Introduction

Driven by market evolution towards triple-play services, cable operators in emerging markets are seeking standardized and digital fiber-based solutions for economical and future proof access technologies. Much of the demand is driven by the need to provide higher bandwidth packet transport for Internet connectivity, video and voice services.

Data Over Cable Systems Interface Standard (DOCSIS®) is a standardized technology for services over cable and thus has strong interoperability between system providers. It also provides robust Quality of Service (QoS) methods, ensuring packet delivery during periods of network congestion. Traditionally, DOCSIS runs on linear fiber (or HFC) to provide service and is not naturally applicable for digital fiber. Cisco has bridged the gap by introducing a new access technology called the Remote PHY.

Existing Architecture

In the emerging markets, most triple-play consumers live in multi-tenant buildings (referred to as Multi Dwelling Units or MDU) with the number of residents usually being less than 500 residents per building or cluster. These buildings are typically served by fiber with one of several “final 100 meter” technologies
installed in the buildings. These technologies include fiber, twisted pair, Ethernet, and coaxial. Cable operators have access to the cable in the building and use this cable for their services. Several technologies exist for enabling two-way services over cable. These include a number of proprietary and vendor-specific methods. However, a standards-based approach to using cable is typically preferred by operators, since this ensures vendor interoperability.

**Need for the Cisco Remote PHY Solution**

DOCSIS and EuroDOCSIS are standards that define two-way operation over a cable network. DOCSIS provides the necessary Quality of Service (QoS) tools for ensuring voice call connectivity during periods of network congestion that are anticipated in triple-play networks. DOCSIS is a robust and mature technology for voice, video, and IP video services.

The Cisco Remote PHY solution leverages existing IP technologies like Ethernet PON (EPON), Gigabit-capable Passive Optical Networks (GPON), and Metro Ethernet (MetroE) equipment; it deploys DOCSIS in MDUs over digital fiber to enable two-way services over cable.

### Hardware Compatibility Matrix for Cisco Remote PHY Device

Note: Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

</tr>
</tbody>
</table>

### Benefits

The Cisco Remote PHY solution provides a cost-effective digital fiber-based DOCSIS solution that uses Ethernet PON (EPON), Gigabit-capable Passive Optical Networks (GPON), or Metro Ethernet (MetroE) as the transmission network between the Cisco CMTS and CM. Both the PON technology and DOCSIS is used in the same network.

- Simple and low cost PON transmission as opposed to costly HFC transformation.
- Reduced investment cost including capital and operational expenditure.
- Low-cost yet highly stable Cisco GS7000 node (includes only the PHY layer).
- Reduced CMTS hardware complexity.
- No restriction on Converged Interconnect Network (CIN) network.
- Futureproof architecture. Easy to migrate as the hardware and control functions are on separate layers.
• End-to-end QoS assurance provided by DOCSIS.
• Support for all DOCSIS services.
• Support for existing DOCSIS network provisioning system.
• High access bandwidth.
• With deep fiber, the optical noise contribution to SNR is eliminated. As a result, the remote QAM modulator runs at higher orders of modulation as compared to a centralized QAM modulator.

**Cisco CCAP RF Line Card for R-PHY**

The Cisco CCAP RF line card for remote PHY architecture is available in two flavours:

• CBR-LC-8D31-16U30—This RF line card with the downstream and upstream PHY modules can be connected with the Cisco GS7000 node by configuring it using the `card cBR-CCAP-LC-40G r-phy` command.

• CBR-CCAP-LC-40G-R—This RF line card with no downstream and upstream PHY modules can be connected with the Cisco GS7000 node.

• CBR-CCAP-LC-G2-R—This line card supports a maximum of 8 RPDs in one service group.

**Cisco Digital Physical Interface Card**

The Cisco Digital Physical Interface Card (DPIC) transmits and receives RF signals between the subscriber and headend over the hybrid fiber-coaxial (HFC) system and is DOCSIS-compliant. This interface card is designed specifically for the Cisco eBR router. The PID is cBR-DPIC-8X10G.

The DPIC is installed in the CMTS and connected to the Cisco GS7000 node via the EPON, GPON, or Metro Ethernet. It supports both downstream and upstream traffic. Both the downstream and upstream traffic share the same ports.

The DPIC supports:

• Eight ten gigabit ethernet SFP+ interfaces
• 80 gigabit non-blocking switching architecture with 40+40 protection scheme
• 40 gigabit DOCSIS traffic bandwidth when connected with the Cisco CBR-CCAP-LC-40G-R line card
• Cisco SFP-10G-SR-S/Cisco SFP-10G-LR-S/Cisco SFP-10G-ZR-S/Cisco SFP-10G-ER-S optic modules
• MACSec and 1588 TC

**Cisco Remote PHY Device**

The Cisco 2x2 Remote PHY Device (RPD) resides inside the Cisco GS7000 node. Below are some of its features:

• Full spectrum DOCSIS 3.0 support
• Full spectrum DOCSIS 3.1 support
• Converged broadcast, narrowcast, and VOD video support
• Out of Band (OOB) signaling support
• Dual 10GBE SFP/SFP+ backhaul connectivity
• Support of Daisy Chain architecture topology
• CCAP support
• Support of optical overlay architectures

Additionally, the Cisco Intelligent Remote PHY Device (iRPD) provides an interface to the Intelligent Node RF section. This interface supports control plane communication that allows more extensive diagnostic and configuration control. The Intelligent Node supports touch-less configuration, per port spectrum capture, power-savings mode, and other enhanced features.

Figure 1: Cisco 2x2 RPD

Network Architecture

The Cisco Remote PHY solution supports the *Single Controller Sharing* architecture. In this architecture, multiple Cisco GS7000 equipments share the downstream and upstream channels of a Cisco RF line card in a cisco cBR chassis.
Network Topologies

The Cisco Remote PHY solution supports the following Ethernet-based networking topologies.

If you want to establish Equal-Cost Multi-Path (ECMP) connection between cBR-8 and RPD, pay attention to the ECMP configuration on both cBR-8 and the Converged Interconnect Network (CIN) routers. The number of maximum paths configured must be equal as or larger than the number of ECMP paths you want to set under the routing protocol for cBR-8 and the first adjacent CIN router.
Other Supported Topologies

**Figure 4: Path Redundancy Deployment**

**Daisy Chain Architecture**

Cisco Remote PHY devices support the daisy chain architecture. The daisy chain architecture includes multiple RPDs connected in series. This daisy chaining topology is transparent to CCAP core. The CCAP core is not notified about the chain topology because before the RPD sets up a GCP connection, notification flow is not configured.

**Figure 5: Daisy Chain Deployment**

**Limitations**

- In the daisy-chaining topology, if one RPD in the chain is down or any link in the middle breaks, the RPD in the downstream is disconnected, until the chain is restored again.

- You must be careful when resetting or clearing an RPD, as the CCAP core is not notified about the chain topology. If you clear or reset an upstream RPD in a daisy-chain, all RPDs after that specific RPD will be disconnected until the upstream RPD boots up.
- Each RPD reset needs a reprogramming of the FPGA. The connection is interrupted during this reset.
- The daisy-chaining topology uses both 10G ports of an RPD. Hence, features like link redundancy and port redundancy which need a second port are not supported.
- You should ensure that the total upstream traffic from all RPDs in the chain is not oversubscribing the 10G ports.
- The last RPD in the chain is not allowed to connect back to the switch to avoid a ring.
- The maximum number of RPDs in the chain is limited to six.
Daisy Chain Architecture
Cisco Remote PHY System Bring Up

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Information about Bring Up

Bring up process is prerequisite to the operation of the remote PHY system, just like the cable modem bring up in a DOCSIS system.
How to Bring Up

This section describes how to bring up RPD on Cisco cBR-8.

Configuring DHCP Server

You can choose to configure the DHCP server using any of the following methods.

Configuring DHCP Server using IPv4

To configure DHCP server using IPv4, follow the steps below:

1. Add option for CCAP-Core. Fill in the name, DHCP type, and vendor option string as shown in the figure below.

2. Define option. Fill in the option number and name as shown in the figure below.
3. Define suboption. Fill in the name, type and repeat of suboption 61 as shown in the following figure.

4. Add the option into policy as shown in the following figure. Replace the IP address 120.102.15.1 in the figure to the DPIC port IP address.
Configuring DHCP Server using IPv6 Stateless

The Cisco Remote PHY System supports the Stateless Address Auto Configuration (SLAAC). IPv6 address assignment of the RPD is governed by the configuration bits set in the ICMPv6 Router Advertisement (RA) message and the presence of a valid prefix in the Prefix Information Option (PIO). For more information about RPD IPv6 address assignment, refer to section 6.7 of Remote PHY Specification.

To configure DHCP server using IPv6 Stateless and enable SLAAC, follow the steps below:

1. Configure Prefix Type to “stateless” in CNR prefix.
2. Configure ICMPv6 Router RA message M Bit = 0 and O Bit = 1.

It is recommended that you follow the DHCP options listed in Table 2: Router Advertisement M Bit and O Bit Settings For SLAAC of section 6.7.1 (CM-SP-R-PHY-I10) or 6.6.1 (CM-SP-R-PHY-I11) in the Remote PHY Specification.

