Installed : 60 Consumed : 0 Available : 60
Subslot 8/0 : Downstream Licenses : Installed : 72 Consumed : 8 Available : 64
Subslot 8/0 : Upstream Licenses : Installed : 60 Consumed : 52 Available : 8
Subslot 8/1 : Downstream Licenses : Installed : 0 Consumed : 0 Available : 0
Subslot 8/1 : Upstream Licenses : Installed : 0 Consumed : 0 Available : 0
Router#
```

The following example indicates information about licenses that are loaded on the slot/subslot.

```
Router# show cable licenses 8/0
Load for five secs: 1%/0%; one minute: 1%; five minutes: 1%
Time source is hardware calendar, *05:59:18.633 UTC Mon May 3 2010
Subslot 8/0 : Downstream Licenses : Installed : 72 Consumed : 8 Available : 64
Subslot 8/0 : Upstream Licenses : Installed : 60 Consumed : 52 Available : 8
Router#
```

This example shows the output of the **show cable licenses all** command on the Cisco cBR Series Converged Broadband Router.

```
Router#show cable licenses all
```

```

Entitlement: Downstream License
Consumed count: 768

Enforced state: No Enforcement
```

Router#

If you enable Core Peak Bandwidth (CPB), the **show cable licenses all** command displays only the CPB usage information.

```
show cable licenses all
Entitlement: CPB License
Consumed count: 987
Consumed count reported to SmartAgent: 987
Enforced state: No Enforcement
Quarterly CPB is 987 (100Mbps) in the First quarter of 2018.
First monthly CPB is: 103585495480 bps, 987 (100Mbps).
Second monthly CPB is: 103595095264 bps, 987 (100Mbps).
Third monthly CPB is: 103595124064 bps, 987 (100Mbps).
```

|--------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>show license call-home pak</b>    | Displays the stock keeping unit (SKU) list and features available in a product authorization key (PAK). |
| <b>license call-home install pak</b> | Installs a license by using the Cisco License Call Home feature.                                        |

# show cable licenses cpb

To view the Core Peak Bandwidth (CPB) license information on the Cisco cBR Series Converged Broadband Router, use the **show cable licenses cpb** command in the privileged EXEC mode.

## show cable licenses cpb

[show cable licenses cpb-records year <year> month <month> day <day>]

| Syntax Description | cpb-records   | Shows the history of CPB samples. |
|--------------------|---------------|-----------------------------------|
|                    | year <year>   | Enter the year.                   |
|                    | month <month> | Enter the month.                  |
|                    | day <day>     | Enter the date.                   |

This command has no arguments or keywords.

| Command Default | Disabled            |
|-----------------|---------------------|
| Command Modes   | Privileged EXEC (#) |

(100Mbps)

There are 6 cpb records in Apr 28 2018 UTC.
```

# show cable license wan

To display the WAN license information for the 100G and 10G ports on a Supervisor 250G.

**show cable license wan**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Disabled

**Command Modes** Privileged EXEC (#)

| Release       | Modification                 |
|---------------|------------------------------|
| IOS-XE 16.8.1 | This command was introduced. |

The command displays the following information, depending on the **cable license 100G-conversion** configuration.

- With the **cable license 100G-conversion**, the **show cable license wan** would display:

```
Router(config)# show cable licenses wan

Entitlement: WAN License
Consumed count: 20
Consumed count reported to SmartAgent: 20
Enforced state: No Enforcement
```

- With the **no cable license 100G-conversion**, the **show cable license wan** would display:

```
Router(config)# show cable license wan

Entitlement: WAN License
Consumed count: 0
Consumed count reported to SmartAgent: 0
Enforced state: No Enforcement
```

# show cable load-balance

To display real-time configuration, statistical and operational information for load balancing operations on the router, use the **show cable load-balance** command in privileged EXEC mode.

**show cable load-balance** [{group *n*}] | **all** | **load** | **pending** | {**statistics error** [{**detail** | **linecard slot /subslot** | **summary**}] | **target** | **fiber-node-validation** | **vdoc**}]

## Cisco cBR Series Converged Broadband Router

**show cable load-balance** [{ **all** | **fiber-node-validation** | **load** | **pending** | **statistics** | **target** | **move-history cable slot/subslot/controller-interface-index** }]

| Syntax Description                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group</b> <i>n</i>                      | (Optional) Specifies the number of the load balancing group to be displayed. In Cisco IOS Release 12.2(33)SCE3 and earlier, the valid range is from 1 to 336. The range from 1 to 80 is reserved for legacy load balancing groups (LBG). The range from 81 to 336 is reserved for DOCSIS LBGs.<br><br>In Cisco IOS Release 12.2(33)SCE4 and later, the valid range is from 1 to 256. This range is reserved for legacy LBGs only.<br><br>In the Cisco cBR Series Converged Broadband Router, this option is not supported. |
| <b>all</b>                                 | (Optional) Displays all information about the LBG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>load</b>                                | (Optional) Displays the current interface load and load balancing group assignments.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>pending</b>                             | (Optional) Displays the list of cable modems that are moved from one downstream or upstream to another.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>statistics</b>                          | (Optional) Displays cumulative statistics for load balancing operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>error detail</b>                        | (Optional) Displays the error statistics of all the active line card in detail.<br><br>In the Cisco cBR Series Converged Broadband Router, this option is not supported.                                                                                                                                                                                                                                                                                                                                                   |

| <b>target</b>                              | (Optional) Displays the current and target interfaces (upstreams and downstreams) used for load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>fiber-node-validation</b>               | (Optional) Displays DOCSIS LBG and channel information after checking if the channel configuration in load balancing fits in the fiber node configuration.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>vdoc</b>                                | (Optional) Displays information about all LBGs that have the rule "video-over-DOCSIS (vdoc)-enabled" configured.<br><br>In the Cisco cBR Series Converged Broadband Router, this option is not supported.                                                                                                                                                                                                                                                                                                                  |

**show cable load-balance****Command Default**

Displays information for all load balancing groups for each cable interface and its current load and load balancing status. Starting with Cisco IOS Release 12.2(33)SCE4, the **show cable load-balance** command supports only the legacy LBGs.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release        | Modification                                                                                                                                                                                                                   |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC1    | This command was introduced for the Cisco uBR7246VXR and Cisco uBR10012 routers.                                                                                                                                               |
| 12.2(33)SCC    | This command was modified. The <b>fiber-node-validation</b> parameter was added to the command.                                                                                                                                |
| 12.2(33)SCF    | This command was modified. The <b>vdcc</b> keyword was added to the command.                                                                                                                                                   |
| 12.2(33)SCE4   | The valid range for the load balance group was changed.                                                                                                                                                                        |
| 12.2(33)SCG    | A new column in the output displays the group index for the legacy LBG.                                                                                                                                                        |
| 12.2(33)SCH1   | The output of this command (when used without any keyword) was modified.                                                                                                                                                       |
| 12.2(33)SCI    | This command was modified. The <b>error</b> keyword was added.                                                                                                                                                                 |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <b>group</b> , <b>error</b> (including <b>detail</b> , <b>linecard</b> and <b>summary</b> options), and <b>vdcc</b> keywords were removed |
| IOS-XE 17.6.1w | The option <b>move-history slot/subslot/controller-interface-index</b> was added.                                                                                                                                              |

**Usage Guidelines**

Use the **show cable load-balance** command to display the current, real-time statistics for load balancing operations.

Use this command to display the status of the **cable load-balance docsis30-enable downstream-only** command.

**Examples**

The following is a sample output from the **show cable load-balance** command:

```
Router# show cable load-balance
```

| Group | Interval | Method        | DCC Init<br>Technique | Threshold<br>Minimum | Static | Enforce | Ugs | PCMM |
|-------|----------|---------------|-----------------------|----------------------|--------|---------|-----|------|
| 1     | 10       | service-flows | 1                     | 1                    | 2%     | 2%      | --- | ---  |
| 2     | 10       | modems        | 0                     | 5                    | 10%    | ---     | --- | ---  |

```
DOCSIS LB Enabled: No
```

Effective with Cisco IOS Release 12.2(33)SCG, a new column in the output for the **show cable load-balance** command also displays the group index for the legacy LBG. The Group Index column identifies the mapping between the legacy LBG ID and the internal group index of the legacy LBG.

```
Router# show cable load-balance
Legacy Group Interval Method DCC Init Threshold
Group Index Technique Minimum Static Enforce Ugs PCMM
```

```

Router#

Starting with Cisco IOS Release 12.2(33)SCG, a new column in the output for the **show cable load-balance all** command also displays the group index for the legacy LBG.

The following is a sample output from the **all** option of the **show cable load-balance** command:

```
Router# show cable load-balance all
Legacy Group Interval Method DCC Init Threshold
Group Index Technique Minimum Static Enforce Ugs PCMM

```

**Table 86: show cable load-balance Field Descriptions (default display)**

| Field                                           | Description                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Fields for the Default Displays and load Option |                                                                                                  |
| Group Index                                     | Identifies the mapping between the legacy LBG ID and the internal group index of the legacy LBG. |
| Interface                                       | Cable interface (downstream or upstream) that belongs to a load balancing group.                 |
| Group                                           | Number of the load balancing group to which the cable interface has been assigned.               |

| Field                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Utilization                                             | <p>This field is a long-term average of the upstream utilization and displays current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"> <li>• The percentage shows the load usage for the entire interface.</li> <li>• The first percentage, within the parentheses, shows the load for the downstream.</li> <li>• The second percentage, within the parentheses, shows the average load for all upstreams on the downstream.</li> </ul> <p>For example, if this field shows 18%(18%/12%), it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p><b>Note</b> To view the short-term average of the utilization, use the <b>show interface cable mac-scheduler</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| State                                                   | <p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> <li>• down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state.</li> <li>• initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes.</li> <li>• up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing.</li> <li>• testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes.</li> </ul> <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> <li>• suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a timeout period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state.</li> <li>• disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts.</li> <li>• unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a timeout period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.</li> </ul> |
| Reserved                                                | Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Modems                                                  | Number of cable modems currently online on this cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Weight                                                  | Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Additional Fields When Displaying Load Balancing Groups |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Interval                                | Indicates in seconds, the current load on each cable interface in the LBG as configured using the <b>cable load-balance group interval</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Method                                  | Load balancing method used for the LBG as configured using the <b>cable load-balance group (global configuration)</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Threshold                               | <p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> <li>• M = Minimum</li> </ul> <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the <b>load minimum</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• S = Static</li> </ul> <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs static load balancing. When the load between interfaces is greater than this value, cable modems that are in the process of registering with the CMTS are moved between interfaces until the load difference is again below this value. (This value is configured using the <b>load</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• E = Enforce</li> </ul> <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the <b>enforce</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• U = Ugs</li> </ul> <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the <b>ugs</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• P = PacketCable MultiMedia (PCMM)</li> <li>• Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.</li> </ul> |
| Additional Fields for the target Option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Interface                               | Source downstream or upstream interface that is part of a cable load balancing group. If the Target field contains a value, it indicates that the source interface is currently oversubscribed. To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Target                                                 | <p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> <li>• If it is a downstream interface, the display shows the center frequency of the downstream within parentheses.</li> <li>• If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface.</li> <li>• When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces.</li> <li>• If this field is blank, it indicates that the source interface is not oversubscribed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Additional Fields for the statistics Option            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Target interface                                       | Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Transfers                                              | <p>The following information is tracked for the indicated target interface:</p> <ul style="list-style-type: none"> <li>• complete—Number of cable modems successfully moved to the target interface.</li> <li>• pending—Number of cable modems in the process of being moved to the target interface.</li> <li>• retries—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure.</li> <li>• failures—Number of times that the CMTS exceeded the maximum number of allowable retries (5) when trying to move a particular cable modem to the target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> <li>• The specific cable modems are not DOCSIS-compliant.</li> <li>• One or both interfaces are having problems passing traffic.</li> <li>• One or both interfaces are having persistent RF noise problems.</li> <li>• The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).</li> </ul> </li> </ul> |
| Additional Fields for the pending Option               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Modem                                                  | Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source interface                                       | Downstream or upstream cable interface on which the cable modem is currently online.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Target interface                                       | Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Retries                                                | Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Additional Fields for the fiber-node-validation Option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Field                                         | Description                                                                                                                      |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| DOCSIS LBG ID                                 | The DOCSIS LBG ID.                                                                                                               |
| Channel                                       | The upstream or downstream channel that is associated with the DOCSIS LBG.                                                       |
| Fiber-node list                               | The list of all fiber nodes that include the channel.                                                                            |
| Additional Fields for the move-history option |                                                                                                                                  |
| Modem                                         | The mac address of the moved cable modem                                                                                         |
| Host Interface                                | The mac-domain of the cable modem.                                                                                               |
| Group ID                                      | The load balance group ID of cable modem.                                                                                        |
| Primary RF/RCC Source                         | Old downstream information of the cable modem, including the primary downstream channel, RCC ID before moving.                   |
| Primary RF/RCC Target                         | New downstream information of the cable modem, including the new primary downstream channel, RCC ID after moving.                |
| MD/TCS Source                                 | Old upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel before moving. |
| MD/TCS Target                                 | New upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel after moving.  |
| Action                                        | The action of the cable modem movement, such as DBC, DCC, UCC, REINIT(DCC with init-tech 0).                                     |
| Trans-Start Time                              | The trigger of the cable modem movement, such as D2.0 LB, D3.0 static LB, D3.0 dynamic LB.                                       |
| Elapse Time (ms)                              | The start time of the cable modem movement.                                                                                      |
| Client                                        | The elapsed time - how long the cable modem movement spent.                                                                      |
| Result                                        | The result of the action on modem movement - success, failure, and the internal confirmation code.                               |

| <b>cable load-balance group policy ugs</b>  | Configures how the Cisco CMTS should load balance cable modems with active unsolicited grant service (UGS) service flows.    |
| <b>cable load-balance group threshold</b>   | Configures the threshold values that a load balancing group should use for load balancing operations.                        |
| <b>show cable load-balance docsis-group</b> | Displays real time configurational, statistical, and operational information of the load balancing operations on the router. |

## show cable load-balance docsis-group

To display real-time configurational, statistical, and operational information of the load balancing (LB) operations on the router, use the **show cable load-balance docsis-group** command in privileged EXEC mode.

### Cisco uBR10012 Router

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot / subslot
/ controller-interface-index} [{all | load | pending | restrict | statistics | target | modem-list | primary-load
| rcs-cm-list}]
```

### Cisco uBR7225VXR and Cisco uBR7246VXR Routers

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot / port} [{all |
init-tech-ovr | load | modem-list | pending | service-type-id | statistics | tag | target | vdoc}]
```

### Cisco cBR Series Converged Broadband Router