To display the RPD get IPv6 address by SLAAC, use the `show dhcp` command.

```
R-PHY#show dhcp
Interface IP-Address Subnet-Mask
vbh0 2001:93:3:58:1204::9fff:fec1:100 ffff:ffff:ffff:ffff:
```

Configuring DHCP Server using IPv6 Stateful

To configure DHCP server using IPv6 Stateful, follow the steps below:

1. Configure Prefix Type to “dhcp” in CNR prefix. See the following image.
2. Configure ICMPv6 Router RA message M Bit = 1.
To display the RPD get IPv6 address by Stateful method, use the `show dhcp` command.

```
R-PHY#show dhcp
```

<table>
<thead>
<tr>

### Configuring PTP

To configure PTP, use the following example as reference:

**On cBR-8 router:**

```
interface Loopback1588
  ip address 159.159.159.4 255.255.255.255
interface TenGigabitEthernet5/1/3 /* connect to ASR903 */
  ip address 192.104.10.4 255.255.255.0
ip route 10.90.3.93 255.255.255.255 192.104.10.93 /* route to ASR903 loopback ip */

ptp clock ordinary domain 0
  servo tracking-type R-DTI
  clock-port slave-from-903 slave
    delay-req interval -4
    sync interval -5
    sync one-step
    transport ipv4 unicast interface Lo1588 negotiation
    clock source 10.90.3.93 /* ASR903 loopback ip */

ptp r-dti 1
  ptp-domain 0 /* same domain number with ptp server */
  clock-port 1
    ethernet 1 /* default value is same index with clock-port index, for RPD, ethernet 1=vbh0, ethernet 2=vbh1 */
    clock-source 10.90.3.93 gateway 93.3.10.2 /* clock-source is ASR093 loopback ip, gateway is ASR093 BDI ID for node */
```

**On ASR903 router as PTP master:**

```
ptp clock ordinary domain 0
```
clock-port Master-to-all-cBR8 master
sync interval -5
sync one-step
transport ipv4 unicast interface Lo1588 negotiation

interface Loopback1588
ip address 10.90.3.93 255.255.255.255

interface GigabitEthernet0/3/5

</tbody>
</table>
Information about Network Authentication

RPD must be able to operate in both authenticated and unauthenticated networks. Whether authentication is required for an RPD is determined by the network that it is connected to. In some cases, RPD is located in an untrusted network, and it must connect to devices inside the trusted network, which presents a potential security vulnerability. 802.1x is introduced to provide authentication services to eliminate the potential security issues.

802.1x is a Layer 2 protocol that uses EAP (Extensible Authentication Protocol) to provide authentication services. Following certificates are needed to use the network authentication:

- Cablelabs Root CA certificate: caRoot.pem
- CableLabs Device CA Certificate: deviceCA.pem
- RPD Certificate: rpdCert.pem, private key: rpd.key
- Cablelabs Service Provider CA Certificate: spCA.pem
- AAA Server Certificate: aaaCert.pem, private key: aaa.key

How to Enable Network Authentication

This section describes how to enable network authentication for RPD.

Installing Certificates in Radius Server

To install the certificate in Radius server, follow the steps below:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| Step 1 | Combine CA certificate for AAA server.  
Example:  
cat spCA.pem caRoot.pem > ca_root_srv.pem |
| Step 2 | In freeRadius Server, copy "ca_root_srv.pem", "spCA.pem", "aaaCert.pem" and "aaa.key" to "/etc/freeradius/certs". |

Configuring Radius Server

To install the certificate in RPD, follow the steps below:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Define a new client in /etc/freeradius/clients.conf</td>
</tr>
</tbody>
</table>
Example:

```plaintext
client rphytest_ng13 {
  ipaddr = 20.5.0.36
  secret = rphytest
  shortname = ng13_switch
  require_message_authenticator = yes
}
```

The "ipaddr" is the switch's management ip address.

**Step 2**

In "/etc/freeradius/eap.conf", change the following lines in "tls" to specify the server's private key file and certificate files.

Example:

```plaintext
tls {
  private_key_file = ${certdir}/aaa.key
  certificate_file = ${certdir}/aaaCert.pem
  CA_file = ${cadir}/ca_root_srv.pem
}
```

**Step 3**

Start radius in radius sever.

Example:

```plaintext
sudo freeradius
```

Make sure only one freeradius instance is running.

---

**Configuring Switch**

To configure the switch, follow the steps below:

**Note**

This procedure is for Catalyst 3750 switch, other switch may use different commands.

**Procedure**

**Step 1**

Add the following configuration in global configuration mode.

Example:

```plaintext
dot1x system-auth-control /* enable 802.1x */
aaa new-model
aaa authentication dot1x default group radius
radius-server host 10.79.41.103 auth-port 1812 key rphytest
```

**Step 2**

Add the following configuration under interface which connects to RPD.

Example:

```plaintext
authentication port-control auto
dot1x pae authenticator
```
Verifying Authentication Status

To display dot1x authentication information for RPD, use the `show dot1x` command as shown in the following example:

```
Router# show dot1x summary
Interface  Core-id    EAP_Received Status
vh0        CORE-3415960568 True  UP

Router# show dot1x detail
Interface  Core-id    EAP_Received Status

```
CHAPTER 4

Synchronizing Time on Cisco Remote PHY Devices

This section explains how to synchronize time on the Remote PHY (R-PHY) devices and CCAP core of the Cisco cBR Router.

- Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 21
- Information about Time Synchronization, on page 21
- How to Configure Time Synchronization, on page 22
- Configuration Examples, on page 29
- Feature Information for Synchronizing Time on R-PHY Devices, on page 30

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

</tr>
</tbody>
</table>

Information about Time Synchronization

In a Remote PHY system, synchronizing its local timestamp and reference frequency to the cable converged access platform core function (CCAP Core) is important. The protocol used for this feature, the Precision Time Protocol (PTP), helps in synchronizing time between a CCAP core function and a series of remote PHY devices (RPD) that enable R-PHY and provides support for converged DOCSIS, video, and out-of-band (OOB) services.
Cisco CBR-8 supports PTP Ordinary Clock (OC) slave mode, in which the PTP slave ports are from the backhaul 10GE Ethernet ports or the management Ethernet ports of SUP PIC.

Remote DTI

Remote DOCSIS Timing Interface (R-DTI) is the network synchronization protocol used between CCAP-core and R-PHY. When traffic from the CCAP-Core is received on the downstream receiver, the following processes occur:

• Terminates DEPI framing
• Extracts the payload, frames it, modulates, and transmits it out

During the upstream process, the signal is received from the coax and the system demodulates it. From the FEC payload, the DOCSIS frames are extracted and placed in the UEPI encapsulation. The frames are then transmitted through the upstream transmitter to the CCAP core. A local CPU manages DEPI and GCP control planes, and interfaces with network management. A clocking circuit interfaces with the R-DTI and manages clocking for the R-DTI entity.

The GS7000 R-PHY supports map re-stamp option.

Restrictions for Configuring Time Synchronization

The following restrictions are applicable to configuring time synchronization on Cisco cBR-8.

• Cisco cBR-8 supports PTP slave on both SUP-PIC and DPIC.

• Cisco RPD PTP does not support pass-through mode. Pass-through mode means RPDs are communicating with PTP server through cBR-8, and cBR-8 is PTP unaware of the communication between RPDs with PTP server.

How to Configure Time Synchronization

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Configuring Time Interface and PTP domain

To configure time interface and PTP domain, use the following procedure.

```
enable
configure terminal
interface type [slot_#/]port_#
interface Loopback1588
    ip address <IP Address/subnet>
interface TenGigabitEthernet<slot/port>
    ip address <IP Address/subnet>

ip route < PTP master IP Address/subnet> < loopback IP Address>
```
ptp clock ordinary domain 0 (This is for CBR PTP connection)
servo tracking-type R-DTI
clock-port slave-from-903 slave
delay-req interval -4
sync interval -5
sync one-step
transport ipv4 unicast interface Lo1588 negotiation
clock source < PTP master loopback IP Address>

The following table explains the parameters used in this example:

**Table 5: Parameters for time interface and PTP domain configuration**

<table>
<thead>

</tbody>
</table>
Verifying Time Interface and PTP Domain Configuration

The following example shows how to verify the time interface and PTP domain configuration:

Router# show ptp clock running domain 0
Load for five secs: 5%/2%; one minute: 6%; five minutes: 6%
No time source, 15:16:20.421 CST Wed Mar 15 2017

PTP Ordinary Clock [Domain 0]

PHASE_ALIGNED 1 3687693 11177073 Hot standby

PORT SUMMARY
PTP Master
Name Tx Mode Role Transport State Sessions Port Addr
slave-from-903 unicast slave Lo1588 Slave 2 10.10.10.11

SESSION INFORMATION
slave-from-903 [Lo1588] [Sessions 2]
Peer addr Pkts in Pkts out In Errs Out Errs
10.10.10.11 5588900 1843789 0 0
10.10.10.12 5588173 1843904 0 0

Configure RPD PTP Connection

To configure RPD PTP connection, use the following commands.

enable
configure terminal
interface type [slot_/]port_
ptp r-dti 1 (RPD PTP connection)
ptp-domain 0
clock-port <same domain number with PTP server>
clock source ip <IP Address> gateway ip <IP Address>
clock source ip <IP Address> gateway ip <IP Address> alternate
Verifying RPD PTP Connection Configuration

The following example shows how to verify the RPD PTP Connection configuration:

Router# show ptp clock 0 config
Domain/Mode : 0/OC_SLAVE
Priority 1/2/local : 128/255/128
Profile % : 001b19000100-000000 E2E

==Stream 0 : Port 1 Master IP: 10.10.10.11
==Stream 1 : Port 1 Master IP: 10.10.10.11

Associate R-DTI with RPD

To associate R-DT the local prefix SID associated to the segment ID, use the following commands.

```plaintext
enable
configure terminal
interface type [slot_#/]port_#
cable rpd node1
identifier 0044.4f04.0044 (node vbh0 mac)
core-interface Te3/1/0
rpd-ds 0 downstream-cable 3/0/0 profile 3
rpd-us 0 upstream-cable 3/0/0 profile 3
r-dti 1
rpd-event profile 0
rpd-55d1-us-event profile 0
```

Verifying Associating R-DTI with RPD

The following example shows how to verify whether the RPD is associated to R-DTI:

Router# show running-config
Load for five secs: 8%/2%; one minute: 9%; five minutes: 9%

Verifying PTP Clock Functioning

To verify whether the PTP Clock is running, use the following commands:

```
Router#show ptp clock running
Load for five secs: one minute: 5%; five minutes: Time source is NTP, 14 CST Fri Feb 17 2017
PTP Ordinary clock [Domain 0]
```

State Ports pkts sent pkts rcvd Redundancy Mode

```
PHASE-ALIGNED 1 7339500 22245593 Hot standby
```

Port Summary

```
cable video
```

end
Verifying PTP Clock Running Domain

The following example shows how to verify the PTP clock running domain:

```
Router# show ptp clock running domain 0
Load for five secs: 5%/2%; one minute: 6%; five minutes: 6%
No time source, 15:16:20.421 CST Wed Mar 15 2017
PTP Ordinary Clock [Domain 0]
State Ports Pkts sent Pkts rcvd Redundancy Mode
PHASE_ALIGNED 1 3687693 1177073 Hot standby
```

Verifying Time Sync State

To verify the status of time synchronization, use the `show ptp clock <n> state` command as given in the following example:

```
Router# show ptp clock 0 state
apr state : PHASE_LOCK
clock state : SUB_SYNC
current tod : 1485414295 Thu Jan 26 07:04:55 2017
active stream : 0

--stream 0:
port id : 0
master ip : 10.10.10.11
stream state : PHASE_LOCK
Master offset : -405
Path delay : -17071
Forward delay : -17476
Reverse delay : -16623
Freq offset : -291143
1Hz offset : -676

--stream 1:
port id : 0
master ip : 192.168.0.11
stream state : PHASE_LOCK
Master offset : -369
Path delay : -1619
Forward delay : -1988
Reverse delay : -1260
Freq offset : -297905
1Hz offset : -664
```

Verifying Time Sync Statistics

To verify the statistics of the time synchronization, use the `show ptp clock <n> state` command as given in the following example:
Router# show ptp clock 0 statistics
AprState 4 :
200-00:06:51.568 180-00:06:41.930 080-00:04:17.925

Configuration Examples
This section provides examples for configuring Cisco cBR for time synchronization.

Example: Configuring Time Interface and PTP Domain
The following example shows how to configure time interface and PTP domain:

disable
crux terminal
interface Loopback1588
ip address 10.10.10.11 255.255.255.224
interface TenGigabitEthernet5/1/3 (connect to PTP master)
ip address 192.168.0.13 255.255.255.224
ip route 10.10.10.11 255.255.255.224 192.168.0.12 (route to PTP master loopback ip)
ptp clock ordinary domain 0 (This is for cbr ptp connection)
servo tracking-type R-DTI
Example: Configure RPD PTP Connection

The following example shows how to configure RPD PTP connection:

```bash
enable
configure terminal
ptp r-dti 1
ptp-domain 0
mode slave
priority1 128
priority2 255
local-priority 128
clock-port 1
eternet 1
... clock-port 2
eternet 2
... clock-port 1
eternet 1
state up
transport ipv4
clock source ip 10.10.1.12 gw 10.10.1.1
clock source ip 192.168.0.0 gateway ip 10.10.1.2 alternate
transport cos 6
transport dscp 47
sync interval -4
announce interval 0
announce timeout 11
delay-req interval -4
unicast grant-duration 300
local-priority 128
```

Example: Associate R-DTI with RPD

The following example shows how to associate R-DTI with RPD:

```bash
enable
configure terminal
cable rpd node1
identifier 0004.9f03.0061 (node vbh0 mac)
core-interface Te3/1/0
rpd-ds 0 downstream-cable 3/0/0 profile 3
rpd-us 0 upstream-cable 3/0/0 profile 3
r-dti 1
rpd-event profile 0
rpd-55d1-us-event profile 0
```

Feature Information for Synchronizing Time on R-PHY Devices

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release,

Note
The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 6: Feature Information for Synchronizing Time on R-PHY Devices

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronizing Time on R-PHY Devices</td>
<td>Cisco 2x2 RPD Software 2.x</td>
<td>This feature was introduced in the Cisco 2x2 Remote PHY Device.</td>
</tr>
</tbody>
</table>
DEPI/UEPI/L2TP integration with Cisco Remote PHY Device

This document describes how to configure the DEPI/UEPI/L2TP integration with RPD on the Cisco cBR Series Converged Broadband Router.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com is not required.

• Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 33
• Information about DEPI/UEPI/L2TP integration with RPD, on page 34
• How to Configure DEPI/UEPI/L2TP integration with RPD, on page 34
• Feature Information for DEPI/UEPI/L2TP integration with RPD, on page 36

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

Information about DEPI/UEPI/L2TP integration with RPD

DEPI

Downstream External PHY Interface (DEPI) is the downstream interface between the CCAP Core and the RPD. R-DEPI is based on DEPI. More specifically, it is an IP pseudowire between the MAC and PHY in an MHA v2 system that contains both a data path for DOCSIS frames, video packets, and OOB packets, as well as a control path for setting up, maintaining, and tearing down sessions.

UEPI

Upstream External PHY Interface (UEPI) is the upstream interface between the RPD and the CCAP Core. Like DEPI, it is an IP pseudowire between the PHY and MAC in an MHA v2 system that contains both a data path for DOCSIS frames, and a control path for setting up, maintaining, and tearing down sessions.

How to Configure DEPI/UEPI/L2TP integration with RPD

This section describes how to configure DEPI/UEPI/L2TP integration with RPD.

Configuring depi-class/l2tp-class Pair

It’s not permitted to change the default l2tp-class configuration (rphy-l2tp-global-class) for R-DEPI by user, because the parameter values are fine tuned to accommodate most common cases.

If user wants to use parameter values other than the default ones, they can use manually defined depi-class/l2tp-class pair. To do so, follow the example below:

```
Router# configure terminal
Router(config)# l2tp-class l2tp_demo
Router(config-l2tp-class)#exit
Router(config)# depi-class depi_demo
Router(config-depi-class)#l2tp-class l2tp_demo
Router(config-depi-class)#exit
Router(config)#cable rpd node
Router(config-rpd)#core-interface Te1/1/7
Router(config-rpd-core)#depi depi_demo /* Be sure to configure when the RPD core is offline*/
Router(config-rpd-core)#end
```

Verifying the RPD Status

To verify the RPD status, use the `show cable rpd` command as shown in the example below:

```
Router# show cable rpd
Load for five secs: 6%/1%; one minute: 5%; five minutes: 5%
No time source, *04:52:03.936 UTC Tue Jan 17 2017
MAC Address    IP Address    I/F    State    Role    HA    Name
0004.9f00.0901 91.0.10.10    Te1/1/0  init(12tp) Pri    Act    node
```
Display DEPI Related Information

To display the Downstream External PHY Interface (DEPI) related information, use the command as shown in the following example:

Router# show cable rpd depi

DEPI Tunnel and Session Information  Total tunnels 1  sessions 26

CHAPTER 6

DEPI Latency Measurement

This document describes how to configure the DEPI latency measurement on the Cisco cBR Series Converged Broadband Router.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

</tbody>
</table>
Information about DEPI Latency Measurement

The DEPI Latency Measurement (DLM) packet is a specific type of data packet used for measuring the network latency between the CCAP core and the RPD. There are two types of DLM packets, ingress DLM packet and egress DLM packet. The ingress DLM measures the latency between the CCAP core and the ingress point in the RPD, and the egress DLM measures the latency between the CCAP core and the egress point of the RPD. For now, only the ingress DLM is supported. Egress DLM will be supported in the future if required.

How to Configure DLM

This section describes how to configure DLM on Cisco cBR-8.

Configuring DLM

To configure DLM, complete the following procedure. DLM is disabled by default, only enabled when configured.

configure terminal
cable rpd name
core-interface interface_name
network-delay dlm interval_in_seconds

Verifying DLM Configuration

To verify the DLM configuration, use the show cable rpd dlm command as shown in the example below:

Router# show cable rpd 0000.bbaa.0002 dlm
Load for five secs: 4%/1%; one minute: 4%; five minutes: 4%
Time source is NTP, 13:12:36.253 CST Sun Jan 1 2017
DEPI Latency Measurement (ticks) for 0000.bbaa.0002
Last Average DLM: 4993
Average DLM (last 10 samples): 4990
Min DLM since system on: 4800
Sample #   Latency (usecs)
0           491
1           496
2           485
3           492
4           499
5           505
6           477
7           474
8           478
9           471

The table below shows descriptions for the fields displayed by this command:
Table 11: show cable rpd dlm Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Average DLM</td>
<td>It means the last time average DLM (AD). At first, the Last Average DLM (LAD) is always 0, when the absolute value of (LAD - AD) exceeds or equal to 75us, LAD will be updated to be the value of AD, MAP advance triggered to update, AD will keep updating with the last (latest) 10 samples.</td>
</tr>
</tbody>
</table>

Example: DLM Configuration

The following example shows how to configure DLM:

Router# configure terminal
Router(config)# cable rpd 1
Router(config-rpd)# core-interface tenGigabitEthernet 3/1/0
Router(config-rpd-core)# network-delay dlm 10

Feature Information for DLM

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Note

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

</table>
CHAPTER 7

Multiple Cores

This document describes the multiple cores in the Remote PHY system.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

• Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 41
• Information about Multiple Cores, on page 42
• How to Configure Multiple Cores, on page 42

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

Table 13: Hardware Compatibility Matrix for the Cisco 2x2 Remote PHY Device

<table>
<thead>
<tr>
<th>Cisco HFC Platform</th>

</tr>
</thead>
<tbody>
<tr>
<td>Cisco GS7000 BAU</td>
<td>Cisco 2x2 RPD Software 2.x and Later Releases Cisco Remote PHY Device 2x2 PID—RPD-2X2=</td>
</tr>
</tbody>
</table>
Information about Multiple Cores

The RPD can be managed by more than one CCAP core. An RPD is controlled by exactly one principal CCAP core and zero or more auxiliary CCAP core(s). Each CCAP core manages a subset of RPD resources, e.g., particular channels or RF ports.

Principal core is responsible for the configuration of common parameters for the RPD and for certain device management functions. Principal core can provide DOCSIS, video or OOB service. Auxiliary cores are responsible for providing video or OOB services. They are restricted to the resource set assigned to them by the principal core.

Restrictions for Multiple Cores Configuration

The following restrictions are applicable to multiple cores configuration:

• Maximum four cores are supported.
• DOCSIS controllers can only be configured to principal core, while video controllers can be configured to all cores.
• Only one core can be principal, the rest will be auxiliary.
• Principal core needs to be configured explicitly.
• At least one DOCSIS downstream controller and one upstream controller are needed for principal core.
• No upstream controller for auxiliary core and at least one downstream controller is needed for auxiliary core.
• Only single CMTS is supported.
• No downstream frequency and channel id overlap is allowed for all the cores.

How to Configure Multiple Cores

This section describes how to configure multiple cores on Cisco cBR-8.