```
show cable load-balance docsis-group {docsis-group-id | FN fn-id MD cable slot / subslot
/ controller-interface-index} [{all | pending | restrict | rfch-util | service-type-id | tag | move-history
}]
show cable load-balance docsis-group {docsis-group-id} [{load | modem-list | statistics |
target}] [{wideband | dbg}]
```

#### Syntax Description

|                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>docsis-group-id</i>                                       | DOCSIS load balancing group ID. The group ID is in the range of 1 to 2147483647.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>FN</b> <i>fn-id</i>                                       | Specifies the fiber node (FN) where certain DOCSIS 3.0 GLBG parameters, such as <b>disable</b> , <b>docsis-policy</b> , <b>init-tech-list</b> , <b>interval</b> , <b>method</b> , <b>policy</b> , and <b>threshold</b> , can be configured.                                                                                                                                                                                                                                                  |
| <b>MD cable</b><br><i>slot/subslot/cable-interface-index</i> | Specifies the MAC domain interface of the fiber node. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. The permitted range is from 5 to 8.</li> <li><i>subslot</i>—Subslot where the line card resides. The available slots are 0 or 1.</li> <li><i>cable-interface-index</i>—Downstream controller number on the line card. The permitted range is from 0 to 4. For Cisco cBR Series Converged Broadband Router, the valid range is 0 to 15.</li> </ul> |
| <b>MD cable</b> <i>slot/port</i>                             | Specifies the MAC domain interface of the fiber node on the Cisco uBR7246VXR or Cisco uBR7225VXR routers. <ul style="list-style-type: none"> <li><i>slot</i>—Slot where the line card resides. <ul style="list-style-type: none"> <li>Cisco uBR7225VXR router—The valid range is from 1 to 2.</li> <li>Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> </ul> </li> <li><i>port</i>—The downstream controller port on the line card. The permitted values are 0 or 1.</li> </ul> |
| <b>all</b>                                                   | (Optional) Displays all load balancing group information.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                        |                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>init-tech-ovr</b>   | (Optional) Displays the initialization technique override rules associated with this DOCSIS load balancing group (LBG).<br>Not supported on Cisco cBR Series Converged Broadband Router             |
| <b>load</b>            | (Optional) Displays current interface load and LBG assignments.                                                                                                                                     |
| <b>modem-list</b>      | (Optional) Displays cable modems assigned to the specified DOCSIS LBG.                                                                                                                              |
| <b>move-history</b>    | (Optional) Displays detailed information for every cable modem movement triggered through load balance.                                                                                             |
| <b>pending</b>         | (Optional) Displays a list of cable modems that are pending movement from one downstream or upstream to another.                                                                                    |
| <b>primary-load</b>    | (Optional) Displays the primary channel load information for specified DOCSIS LBG.<br>Not supported on Cisco cBR Series Converged Broadband Router                                                  |
| <b>restrict</b>        | (Optional) Displays the restricted cable modem list associated with this DOCSIS LBG.                                                                                                                |
| <b>rfch-util</b>       | (Optional) Displays the RF channel utilization.                                                                                                                                                     |
| <b>service-type-id</b> | (Optional) Displays information about the service type ID list associated with this DOCSIS LBG.                                                                                                     |
| <b>statistics</b>      | (Optional) Displays cumulative statistics of load balancing operations for one group.                                                                                                               |
| <b>tag</b>             | (Optional) Displays the tag list associated with this DOCSIS LBG.                                                                                                                                   |
| <b>target</b>          | (Optional) Displays current and target interfaces (upstream and downstream) used for load balancing.                                                                                                |
| <b>vdoc</b>            | (Optional) Displays information about the state of the video-over-DOCSIS (VDOC) LB for the particular LBG.<br>Not supported on Cisco cBR Series Converged Broadband Router                          |
| <b>rsc-cm-list</b>     | (Optional) Displays the cable modems used for load balancing within the RCS and the utilization of each wideband interface.<br>Not supported on Cisco cBR Series Converged Broadband Router         |
| <b>wideband</b>        | (Optional) Displays the current wideband load, cable modem's associated to wideband interface in the DOCSIS 3.0 load balancing group, wideband target interface, and wideband interface statistics. |
| <b>dbg</b>             | (Optional) Displays the potential target dynamic bonding group for each of the source bonding groups.                                                                                               |

**Command Default**

Displays information of all load balancing groups for each cable interface with its current load and load balancing status.

**Command Modes**

Privileged EXEC (#)

|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                                                                                                                                                                                                                                               |
| 12.2(33)SCF    | The output for this command is enhanced to include more load balancing statistics for cable modems (CMs) provisioned in the multiple receive channel (MRC) and multiple transmit channel (MTC) mode.<br><br>The output for the <b>load</b> keyword includes information about narrowband and wideband CMs. |
| 12.2(33)SCH    | This command was modified. The <b>primary-load</b> keyword was added. The output for this command is enhanced to include a new field MUPFXLR that provides more status information for the <b>modem-list</b> keyword.                                                                                      |
| 12.2(33)SCI    | This command was modified. The <b>rsc-cm-list</b> keyword was added. The output for the <b>statistics</b> keyword was enhanced to support DOCSIS3.0 load balance.                                                                                                                                          |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <b>init-tech-ovr</b> , <b>primary-load</b> , <b>rsc-cm-list</b> and <b>vdoc</b> keywords are not supported                                                                                                            |
| IOS-XE 3.17.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <b>rfch-util</b> and <b>wideband</b> keyword was added.                                                                                                                                                               |
| IOS-XE 16.7.1  | The command was modified. The <b>dbg</b> keyword was added.                                                                                                                                                                                                                                                |
| IOS-XE 17.6.1w | The command was modified. The option <b>move-history</b> was added.                                                                                                                                                                                                                                        |

**Usage Guidelines**

Use the **show cable load-balance docsis-group** command to display the current, real-time statistics for load balancing operations.

In Cisco IOS Release 12.2(33)SCH, the **primary-load** keyword was added to to display the primary channel load information. The **primary-load** keyword is optional and is used with *docsis-group-id*.

The **show cable load-balance docsis-group primary-load** command is associated with [Target RCS Selection for Static Load Balancing](#) feature.

Effective with Cisco IOS Release 12.2(33) SCI, the output of the **statistics** keyword was modified to display the following additional parameters:

- Failure statistics for Dynamic Bonding Change (DBC).
- Load balancing total attempts

**Examples**

Target RCS Selection for Static Load Balancing

The following is a sample output of the **show cable load-balance docsis-group** command:

```
Router# show cable load-balance docsis-group 1
DOCSIS 2.0 LB Enabled: Yes DOCSIS 3.0 LB Enabled: No
DOCSIS Group Status Interval DCC mask Policy Method Threshold
```

**show cable load-balance docsis-group**

```

Group Index /UCC DS/US M/E/U/P/S
1 82 RE 10 0x40(1)/Y 0 m/m 5/10/70/70/50

```

The following is a sample output of the **show cable load-balance docsis-group load** command:

```

Router# show cable load-balance docsis-group 1 load
DOCSIS load-balancing load
Interface State Group Utilization Rsvd NBCM WB/UB Weight
 Index
Cable7/0/0 (333 MHz) up 81 1%(0%/1%) 0% 3 8 37

In3/0/1:24 (717 MHz) initial 2147557888 0%(0%/0%) 0% 0 13 37
In3/0/1:28 (741 MHz) initial 2147557888 0%(0%/0%) 0% 0 13 37

```

The following is a sample output of the **show cable load-balance docsis-group load** command in Cisco IOS Release 12.2(33)SCF and later releases displaying sample wideband (WB), narrowband (NB), or mixed cable modem details. The NBCM and WB/upstream bonding (UB) columns display information about DOCSIS 3.0 MRC-only and MTC CMs for DOCSIS static modem-count based load balancing:

```

Router# show cable load-balance docsis-group 60 load
DOCSIS load-balancing load
Interface State Group Utilization Rsvd NBCM WB/UB Weight
 Index
Mo1/0/0:0 (423 MHz) initial 81 0%(0%/0%) 0% 0 7 36

```

```

Mo1/0/0:0/U0 up 81 0% 0% 2 0 5.1
Mo1/0/0:0/U1 up 81 0% 0% 3 0 5.1
Mo1/0/0:0/U2 up 81 0% 0% 2 0 5.1
Mo1/0/0:0/U3 up 81 0% 0% 3 0 5.1
Mo1/0/0:4 (447 MHz) initial 81 0%(0%/0%) 0% 0 3 36
Mo1/0/0:4/U0 up 81 0% 0% 2 0 5.1
Mo1/0/0:4/U1 up 81 0% 0% 3 0 5.1
Mo1/0/0:4/U2 up 81 0% 0% 2 0 5.1
Mo1/0/0:4/U3 up 81 0% 0% 3 0 5.1

```

Table 87: DOCSIS 3.0 Load Balancing Counter Definition

| Modem Operating Mode            | NBCM Total    |                 | WB/UB Total                 |                        |
|---------------------------------|---------------|-----------------|-----------------------------|------------------------|
| Downstream (DS)                 | Upstream (US) | DS              | US                          |                        |
| Non-MRC mode (online, NB CM)    | Count primary | Count single US | Not counted                 | Not counted            |
| MRC mode only (w-online, WB CM) | Not counted   | Count single US | Count primary and secondary | Count single US        |
| MTC mode (UB online, UB CM)     | Not counted   | Not counted     | Count primary and secondary | Count all TCS channels |

The following is a sample output of the **show cable load-balance docsis-group pending** command in Cisco IOS Release 12.2(33)SCE and earlier releases.

```

Table 89: show cable load-balance docsis-group - Field Description for MUPFXLR status field

| Field                      | Description                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MUPFXLR field descriptions |                                                                                                                                                                                                        |
| Multicast (M)              | Multicast session operating on the modem. It indicates a host behind a cable modem that has joined an IGMP group. Verify this status using the show cable modem verbose   in Features Bitmask command. |
| UGS (U)                    | Indicates that a cable modem has UGS service flows. This configuration can be verified by show cable modem qos   in UGS                                                                                |
| Packetcable (P)            | Indicates that a cable modem has one or more Packetcable gate. This status can be verified by show packetcable gate summary and show cable modem cpe commands.                                         |
| max-Failures (F)           | Indicates that a cable modem has reached maximum failure threshold. This status can be verified by the show cable modem internal load command.                                                         |
| eXcluded (X)               | Indicates that a cable modem is listed in the list of excluded modems. This status can be verified by the show running-config   begin load-balance exclude command.                                    |
| L2VPN (L)                  | Indicates that a cable modem is provisioned in L2VPN service. This status can be verified by the show cable l2-vpn xconnect command.                                                                   |
| RSVP (R)                   | Indicates that a cable modem has RSVP flows. This status can be verified by the show cable modem verbose   in Features Mask command.                                                                   |

The following is a sample output of the **show cable load-balance docsis-group modem-list** command on the modular cable configuration:

**Table 90: show cable load-balance docsis-group – Field Description**

| Field                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fields for the Default Display and all Option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DOCSIS Group                                  | Current number of DOCSIS groups created on the CMTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Group Index                                   | Number of the load balancing group to which the cable interface has been assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Status                                        | Information about the DOCSIS LBG: <ul style="list-style-type: none"> <li>• R—Restricted load balancing group (RLBG).</li> <li>• G—General load balancing group (GLBG).</li> <li>• E—The DOCSIS LBG is enabled.</li> <li>• D—The DOCSIS LBG is disabled.</li> </ul>                                                                                                                                                                                                                                                             |
| Interval                                      | Minimum time period configured when cable modems can be moved to load balance the interfaces.<br>In Cisco IOS Release 12.2(33)SCE and earlier releases, the valid range is 1 to 1000 seconds, with a default value of 10. In Cisco IOS Release 12.2(33)SCE1 and later releases, the default value of <i>interval</i> is 30.                                                                                                                                                                                                    |
| DCC mask/UCC                                  | Downstream and upstream channel change masks associated with the DOCSIS group.<br>For example, in the output '0x40(1)/Y', '0x40' indicates that the user configured the dynamic channel change (DCC) technique 1 for the DOCSIS LBG. Similarly, '0x80' indicates configured DCC technique 0 and '0x20' indicates configured DCC technique 2. '(1)' indicates the DCC technique 1 is used to move the cable modem (CM). '/Y' indicates that load balancing sends upstream channel change (UCC) for movement of US channel only. |
| Policy                                        | DOCSIS policy associated with the load balancing group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Method                                        | Load balancing method used for the load balancing group. The following indicates what method is used for DS and US modems: <ul style="list-style-type: none"> <li>• m = modem<br/>Uses the number of active cable modems on an interface.</li> <li>• s = service flow<br/>Uses the number of active Service Flow IDs (SFIDs) on an interface.</li> <li>• u = utilization<br/>Uses the current percent of utilization of an interface.</li> </ul>                                                                               |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threshold   | <p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> <li>• M = Minimum</li> </ul> <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the <b>load minimum</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• S = Stability.</li> </ul> <p>Minimum allowable percentage of good periodic ranging requests that is acceptable. When the channel has a lower percent of modems responding to the ranging requests in a one minute period, the Cisco CMTS begins moving modems. The valid range is 0 to 100 percent, with a default of 50 percent.</p> <ul style="list-style-type: none"> <li>• E = Enforce</li> </ul> <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the <b>enforce</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• U = Ugs</li> </ul> <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the <b>ugs</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• P = PacketCable MultiMedia (PCMM)</li> </ul> <p>Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.</p> |
| Interface   | Cable interface (downstream or upstream) that belongs to a load balancing group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Utilization | <p>Long-term average of the upstream utilization. Displays the current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"> <li>• The percentage shows the load usage for the entire interface.</li> <li>• The first percentage, within the parentheses, shows the load for the downstream.</li> <li>• The second percentage, within the parentheses, shows the average load for all upstreams on the downstream.</li> </ul> <p>For example, if this field shows “ 18%(18%/12%) ”, it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p><b>Note</b> To view the short-term average of the utilization, use the <b>show interface cable mac-scheduler</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| State                                       | <p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> <li>• down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state.</li> <li>• initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes.</li> <li>• up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing.</li> <li>• testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes.</li> </ul> <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> <li>• suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a time-out period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state.</li> <li>• disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts.</li> <li>• unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a time-out period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.</li> </ul> |
| Reserved                                    | Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Modems                                      | Number of cable modems currently online on this cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Weight                                      | Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Additional Fields for the target Option     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Interface                                   | <p>Source downstream or upstream interface that is part of a cable load balancing group. If the target field contains a value, it indicates that the source interface is currently oversubscribed.</p> <p>To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Target                                      | <p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> <li>• If it is a downstream interface, the display shows the center frequency of the downstream within parentheses.</li> <li>• If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface.</li> <li>• When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces.</li> <li>• If this field is blank, it indicates that the source interface is not oversubscribed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Target interface                              | Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Transfers                                     | <p>The following information is tracked for the indicated target interface:</p> <ul style="list-style-type: none"> <li>• complete—Number of cable modems successfully moved to the target interface.</li> <li>• pending—Number of cable modems in the process of being moved to the target interface.</li> <li>• retries—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure.</li> <li>• failures—Number of times that the CMTS exceeded the maximum number of allowable retries (5) when trying to move a particular cable modem to the target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> <li>• The specific cable modems are not DOCSIS-compliant.</li> <li>• One or both interfaces are having problems passing traffic.</li> <li>• One or both interfaces are having persistent RF noise problems.</li> <li>• The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).</li> </ul> </li> </ul> |
| Additional Fields for the pending Option      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Modem                                         | Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source interface                              | Downstream or upstream cable interface on which the cable modem is currently online.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Target interface                              | Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Retries                                       | Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| RCC-ID                                        | RCC index per MAC domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Pending                                       | Number of pending modems on the channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Additional Fields for the move-history option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Modem                                         | The mac address of the moved cable modem                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field                 | Description                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Host Interface        | The mac-domain of the cable modem.                                                                                               |
| Group ID              | The load balance group ID of cable modem.                                                                                        |
| Primary RF/RCC Source | Old downstream information of the cable modem, including the primary downstream channel, RCC ID before moving.                   |
| Primary RF/RCC Target | New downstream information of the cable modem, including the new primary downstream channel, RCC ID after moving.                |
| MD/TCS Source         | Old upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel before moving. |
| MD/TCS Target         | New upstream information of the cable modem including the index of mac-domain, the bitmap of the upstream channel after moving.  |
| Action                | The action of the cable modem movement, such as DBC, DCC, UCC, REINIT(DCC with init-tech 0).                                     |
| Trans-Start Time      | The trigger of the cable modem movement, such as D2.0 LB, D3.0 static LB, D3.0 dynamic LB.                                       |
| Elapse Time (ms)      | The start time of the cable modem movement.                                                                                      |
| Client                | The elapsed time - how long the cable modem movement spent.                                                                      |
| Result                | The result of the action on modem movement - success, failure, and the internal confirmation code.                               |