Configuring Multiple Cores

To configure the multiple cores, follow the example below:

Router(config)# cable rpd sjc_block22 /* unique name for each rpd */
Router(config-rpd)# description rpd for sjc block 22
Router(config-rpd)# identifier 1122.3344.5566 /* unique id for each rpd */
Router(config-rpd)# rpd-ds 0 power-level 5 /* DS max-carrier and power-level info */
Router(config-rpd)# rpd-ds 0 dedicated-cw-tone cw1 /* DS pilot tone info */
Router(config-rpd)# core-interface Te3/1/0 /* Core side interface (D-PIC interface) for services below */
Router(config-rpd-core)# principal /* Specify the principal core */
Router(config-rpd-core)# rpd-ds 0 controller downstream-cable 3/0/0 profile 100 /* DS docsis channel config */
Router(config-rpd-core)# rpd-ds 0 controller downstream-cable 3/0/1 profile 200 /* DS docsis channel config */
Verifying Multiple Cores Configuration

To display the information of the principal and auxiliary cores, use the `show cable rpd` command as shown in the example below:

```
Router# show cable rpd
MAC Address    IP Address    I/F    State    Role    HA  Name
0004.9f00.0907 120.100.2.20  Te1/1/6 online Pri  Act  node
0004.9f00.0907 120.100.2.20  Te1/1/0 online Aux  Act  node
0004.9f00.0907 120.100.2.20  Te1/1/1 online Aux  Act  node
0004.9f00.0907 120.100.2.20  Te1/1/2 online Aux  Act  node
```

Only the active cores are displayed, stand-by cores are hidden.
CHAPTER 8

GCPP Support for Remote PHY

This document provides information on the Generic Control Protocol Principal (GCPP) support on Cisco cBR-8 series routers.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 45
- Information About GCPP Support, on page 46
- How to Configure GCPP Core, on page 47
- Configuration Example, on page 47
- Feature Information for GCPP Support, on page 48

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

</tr>
</tbody>
</table>
Information About GCPP Support

The Generic Control Protocol (GCP) sets up a control plane tunnel over a generic transport protocol such as TCP or UDP. GCP is used to program the remote PHY system upstream and downstream parameters from the CMTS. It is also used to control the remote PHY system.

The Remote PHY architecture with GCPP (Generic Control Protocol Principal) server, includes separate DOCSIS, QAM video and OOB cores. To enable the use of multiple RPHY cores, the architecture utilizes a GCP Principal Core (GCPP). Initially, the RPDs contact and authenticate with the GCPP core, which also configures the RPDs in its domain in coordination with the Cores (DOCSIS, QAM video, and OOB).

Without the GCPP core, cBR8 is the principal core for RPD. However, in this GCPP architecture, the GCPP server is the principal core and the Cisco cBR8 is an auxiliary core.

Figure 6: Remote PHY Architecture with GCPP

GCPP Core

GCPP core provides containerized services for automating deployments, managing applications, the initial authentication of the RPDs, and configuring RPD features and video services. The Principal Core does not provide any services (video or data).

The GCPP configures RPDs using GCP with the details of the other Cores that will configure it and the resources that will be configured by those Cores. The GCPP then performs the RPD operational configuration and the video and OOB service configuration. By the end of this process, the RPD will have its operational configuration and video and OOB services set up.

The GCPP core performs the following three primary functions:

- Initial authentication of the RPD
• Initial configuration of the RPD, including the list of cores to which it connects and the resources that those other cores will configure

• Configuration of the multicast sources that the RPD uses to populate QAM video (broadcast and narrowcast) channels

GCPP allows integrating videos on a standardized, single video platform. It also provides the configuration of the RPD's video channels, removing the requirements from the Video Core to support RPD authentication and GCP configuration.

How to Configure GCPP Core

Note
To know more about the commands referenced in this section, see the Cisco IOS Master Command List.

This section contains the following:

Adding GCPP Core IP Address

Add the GCPP core IP address in the original CNR RPD policy if your RPD helper address is cnr8/auto-cnr. Or add the DHCP pool with the GCPP core/CCAP core in the USD.

Configuring Cisco cBR for Enabling GCPP

To set the GCPP server as the core server, configure Cisco cBR to remove the principal keyword under RPD configuration.

cable rpd <RPD name>
  identifier <RPD ID>
  core-interface <slot/subslot/port>
  principal <<<<<<<<<<< remove it, gcpp is the principal core
  rpd-ds <port-ID> downstream-cable <slot/sub-slot/controller> profile <ID>
  rpd-us <port-ID> upstream-cable <slot/sub-slot/controller> profile <ID>
  core-interface <slot/subslot/port>
  rpd-ds <port-ID> downstream-cable <slot/sub-slot/controller> profile <ID>
  r-dti <ID>
  rpd-event profile <ID>
  rpd-55d1-us-event profile <ID>

Configuration Example

This section provides example of Cisco cBR-8 Converged Broadband Router configuration when GCPP is the core.

Example: GCPP Configuration

cable rpd p1_0719
  identifier 0004.9f00.0719
  core-interface Te6/1/2
Feature Information for GCPP Support

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Note

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

</tr>
</tbody>
</table>
Information about IKEv2 Mutual Authentication

When the RPD connects to the CCAP Core, a mutual authentication using IKEv2 with public key signatures is optionally required and a secure control session may be established which can be secured using IPsec.

Mutual authentication is optionally required between the RPD and CCAP Core, and a secure connection may not be required in all cases. Whether authentication is required for an RPD is determined by the network that it is connected to. In some cases, RPD is located in an untrusted network, and it must connect to devices inside the trusted network, which presents a potential security vulnerability.

Authentication is initiated by RPD. Whether the RPD is required to authenticate is under control of the CCAP Core.

Configure IKEv2 Mutual Authentication

This section describes how to configure IKEv2 mutual authentication for RPD.

Note

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

CMTS Side Configuration

Global Configuration

To enable IKEv2 mutual authentication, use `cable rphy auth enable` command in the global configuration mode.

Per PRD Configuration

To configure the IKEv2 mutual authentication per PRD, use `ikev2-core authentication {enable | disable | bypass}` command in the RPD configuration mode.

To display the authentication state, use `show cable rpd` command as shown in the following example:

```
Router#show cable rpd
Load for five secs: 5%/1%; one minute: 4%; five minutes: 5%
Time source is NTP, 10:08:45.016 CST Mon Sep 4 2017
MAC Address   IP Address   I/F  State  Role  HA  Auth  Name
0004.9f00.0719 6.6.6.100   Te6/1/2  online  Pri  Act  Y  p1_0719
0004.9f00.0719 6.6.6.100   Te6/1/1  online  Aux  Act  Y  p1_0719
badb.ad13.411c 6.6.6.101   Te6/1/2  onliassne  Pri  Act  Y  p2_411c
badb.ad13.411c 6.6.6.101   Te6/1/1  online  Aux  Act  Y  p2_411c
```

Note

If RPD IKEv2 authentication is enabled, and RPD Core is authenticated, then the column of “auth” will show “Y”. If RPD IKEv2 authentication is enabled, and RPD Core is not authenticated, then the column of “auth” will show “N”. If RPD IKEv2 authentication is disabled, the column of “auth” will show “N/A”.
RPD Node Side Configuration

To configure the IKEv2 mutual authentication on RPD node, use `ikev2 authentication {enable | disable}` command on RPD node.

To display the authentication configuration state, use `show ikev2` command as shown in the following examples:

```
R-PHY#show ikev2 configuration
IKEv2 authentication is currently enabled, next boot is enabled!
```

```
R-PHY#show ikev2 session
Local   Remote   Status
6.6.6.100 6.6.6.1   UP
```

Feature Information for IKEv2 Mutual Authentication

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Information About Remote PHY Line Card and Supervisor Redundancy

This section provides details of line card and Supervisor redundancy.
Line Card Redundancy

In Remote PHY (R-PHY) configuration, RPDs connect to both active linecard and standby linecard, and have active connections to active linecard, standby connections to standby linecard. From RPD side, it connects to active core and standby core independently.

Each RPD has one principal core, and may have several auxiliary cores. LCHA needs to support multiple cores. These cores are on the same linecard or different linecards. The port on the standby linecard can protect all the same ports on the active linecards.

*Figure 7: Multiple cores on the same line card*

In the figure above, the RPD has multiple cores connected to the same active linecard. In order to support LCHA, RPD needs to connect to the same port on the standby linecard. In this way, RPD has several standby cores to protect the active cores. The standby core have the same resource as the active core.

When multiple cores connect to different active linecards, if they connect to different ports of the linecard, there will have different standby cores. If active core connects to the same port on different linecard, they share one standby core.
In the figure above, RPD have two standby cores. One standby core connects to port 6 of the standby linecard, it can protect the active core which connects to port 6 of the active linecard 2. The other standby core connects to port 0 of the standby linecard, it can protect the active cores connect to port 0 of linecard 0 and linecard 1. So for the standby core 0, it contains the resource for both active core 0 and active core 1.

When active linecard 0 fails over to standby linecard, the standby core 1 will be deleted, the standby core 0 will bring the resource of active core 0 to active. When linecard 2 fails over to standby linecard, the standby core 0 will be deleted, and standby core 1 will become active for active core 3.

For more information about Line Card Redundancy, see Line Card Redundancy.

### Supervisor Redundancy

Compared to the SUP high availability recover process in iCMTS configuration, the Remote PHY SUP high availability recover process has RPD status change as shown in the example below:

```
show cable rpd 0004.9f00.0625 lcha-cores
MAC Address  IP Address   I/F  State     Role  HA Name
0004.9f00.0625 120.105.6.10 Te0/1/1  recovering  Pri Act node1
0004.9f00.0625 120.105.6.10 Te9/1/1  recovering  NA Sby node1
```

```
show cable rpd 0004.9f00.0625 lcha-cores
MAC Address  IP Address   I/F  State     Role  HA Name
0004.9f00.0625 120.105.6.10 Te0/1/1  init(l2tp)  Pri Act node1
0004.9f00.0625 120.105.6.10 Te9/1/1  init(l2tp)  NA Sby node1
```

```
show cable rpd 0004.9f00.0625 lcha-cores
MAC Address  IP Address   I/F  State     Role  HA Name
0004.9f00.0625 120.105.6.10 Te0/1/1  online    Pri Act node1
0004.9f00.0625 120.105.6.10 Te9/1/1  online    NA Sby node1
```

The status of the RPD changes from recovering to online, indicating that the SUP redundancy is working in the Remote PHY configuration.
For more information about SUP redundancy, see Supervisor Redundancy.

**DPIC Link Redundancy**

The Cisco cBR Series Remote PHY Digital Physical Interface Card (DPIC) provides the Ethernet network connection between the CCAP core and Remote PHY devices.

You can enable or disable RPHY link redundancy feature for a chassis. The redundancy state of a link is described using the link *mode* and *role*.

The redundancy mode is the term that is used for the configured or administered designation of a link, and is determined during the link configuration. The redundancy mode does not change during a switchover. There are two redundancy modes:

- **Primary mode**: This is the default working link of a core interface. The primary link is fixed to port 0, 2, 4, 6 when the link high availability is enabled.

- **Secondary mode**: This mode provides protection to the primary link. The secondary link is fixed to port 1, 3, 5, 7 when the link high availability is enabled.

The redundancy role is a dynamic entity that indicates the runtime or operational status of a port. The role changes only during a link switchover. The entity has two states:

- **Active role**: This link carries the RPHY data stream of the core interface. When the primary link is switched over to the secondary link, the secondary link becomes the active link of the core interface.

- **Standby role**: This link does not run any RPHY data traffic, but gets prepared to become active when the current active link has failed. According to the physical state of the standby link, the standby link can be further distinguished into a standby-hot link and standby-cold link. A standby-hot retains the link in the UP state. The 10-Gigabit Ethernet transceiver and TX power are enabled in this case, and the 10-Gigabit Ethernet port state is UP in the directly connected switch or router. The link of standby port is shut down, the TX power turned off and the 10-Gigabit Ethernet port state in the directly connected switch or router is down.

cBR supports both standby-hot and standby-cold redundancy modes.

In 1+1 core link redundancy configuration, the secondary link is the backup link for the primary link. At any given time, only one link (the active link) carries the RPHY control and data traffic for a core interface. The standby link provides protection for only one primary link. Current 8x10G DPIC has eight 10G ports on front panel and 4x10G XFI ports to Cylons-R 40G. Each 10G XFI port provides two core interfaces sharing the total 10G bandwidth. For an 8-port DPIC card, you can provide four 1+1 redundant groups.

When link high availability is enabled in the chassis, the secondary card supports link HA as do the other linecards. Each linecard makes its link switchover decisions that is independently based on the physical link state.

**How to Configure Remote PHY Line Card Redundancy**

This section describes how to configure Remote PHY (R-PHY) Line Card Redundancy on Cisco cBR-8.
Configuring DPIC Ports

The Remote PHY LCHA, typically has separate paths for primary and secondary interfaces on the RPD. Hence, you should configure separate VRFs for DPIC interfaces on the secondary LC.

The following example shows how to configure DPIC port to support Remote PHY Line Card Redundancy:

Router# configure terminal
Router(config)# interface TenGigabitEthernet8/1/0
Router(config-if)# vrf forwarding te80
Router(config-if)# ip address 80.6.16.166 255.255.255.0
Router(config-if)# exit
Router(config)# interface TenGigabitEthernet8/1/1
Router(config-if)# vrf forwarding te81
Router(config-if)# ip address 80.6.16.167 255.255.255.0
Router(config-if)# exit
Router(config)# interface TenGigabitEthernet6/1/0
Router(config-if)# vrf forwarding te60
Router(config-if)# ip address 80.6.16.186 255.255.255.0
Router(config-if)# exit
Router(config)# interface TenGigabitEthernet6/1/1
Router(config-if)# vrf forwarding te61
Router(config-if)# ip address 80.6.16.187 255.255.255.0

Configuring RPD

The following example shows how to configure RPD to support Remote PHY Line Card Redundancy:

Router# configure terminal
Router(config)# cable rpd node1
Router(config-rpd)# identifier 0004.9f03.0055
Router(config-rpd)# core-interface te8/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 8/1/0 profile 0
Router(config-rpd-core)# rpd-us 0 upstream-cable 8/1/0 profile 0
Router(config-rpd-core)# exit
Router(config-rpd)# core-interface te8/1/1
Router(config-rpd-core)# rpd-ds 0 downstream-cable 8/1/1 profile 0
Router(config-rpd-core)# rpd-us 0 upstream-cable 8/1/1 profile 0
Router(config-rpd-core)# exit
Router(config-rpd)# cable rpd node2
Router(config-rpd)# identifier 0004.9f03.0163
Router(config-rpd)# core-interface te8/1/2
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 8/0/1 profile 1
Router(config-rpd-core)# rpd-us 0 upstream-cable 8/0/2 profile 2

Configuring Remote PHY Line Card Redundancy

The following example shows how to configure Remote PHY Line Card Redundancy:

Router# configure terminal
Router(config)# redundancy
Router(config-red)# mode sso
Router(config-red)# linecard-group 0 internal-switch
Router(config-red-lc)# class 1:N
Router(config-red-lc)# member slot 8 primary
Router(config-red-lc)# member slot 6 secondary
Router(config-red-lc)# no revertive
Verifying Remote PHY Line Card Redundancy Configuration

To verify the Remote PHY line card redundancy configuration, use the example below:

Router# show redundancy linecard all

How to Configure DPIC Link Redundancy

This section describes how to configure DPIC Link Redundancy on Cisco cBR-8.

Configuring DPIC Link Redundancy

The link redundancy is disabled by default. You need to enable the link redundancy feature manually.

- To set the DPIC link in the UP state, use the `cable rphy link redundancy hot` command.

- To set the DPIC link in the standby-down state, use the `cable rphy link redundancy cold` command. For example:

  ```
  Router# cable rphy link redundancy cold
  
  RPHY Link HA: Cold mode enabled
  Core Interface Port Mode Role Status
  -------------- ---- ---------- -------- -----
  Te 2/1/0 0 Primary Active Up
  Te 2/1/0 1 Secondary Standby Ready
  Te 2/1/2 2 Primary Active Up
  Te 2/1/2 3 Secondary Standby Ready
  Te 2/1/4 4 Primary Active Up
  Te 2/1/4 5 Secondary Standby Ready
  Te 2/1/6 6 Primary Active Up
  Te 2/1/6 7 Secondary Standby Ready
  
  ```

- To disable the link redundancy, run the `no cable rphy link redundancy` command.

Verifying DPIC Link Redundancy

To verify the DPIC link redundancy, go through the following steps:
• To check the link redundancy of any of the DPIC slots, run the `show redundancy digi-pic slot <0-9>` command. See the following example:

```bash
Router# show redundancy digi-pic slot 0:
```

<table>
<thead>
<tr>
<th>Root Interface</th>
<th>Port</th>
<th>Mode</th>
<th>Role</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Re 0/1/0</td>
<td>0</td>
<td>Primary</td>
<td>Active</td>
<td>Up</td>
</tr>
<tr>
<td>Re 0/1/0</td>
<td>1</td>
<td>Secondary</td>
<td>Standby</td>
<td>Up (&quot;Ready&quot; in standby-cold mode)</td>
</tr>
<tr>
<td>Re 0/1/2</td>
<td>2</td>
<td>Primary</td>
<td>Active</td>
<td>Up</td>
</tr>
<tr>
<td>Re 0/1/2</td>
<td>3</td>
<td>Secondary</td>
<td>Standby</td>
<td>Down</td>
</tr>
<tr>
<td>Re 0/1/4</td>
<td>4</td>
<td>Primary</td>
<td>Standby</td>
<td>Up (&quot;Ready&quot; in standby-cold mode)</td>
</tr>
<tr>
<td>Re 0/1/4</td>
<td>5</td>
<td>Secondary</td>
<td>Active</td>
<td>Up</td>
</tr>
<tr>
<td>Re 0/1/6</td>
<td>6</td>
<td>Primary</td>
<td>Active</td>
<td>Down</td>
</tr>
<tr>
<td>Re 0/1/6</td>
<td>7</td>
<td>Secondary</td>
<td>Standby</td>
<td>Down</td>
</tr>
</tbody>
</table>

• To view the DPIC history, use the `show redundancy digi-pic history slot <0-9>` command. See the following example:

```bash
Router# show redundancy digi-pic history slot 2
```

```
Jun 25 2018 14:41:14 - 2/1/0: Auto switchover from port:1 link:down to port:0 link up, success.
Jun 25 2018 14:40:54 - 2/1/0: Auto switchover from port:0 link:down to port:1 link up, success.
```

• To check the link redundancy of the TenGigabitEthernet 0/1/4, use the `show redundancy digi-pic interface TenGigabitEthernet 0/1/4` command. See the following example:

```bash
Router# show redundancy digi-pic interface TenGigabitEthernet 0/1/4
```

```
Link HA : Hot mode enabled
HA State : In Failover
Reason : Manual Switchover

Port Mode     Role     Status
------------- -------- ---------------------
  4 Primary    Standby Up ("Ready" in standby-cold mode)
  5 Secondary Active Up
```

You can view the DPIC history of the TenGigabitEthernet using the `show redundancy digi-pic history interface TenGigabitEthernet <0-9>/1/<0, 2, 4, 6>` command. See the following example:

```bash
Router# show redundancy digi-pic history interface TenGigabitEthernet 2/1/0
```

```
Jun 25 2018 14:41:14 - 2/1/0: Auto switchover from port:1 link:down to port:0 link up, success.
Jun 25 2018 14:40:54 - 2/1/0: Auto switchover from port:0 link:down to port:1 link up, success.
```
### Feature Information for Remote PHY Redundancy

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 19: Feature Information for Remote PHY Redundancy**

PART III

RPHY System Configuration

• Cisco Remote PHY Controller Profile and RPD Configuration, on page 65
• Cisco Remote PHY Device Downstream Virtual Splitting, on page 83
• Cisco Remote PHY DS OFDM Channel Configuration, on page 93
• Virtual Combining of Upstream Channels on RPD, on page 105
• Redundant Multicast DEPI Pool, on page 111
• DOCSIS3.1 Downstream Resiliency for RPHY, on page 115
• Dynamic Bonding Group for RPHY, on page 119
• Cisco Remote PHY Device IPv6, on page 131
The Remote PHY (R-PHY) Controller Profile includes upstream controller-profile and downstream controller-profile. Upstream controller-profile is used to specify the upstream (US) channels and related parameters, which are part of a specific profile, similar to the following:

- Channel width
- DOCSIS mode
- Frequency
- Minislot size
- Modulation-profile

The downstream controller-profile is used to specify the RF channels and their RF parameters that belong to a specific profile, including the following details:

- Channel type (DOCSIS, Video Sync, Video Async)
- Frequency
- RF output
- QAM-profile (annex, modulation, inter-leaver, symbol rate, and so on)

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 66
- Controller Profile and RPD, on page 66
- Configure Controller Profile and RPD, on page 69
Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

Controller Profile and RPD

The Controller Profile functions in a similar way to the controller integrated-cable Slot/Bay/Port (for downstream controller) or upstream-cable Slot/Bay/Port (for upstream controller) in I-CMTS. However if a Controller Profile is not associated to an RPD, physical resources cannot be allocated.