The following is a sample output of the **show cable load-balance docsis-group rcs-cm-list** command in Cisco IOS Release 12.2(33)SCI and later releases:

```
Router# show cable load-balance docsis-group fn 11 md c7/0/0 rcs-cm-list
```

```

#### Note

- The **show cable load-balance docsis-group target wide** and **show cable load-balance docsis-group fn n md cable slot/subslot/controller-interface statistics wideband** CLIs does not support LCHA and LCPR.
- For the **show cable load-balance docsis-group target wide** and **show cable load-balance docsis-group fn n md cable slot/subslot/controller-interface statistics wideband** CLIs, the maximum number of modem movement entries per line card is 16000.

The following example shows the output of the **show cable modem x.x.x verbose** command in DCC|DBC:

```

Router# show cable modem c8fb.26a6.bf68 verbose |in DCC|DBC
DBC req/rsp/ack : 1/1/1
DCC req/rsp/ack : 0/0/0

```

|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interval     | <p>Minimum time period configured when cable modems can be moved to load balance the interfaces.</p> <p>In Cisco IOS Release 12.2(33)SCE and earlier releases, the valid range is 1 to 1000 seconds, with a default value of 10. In Cisco IOS Release 12.2(33)SCE1 and later releases, the default value of <i>interval</i> is 30.</p>                                                                                                                                                                                                             |
| DCC mask/UCC | <p>Downstream and upstream channel change masks associated with the DOCSIS group.</p> <p>For example, in the output '0x40(1)/Y', '0x40' indicates that the user configured the dynamic channel change (DCC) technique 1 for the DOCSIS LBG. Similarly, '0x80' indicates configured DCC technique 0 and '0x20' indicates configured DCC technique 2. '(1)' indicates the DCC technique 1 is used to move the cable modem (CM). '/Y' indicates that load balancing sends upstream channel change (UCC) for movement of US channel only.</p>          |
| Policy       | DOCSIS policy associated with the load balancing group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Method       | <p>Load balancing method used for the load balancing group. The following indicates what method is used for DS and US modems:</p> <ul style="list-style-type: none"> <li>• m = modem</li> </ul> <p>Uses the number of active cable modems on an interface.</p> <ul style="list-style-type: none"> <li>• s = service flow</li> </ul> <p>Uses the number of active Service Flow IDs (SFIDs) on an interface.</p> <ul style="list-style-type: none"> <li>• u = utilization</li> </ul> <p>Uses the current percent of utilization of an interface.</p> |

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threshold | <p>Thresholds configured for this load balancing group:</p> <ul style="list-style-type: none"> <li>• M = Minimum</li> </ul> <p>Minimum difference in the number of cable modems or service flows that can exist on two interfaces in the group before cable modems are moved between the interfaces. If the imbalance between interfaces is below this value, cable modems are not moved. This field contains a value only when the group is configured for the modems or service flows method of load balancing. (This value is configured using the <b>load minimum</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• S = Stability.</li> </ul> <p>Minimum allowable percentage of good periodic ranging requests that is acceptable. When the channel has a lower percent of modems responding to the ranging requests in a one minute period, the Cisco CMTS begins moving modems. The valid range is 0 to 100 percent, with a default of 50 percent.</p> <ul style="list-style-type: none"> <li>• E = Enforce</li> </ul> <p>Minimum difference in the percentage of total load that must exist between interfaces in a load balancing group before the Cisco CMTS performs dynamic load balancing and begins moving cable modems that are currently online. When the difference in load between two interfaces falls below this value, the CMTS stops dynamic load balancing and performs static load balancing. (This value is configured using the <b>enforce</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• U = Ugs</li> </ul> <p>Percentage of the bandwidth that is allocated for Unsolicited Grant Services (UGS) traffic, such as Voice-over-IP (VoIP), that is in use on an interface because the CMTS moves cable modems that are online with active UGS service flows. (This value is configured using the <b>ugs</b> option of the <b>cable load-balance group threshold</b> command.)</p> <ul style="list-style-type: none"> <li>• P = PacketCable MultiMedia (PCMM)</li> </ul> <p>Percentage of the reserved bandwidth threshold. Above this level, cable modems with active PCMM service flows participate in load balancing. The default threshold is 70%.</p> |
| Interface | Cable interface (downstream or upstream) that belongs to a load balancing group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Utilization | <p>Long-term average of the upstream utilization. Displays the current load usage of the cable interface expressed as a percentage of the total bandwidth. For upstreams, this field shows a single percentage value, which is the average percentage of bandwidth being used on the upstream.</p> <p>For downstreams, this field shows a set of three percentage values:</p> <ul style="list-style-type: none"><li>• The percentage shows the load usage for the entire interface.</li><li>• The first percentage, within the parentheses, shows the load for the downstream.</li><li>• The second percentage, within the parentheses, shows the average load for all upstreams on the downstream.</li></ul> <p>For example, if this field shows “ 18%(18%/12%) ”, it indicates that downstream and upstream channels on the interface are running on an average load of 18 percent. The downstream is running on an average load of 18 percent and all upstreams for this downstream are running on an average load of 12 percent.</p> <p><b>Note</b> To view the short-term average of the utilization, use the <b>show interface cable mac-scheduler</b> command.</p> |

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State                                   | <p>Current state of the cable interface.</p> <p>The following states indicate normal operational states, depending on the configuration:</p> <ul style="list-style-type: none"> <li>• down—Interface is shut down. The CMTS cannot use the interface for load balancing in this state.</li> <li>• initial—Interface is currently in the initialization phase. The CMTS uses the interface for load balancing after the initialization completes.</li> <li>• up—Interface is up and passing traffic. The CMTS actively uses the interface for load balancing.</li> <li>• testing—Interface is currently under a load balancing test. The CMTS is unable to use the interface for normal load balancing operations until the test completes.</li> </ul> <p>The following states indicate abnormal states. The CMTS does not use interfaces in these states for load balancing operations, but continues to monitor and update the status every time the CMTS polls the interfaces for their current load usage:</p> <ul style="list-style-type: none"> <li>• suspicious—Interface is in an unknown state. The interface might be up and passing traffic, but is not consistent enough to support load balancing operations. The CMTS attempts to reinitialize the interface after a time-out period. If the interface has failed initialization more than 10 times, the CMTS moves the interface to the disabled state.</li> <li>• disabled—Interface has been disabled because a load balancing test is in-progress or because the interface reinitialization failed after 10 attempts.</li> <li>• unstable—Interface has failed repeated initialization attempts. The CMTS will attempt to reinitialize the interface after a time-out period. If a load balance test is not in-progress and if reinitialization fails, the CMTS moves it to the unstable state.</li> </ul> |
| Reserved                                | Percentage of bandwidth that is currently reserved by unsolicited grant service (UGS) service flows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Modems                                  | Number of cable modems currently online on this cable interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Weight                                  | Interface bandwidth, in megabits per second (mbps), for the downstream or upstream. The system uses this value in calculating whether the loads on the interfaces are balanced. Changing a channel parameter, such as modulation profile or channel width, affects the channel bandwidth and weight value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Additional Fields for the target Option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Interface                               | <p>Source downstream or upstream interface that is part of a cable load balancing group. If the target field contains a value, it indicates that the source interface is currently oversubscribed.</p> <p>To reduce the cable load, the CMTS moves cable modems from the source interface to the target interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Target                                      | <p>Downstream or upstream interface to which cable modems on the source interface are being moved as part of load balancing operations. This field indicates the following:</p> <ul style="list-style-type: none"> <li>• If it is a downstream interface, the display shows the center frequency of the downstream within parentheses.</li> <li>• If only a frequency is shown, it indicates that the CMTS is moving cable modems to a different center frequency on the same downstream interface.</li> <li>• When the display includes the words “enforce”, it indicates that the CMTS is performing dynamic load balancing on the interfaces.</li> <li>• If this field is blank, it indicates that the source interface is not oversubscribed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Additional Fields for the statistics Option |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Target interface                            | Downstream or upstream interface. If this is a downstream interface, the display shows the center frequency of the downstream within parentheses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Transfers                                   | <p>The following information is tracked for the indicated target interface:</p> <ul style="list-style-type: none"> <li>• Cmpl—Number of cable modems successfully moved to the target interface.</li> <li>• Pend—Number of cable modems in the process of being moved to the target interface.</li> <li>• Retry—Number of times that the CMTS unsuccessfully tried to move the same cable modem to the target interface. This occurs when one or more MAC layer messages to the cable modem are dropped due to radio frequency (RF) noise or because the modem is not DOCSIS-compliant. If the number of retries exceeds five for a particular cable modem, the CMTS counts this as a failure.</li> <li>• Fail (NB)—Number of cable modems failed to move to narrow band interface.</li> <li>• Fail (WB)—Number of cable modems failed to move to wideband interface.</li> <li>• Total Attem—Number of times that the CMTS tried to move the same cable modem to the target interface.</li> <li>• Max Fail—Number of times that the CMTS exceeded the maximum number of allowable retries (3) when trying to move a cable modem to the particular target interface. A large number of failures could indicate one or more possible problems: <ul style="list-style-type: none"> <li>• The specific cable modems are not DOCSIS-compliant.</li> <li>• One or both interfaces are having problems passing traffic.</li> <li>• One or both interfaces are having persistent RF noise problems.</li> <li>• The source and target interfaces are not combined in the same node and do not share the same physical connectivity (which is required when interfaces are part the same load balancing group).</li> </ul> </li> </ul> |

| Field                                         | Description                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Additional Fields for the pending Option      |                                                                                                                                                                                                                                                                                                          |
| Modem                                         | Hardware (MAC) address of the cable modem that is moved as part of load balancing operations.                                                                                                                                                                                                            |
| Source interface                              | Downstream or upstream cable interface on which the cable modem is currently online.                                                                                                                                                                                                                     |
| Target interface                              | Downstream or upstream cable interface to which the CMTS is trying to move the cable modem to load balance the interfaces in this load balancing group. If the CMTS is moving the cable modem to a different frequency on the same downstream interface, this field shows only the new center frequency. |
| Retries                                       | Number of times that the CMTS has attempted to move this cable modem to the target interface. The CMTS attempts to move the cable modem 5 times before counting this load balancing move as a failure.                                                                                                   |
| Additional Fields for the modem-list option   |                                                                                                                                                                                                                                                                                                          |
| US                                            | Upstream channels in the DOCSIS LBG.                                                                                                                                                                                                                                                                     |
| MAC Address                                   | Total number (in parentheses) and MAC addresses of the modems connected to the upstream channels.                                                                                                                                                                                                        |
| Additional fields for the primary-load option |                                                                                                                                                                                                                                                                                                          |
| MD                                            | MAC Domain.                                                                                                                                                                                                                                                                                              |
| RCC-ID                                        | RCC index per MAC domain.                                                                                                                                                                                                                                                                                |
| Pending                                       | Number of pending modems on the channel.                                                                                                                                                                                                                                                                 |

**Related Commands**

| Command                                          | Description                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------|
| <b>cable load-balance docsis-group</b>           | Creates a DOCSIS LBG on the Cisco CMTS.                                          |
| <b>cable load-balance docsis-policy</b>          | Creates a DOCSIS policy and associates an existing rule and tag with the policy. |
| <b>cable load-balance docsis-enable</b>          | Enables or disables DOCSIS load balancing on the Cisco CMTS.                     |
| <b>cable load-balancedocsis30-dynamic-enable</b> | Enables the DOCSIS 3.0 dynamic load balancing on the Cisco CMTS.                 |
| <b>cable load-balance rule</b>                   | Creates a rule to prevent the CM from disabling or enabling load balancing.      |
| <b>cable tag</b>                                 | Creates a tag to associate it with DOCSIS policies and groups.                   |
| <b>clear cable load-balance count</b>            | Clears all of the load balance movement count statistics.                        |

# show cable logging

To display the log of messages about bad IP source addresses, downstream indexes, or DOCSIS-layer events on the cable interfaces, use the **show cable logging** command in user EXEC or privileged EXEC mode.

**show cable logging** [{badipsource | downstream-index | layer2events | summary}] [*slot*]

## Cisco cBR Series Converged Broadband Router

**show cable logging** [{badipsource | downstream-index | layer2events | overlapip | summary}]

### Syntax Description

|                         |                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>badipsource</b>      | Displays the contents of the error log buffer containing the error messages for bad IP source addresses.                                                                                                                                                                                                                                                                                                    |
| <b>downstream-index</b> | Displays the contents of the message log buffer for downstream indexes.                                                                                                                                                                                                                                                                                                                                     |
| <b>layer2events</b>     | Displays the contents of the message log buffer for DOCSIS-layer (Layer-2) events.                                                                                                                                                                                                                                                                                                                          |
| <b>overlapip</b>        | Displays the Cable OVERLAPIP messages on the Cisco cBR router.                                                                                                                                                                                                                                                                                                                                              |
| <b>summary</b>          | Displays the status of the logging feature and its buffer.                                                                                                                                                                                                                                                                                                                                                  |
| <i>slot</i>             | (Optional) Slot of a particular cable interface on the Cisco uBR7200 series router. The <i>slot</i> parameter can range from 3 to 6, depending on the cable interface.<br><br><b>Note</b> This option is supported only on the Cisco uBR-MC16U/X, Cisco uBR10-MC5X20U, Cisco uBR10-MC5X20H, and Cisco uBR-MC28U/X cable interface line card.<br><br>This variable is not supported on the Cisco cBR router. |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release     | Modification                                                                                                                                 |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(13)EC  | This command was introduced for the Cisco uBR7100 series and Cisco uBR7200 series universal broadband routers.                               |
| 12.2(11)CY  | Support was added for the Cisco uBR10012 universal broadband router.                                                                         |
| 12.2(11)BC2 | Support was added to the Release 12.2 BC train for the Cisco uBR7100 series, Cisco uBR7200 series, and Cisco uBR10012 routers.               |
| 12.2(15)CX  | Support was added to display the log buffer on an individual Cisco uBR-MC28U/X cable interface line card on the Cisco uBR7200 series router. |
| 12.2(15)BC2 | Support was added for the Cisco uBR-MC16U/X, Cisco uBR10-MC5X20U, and Cisco uBR10-MC5X20H cable interface line cards.                        |

| Release        | Modification                                                                                                                                                                                            |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.3(9a)BC     | The <b>layer2events</b> keyword was added.                                                                                                                                                              |
| 12.3(21)BC     | This command was enhanced to support logging events tracked with the Cable Duplicate MAC Address Reject feature on the Cisco CMTS, when configured. This supports the detection of cloned cable modems. |
| 12.2(33)SCA    | This command was integrated into Cisco IOS Release 12.2(33)SCA. Support for the Cisco uBR7225VXR router was added.                                                                                      |
| 12.3(23)BC5    | The command output was modified to display the CPU revision number of the line card.                                                                                                                    |
| 12.2(33)SCB    | This command was integrated into Cisco IOS Release 12.2(33)SCB.                                                                                                                                         |
| 12.2(33)SCG    | The <b>downstream-index</b> keyword was added.                                                                                                                                                          |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router.                                                                                                                        |

### Usage Guidelines

For additional information about the Cable Duplicate MAC Address Reject feature on the Cisco CMTS, or enforced DOCSIS 1.1 security, see the *Cable Duplicate MAC Address Reject for the Cisco CMTS*.

The **cable logging badipsource** command creates a circular buffer that contains the BADIPSOURCE error messages, which the Cisco CMTS generates when it discovers a CM or CPE device using an unauthorized IP address. Similarly, the **cable logging layer2events** command creates a buffer to contain the system messages that are generated for DOCSIS-layer (Layer2) events. If the BADIPSOURCE or DOCSIS-layer buffer becomes full, the oldest messages are deleted to make room for the newer messages.

Use the **show cable logging** command to display the current contents of the BADIPSOURCE, downstream-index, or DOCSIS-layer buffer. After you have viewed all of the error messages in the current buffer, use the **clear cable logging** command to clear out the buffer to make room for newer messages.

Use the **show cable logging summary** command to check if the logging feature is enabled and also to view the status of the logging buffer.

The Broadband Processing Engine (BPE) cable interface line cards (such as the Cisco uBR-MC16U/X and Cisco uBR-MC28U/X) contain an onboard processor that also maintains its own log buffer. To display the contents of this log, add the card slot number after the **show cable logging** command.

**Note** The BADIPSOURCE, downstream-index, and DOCSIS-layer messages are stored in separate buffers. Enabling, clearing, or displaying one buffer does not affect the other buffer.

### Examples

This example shows the output of the **show cable logging badipsource** command. The oldest messages are displayed first.

```
Router# show cable logging badipsource
00:01:19: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/1, IP packet from invalid source.
IP=10.44.50.13, MAC=0050.0f02.1d15, Expected SID=1, Actual SID=1
00:01:26: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/1, IP packet from invalid source.
IP=10.44.50.13, MAC=0050.0f02.1d15, Expected SID=1, Actual SID=1
01:49:33: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb00.029d, Expected Interface=Cable6/1/0 SID=2833
```

```

02:12:03: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb15.73bd, Expected Interface=Cable6/1/0 SID=2800
02:12:43: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=00e0.ca01.287a, Expected Interface=Cable6/1/0 SID=3299
02:22:50: %UBR10000-3-BADIPSOURCE: Interface Cable6/1/0, IP packet from invalid source.
IP=0.0.0.44, MAC=0030.eb00.02a2, Expected Interface=Cable6/1/0 SID=394

```

This example shows the output of the **show cable logging badipsource** command when logging has not been enabled with the **cable logging badipsource** command:

```
Router# show cable logging badipsource
```

```
Cable logging: BADIPSOURCE Disabled
```

This example shows the output for the **downstream-index** option, showing whether logging is enabled, the total size of the buffer, how many bytes are currently used, and how many error messages have been logged since the buffer was last cleared.

```
Router# show cable logging summary
```

```

Cable logging: Enabled
 Total buffer size (bytes): 1000000
 Used buffer size (bytes) : 36968
 Logged messages : 231

```

This example shows the output for the **summary** option, showing whether logging is enabled, the total size of the buffer, how many bytes are currently used, and how many error messages have been logged since the buffer was last cleared.

```
Router# show cable logging summary
```

```

Cable logging: BADIPSOURCE Enabled
 Total buffer size (bytes): 1000000
 Used buffer size (bytes) : 36968
 Logged messages : 231

```

This example shows the output for the **summary** option, indicating the CPU revision number of the line card. The display given below is specific to the uBR7200 series routers.

```

Router# show cable logging summary slot 6
Current LC State Info for slot 6
CLC CPU: BCM1250 (Rev A8/A10)
- Status - NO NPE/CLC OIR Timeout detected
Last Process Executed = Per-minute Jobs (4 ms count = 0ms)
Intr Busy Count = 0
Sched Flag Count = 2076
Status = 0x0

604756A8/0x0 60406D38/0x0 60475DC4/0x0 60406D48/0x0

```

```

Cable logging: BADIPSOURCE Disabled Slot 6
Cable logging: LAYER2EVENTS Disabled Slot 6
Cable logging: OVERLAPIP Disabled Slot 6

```

This example shows the output from the DOCSIS-layer buffer. This example shows the log buffer on a BPE cable interface line card that is in slot 4:

```

Router# show cable logging layer2events slot 4

Cable logging: LAYER2EVENTS Enabled Slot 4
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 567
 Logged messages : 3
SLOT 4/0: 02:11:42: %UBR7200-4-REG_REJ_AUTH_FAIL_CMTS_MIC_INVALID: <133>CMTS[DOCSIS]:<73000500> Registration rejected authentication failure: CMTS MIC invalid.
CM Mac Addr <0002.b96f.ff05>
SLOT 4/0: 02:11:53: %UBR7200-4-REG_REJ_AUTH_FAIL_CMTS_MIC_INVALID: <133>CMTS[DOCSIS]:<73000500> Registration rejected authentication failure: CMTS MIC invalid.
CM Mac Addr <0002.b96f.ff05>
SLOT 4/0: 02:12:05: %UBR7200-4-REG_REJ_AUTH_FAIL_CMTS_MIC_INVALID: <133>CMTS[DOCSIS]:<73000500> Registration rejected authentication failure: CMTS MIC invalid.
CM Mac Addr <0002.b96f.ff05>

```

### Examples for the Cisco cBR Series Converged Broadband Router

This example shows the output for the **show cable logging badipsource** command on the Cisco cBR router:

```

Router#show cable logging badipsource
Cable logging: BADIPSOURCE Enabled
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 0
 Logged messages : 0
Cable logging: BADIPSOURCE Enabled Slot 3 Subslot 0
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 0
 Logged messages : 0
Router#

```

This example shows the output for the **show cable logging downstream-index** command on the Cisco cBR router:

```

Router#show cable logging downstream-index
Cable logging: DS_IDX Enabled
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 0
 Logged messages : 0
Cable logging: DS_IDX Enabled Slot 3 Subslot 0
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 0
 Logged messages : 0

```

Router#

This example shows the output for the **show cable logging layer2events** command on the Cisco CBR router:

```
Router#show cable logging layer2events
Cable logging: LAYER2EVENTS Enabled
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 0
 Logged messages : 0
Cable logging: LAYER2EVENTS Enabled Slot 3 Subslot 0
 Total buffer size (bytes): 4096
 Used buffer size (bytes) : 4096
 Logged messages : 2380

# show cable mac-domain cable forwarding

To display all the interfaces (wideband and modular) and statistics belonging to the Mac domain, use the **show cable mac-domain cable forwarding** command in privileged EXEC mode.

**show cable mac-domain cable *slot/subslot/port* forwarding**

## Syntax Description

|                   |                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------|
| <i>slot</i>       | Specifies the chassis slot number of the cable interface line card. The range is from 5 to 8.   |
| <i>subslot</i>    | Specifies the secondary slot number of the cable interface line card. The range is from 0 or 1. |
| <i>port</i>       | Specifies the port number. The range is from 0 to 4 (depending on the cable interface).         |
| <b>forwarding</b> | Displays the forwarding statistics for the cable line cards.                                    |

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release        | Modification                                                                     |
|----------------|----------------------------------------------------------------------------------|
| 12.3(23)BC     | This command was introduced.                                                     |
| 12.2(33)SCA    | This command is integrated in Cisco IOS Release 12.2(33)SCA.                     |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. |

## Usage Guidelines

The **show cable mac-domain cable forwarding** command does not support wideband and modular interfaces. However, if wideband and modular interfaces belong to the Mac domain, the interfaces are listed in the output with the interface state.

Starting with Cisco IOS Release 12.2(33)SCF, for a chassis loaded with the UBR-MC20X20V or uBR-MC3GX60V line cards, and legacy uBR-MC5X20 line cards, the **show cable mac-domain cable forwarding** command shall not display the legacy downstream information for the UBR-MC20X20V and the uBR-MC3GX60V line cards.

## Examples

The following is sample output of the **show cable mac-domain cable forwarding** command on the cable interface at 1/0/0:

```
Router# show cable mac-domain cable 1/0/0 forwarding
Interface Output Interface Reserved/ Interface
Name Packets Rate Bandwidth Reservable State
 (bytes) (bits/sec) (Kbps) Bandwidth

Ca1/0/0 201358 0 26000 6500/19500 UP
Mo1/0/0:0 344340 0 4160 1040/3120 UP
Mo1/0/0:1 252132 0 7800 1950/5850 UP
Mo1/0/0:2 252132 0 7800 1950/5850 UP
Wi1/0/0:0 198916 0 7803 1951/5852 UP
Wi1/0/0:1 1152 0 10404 2601/7803 UP
```

Table below describes the significant fields shown in the display.

**Table 92: show cable mac-domain cable forwarding Field Descriptions**

| Field                         | Description                                        |
|-------------------------------|----------------------------------------------------|
| Interface Name                | The name of the interface belonging to Mac domain. |
| Output Packets/Rate           | The cumulative packets output and output rate.     |
| Interface Bandwidth           | The total interface bandwidth allocated.           |
| Reserved/Reservable Bandwidth | The total reserved and available bandwidth.        |
| Interface State               | Indicates whether the interface is up or down.     |

# show cable mac-domain cable cgd-associations

To display a summary of the Channel Grouping Domain (CGD) associations for all cable MAC domains, use the **show cable mac-domain cable cgd-associations** command in privileged EXEC mode.

## Cisco uBR10012 Router

**show cable mac-domain cable slot /subslot /port cgd-associations**

## Cisco uBR7225VXR and Cisco uBR7246VXR Routers

**show cable mac-domain cable slot /port cgd-associations**

## Cisco cBR Series Converged Broadband Router

**show cable mac-domain cable slot /port cgd-associations**

### Syntax Description

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 12.3(23)BC     | This command was introduced for the Cisco uBR10012 router.                                                                       |
| 12.2(33)SCB    | This command was integrated into Cisco IOS Release 12.2(33)SCB. Added support for Cisco uBR7246VXR and Cisco uBR7225VXR routers. |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router.                                                 |

**Usage Guidelines**

The **show cable mac-domain cgd-associations** command displays the following information for each cable MAC domain:

- Shared port adapter (SPA) downstream channels that have been added to each MAC domain.
- Upstream channels associated with each SPA downstream channel and the downstream channels of the integrated cable interface line card.

If the All column in the command output indicates Y, then this indicates that all upstream channels associated with the line card downstream channels or SPA downstream channels are configured using the **upstream cable connector** command. If all upstream channels are not configured, then this column will not be displayed.

- The SPA downstream channels that are currently active.

A SPA downstream channel is active when the corresponding modular cable interface, which represents the SPA downstream channel, and its line protocol are up. A SPA downstream channel that is considered active is an operational primary downstream channel in the cable MAC domain.

**Note** For more information on Channel Grouping Domains, refer to the *Cisco DOCSIS 3.0 Downstream Solution Design and Implementation Guide, Release 2.0*.

**Cisco IOS Release 12.3(23)BC**

This example shows the output of the **show cable mac-domain cgd-associations** command for the cable interface line card at slot 6, subslot 0, and port 0:

```
Router# show cable mac-domain cable 6/0/0 cgd-associations
CGD Host SPA DS Channels Upstreams (All) Active Remote DS
Ca6/0/0 Local 1 1 Y
 1/0/0 0-1 0
```

**Cisco IOS Release 12.2(33)SCB**

This example shows the output of the **show cable mac-domain cgd-associations** command for the cable interface line card at slot 7, subslot 0, and port 0:

```
Router# show
cable mac-domain Cable7/0/0 cgd-associations
CGD Host Resource DS Channels Upstreams (AllUS) Active Remote DS
Ca7/0/0 7/0/0 0 0
 3/1/0 0-2 0
 0-2
```

**Cisco IOS Release 12.2(33)SCG**

This example shows the output of the **show cable mac-domain cgd-associations** command for the Cisco uBR-MC3GX60V cable interface line card sharing downstreams with the Cisco Wideband SPA, in Cisco IOS Release 12.2(33)SCG:

```
Router# show cable mac-domain cable 8/0/0 cgd-associations
```

**show cable mac-domain cable cgd-associations**

```

CGD Host Resource DS Channels Upstreams (AllUS) Active Remote DS
Ca8/0/0 1/1/0 0 0-3 Yes

```

Table below describes the fields shown in the **show cable mac-domain cgd-associations** command display.