You can either unicast or multicast this profile. Multicast profile is used for DS sharing. You can multicast the same traffic to all RPDs in the multicast group, or to applications such as switched digital video (SDV) or BC video.

An R-PHY configuration consists of one principal core interface and one auxiliary core interface. The principal core specifies the DPIC interface to which the RPD connects. Auxiliary core interfaces specify the external DPIC interfaces that can be used for downstream sharing. Auxiliary core is used in this release only for video multicast and video OOB.

Configuring Controller Profile and cable RPD are the prerequisites for configuring R-PHY video.

The following table lists the DSCP value for different kinds of items.

<table>

RPD Configurations

Compared to the iCMTS configuration, R-PHY configuration supports the following features:

- Up to 512 RPDs per CBR-8 chassis and 64 RPDs per CBR-CCAP-LC-40G-R line card
- 128 separate service groups per CBR-8 chassis
- 32 downstream controllers and up to 768 downstream channels per CBR-CCAP-LC-40G-R line card
- Up to 158 downstream channels (0-157) per downstream controller
- 64 upstream controllers and 128 upstream channels per CBR-CCAP-LC-40G-R line card

In the R-PHY configuration, the following mapping relationships are supported between the controller and the port on RPD:

- Downstream 1:N (N>= 2) mapping: one DS controller is shared by several RPDs and one DS controller is mapped to one DS port of all these RPDs, that is “DS virtual split”, all these DS ports share the same signals from the same DS controller.
- Downstream N:1 mapping: several DS controllers are mapped into the same DS port of one RPD. Notice: the DS channels in these DS controller should use different rf-channel numbers
- Downstream N:N mapping: mixed 1:N and N:1 mapping. For example: several DS controllers are mapped into one DS port of one RPD. But at the same time they are “virtual split” DS controllers and are shared by several RPDs.
- Upstream 1:N(N<=8) mapping: one US controller can be shared by N (N<=8) US ports of multiple RPDs. Currently max two US ports are supported on one RPD, and for each US port, one US controller can be configured.

For the two US ports of one RPD, the same US controller number can be configured.

---

Note

Downstream 1:1 mapping is not supported under 512 RPD configuration, but still supported under smaller scale configuration.

Prerequisites for Configuring Controller Profile and RPD

The following restrictions are applicable to configuring controller profiles:

- All channels within the profiles of an RPD must be unique. Frequencies must not overlap each other.
- The principal core must contain at least one DOCSIS downstream profile
- Auxiliary core should contain only video and out-of-band profiles
- A DS controller can be associated to only one profile

**Restrictions for Configuring Controller Profile and RPD**

The following restrictions are applicable to configuring upstream controller profiles:

- Legacy controller configuration commands are not supported
- Legacy controller configuration cannot be shown in running-configuration

**Restrictions for Configuring Mixed Annex Mode**

The Cisco Remote PHY 220 includes two embedded images to support a mix variety of Annex types. These Annex types are supported.

- Image for Annex B type supports:
  - Up to 64 Annex B broadcast channels
  - Up to 64 Annex B narrowcast channels (DOCSIS or Unicast Video)
  - Up to 32 Annex A narrowcast channels with the rest being Annex B, as long as the total narrowcast spectrum (Annex A and Annex B) does not exceed 384MHz bandwidth per port

- Image for Annex A type supports:
  - Up to 48 Annex A broadcast channels
  - Up to 48 Annex A and C narrowcast channels (DOCSIS or Unicast Video)
  - Up to 32 Annex B narrowcast channels with the rest being Annex A, as long as the total narrowcast spectrum (Annex A and Annex B) does not exceed 384MHz bandwidth per port

- Downstream channels are grouped into eight channels that must have the same PHY parameters (modulation, interleaver, and symbol rate).

- All configured broadcast channels must be from the same Annex type.

- All configured broadcast channels Annex type must match the active Annex image.
  - The first broadcast channel sets the annex type.
  - If the first broadcast channel configured doesn’t match the active Annex image, the image is automatically swapped.

- If more than 32 channels are configured which do not match the Annex type of the active image, RPD sends an alert to manually swap Annex image. To swap images, perform these steps.
Router# configure terminal
Router(config)# fpga
Router(config-fpga)# set-video-annex <Annex_A | Annex_B>
Reboot RPD.

Configure Controller Profile and RPD

---

**Note**

To know more about the commands referenced in this module, see the [Cisco IOS Master Command List](#).

---

Creating Modulation Profiles

Cisco cable modem termination systems (CMTSs) can handle modulation profiles for the RF configuration of a voice and data cable modem plant. Cisco IOS® Software is designed with a default modulation profile that is optimal in most conditions. Therefore, do not change the default configuration. However, if the modulation needs are different for the customer plant, Cisco IOS Software has the ability to customize and to configure the modulation profiles to suit the customer needs.

---

**Caution**

Only an expert, who understands modulation changes and Data-over-Cable Service Interface Specifications (DOCSIS), should modify these parameters. Otherwise, changes can cause disruption or the degradation of services because the commands affect the physical layer.

This section describes how to create modulation profiles for the different modes of DOCSIS operations, using the preconfigured modulation profile options.

---

Modulation Profile Modifications for Cisco Remote PHY 220

To configure modulation profile, you can run this command:

cable modulation-profile profile atdma request fec-thyte fec-len burst-len guard-t modulation scrambler seed
diff | no-diff pre-len last-cw

---

**Important**

For Cisco Remote PHY 220, the preamble length depends on the modulation that you set. For 16QAM modulation, the preamble must have values—64x2^n (0,1,2) bits. For QPSK modulation, the preamble must have values—32x2^n (0, 1, 2, 3) bits.
Table 21: Parameter Descriptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile</td>
<td>Modulation profile number—Valid values are from 1 to 8, where 1 is the default modulation profile. <strong>Note</strong> In order to use this command correctly, enter a line with all parameters for each upstream burst type. An incomplete burst profile causes unreliable operation or loss of modem connectivity.</td>
</tr>
<tr>
<td>atdma</td>
<td>DOCSIS 2.0 Advanced Time Division Multiple Access (A-TDMA) mode</td>
</tr>
</tbody>
</table>
| request   | Interval usage code. Valid entries depend on the mode of operation:  
  - If the upstream is configured for DOCSIS 1.0 and DOCSIS 1.1 modulation profiles, the valid values are initial, long, request, reqdata, short, or station.  
  - If the upstream is configured for DOCSIS 1.x and DOCSIS 2.0 mixed modulation profiles, the valid values are a-long, a-short, a-ugs, initial, long, request, reqdata, short, or station.  
  - If the upstream is configured for DOCSIS 2.0 A-TDMA modulation profiles, the valid values are a-long, a-short, a-ugs, initial, long, request, reqdata, short, or station.  
  The reqdata burst type is included as a placeholder for scripts that might reference it, but the DOCSIS MAC scheduler on the Cisco CMTS does not use this type of burst.  
  When you are using the initial and station bursts for DOCSIS 2.0 A-TDMA mode, qam-8, qam-32, and qam-64 modulation profiles are available in hidden mode only. |
<p>| fec-t-bytes| The number of bytes that can be corrected per FEC code word. This is the number of bytes that the FEC decoder can correct within a code word. A code word consists of information bytes (k bytes) and parity bytes for error correction. The number of parity bytes is equal to two times the number of correctable errors (T). The size of T is dictated by channel impairments. |
| fec-len   | FEC code-word length. Valid values are from 16 to 253. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>burst-len</td>
<td>Maximum burst length in minislots. Valid values are from 0 to 255, where 0 means no limit.</td>
</tr>
<tr>
<td>guard-t</td>
<td>Guard time in symbols—The time between successive bursts. Valid values are from 0 to 255 symbols. This is the blank time at the end of a burst transmission that exists to ensure that one burst ends before another burst starts.</td>
</tr>
<tr>
<td>modulation</td>
<td>Creates a 16-QAM or QPSK modulation profile depending on the values you set.</td>
</tr>
<tr>
<td>scrambler</td>
<td>Enable or disable scrambler—Valid options are scrambler and no-scrambler. Scrambler is used to create an almost random sequence of transmission symbols, which ensures an even spectral distribution of energy that is transmitted within the channel. The scrambler seed is an initial value that is used to start the pseudorandomizer to scramble the bits. Because both the transmitter and the receiver know the seed value, the scrambling can be reversed at the receiver to leave only the original data.</td>
</tr>
<tr>
<td>seed</td>
<td>Scrambler seed, in hexadecimal format—Valid values are from 0x0000 to 0x7FFF.</td>
</tr>
<tr>
<td>diff</td>
<td>Enable or disable differential encoding—Valid options are diff and no-diff. Differential encoding is a technique wherein the information is transmitted by the phase change between two modulation symbols instead of by the absolute phase of a symbol. This technique makes the absolute phase of the received signal insignificant and effectively doubles the BER for the same C/N.</td>
</tr>
<tr>
<td>pre-len</td>
<td>Preamble length in bits—Valid values are from 2 to 128. Preamble length (and preamble offset) are used to define a synchronizing string of modulation symbols, which lets the receiver find the phase and timing of the transmitted burst.</td>
</tr>
<tr>
<td>last-cw</td>
<td>How FEC is handled for last code word—Valid options are fixed for fixed code-word length and shortened for shortened last code word.</td>
</tr>
</tbody>
</table>

**Configure Upstream Controller Profile**

To configure the upstream controller-profile, use the cable upstream controller-profile command, as given in the following example:
Verify Upstream Controller Profile Configuration

To verify the Upstream controller profile configuration, use the `show cable downstream controller-profile` command or `show running-config | section upstream controller-profile <ID>` command, as shown in the following example:

```
Router#show cable upstream controller-profile 0
Load for five secs: 2%/0%; one minute: 3%; five minutes: 3%
Time source is NTP, 15:14:27.916 CST Fri Feb 24 2017
Upstream controller-profile 0
Description:
Upstream controller-profile 0 is being used by controller Upstream-Cable: 8/0/1, 8/0/0
Controller Upstream-Cable
...Upstream-channel 0
  chan-class-id : 0x0
  channel-width : 1600000 1600000
  docsis-mode : atdma
  ...```

Example for the `show running-config | section upstream controller-profile <ID>` command

```
Router#show running-config | s cable upstream controller-profile 0
cable upstream controller-profile 0
  us-channel 0 channel-width 1600000 1600000
  us-channel 0 docsis-mode atdma
  us-channel 0 equalization-coefficient
  us-channel 0 frequency 6000000
  us-channel 0 minislot-size 4
  us-channel 0 modulation-profile 221
  no us-channel 0 shutdown
  us-channel 1 channel-width 1600000 1600000
  us-channel 1 docsis-mode atdma
  us-channel 1 equalization-coefficient
  us-channel 1 frequency 7600000
  us-channel 1 minislot-size 4
```
Configure RPD for US Controller Profile

To configure RPD for associating an upstream controller-profile, using the `rpd-ds <port-id> Upstream-Cable <slot/sub-slot/controller> [profile <id>]` command, as given in the following example:

```
Router#cable rpd 1
   identifier 0004.9f00.0743
   core-interface Te8/1/0
   principal
   rpd-us 0 upstream-cable 8/0/0 profile 0
   rpd-us 1 upstream-cable 8/0/1 profile 4
   r-dti 11
   rpd-event profile 0
   rpd-55d1-us-event profile 0
   
   end
```

The Remote PHY (R-PHY) Controller Profile now provides a new summary that displays the Per RPD us port description. The summary helps distinguish between the different controllers that share the same description of us-channels.

For example, the `show cable modem rpd all summary` command displays the following information:

```
Router#show cable modem rpd all summary

Load for five secs: 5%/0%; one minute: 5%; five minutes: 5%
No time source, *15:36:49.777 UTC Thu Mar 8 2018

RPD ID: badb.ad13.417c

Interface         Total Reg Oper Unreg Offline Wideband initRC initD initIO initO Description
C9/0/4/U0         1 0 0 1 0 0 1 0 0 0 badb.ad13.417c us 0
C9/0/4/U1         2 0 0 2 0 0 2 0 0 0 badb.ad13.417c us 0
```
Configure Downstream Controller Profile

The 2x2 RPD supports segmented and non-segmented (broadcast) controller profiles. By default, the downstream controller profiles are segmented. To make the controller-profile non-segmented, the broadcast keyword can be used in the downstream controller-profile configuration. Non-segmented (broadcast) controller-profiles send the data to all four RF ports of the node (segmented controller profiles send data to the left and right ports). Use cases for broadcast controller profiles are linear (broadcast) video services or a video service group that covers all four ports.

To configure downstream controller profile, use the following commands:

```
configure terminal
cable downstream controller-profile <profile ID>
multicast-pool <id>
broadcast
rf-chan 64 88
type video <SYNC | ASYNC>
qam-profile 7
frequency 111000000
rf-output NORMAL
rf-chan 89 127
type VIDEO <SYNC | ASYNC>
qam-profile 7
frequency 710000000
rf-output NORMAL
```

The `multicast-pool <id>` defines the DEPI multicast group. The type video `<SYNC | ASYNC>` defines synchronous or asynchronous mode.

---

**Note**

The length of configurable limitation is 20 characters while there are 80 characters reserved.
Verify Downstream Controller Profile Configuration

To verify the Downstream controller profile configuration, use the show cable downstream controller-profile command as shown in the following example:

Router#show running-config | section downstream controller-profile
cable downstream controller-profile 0
r-f-chan 0 3
type DOCSIS
frequency 111000000
rf-output NORMAL
qam-profile 1
docsis-channel-id 1

Configure RPD for DS Controller Profile

The 2x2 RPD supports segmented DS configuration, that allows you to configure a second downstream controller. An example of a second downstream controller is highlighted in the below configuration.

configure terminal
cable rpd RPD01
identifier 0004.9f31.0435
core-interface Te3/1/0
principal
rpd-ds 0 downstream-cable 6/0/16 profile 4
rpd-ds 0 downstream-cable 6/0/18 profile 17 (Broadcast channel Profile)
rpd-us 0 upstream-cable 6/0/16 profile 6
rpd-us 1 upstream-cable 6/0/17 profile 6
r-dti 64
rpd-event profile 1

The rpd-ds 0 downstream-cable 3/0/0 profile 1 associates controller 3/0/0 with profile 1, which is a DOCSIS profile.

The rpd-ds 0 downstream-cable 3/0/1 profile 2 associates controller 3/0/1 with profile 3, which is a video profile.

The core-interface Te3/1/0 defines an auxiliary interface for this RPD. This auxiliary interface is used to configure downstream sharing across line cards.

Verify RPD Association with Controller Profile

To verify the downstream controller profile association with RPD, use the show running-config | section cable rpd <ID> command as shown in the following example:

Router#show running-config | section cable rpd RPD01
cable rpd toi-test1
identifier 0000.1cbf.0000
core-interface Te2/1/0
principal
rpd-ds 0 downstream-cable 2/0/9 profile 0
rpd-event profile 0
rpd-55d1-us-event profile 0

Cisco Remote PHY Device Software Configuration Guide for Cisco 2x2 RPD Software 2.x
Configure Downstream Sharing

This configuration is optional. DS sharing is used for multicast (MC) traffic. To configure downstream sharing, use the following commands:

```plaintext
configure terminal
cable rpd RPD01
core-interface Te3/1/0
principal
rpd-ds 0 downstream-cable 3/0/1 profile 2
cable rpd RPD02
core-interface te3/1/0
principal
rpd-ds 0 downstream-cable 3/0/1 profile 2
```

All RDPs in the same multicast group should have the same controller and profile association.

Note

Configure Controller in Fiber Node

To configure the controllers in fiber-node, use the `cable fiber-node` command, as given in the following example:

```plaintext
cable fiber-node 113
downstream Downstream-Cable 8/0/0
upstream Upstream-Cable 8/0/1
```

Verify CM RPD Association

To verify the RPD associated with the cable modem, use the `show cable modem rpd` command as shown in the following example:

```plaintext
Router# show cable modem rpd 0004.9f03.0249
Load for five secs: 4%/2%; one minute: 3%; five minutes: 4%
Time source is NTP, 10:48:11.763 CST Tue Feb 28 2017

```

Display GCP Related Information

To display Generic Control Plane (GCP) related information of the RPD, use the command as shown in the following example:

```plaintext
Router#show cable rpd 0004.9f03.0280 Te3/1/0 gcp-state

</tr>
</tbody>
</table>
**Troubleshooting Tips**

Refer to the following troubleshooting tips if configuration errors occur.

If you configure DS controller profile and cable RPD, you can check the controller status, regardless of the status of the RPD. If the channel’s state is DOWN, use verbose option to view the reason.

```
Router# show controllers downstream-Cable 6/0/1 rf-channel 20 <verbose>
Chan State Admin Frequency Type Annex Mod sr rate Interleaver dcid output
20  UP  UP  231000000 VIDEO-SYNC B  256 5361 I128-J1 - NORMAL
```

**Configuration Examples**

This section provides example configurations for the R-PHY Controller Profile.

**Example: Controller Profile Configuration**

**Upstream Controller Profile Configuration**

```
configure terminal
cable upstream controller-profile 2
cable def-phy-burst 0
us-channel 0 chan-class-id 0
us-channel 0 channel-width 1600000 1600000
us-channel 0 docsis-mode atdma
us-channel 0 equalization-coefficient
us-channel 0 frequency 50000000
us-channel 0 hop-priority frequency modulation channel-width
us-channel 0 ingress-noise-cancellation 100
us-channel 0 maintain-psd
us-channel 0 max-logical-chans 1
us-channel 0 minislot-size 4
us-channel 0 modulation-profile 221
us-channel 0 power-level 0
us-channel 0 rng-holdoff 0
us-channel 0 shutdown
us-channel 0 specsvl error-adaptive-profile 1
us-channel 0 threshold cnr-profiles 25 13
us-channel 0 threshold corrr-fec 3
us-channel 0 threshold hysteresis 3
us-channel 0 threshold snr-profiles 25 13
us-channel 0 threshold uncorr-fec 1
...
end
```

**Downstream Controller Profile Configuration**

```
configure terminal
cable downstream controller-profile 1
```

Feature Information for Remote PHY Controller Profile and RPD Configuration

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
### Table 23: Feature Information for Remote PHY Controller Profile and RPD Configuration

CHAPTER 12

Cisco Remote PHY Device Downstream Virtual Splitting

This document provides information on how to configure downstream virtual splitting on Remote PHY systems.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Information about RPD Downstream Virtual Splitting

The primary use case for multicast delivery between CCAP-core and the RPD is for the delivery of broadcast video services from a single CCAP-core element to a number of RPDs. This allows the system to scale by allowing a single CCAP-core element to generate and serve streams to all the RPDs that are configured to receive the same broadcast lineup. Since broadcast serving groups are quite large (~100,000 or more subscribers), using multicast to deliver the same copy to hundreds of remote PHY devices provides significant cost savings for operators. This mechanism can be used for broadcast video delivered via MPEG QAM channels or for that delivered via IP over DOCSIS. It is meant for the replication of an entire QAM channel to multiple RPDs.

Configure RPD Downstream Virtual Splitting

This section describes how to configure RPD Downstream Virtual Splitting on Cisco cBR-8.

Note

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Configure Multicast DEPI Pool

To configure the multicast DEPI pool, complete the following procedure:

```
configure terminal
cable depi multicast pool id
{ip|ipv6} address ip mask
```

To verify the multicast DEPI pool configuration, use the `show cable depi multicast pool` command as shown in the example below:

```
Router# show cable depi multicast pool
Load for five secs: 4%/0%; one minute: 5%; five minutes: 5%
No time source, *09:23:41.545 CST Mon Apr 23 2018
POOL ID   Net IP    Net Mask          Redundant DESCRIPTION
1         227.0.0.0  255.255.255.0     FALSE
2         228.0.0.0  255.255.254.0     FALSE
127       227.226.225.0  255.255.255.0   FALSE to TE9/1/1+TE9/1/7
POOL ID   IPv6     Redundant DESCRIPTION
6         FF3A::9000:0/126     FALSE
```
Configure Redundant Multicast DEPI Pool

When a secondary line card is configured, multicast IP addresses are assigned to its downstream controllers from the redundant multicast DEPI pool.