**Table 93: show cable cgd-associations Field Descriptions**

| Field             | Description                           |
|-------------------|---------------------------------------|
| CGD Host          | MAC domain interface for CGD.         |
| Resource          | Downstream cable interface line card. |
| DS Channels       | Downstream RF channels.               |
| Upstreams (AllUS) | Upstream channels in the MAC domain.  |
| Active Remote DS  | Active downstream channels.           |

### Cisco cBR Series Converged Broadband Router

This example shows the output of the Cisco cBR-8 router

```
Router#show cable mac-domain c1/0/0 cgd-associations
```

```

CGD Host Resource DS Channels Upstreams (ALLUS) Active DS
Ca1/0/0 1/0/0 8 0-1 Yes 8
 16 0-1 Yes 16
 24 0-1 Yes 24
 32-33 0-1 Yes 32-33
 40 0-1 Yes 40

```

MD US binding:

```

Host MD Controller US channel State
Ca1/0/0 U0 1/0/0 0 UP
Ca1/0/0 U1 1/0/0 1 UP

```

| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router.                |

### Usage Guidelines

Use the **show cable mac-domain downstream-service-group** command to display MAC Domain Downstream Service Group (MD-DS-SG) information for the specified primary downstream channel.

For each fiber node, a traditional DOCSIS downstream channel on a Cisco uBR10-MC5X20 cable interface line card is used to carry MAC management and signaling messages, and the associated traditional DOCSIS upstream channel is used for return data traffic and signaling. The traditional DOCSIS downstream channel used in this way for a MAC domain is called the *primary downstream channel*.

**Note** Beginning in Cisco IOS Release 12.3(23)BC, either an RF channel from the SPA or a Cisco uBR10-MC5X20 downstream channel can serve as a primary channel in a fiber node. Changes in Cisco IOS Release 12.3(23)BC apply to Cisco IOS Release 12.2(33)SCB but do not apply to Cisco IOS Release 12.2(33)SCA.

### Examples

The following two examples display **show cable mac-domain downstream-service-group** output for the primary downstream channel on the cable interface at slot/subslot/port 5/0/0:

#### Cisco IOS Release 12.3(21)BC

```
Router# show cable mac-domain cable5/0/0 downstream-service-group
Primary MD-DS-SG RF
IF Id SPA Chan
C5/0/0 1 1/0/0 0 - 1
```

#### Cisco IOS Release 12.3(23)BC

```
Router# show cable mac-domain cable5/0/0 downstream-service-group
Cable MD-DS-SG RF Local Remote
IF Id SPA Chan Primary Chan Primary Chan
C5/0/0 1 1/0/0 00-01 Yes
```

In the preceding examples, the MD-DS-SG with ID 1 is used for RF channels 0 and 1 on the Wideband SPA located in slot/subslot/bay 1/0/0.

#### Cisco IOS Release 12.2(33)SCB

This example shows the output of the **show cable mac-domain downstream-service-group** command for the primary downstream channel on the cable interface at slot/subslot/port 7/0/0:

```
Router# show cable mac-domain Cable7/0/0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
```

```

C7/0/0 1 3/1/0 00-02 0 1 2
 7/0/0 00 0

```

### Cisco IOS Release 12.2(33)SCD

This example shows the output of the **show cable mac-domain downstream-service-group** command for the primary downstream channel on the cable interface at slot/port 5/0:

```

Router# show cable mac-domain cable 5/0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
C5/0 1 5/0 00-03 0

```

### Cisco IOS Release 12.2(33)SCG

This example shows the output of the **show cable mac-domain downstream-service-group** command for the Cisco uBR-MC3GX60V cable interface line card with primary downstream channel hosted on the Cisco Wideband SPA, in Cisco IOS Release 12.2(33)SCG:

```

Router# show cable mac-domain cable 8/0/0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
C8/0/0 1 1/1/0 00-03 0
 1/3/0 00-03
 7/0/0 00-03
 8/0/2 00-03

```

Table below describes the fields shown in the **show cable mac-domain downstream-service-group** command display.

**Table 94: show cable mac-domain downstream-service-group Field Descriptions**

| Field        | Description                           |
|--------------|---------------------------------------|
| Cable IF     | Cable interface.                      |
| MD-DS-SG     | MAC Domain Downstream Service Group.  |
| Resource     | Downstream cable interface line card. |
| RF Chan      | Downstream RF channel.                |
| Primary Chan | Primary downstream channel.           |

### Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable mac-domain downstream-service-group** command for the Cisco cBR Series Converged Broadband Router:

```

Router# show cable mac-domain c1/0/0 downstream-service-group
Cable MD-DS-SG RF
IF Id Resource Chan Primary Chan
C1/0/0

```

show cable mac-domain cable downstream-service-group

## show cable mac-domain cable rcc

To display runtime receive channel configuration (RCC) on a cable line card interface, use the **show cable mac-domain rcc** command in privileged EXEC mode.

### Cisco uBR7225VXR and Cisco uBR7246VXR Universal Broadband Routers

**show cable mac-domain cable** *slot* /*port* **rcc**

### Cisco uBR10012 Universal Broadband Router

**show cable mac-domain cable** *slot* /*subslot* /*port* **rcc**

### Cisco cBR Series Converged Broadband Router

**show cable mac-domain cable** *slot* /*subslot* /*cable-interface-index* **rcc**

| Syntax Description |                              |                                                                                                                                                                                                                                                                                                                                                  |

| IOS-XE<br>3.18.0SP | This command was modified to show which RCC encoding formats are supported by a particular RCC. |

## Examples

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface with the DOCSIS 3.0 encoding support and DOCSIS 3.1 simplified encoding support columns:

Router# **show cable mac-domain cable 7/0/0 rcc**

| RCC-ID | RCP            | RCs | MD-DS-SG | CMs | WB/RCC-TMPL    | D3.0 | D3.1 |
|--------|----------------|-----|----------|-----|----------------|------|------|
| 4      | 00 00 00 00 00 | 16  | 0        | 1   | WB (Wi7/0/0:0) | Y    | Y    |
| 5      | 00 00 00 00 00 | 25  | 0        | 2   | WB (Wi7/0/0:1) | N    | Y    |
| 6      | 00 10 00 00 08 | 8   | 0        | 0   | RCC-TMPL (3:1) | Y    | N    |
| 7      | 00 00 00 00 00 | 4   | 0        | 0   | WB (Wi7/0/0:4) | Y    | Y    |

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface of the cBR-8 router:

Router# **show cable mac-domain cable 8/0/0 rcc**

| RCC-ID | RCP            | RCs | MD-DS-SG | CMs | WB/RCC-TMPL  |
|--------|----------------|-----|----------|-----|--------------|
| 1      | 00 00 00 00 00 | 2   | 0        | 0   | WB (101)     |
| 2      | 00 10 00 00 03 | 3   | 2        | 0   | RCC-TMPL (1) |

The following is a sample output of the **show cable mac-domain rcc** command on the cable interface of the uBR10012 router:

Router# **show cable mac-domain cable 1/0 rcc**

| RCC-ID | RCP            | RCs | MD-DS-SG | CMs | WB/RCC-TMPL |
|--------|----------------|-----|----------|-----|-------------|
| 1      | 00 00 00 00 00 | 3   | 0        | 3   | WB (25)     |

Table below describes the significant fields shown in the display.

**Table 95: Field Descriptions for show cable mac-domain rcc Command**

| Field       | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| RCC-ID      | RCC index per MAC domain. The RCC ID refers to the RCC ID output from the <b>show cable modem wideband</b> command. |
| RCP         | The receive channel profile associated with the RCC object.                                                         |
| RCs         | Total number of DS channels.                                                                                        |
| MD-DS-SG    | Indicates the MAC domain DS service group for which the RCC is generated.                                           |
| CM          | Total number of CMs associated with the RCC object.                                                                 |
| WB/RCC-TMPL | Indicates the wideband interface or the RCC template.                                                               |
| D3.0        | DOCSIS 3.0 encoding support details.                                                                                |
| D3.1        | DOCSIS 3.1 simplified encoding support                                                                              |

**Note** A zero value in the RCP or MD-DS-SG field indicates that the RCC is generated directly through a wideband interface configuration and not through any RCC templates.

**Note** The channels in this command output are the subset of channels in the REG-RSP-MP.

# show cable mac-domain cable upstream-service-group

To display runtime statistics of the MAC domain upstream service group on a cable interface line card, use the **show cable mac-domain upstream-service-group** command in privileged EXEC mode.

**show cable mac-domain cable *slot* / *subslot* / *port* upstream-service-group**

## Syntax Description

|                               |                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>                   | Chassis slot number of the cable interface line card.<br>Cisco uBR10012 router—The range is from 0 to 8.<br>Cisco cBR-8 router— The range is from 0 to 3 and 6 to 9 |
| <i>subslot</i>                | Secondary slot number of the cable interface line card.<br>Cisco uBR10012 router—The range is from 0 or 1.<br>Cisco cBR-8 router—The value is 0.                    |
| <i>port</i>                   | Port number. The range is from 0 to 4 (depending on the cable interface).                                                                                           |
| <i>cable-interface-index</i>  | <i>cable-interface-index</i> —Downstream cable interface index number on the line card.<br>Cisco cBR-8 router—The range is from 0 to 15.                            |
| <b>upstream-service-group</b> | Specifies the upstream service group number.                                                                                                                        |

|----------------|----------------------------------------------------------------------------------|
| 12.2(33)SCC    | This command was introduced.                                                     |
| IOS-XE 3.15.0S | This command was implemented on the Cisco cBR Series Converged Broadband Router. |

## Usage Guidelines

This command displays privacy information of a particular CM, identified by its IP address or MAC address.

## Examples

The example shows the output of the **show cable mac-domain upstream-service-group** command on the cable interface line card at slot/subslot/port 7/1/0:

```
Router# show cable mac-domain cable 7/1/0 upstream-service-group
Cable MD 7/1/0
US-SG-ID : 1 US-Chan : U0,1,2,3,4
Primary-DS: 5/1/0:0 US-SG-ID: 1
 MDD US-List : U0,1,2,3
 MDD Ambiguity : U0,1,2,3
Primary-DS: 3/0/0:0 US-SG-ID: 1
 MDD US-List : U0,1,2,3,4
 MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:1 US-SG-ID: 1
 MDD US-List : U0,1,2,3,4
```

```

MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:2 US-SG-ID: 1
MDD US-List : U0,1,2,3,4
MDD Ambiguity : U0,1,2,3,4
Primary-DS: 3/0/0:3 US-SG-ID: 1
MDD US-List : U0,1,2,3,4
MDD Ambiguity : U0,1,2,3,4

```

Table below describes the significant fields shown in the display.

**Table 96: show cable mac-domain upstream-service-group Field Descriptions**

| Field         | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| US-SG-ID      | Upstream service group ID.                                                                  |
| US-chan       | Total number of upstream channels on the cable interface line card.                         |
| Primary-DS    | The primary downstream interface.                                                           |
| MDD US-List   | MAC management message: MDD TLV type 7 content, upstream active channel list.               |
| MDD Ambiguity | MAC management message: MDD TLV type 8 content, upstream ambiguity resolution channel list. |

This example shows the output of the **show cable mac-domain upstream-service-group** command for the Cisco cBR Series Converged Broadband Router:

```

Router#show cable mac-domain c1/0/0 upstream-service-group
Cable MD 1/0/0

```

#### Related Commands

|---------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>show interface rf-status</b> | Displays the logical up and down states for each of the configured RF channels on a wideband interface. |

# show cable mcast-shadow

To display information about multicast dataplane shadow, use the **show cable mcast-shadow** command in privileged EXEC mode.

**show cable mcast-shadow** [ { **bundle** *bundle interface number* { *source ipv4 address group ipv4 address* } } | { *source ipv6 address group ipv6 address* } } ]

## Syntax Description

|                                              |                                                                    |
|----------------------------------------------|--------------------------------------------------------------------|
| <b>bundle</b> <i>bundle interface number</i> | Specifies bundle interface number. The value ranges from 1 to 255. |
| <i>source ipv4 address</i>                   | The source ipv4 address.                                           |
| <i>group ipv4 address</i>                    | The group ipv4 address.                                            |
| <i>source ipv6 address</i>                   | The source ipv6 address.                                           |
| <i>group ipv6 address</i>                    | The group ipv6 address.                                            |

## Command Default

| 12.3(9a)BC      | This command was introduced.                                                                                                                                                                                                                 |         |              |            |                              |             |                                                                   |
| 12.2(33)SCB     | SAMIS over Internet Protocol Detail Record (IPDR) was introduced.                                                                                                                                                                            |         |              |            |                              |             |                                                                   |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>The <b>show cable metering-status</b> command displays information about the most recent successful usage-based billing operation. If usage-based billing is configured for File mode, this command displays the device and file name for the record that was last written. If usage-based billing is configured for Streaming mode, this command displays the IP address and port number for the external server to which the billing record was sent.</p> |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note** This command displays the status of the last successful billing record operation. If a failure occurred, the CMTS sends an SNMP trap to the SNMP manager with that information.

## Examples

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to write the billing records to a local file system:

```
Router# show cable metering-status
destination complete-time flow cpe status
 aggr supp
disk0:R7519-UBR7246-200308-004428 Jun 12 09:33:05 No No success
```

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to stream the billing records to an external server:

```
Router# show cable metering-status

destination complete-time flow cpe status
 aggr supp
10.11.37.2 :1234 Jun 12 09:33:05 No No success
```

This example shows a typical output for the verbose form of the **show cable metering-status** command:

```
Router# show cable metering-status verbose
```

```

Destination : disk0:R7519-UBR7246-20000308-004428
Complete Time : Jun 12 09:33:05
Flow Aggregate : Yes
Cpe list suppression : Yes
Status of last export : success

```

This example shows a typical output for the **show cable metering-status** command when usage-based billing is configured to use the Internet Protocol Detail Record (IPDR) Exporter to stream the billing records to an external server:

```

Router# show cable metering-status
destination complete-time flow cpe status
 aggr supp
IPDR_Session1 Jun 12 09:33:05 N/A N/A success

```

This example shows a typical output for the verbose form of the **show cable metering-status** command when usage-based billing is configured to use the IPDR Exporter to stream the billing records to an external server:

```

Router# show cable metering-status
verbose

Last export status
Destination : IPDR_Session1
Complete Time : Jun 12 09:36:05
Status of last export : success

```

This example shows the error message that is displayed when you enter the **show cable metering-status** command but not have enabled usage-based billing:

```

Router# show cable metering-status
CMTS Metering collection not enabled

```

This example shows if the SAMIS report failed, the output displays the details of the failure:

```

Router# show cable metering-status
verbose

Load for five secs: 0%/0%; one minute: 1%; five minutes: 0%
Time source is NTP, .19:24:53.955 PDT Fri Jun 11 2010
Last export status
Destination : 20.1.0.2:5959
Complete Time : Jun11 19:24:40
Flow Aggregate : No
Full records : Yes
Cpe list suppression : No
Source interface : GigabitEthernet0/1
Status of last export : write-error (bulk-data)

```

Table below describes the fields displayed by the **show cable metering-status** command.

**Table 97: show cable metering-status Field Descriptions**

| Field                    | Description                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination, Destination | Destination for the billing records. This is a file system device name and file name, if records are being written to a local file system, or an IP address and TCP port number, if records are being streamed to an external server. |

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| complete_time, Complete Time       | Date and time when the last billing record was written to a local file or streamed to an external server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| flow aggr, Flow Aggregate          | Indicates whether traffic counters are aggregated in the billing records, so that one total is recorded for the upstream service flows and downstream service flows for each CM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| cpe suppress, CPE list suppression | Indicates whether CPE IP addresses are included or suppressed in the billing records: <ul style="list-style-type: none"> <li>• Yes — CPE addresses are suppressed and are not included in the billing records.</li> <li>• No— CPE addresses are included in the billing records.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| status, Status of last export      | Indicates the status of the last billing operation: <ul style="list-style-type: none"> <li>• success—The billing records were successfully written to the filesystem (file mode) or transferred to the billing collection server (streaming mode).</li> <li>• connect-failed—The CMTS was able to open the proper socket connection to the server but could not connect to the server.</li> <li>• data-incomplete—A failure occurred during the file write or the streaming to the collection server, and the records that were written might be incomplete.</li> <li>• disk-full—The billing records could not be written because the filesystem does not have sufficient free space.</li> <li>• no-memory—The processor had insufficient memory to collect the billing records.</li> <li>• open-failure—The transfer failed because the CMTS could not open a new file on the filesystem (file mode) or open a socket to the destination IP address and port (streaming mode).</li> <li>• unknown—An unknown error occurred.</li> <li>• write-error (<i>data-type</i>)—The operating system reported an error when attempting to write the billing records (file mode), or the send to the destination socket failed (streaming mode). <ul style="list-style-type: none"> <li>• The value of data-type could be <i>file-header</i> , <i>file-end</i> , <i>bulk-data</i> , <i>sflog</i> , <i>bulk-data</i> , <i>ipdr-data</i> , <i>ipdr-sflog</i> , or <i>ipdr-file</i> .</li> </ul> </li> </ul> |

### Examples for Cisco cBR Series Converged Broadband Router

This example shows the output of the **show cable metering-status** command on the Cisco cBR router for Collector configuration—ipdr-d3, session 1, type 1 collecting full-records, as follows:

```
Router#show cable metering-status
destination complete-time flow cpe full status
 aggr supp rec
IPDR_Session1 May21 13:27:04 No N/A Yes connect-failed

Router#
```

**Related Commands**

| Command                                | Description                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>cable metering destination</b>      | Enables usage-based billing and streams the billing records to an external server.               |
| <b>cable metering filesystem</b>       | Enables usage-based billing and writes the billing records to a file on a local file system.     |
| <b>cable metering source-interface</b> | Enables debugging of usage-based billing operations.                                             |
| <b>snmp-server enable traps cable</b>  | Enables the sending of Simple Network Management Protocol (SNMP) traps for cable-related events. |

# show cable modem

To display information for the registered and unregistered cable modems, use the **show cable modem** command in privileged EXEC mode.

**show cable modem** [{*ip-address*|*mac-address* | **cable** {*slot* / *port* | *slot* / *subslot* / *port* } }] [**upstream** *port* ]}] [**queue** [**verbose**] [**cm-status**]

## Cisco IOS Release 12.2(33)SCE and later releases

**show cable modem** [{*ip-address* | *mac-address* | **cable** {*slot* / *cable-interface-index* | *slot* / *subslot* / *cable-interface-index* } }] [**upstream** *port* ]}] [**verbose**] [**cm-status**]

## Cisco cBR Series Converged Broadband Router

**show cable modem** [{*ip-address* | *mac-address* | **cable** {*slot* / *subslot* / *cable-interface-index* } }] [**upstream** *port* ]}] [**verbose**] [**cm-status**]

### Syntax Description

|                    |                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>  | (Optional) IPv4 or IPv6 address of a specific cable modem to be displayed. If you specify the IP address for a CPE device behind a cable modem, information for that cable modem is displayed.                                                                                                                                                 |
| <i>mac-address</i> | (Optional) MAC address of a specific cable modem to be displayed. If you specify the MAC address for a CPE device behind a cable modem, information for that cable modem is displayed.                                                                                                                                                         |
| <b>cable</b>       | (Optional) Displays the modems on a specific cable interface.                                                                                                                                                                                                                                                                                  |
| <i>slot</i>        | Slot where the line card resides. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR router—The valid value is 1 or 2.</li> <li>• Cisco uBR7246VXR router—The valid range is from 3 to 6.</li> <li>• Cisco uBR10012 router—The valid range is from 5 to 8.</li> <li>• Cisco cBR router—The valid range is 0 to 3 and 6 to 9.</li> </ul> |
| <i>subslot</i>     | Secondary slot number of the cable interface line card.<br>Cisco uBR10012 only —The valid subslots are 0 or 1.<br>Cisco cBR router—The valid value is 0.                                                                                                                                                                                       |
| <i>port</i>        | Downstream port number. <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range is from 0 to 4 (depending on the cable interface).</li> </ul>                                                                                       |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>cable-interface-index</i> | <p>Downstream port of the Cisco uBR10-MC5X20 and Cisco uBR-MC28 line cards, or MAC domain index of the Cisco UBR-MC20X20V and Cisco uBR-MC3GX60V line cards.</p> <ul style="list-style-type: none"> <li>• Cisco uBR7225VXR and Cisco uBR7246VXR routers—The valid port value is 0 or 1.</li> <li>• Cisco uBR10012 router—The valid range for the Cisco UBR-MC20X20V and Cisco uBR-MC5X20 line cards is from 0 to 4. The valid range for the Cisco uBR-MC3GX60V line card is from 0 to 14.</li> <li>• Cisco cBR router—The valid range is 0 to 15.</li> </ul> |
| <b>upstream port</b>         | <p>(Optional) Displays information for all cable modems using the specified upstream port. You can specify this option only when displaying information for a cable interface. The valid range for <i>port</i> begins with 0 and ends with a value that depends on the number of upstream ports supported by the cable interface line card.</p> <p>Cisco cBR router—The valid range of <i>port</i> is 0 to 7.</p>                                                                                                                                            |
| <b>name fqdn</b>             | <p>(Optional) Specifies the fully qualified domain name (FQDN) of the cable device to be displayed. This option is only available if the <b>show cable modem domain-name</b> command has been run for the first time to update the cable DNS cache on the CMTS router.</p> <p>This keyword is not supported on the Cisco cBR router.</p>                                                                                                                                                                                                                     |
| <b>verbose</b>               | Displays detailed information of the cable modems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cm-status</b>             | Displays cable modem status events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>cm-status ack</b>         | Displays the modems to which cable modem status acknowledgement messages are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>queue</b>                 | <p>Displays the downstream hierarchical queueing framework (HQF) queue information for a cable modem.</p> <p>This keyword is not supported on the Cisco cBR router.</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>logical-channel-index</i> | <p>(Optional) Logical channel index. The valid values are 0 or 1.</p> <p>This keyword is not supported on the Cisco cBR router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |

| BC Release  | Modification                                                                                                                                                                                                                                                                                                                                      |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(15)BC1 | Additional lines were added to the <b>show cable modem verbose</b> displays, for one or all cable modems, to show information about the dynamic shared-secret feature. Cable modems that fail the dynamic secret authentication checks and then come online are marked with an exclamation point (!), so that this situation can be investigated. |
| 12.2(4)BC1  | Support was added for the Cisco uBR10012 router.                                                                                                                                                                                                                                                                                                  |

| BC Release   | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(8)BC2   | The output for the Online State field was updated for the <b>cable tftp-enforce</b> command. A pound sign (#) appears next to the state value when a cable modem was allowed to come online without attempting to download a DOCSIS configuration file through the cable interface with the Cisco CMTS.                                                                                                                                                                                                                                                                                                        |
| 12.2(15)BC1c | The <b>verbose</b> option displays whether dynamic service change requests (DSX) are allowed from cable modems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 12.2(15)BC2  | <p>Two new states—cc(r1) and cc(r2)—have been added to the cable modem MAC state field to indicate the cable modem status when it has been instructed to change channels and is ranging to obtain a new downstream or upstream channel.</p> <p>Also, three new states—online(pkd), online(ptd), and expire(pkd)—were added to clarify the BPI state when network access has been disabled in the cable modem's DOCSIS configuration file.</p> <p>In addition, the <b>show cable modem verbose</b> command now displays the total amount of time that a cable modem has been online since last registering.</p> |
| 12.3(13a)BC  | <p>New initialization states were added for the MAC State Field:</p> <ul style="list-style-type: none"> <li>• init(d)—The Cisco CMTS has seen DHCPDISCOVER</li> <li>• init(io)—The Cisco CMTS has seen DHCPOFFER</li> <li>• init(dr)—The Cisco CMTS has seen DHCPREQUEST</li> <li>• init(i)—The Cisco CMTS has seen DHCPACK</li> <li>• init(o)—The Cisco CMTS has seen first TFTP packet for TFTP request for cable modem configuration file</li> <li>• init(t)—The Cisco CMTS has seen the TOD request</li> </ul>                                                                                             |
| 12.3(21)BC   | All cable bundles are now automatically converted and configured to be in a virtual bundle, and standalone cable interfaces must be manually configured to be in a virtual bundle to operate properly. Previously, new virtual interface bundles and bundle members required reconfiguration, and there could also be standalone interfaces not part of a bundle at all.                                                                                                                                                                                                                                       |
| 12.3(23)BC   | <p>The <b>verbose</b> option displays additional information about the cable modem. The following fields have been added to the output of this option:</p> <ul style="list-style-type: none"> <li>• Host Interface</li> <li>• Primary Downstream</li> <li>• Wideband Capable</li> <li>• Voice Enabled</li> <li>• DS Change Times</li> </ul>                                                                                                                                                                                                                                                                    |
| C Release    | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| BC Release   | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.1(4)CX    | Support was added for the Cisco uBR10012 router.                                                                                                                                                                                                                                                                                                                                                                                            |
| 12.2(15)CX   | The <b>verbose</b> option displays the sysDescr field for each cable modem, when the <b>cable modem remote-query</b> command has been configured. Other fields have also been added to support DOCSIS 2.0 (ATDMA) operation.                                                                                                                                                                                                                |
| E Release    | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 12.1(10)EC1  | Adds an exclamation point to cable modems that have exceeded the maximum delay/timing offset specified by the <b>cable map-advance</b> command.                                                                                                                                                                                                                                                                                             |
| 12.1(11b)EC1 | The output for the Online State field was updated for the <b>cable tftp-enforce</b> command. A pound sign (#) appears next to the state value when a cable modem was allowed to come online without attempting to download a DOCSIS configuration file through the cable interface with the Cisco CMTS.                                                                                                                                     |
| 12.1(20)EC1  | The three new states—online(pktd), online(ptd), and expire(pktd)—were added to the Cisco IOS Release 12.1 EC train.                                                                                                                                                                                                                                                                                                                         |
| N Release    | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11.3(5)NA    | The output was reorganized and the Receive Power field was added.                                                                                                                                                                                                                                                                                                                                                                           |
| T Release    | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2.1(1a)T1    | The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular cable modem and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the cable modem has reached its maximum power transmit level and cannot increase its power level further. |
| 12.0(7)T     | The <b>detail</b> option was replaced with the <b>verbose</b> option.                                                                                                                                                                                                                                                                                                                                                                       |
| X Release    | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11.3XA       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 12.0(4)XI    | The output was expanded to show the primary service identifier (SID) and the customer premises equipment (CPE) count.                                                                                                                                                                                                                                                                                                                       |
| 12.0(7)XR    | The output of this command was enhanced to show that the Cisco CMTS has detected an unstable return path for a particular cable modem and has compensated with a power adjustment. An asterisk (*) appears in the power adjustment field for a modem when a power adjustment has been made; an exclamation point (!) appears when the cable modem has reached its maximum power transmit level and cannot increase its power level further. |

| BC Release   | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2(33)SCA  | <p>This command was integrated into Cisco IOS Release 12.2(33)SCA, with the following changes:</p> <ul style="list-style-type: none"> <li>• Support for the Cisco uBR7225VXR router was added.</li> <li>• Support for specifying the IPv6 address of a cable modem or CPE device was added.</li> <li>• The <b>name</b> keyword option was added for specifying the fully-qualified domain name of a cable modem.</li> <li>• The output column spacing and headings were changed, including some of the following changes: <ul style="list-style-type: none"> <li>• “BPI Enb” has been changed to “BPI”</li> <li>• “DIP” output field was added to indicate support of dual IP for both IPv4 and IPv6 addressing.</li> </ul> </li> <li>• The following new initialization states were added to show initialization of cable modems and CPEs supporting IPv6: <ul style="list-style-type: none"> <li>• init6(s)—CMTS router has seen SOLICIT message.</li> <li>• init6(a)—CMTS router has seen ADVERTISE message.</li> <li>• init6(r)—CMTS router has seen REQUEST message.</li> <li>• init6(i)—CMTS router has seen REPLY message.</li> <li>• init6(o)—CMTS router has seen version 6 TFTP request.</li> <li>• init6(t)—CMTS router has seen version 6 TOD request.</li> </ul> </li> </ul> |
| 12.2(33)SCB  | A new keyword, <b>cm-status</b> , was added to display cable modem status events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 12.2(33)SCC  | <p>This command was modified with the following changes:</p> <ul style="list-style-type: none"> <li>• The command output displays the cable modem attribute bitmasks.</li> <li>• The command output provides basic receive-statistics for all event code types of the specified cable modem.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 12.2(33)SCD  | This command was modified. The cm-status keyword was added to display the cable modem status events and the queue keyword was added to display downstream HQF queue information on the Cisco uBR7225VXR and Cisco uBR7246VXR routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 12.2(33)SCD2 | This command was modified. The command output was modified to display the cable modems that are in upstream and downstream partial service mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 12.2(33)SCE  | This command was modified. The <i>port</i> parameter was changed to <i>cable-interface-index</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 12.2(33)SCE4 | This command was modified. The command output displays online time of the modem since the last counter reset, along with the total time online.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 12.2(33)SCF              | This command was modified. The <i>logical-channel-index</i> argument was added. The <b>show cable modem verbose</b> command output was modified to display the downstream channel information for the cable modems.                                                                                                                                                                                                                                  |
| 12.2(33)SCH              | The <b>show cable modem verbose</b> command output was modified to display the ranging class ID of a cable modem.                                                                                                                                                                                                                                                                                                                                    |
| 12.2(33)SCG5             | The output of the command with the <b>verbose</b> keyword was modified to display the status of the Upstream Drop Classifier (UDC) feature. The field “UDC Enabled” was added in the output.                                                                                                                                                                                                                                                         |
| 12.2(33)SCH1             | The output of the command with the <b>verbose</b> keyword was modified to display the following: <ul style="list-style-type: none"> <li>• The channel IDs for 16 downstream channels and channel information for 4 upstream channels on the Cisco uBR10012 routers using PRE4 or versions later than PRE4, and Cisco uBR7200 series routers using NPE-G2.</li> <li>• The number of IPv6 addresses per cable modem and the maximum values.</li> </ul> |
| 12.2(33)SCH2             | The output of the command with the <b>verbose</b> keyword was modified to display the channel IDs for 24 downstream channels and the channel information for 8 upstream channels on the Cisco uBR10012 routers using PRE4 or versions later than PRE4, and Cisco uBR7200 series routers using NPE-G2.                                                                                                                                                |
| 12.2(33)SCI2             | This command was integrated into Cisco IOS Release 12.2(33)SCI2.                                                                                                                                                                                                                                                                                                                                                                                     |
| IOS-XE 3.15.0S           | This command was implemented on the Cisco cBR Series Converged Broadband Router. The <b>name</b> , <b>queue</b> keyword and the <i>logical-channel-index</i> variable were removed.                                                                                                                                                                                                                                                                  |
| IOS-XE 3.16.0S           | The output of the command was modified to display the battery backup mode for MAC state. The output of the command with <b>verbose</b> keyword was modified to display battery mode and battery mode status.                                                                                                                                                                                                                                         |
| IOS-XE 3.18.0S           | The output of the command was modified to display the energy management mode for MAC state. The output of the command with <b>verbose</b> keyword was modified to display energy management mode and energy management mode status.                                                                                                                                                                                                                  |
| IOS-XE 3.18.0SP          | The output of the command with the <b>verbose</b> keyword was modified to display the new DOCSIS 3.1 Commanded Power levels per upstream.                                                                                                                                                                                                                                                                                                            |
| IOS-XE 16.6.1            | The output of the command with the <b>verbose</b> keyword was modified to display the cable modem’s CM-STATS-ACK capability.<br><br>A new keyword, <b>ack</b> , was added to display cable modems to which cable modem status acknowledgement messages are sent.                                                                                                                                                                                     |
| IOS XE Amsterdam 17.3.1w | The output of the command was updated to include the partial mode description.                                                                                                                                                                                                                                                                                                                                                                       |
| IOS XE Bengaluru 17.6.1x | The output of the command was updated to display more detailed CM-STATUS event history.                                                                                                                                                                                                                                                                                                                                                              |

**Usage Guidelines**

This command displays information for all cable modems, for all cable modems attached to a specific CMTS cable interface, or for a particular cable modem, identified by its IP address, MAC address, or its domain name. The output is sorted by the cable interface and the cable modem's MAC address.

**Note** The upstream channel list displayed by **show cable modem ip-address/mac-address [verbose]** command is the subset of upstream service flow forwarding interface channel set of the cable modem.

**Note** In Cisco IOS Release 12.2(33)SCA, the **show cable modem domain-name** command must be run first on the route processor (RP) of the CMTS router before any domain name can be used as part of a cable command.

**Tip** Several options in the **show cable modem** command do not pause the screen to display the information page by page, even if the **terminal length** command has been used to set the page size of your terminal. Paging and pausing the display could result in outdated or stale information for cable modems, and thus produce an incorrect snapshot of the current cable modem state of the system. To capture or review this information, use your terminal program's capture buffer to save the information to a file, and then review it offline.

**Tip** You can also specify the MAC address or IP address for a CPE device, and the Cisco CMTS will display the information for the cable modem that is associated with that CPE device in its internal database.

**Note** If the CPE IP address is no longer associated with a cable modem, the **show cable modem** command might not display information about the cable modem. To display the IP address of the CPE device for the cable modem, use the **clear cable host ip-address** command to clear the IP address of the modem from the router database, and then enter the **ping docsis mac-address** command, which resolves the MAC address by sending the DOCSIS ping to the CM.

**Note** When an IPv4 CPE is moved from one bundle interface to another bundle interface, the **show cable modem** command displays duplicate CPE device under the original modem and new modem. CPE ping may also fail. To prevent duplication, use the **clear cable host** command to manually remove the old CPE device entry before moving the IPv4 CPE from one bundle interface to another. Reload the CPE after moving it to another bundle interface.

Refer to the following document on Cisco.com for additional information about cable interface bundling and virtual interface bundling on the Cisco CMTS:

- *Cable Interface Bundling and Virtual Interface Bundling on the Cisco CMTS*

### Operation with Hot Standby Connection-to-Connection Protocol (HCCP) Configuration

If you are using Hot Standby Connection-to-Connection Protocol (HCCP) 1+1 or 1:n (N+1) redundancy, the new primary processor after a switchover automatically creates a new database of the online cable modems. This means that the **show cable modem ip-address** command might not show a particular cable modem until the CMTS receives IP traffic from that cable modem. You can force IP traffic by using the **ping ip-address** command, and then the **show cable modem ip-address** command will show the cable modem. You can also display any particular cable modem by using the **show cable modem | include ip-address** command.

In addition, when HCCP redundancy has been configured, the Cisco IOS software automatically synchronizes the secondary, backup cards whenever the configuration is changed. The cards can also be synchronized manually, using the **hccp resync** command. When a SYNC event command is occurring, CLI commands might be very slow to respond. In particular, if you enter the **show cable modem** command at the same time a SYNC event is occurring, the command might respond produce a blank display, or it might display an error message similar to the following:

```
%No response from slot 6/1. Command aborted
```

If this occurs, wait a minute or so and retry the command.

### Operation of the show cable modem Commands with Different Cable Interface Line Cards

The **show cable modem** commands display the most current information for standard cable interface line cards. If the card itself is down, the **show cable modem** commands still show whatever information is appropriate (such as offline cable modems and flap list information).

The **show cable modem** commands function slightly different when used on routers that are using Broadband Processing Engine (BPE) cable interface line cards (such as the Cisco uBR-MC16U/X, Cisco uBR-MC28U/X, or Cisco uBR10-MC5X20S/U/H). When BPE cards are the only cable interface cards installed, the **show cable modem** commands do not display any output until at least one BPE card is up and communicating with the router processor. If the BPE cards are not yet up, the **show cable modem** command does not display any output.

**Note** The **hccp** commands are not supported on the Cisco cBR router for Cisco IOS-XE 3.15.0S.

### Example of the show cable modem Command Output for all cable modems

The following sample output from the **show cable modem** command shows the default cable modem displays for individual cable modems.

```
Router# show cable modem
```

| MAC Address    | IP Address  | I/F     | MAC State | Prim Sid | RxPwr (db) | Timing Offset | Num CPEs | BPI Enbld |
|----------------|-------------|---------|-----------|----------|------------|---------------|----------|-----------|
| 0010.7b6b.58c1 | 0.0.0.0     | C4/0/U5 | offline   | 5        | -0.25      | 2285          | 0        | yes       |
| 0010.7bed.9dc9 | 0.0.0.0     | C4/0/U5 | offline   | 6        | -0.75      | 2290          | 0        | yes       |
| 0010.7bed.9dbb | 0.0.0.0     | C4/0/U5 | offline   | 7        | 0.50       | 2289          | 0        | yes       |

| 0010.7bb3.fcdd | 0.0.0.0     | C5/0/U5 | init(r1)  | 2        | -20.00     | 1624          | 0        | no        |
| 0010.7b43.aa7f | 0.0.0.0     | C5/0/U5 | init(r2)  | 3        | 7.25       | 1623          | 0        | no        |

**Example of the show cable modem Command for a Specified MAC Address**

```
Router# show cable modem 0010.7bb3.fcd1
```

| MAC Address    | IP Address  | I/F     | MAC State | Prim Sid | RxPwr (db) | Timing Offset | Num CPEs | BPI Enbld |
|----------------|-------------|---------|-----------|----------|------------|---------------|----------|-----------|
| 0010.7bb3.fcd1 | 10.20.113.2 | C5/0/U5 | online    | 1        | 0.00       | 1624          | 0        | Y         |

**Example of the show cable modem Command for all cable modems on a Cisco uBR10012 Router**

The following shows a typical display for a Cisco uBR10012 router:

**Note** The asterisk(\*) in the Primary SID (Prim Sid) field indicates that the modem has service flows with zero blaze index in Cisco IOS Release 12.3(23)BC. In Cisco IOS Release 12.2(33)SCB and later, the asterisk that may appear in the Primary SID field does not signify anything.

```
Router# show cable modem
```

**Example of show cable modem Command When no cable modems are Online**

The following example shows sample output when the cable interface line cards are up, but no cable modems are yet online:

```
Router# show cable modem
```

| MAC Address | IP Address | I/F | MAC State | Prim Sid | RxPwr (db) | Timing Offset | Num CPE | BPI Enb |
|-------------|------------|-----|-----------|----------|------------|---------------|---------|---------|
|-------------|------------|-----|-----------|----------|------------|---------------|---------|---------|

### Example of show cable modem Command When no Cable Interface Line Cards are Up

The following example shows sample output when the Cisco CMTS router contains only Broadband Processing Engine (BPE) cable interface line cards and none of the cable interface line cards are up:

```
Router# show cable modem
```

### Example of the show cable modem Command for all cable modems on a Cisco cBR Series Converged Broadband Router

The following shows a typical display on a Cisco cBR Series Converged Broadband Router:

```
Router#show cable modem
```

| MAC Address    | IP Address  | I/F       | MAC State | Prim Sid | RxPwr (dBmV) | Timing Offset | Num CPE | I P |
|----------------|-------------|-----------|-----------|----------|--------------|---------------|---------|-----|

```

**Example of show cable modem verbose Command for a Specified MAC Address**

The following example shows sample output for the **verbose** option for a particular CM:

```
Router# show cable modem 0010.7bb3.fcd1 verbose
```

```
MAC Address : 00C0.7bb3.fcd1
IP Address : 10.20.113.2
Prim Sid : 1
QoS Profile Index : 6
Interface : C5/0/U5
sysDescr : Vendor ABC DOCSIS 2.0 Cable Modem
Upstream Power : 0 dBmV (SNR = 33.25 dBmV)
Downstream Power : 0 dBmV (SNR = ----- dBmV)
Timing Offset : 1624
Initial Timing Offset : 2812
Received Power : 0.25
MAC Version : DOC1.0
Qos Provisioned Mode : DOC1.0
Enable DOCSIS2.0 Mode : Y
Phy Operating Mode : atdma
Capabilities : {Frag=N, Concat=N, PHS=N, Priv=BPI}
Sid/Said Limit : {Max Us Sids=0, Max Ds Sids=0}
Optional Filtering Support : {802.1P=N, 802.1Q=N}
Transmit Equalizer Support : {Taps/Symbol= 0, Num of Taps= 0}
Number of CPE IPs : 0 (Max CPES = 1)
CFG Max-CPE : 1
Flaps : 373 (Jun 1 13:11:01)
Errors : 0 CRCs, 0 HCSes
Stn Mtn Failures : 0 aborts, 3 exhausted
Total US Flows : 1 (1 active)
Total DS Flows : 1 (1 active)
Total US Data : 1452082 packets, 171344434 bytes
Total US Throughput : 0 bits/sec, 0 packets/sec
Total DS Data : 1452073 packets, 171343858 bytes
Total DS Throughput : 0 bits/sec, 0 packets/sec
Active Classifiers : 0 (Max = NO LIMIT)
DSA/DSX messages : reject all
Dynamic Secret : A3D1028F36EBD54FDCC2F74719664D3F
Total Time Online : 16:16
```

**Note** When a DCC occurs, the cable modem US and DS counters are reset. The US and DS counters include counters such as data and throughput seen in the **show cable modem (mac-address) verbose** command output and packets and bytes seen in the **show cable modem (mac-address) counters** command output.

**Note** The “Number of CPES” field shows the value set for the CM, not the value for the CMTS that is set by the **cable modem max-cpe** command. In Cisco IOS Release 12.2(15)BC1 and later releases, the **verbose** display also includes information about the dynamic shared-secret feature (see the **cable dynamic-secret** command).

**Note** An asterisk (\*) in the Receive Power column indicates that a power adjustment has been made for that CM. An exclamation point (!) in the Receive Power column indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further. An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the **cable map-advance** command. A pound sign (#) in the MAC State column indicates that the **cable tftp-enforce mark-only** command has been used for the cable modem to attempt a TFTP download of the DOCSIS configuration file before registering, but the cable modem did not do so (Cisco IOS Release 12.1(11b)EC1 and Cisco IOS Release 12.2(8)BC2 or later releases).

**Tip** The **show cable modem** command displays the cable modem timing offset in DOCSIS ticks, while other commands, such as **cable map-advance**, display the offset in microseconds. Use the following method to convert microseconds to DOCSIS ticks: ticks = microseconds\*64/6.25 .

### Example of the Updated show cable modem verbose Command for a Specified MAC Address in Cisco IOS Release 12.3(23)BC

The following example shows sample output for the **verbose** option for a particular cable modem for the Cisco IOS Release 12.3(23)BC with new output fields:

```
Router# show cable modem 0000.39b9.ac51 verbose
MAC Address : 0000.39b9.ac51
IP Address : 55.1.176.11
Prim Sid : 7
QoS Profile Index : 5
Host Interface : C8/0/0/U5
Primary Downstream : Mo3/0/1:3 (RfId : 27)
Wideband Capable : N
sysDescr : Toshiba PacketCable 1.0 EMTA ; <<HW_REV: 13.0.0;
VENDOR: Toshiba Corporation; BOOTR: 2.2; SW_REV: 6.1.318; MODEL: PCX3000>>
Upstream Power : 29.00 dBmV (SNR = 16.07 dB)
Downstream Power : 14.90 dBmV (SNR = 34.30 dB)
Timing Offset : 1774
Initial Timing Offset : 1774
Curr US Timing Adjust : 272
Prev US Timing Adjust : 0
Received Power : 0.00 dBmV
MAC Version : DOC1.1
QoS Provisioned Mode : DOC1.0
Enable DOCSIS2.0 Mode : Y
Phy Operating Mode : tdma
Capabilities : {Frag=N, Concat=Y, PHS=N, Priv=}
Sid/Said Limit : {Max US Sids=0, Max DS Sids=0}
Optional Filtering Support : {802.1P=N, 802.1Q=N}
Transmit Equalizer Support : {Taps/Symbol= 0, Num of Taps= 0}
Number of CPE IPs : 0(Max CPE IPs = 17)
CFG Max-CPE : 3
Flaps : 7(Sep 16 20:04:13)
Errors : 0 CRCs, 0 HCSes
Stn Mtn Failures : 0 aborts, 0 exhausted
Total US Flows : 1(1 active)
```

```

Total DS Flows : 1(1 active)
Total US Data : 3399 packets, 1956063 bytes
Total US Throughput : 0 bits/sec, 0 packets/sec
Total DS Data : 125 packets, 10704 bytes
Total DS Throughput : 0 bits/sec, 0 packets/sec
Active Classifiers : 0 (Max = NO LIMIT)
CM Upstream Filter Group : 10
DSA/DSX messages : permit all
Voice Enabled : NO
DS Change Times : 0
Total Time Online : 7d22h

```

**Note** In Cisco IOS Release 12.3(23)BC, the output for this command does not display information about dynamic shared secret.

### Example of show cable modem Command for a cable modem or CPE With a Specified IPv6 Address

The following example shows sample output for the **show cable modem** command for a cable modem with the IPv6 address of 2001:ODBA:4321:600:980D:E743:174F:1E48.

**Note** The IP Address field shows "---" because the IPv6 address is too long for the size of the output field. To view a complete IPv6 address for a device, use the **verbose** form of the command.

```

Router# show cable modem 2001:ODBA:4321:600:980D:E743:174F:1E48

```

| MAC Address    | IP Address | I/F       | MAC State | Prim Sid | RxPwr (dBmV) | Timing Offset | Num CPE | P I |
|----------------|------------|-----------|-----------|----------|--------------|---------------|---------|-----|
| 0019.474a.ccd0 | ---        | C5/0/1/U0 | w-online  | 38       | 0.00         | 1580          | 0       | N   |

### Example of the show cable modem verbose Command Output That Shows cable modem Attribute Masks in Cisco IOS Release 12.2(33)SCC

The following example shows the sample output for the **verbose** option for a particular cable modem in Cisco IOS Release 12.2(33)SCC:

```

Router# show cable modem 001a.c3ff.ce9e verbose
MAC Address : 0019.474a.d396
IP Address : 10.10.2.4
IPv6 Address : ---
Dual IP : N
Prim Sid : 1

### Example of the show cable modem Command Output for upstream drop classifier (UDC) feature

Effective from Cisco IOS Release 12.2(33)SCG5, the **verbose** keyword displays the status of the Upstream Drop Classifier (UDC) feature for a specific cable modem. The “UDC Enabled” field displays ‘Y’ if it is enabled.

The following example shows the output of the **show cable modem** command with the **verbose** keyword for the UDC feature:

```
Router# show cable modem 4458.2945.3004 verbose
```

```

MAC Address : 4458.2945.3004

**Table 98: show cable modem Field Descriptions**

| Field          | Description                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC Address    | MAC address for the CM.                                                                                                                                               |
| IP Address     | IP address that the DHCP server has assigned to the CM.                                                                                                               |
| IPv6 Address   | IPv6 address that the DHCP server has assigned to the CM.                                                                                                             |
| Dual IP        | Support of dual IP for both IPv4 and IPv6 addressing.                                                                                                                 |
| I/F, Interface | Cable interface line card providing the upstream for this CM.                                                                                                         |
| sysDescr       | Vendor and model of the cable modem, as reported by the cable modem. This field displays a value only when the <b>cable modem remote-query</b> command is configured. |

| Field                              | Description                                                                                                                                                                                                                                                                                                          |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upstream Power<br>Downstream Power | Upstream and Downstream Power fields are displayed only if the CM remote-query feature has been enabled using the <b>cable modem remote-query</b> command. Upstream Power displays the cable modem transmit level in dBmV, and Downstream Power displays the dBmV level received at the CM, as measured by the CMTS. |
| MAC State                          | Current state of the MAC layer.                                                                                                                                                                                                                                                                                      |
| Prim SID                           | Primary SID assigned to this CM.                                                                                                                                                                                                                                                                                     |
| Host Interface                     | Host interface name.                                                                                                                                                                                                                                                                                                 |
| Primary Wideband Channel ID        | Bonding group ID of the wideband interface assigned to the CM.                                                                                                                                                                                                                                                       |
| MD-DS-SG                           | MAC Domain Downstream Service Group, the downstream channels of a single MAC domain that reach the cable modem.                                                                                                                                                                                                      |
| DSID                               | Downstream Service Identifier.                                                                                                                                                                                                                                                                                       |
| Primary Downstream                 | Primary downstream channel assigned to the CM.                                                                                                                                                                                                                                                                       |
| Wideband Capable                   | Cable modem is wideband-capable or not.                                                                                                                                                                                                                                                                              |
| Downstream Channel DCID RF Channel | Downstream channel and channel ID used by a CM.                                                                                                                                                                                                                                                                      |
| Multi-Transmit Channel Mode        | Cable modem is in MTC mode or not.                                                                                                                                                                                                                                                                                   |
| UDC Enabled                        | Upstream Drop Classifier enabled or disabled. Displays 'Y' for enabled state and 'N' for disabled.                                                                                                                                                                                                                   |
| Upstream SNR                       | Upstream signal-to-noise ratio (SNR) for a particular cable modem (CM), in decibels (dB).                                                                                                                                                                                                                            |
| Upstream SM MER (dB)               | Upstream station maintenance (SM) modulation error ratio (MER) for a particular cable modem, in decibels (dB).                                                                                                                                                                                                       |
| Upstream Data MER (dB)             | Upstream modulation error ratio (MER) for a particular cable modem, in decibels (dB). This field is displayed only when RF adaptation is enabled.                                                                                                                                                                    |

| Field                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| RxPwr, Received Power                                                                                              | <p>Average power in dBmV for the upstream channel symbol rate for the CM. With default settings, 0 dBmV is considered optimal, but a range of -1 to 1 dBmV is allowable. When cable modems exceed this range, older Cisco IOS releases supported a drop to as low as -2 dBmV. Recent Cisco IOS releases support a drop to as low as -4 dBmV.</p> <p>This field supports a resolution of 0.25 dBmV, but the dB resolution level for cable modems and for the Cisco CMTS are slightly higher—approximately 1.0 and 1.4 dB.</p> <p><b>Note</b> An asterisk (*) in the RxPwr column indicates that a power adjustment has been made for that CM. An exclamation point (!) indicates that the cable modem has reached its maximum power transmit level and cannot increase its power level further.</p>                                                                                |
| Timing Offset and Initial Timing Offset                                                                            | <p>Timing offset for the CM, in ticks, as recognized on the CMTS. (A tick, as used here, is 6.25/64 microseconds.) This is the delay between when a particular cable modem is scheduled to make a transmission and when the CMTS actually receives it.</p> <p><b>Note</b> An exclamation point (!) in the Timing Offset column indicates that the cable modem has exceeded the maximum delay and timing offset specified by the <b>cable map-advance</b> command.</p> <p><b>Note</b> The timing offset shown here is typically smaller than the TX Time Offset value shown by the <b>show cable modem remote-query</b> command, because the latter value is the offset as recognized on the cable modem (which will include any internal delay between when the cable modem software begins the transmission and when the bits actually appear on the local cable interface).</p> |
| Reported Transmit Power (dBmV)                                                                                     | Reported Transmit Power level by the cable modem for each upstream channel. This applies only to the cable modems operating in the MTC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Peak Transmit Power (dBmV)                                                                                         | This is the maximum transmit power level that the cable modem in the MTC mode could transmit at for the upstream channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Minimum Transmit Power (dBmV)                                                                                      | This is the minimum transmit power level that the cable modem in the MTC mode could transmit at for the upstream channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Pre-EQ Good : Pre-EQ Scaled :<br>Pre-EQ Impulse: Pre-EQ Direct<br>Loads | Equalizer statistics counter.                                                                                                                                                                                                                                                                                             |
| Good Codewords rx                                                       | Good code words for a particular upstream channel. This counter is reset during interface reset.                                                                                                                                                                                                                          |
| Corrected Codewords rx                                                  | Correctable code words for a particular upstream channel. This counter is reset during interface reset.                                                                                                                                                                                                                   |
| Uncorrectable Codewords rx                                              | Uncorrectable code words for a particular upstream channel. This counter is reset during interface reset.                                                                                                                                                                                                                 |
| sysDescr                                                                | Identifies the vendor and model of the cable modem, as reported by the cable modem. This field displays a value only when the cable modem remote-query.                                                                                                                                                                   |
| Num CPEs, CFG Max-CPE                                                   | Indicates the number of CPE devices for which the cable modem is providing services.                                                                                                                                                                                                                                      |
| Number of CPE IPs                                                       | Indicates the maximum number of IP addresses assigned to CPE devices behind this CM, as configured by the <b>cable max-hosts</b> command.                                                                                                                                                                                 |
| Ver, MAC Version                                                        | Displays the maximum supported version of DOCSIS that the cable modem supports (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0).                                                                                                                                                                                                      |
| QoS Prov, QoS Provisioned<br>Mode                                       | Displays the version of DOCSIS that the cable modem currently is provisioned for (DOCSIS 1.0, DOCSIS 1.1, DOCSIS 2.0).                                                                                                                                                                                                    |
| Enable DOCSIS 2.0 Mode                                                  | Indicates that the cable modems are allowed to come online when in mixed-mode environments such as DOCSIS 1.0 TDMA, DOCSIS 1.1 TDMA and DOCSIS 2.0 ATDMA. This value is set to Y by default, unless the TLV 39 has been set to disabled (0) in the CM's Registration Request message or in the DOCSIS configuration file. |
| Phy Operating Mode                                                      | Indicates the type of PHY-layer modulation that the cable modem is using: tdma or atdma. Also indicates the TDMA/ATDMA/SCDA mode that the cable modem is operating on a specific channel.                                                                                                                                 |
| Modem Status                                                            | Indicates the overall modem state and the security state of the primary SID.                                                                                                                                                                                                                                              |
| BPI Enbld, BPI                                                          | Indicates whether or not Baseline Privacy Interface (BPI) or BPI Plus (BPI+) encryption is enabled for the CM.                                                                                                                                                                                                            |
| DIP                                                                     | Dual IP flag. Identifies whether or not ("Y" or "N") the cable modem or CPE supports both IPv4 and IPv6 addressing.                                                                                                                                                                                                       |
| Capabilities                                                            | Indicates what the cable modem reported as its capabilities in its Registration Request message: DOCSIS fragmentation, concatenation, packet header suppression (PHS), and BPI encryption.                                                                                                                                |

| Field                             | Description                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Capabilities             | Indicates the privacy mode used by the cable modem (BPI or BPI+), early authentication and encryption (EAE) support, and the Key Length.        |
| Optional Filtering Support        | Indicates whether 802.1P or 802.1Q packet filtering is enabled for this CM.                                                                     |
| Transmit Equalizer Support        | Number of taps being used for transmit equalization.                                                                                            |
| Flaps                             | Number of flaps reported by this CM, with the date and time of the last flap within the parentheses.                                            |
| Errors                            | Number of frame CRC and HCS errors reported for this CM.                                                                                        |
| Stn Mtn Failures                  | Number of station maintenance (cable keepalive) messages that the CMTS sent to this cable modem but did not receive any reply.                  |
| Total US Flows                    | Total number of upstream service flows, with the number of active service flows within the parentheses.                                         |
| Total DS Flows                    | Total number of downstream service flows, with the number of active service flows within the parentheses.                                       |
| Total US Data                     | Total data this cable modem has transmitted on the upstream, in packets and bytes.                                                              |
| Total US Throughput               | Calculated throughput for this cable modem on the upstream, if available.                                                                       |
| Total DS Data                     | Total data this cable modem has received on the downstream, in packets and bytes.                                                               |
| Total DS Throughput               | Calculated throughput for this cable modem on the downstream, if available.                                                                     |
| Active Classifiers                | Current number of active classifiers for this CM, with the maximum number of allowable classifiers for this cable modem within the parentheses. |
| CM Required Attribute             | Indicates the current required attribute-mask value.                                                                                            |
| CM Forbidden Attribute            | Indicates the current forbidden attribute-mask value.                                                                                           |
| DSA/DSX messages                  | Indicates whether dynamic service changes (DSX) from the cable modem are permitted (permit all) or disallowed (reject all).                     |
| Voice Enabled                     | Indicates whether the cable modem is voice-enabled.                                                                                             |
| Number of Multicast DSIDs Support | Indicates the total number of supported multicast DSIDs.                                                                                        |
| FCType10 Forwarding Support       | Indicates FCType10 Forwarding Support.                                                                                                          |

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic Secret     | <p>Dynamically-generated shared secret (a 16-byte hexadecimal value) that was used in the cable modem's previous registration cycle. If the cable modem is currently offline, this field shows all zeroes. If a cable modem has been excluded from being processed by the dynamic shared secret feature, using the <b>cable dynamic-secret exclude</b> command, this field shows "Excluded".</p> <p><b>Note</b> This field displays a value only when the <b>cable dynamic-secret</b> command has been used on the CMTS interface.</p> |
| Total Time Online  | Amount of time in days, hours, and minutes that this cable modem has been continuously online since it last registered with the CMTS. This field begins incrementing whenever the cable modem enters one of the online(x) MAC states, and is reset to 0 whenever the cable modem enters any other MAC state.                                                                                                                                                                                                                           |
| Event              | Event type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Ranging Class ID   | Upstream ranging class ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Upstream SNR       | Signal-to-noise ratio of the upstream signal (station maintenance).                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Upstream Data SNR  | Signal-to-noise ratio for actual data bursts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The table below shows the possible values for the MAC state field.

**Note** The CM MAC state field can also be retrieved using SNMP by getting the value of the cdxCmtscable modemstatusValue object in the CISCO-DOCS-EXT-MIB. The following symbols appended to the modem state indicate a special condition: An exclamation mark (!) indicates that the cable dynamic-secret command is used with either the mark or reject keyword and the cable modem has failed the dynamic secret authentication check. An ampersand (&) indicates that the cable modem has registered using a self-signed certificate. This is inherently not secure and can be avoided by negating the cable privacy accept-self-signed-certificate command. The asterisk (\*) indicates that the cable modem does not satisfy the BPI+ policy and the data traffic is blocked. The cable privacy bpi-plus-policy command enforces this requirement. A hash sign (#) indicates that the cable modem is using an unknown configuration file. To solve this problem, use the cable dynamic-secret command with the reject keyword. This will reject registration for cable modems with DOCSIS configuration files. In Cisco IOS Releases 12.1(20)EC, 12.2(15)BC1, and earlier releases, when network access is disabled in the DOCSIS configuration file sent to the CM, the network disabled status takes precedence, and the MAC status field shows online(d) even if BPI encryption fails.

**Table 99: Descriptions for the MAC State Field**

| MAC State Value                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