To configure the redundant multicast DEPI pool, complete the following procedure:

```
cisco
cable depi multicast pool id redundant
```

To verify the multicast DEPI pool configuration, use the `show cable depi multicast pool` command as shown in this example:

```
Router# show cable depi multicast pool
Load for five secs: 4%/0%; one minute: 4%; five minutes: 4%
No time source, *14:14:13.780 CST Tue Aug 7 2018
POOL ID Net IP Net Mask Redundant DESCRIPTION
1 227.0.0.0 255.255.0.0 FALSE
127 227.226.225.0 255.255.255.0 FALSE to TE9/1/1+TE9/1/7

POOL ID IPv6 Redundant DESCRIPTION
2 FF39::8000:0/120 FALSE
4 FF39::9000:0/112 TRUE
```

To view the IPv6 addresses assigned to the secondary linecard downstream controllers, use the `show cable depi multicast ipv6 all` command as shown in this example:

```
Router# show cable depi multicast ipv6 all
Load for five secs: 5%/0%; one minute: 5%; five minutes: 4%
No time source, *14:15:08.476 CST Tue Aug 7 2018
IPv6 POOL ID CONTROLLER
FF39::9000:0 4 0/0/0(1-Te0/1/0)
FF39::9000:8 4 0/0/1(2-Te0/1/0)
FF39::9000:10 4 0/0/2(3-Te0/1/0)
FF39::9000:18 4 0/0/3(4-Te0/1/0)
FF39::9000:20 4 0/0/4(5-Te0/1/0)
```

**Note**

- To view the IPv4 addresses, use the `show cable depi multicast ip all` command.
- One redundant DEPI pool is available for either IPv4 or IPv6 addresses.
- If you do not configure redundant pool, secondary linecard downstream controllers use the same IP as the downstream controllers in the primary linecard.
- You cannot use the redundant multicast pool in the downstream controller profile configuration.
- DEPI multicast pool can be configured as redundant pool if DEPI multicast pool contains less than 266 IP addresses, and if line card high availability is configured on the Cisco cBR-8.

Enable Multicast Sharing under Downstream Controller Profile

To enable the multicast sharing under downstream controller profile, complete the following procedure:
configure terminal
cable downstream controller-profile id
multicast-pool id

Then configure the other parameters of the controller profile and related RF channels.

You can change the multicast pool for the downstream sharing controllers without configuring the RPD. See the following example for detailed configuration:

Router#config terminal
Router(config)#cable downstream controller-profile 111
Warning: changes to this profile will affect the following controllers:
Downstream controller-profile 111 is being used by controller Downstream-Cable:
   6/0/0, 6/0/1,

Confirm to continue? [no]: yes
Router(config-controller-profile)#multicast-pool 50
This profile is being used by the following RPDs:
Controller RPD DS Port List:
    --------------- --------- ---------------
    0004.9f03.0214 Te6/1/0 rpd_b
    000c.2923.9991 Te6/1/0 rpd_a ...

Confirm to continue? [no]: yes

To verify the multicast sharing is enabled under the downstream controller profile, use the show cable downstream controller-profile command as shown in the example below:

Router# show cable downstream controller-profile 1
Load for five secs: 8%/1%; one minute: 10%; five minutes: 10%
No time source, *07:14:32.551 CST Tue Nov 15 2016
Downstream controller-profile 1
Description:
Downstream controller-profile 1 is being used by controller Downstream-Cable:
   3/0/0,
   Admin: UP
MaxOdfmSpectrum: 0
MaxCarrier: 128
BasePower: 33.0 dBmV
Mode: normal
Frequency profile: unconfigured
DS Splitting: Yes
Multicast Pool ID: 1

Configure the RPD with the Same Downstream Controller and Profile

To configure the RPDs with the same downstream controller and profile, complete the following procedure:

configure terminal
cable rpd name
identifier id
core-interface TenGigabitEthernet slot/subslot/port
principal
rpd-ds 0 downstream-cable slot/subslot/port profile id
rpd-us 0 upstream-cable slot/subslot/port profile id
r-dti id
rpd-event profile id
rpd-55d1-us-event profile id
Configure at least 2 RPDs with the same downstream controller and profile to implement the multicast DEPI.

### Configure the RPDs to different fiber-nodes

To configure the RPDs to different fiber-nodes, complete the following procedure:

```bash
configure terminal
cable fiber-node id
downstream Downstream-Cable slot/subslot/port
upstream Upstream-Cable slot/subslot/port
```

**Note** Configure at least 2 fiber-nodes with the same downstream controller to implement the multicast DEPI.

### Configure the RPDs to MAC Domain

To configure the RPDs to the MAC domain, complete the following procedure:

```bash
configure terminal
interface cable slot/subslot/port
downstream Downstream-Cable slot/subslot/port rf-channel id
upstream index Upstream-Cable slot/subslot/port us-channel index
cable upstream index jumbo-grants
cable upstream balance-scheduling
cable upstream bonding-group id
upstream id
attributes 800000F0
cable bundle id
cable map-advance static value
cable sid-cluster-group num-of-cluster value
cable sid-cluster-switching max-request value
```

**Note** Different RPDs can be configured to share the same downstream controller under one MAC domain or different MAC domains.

### Enable Multicast on Cisco cBR-8 Router

To enable the multicast on cBR-8, complete the following procedure:

```bash
configure terminal
ip multicast-routing distributed
```
Enable Multicast on Layer 2 Switch

To enable multicast on Layer 2 switch, complete the following procedure:

```bash
configure terminal
ip igmp snooping
vlan configuration vlan
ip igmp snooping querier ip
```

Only need to create IGMP Snooping Group on one switch between DPIC and RPD.

Create IGMP Snooping Group under vlan which is used for connection between DPIC and RPD.

IP address used for IGMP snooping querier can be any address that is not conflict with the existing IP address in the system.

Enable Multicast on Layer 3 Router

To enable multicast on Layer 3 router, complete the following procedure:

```bash
configure terminal
ip pim ssm default
interface gigabitEthernet 0/0/0
ip pim sparse-dense-mode
ip igmp version 3
```

SSM must be enabled on all routers between DPIC and RPD.

All PIM neighbor must be enabled on all routers.

PIM neighbor can use sparse-dense-mode or sparse-mode.

Verify RPD Downstream Virtual Splitting Configuration on cBR-8 Side

To verify the RPD Downstream Virtual Splitting configuration on cBR-8 side, complete the procedure as shown in the example below, and check if these criteria are met:

- The remote session ID begins with 0x8 in the output of the `show cable rpd depi | in Ds` command.

```bash
Router# show cable rpd depi | in Ds
0x40003f21 0x80003d22 1377638051 Da3/0/0:0 est 04:20:36 1 P
0x40003f31 0x80003d32 1377638051 Da3/0/0:16 est 04:20:35 3 P
0x40003f41 0x80003d42 1377638051 Da3/0/0:32 est 04:20:35 5 P
0x40003f39 0x80003d3a 1377638051 Da3/0/0:24 est 04:20:35 4 P
0x40003f29 0x80003d2a 1377638051 Da3/0/0:16 est 04:20:34 2 P
0x40013f21 0x80003d22 1404837649 Da3/0/0:0 est 00:07:21 14 P
0x40013f39 0x80003d3a 1404837649 Da3/0/0:24 est 00:07:21 17 P
0x40013f41 0x80003d42 1404837649 Da3/0/0:32 est 00:07:21 18 P
0x40013f29 0x80003d2a 1404837649 Da3/0/0:8 est 00:07:21 15 P
0x40013f31 0x80003d32 1404837649 Da3/0/0:16 est 00:07:21 16 P
```

- There is assigned IP and pool ID in the output of the `show cable depi multicast ip all` command.

```bash
Router# show cable depi multicast ip all
Load for five secs: 7%/2%; one minute: 8%; five minutes: 8%
No time source, *23:00:55.344 CST Sun Nov 13 2016
ASSIGNED IP    POOL ID    CONTROLLER
225.225.225.0   1          3/0/0
```
• The cable modem is online in the output of the `show cable modem rpd` command.

Router# `show cable modem`
Load for five secs: 8%/3%; one minute: 9%; five minutes: 9%
No time source, *16:06:52.191 CST Thu Mar 2 2017

Feature Information for RPD Downstream Virtual Splitting

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 13

Cisco Remote PHY DS OFDM Channel Configuration

This document provides information on how to configure DOCSIS 3.1 DS OFDM channel on Remote PHY systems.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Configuration Example, on page 103
- Feature Information for RPHY DS OFDM Channel Configuration, on page 103

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

Information About R-PHY DOCSIS 3.1 DS OFDM Channel

Cisco cBR routers support DS OFDM channels in an R-PHY system. The OFDM-channel-support includes two OFDM channels for each Remote PHY device (RPD) with a channel bandwidth up to 192 MHz and the modulation up to 4096 QAM.

RPD supports up to 128 SC-QAM channels in the presence of 2 OFDM channels. If more than 128 SC-QAM channels are already configured, then user needs to configure the RPD core to reduce the number of SC-QAM channel before the second OFDM can be configured.

Each OFDM channel supports a control profile, the NCP profile, and up to five data profiles. For a line card, a maximum of 32 DS OFDM channels are supported.

Configure DS OFDM Channel

To know more about the commands referenced in this section, see the Cisco IOS Master Command List.

Configure OFDM Channel Profile

To configure the OFDM channel profile, run the following commands:

```
enable
configure terminal
cable downstream ofdm-chan-profile id
description System Profile id
cyclic-prefix value
interleaver-depth value
pilot-scaling value
roll-off value
subcarrier-spacing value
profile-control {modulation-default mod_prof_id | modulation-profile mod_prof_id}
profile-ncp modulation-default <mod_prof_id>
profile-data channel_data_prof_id {modulation-default mod_prof_id | modulation-profile mod_prof_id}
```
Configure RPD Port/Controller and Channel

To configure the port or controller and channel, use the following commands.

```
enable
cfg-term
rp-cfg rpd <rpd_name_string>
  identifier <xxxx.xxxx.xxxx>
  core-interface Te slot/subslot/port
  principal
  rp-ds <port> downstream-cable slot/subslot/port profile <ID>
  rp-us <port> upstream-cable slot/subslot/port profile <ID>

cfg-term
cfg-downstream-controller-profile <ID>
cfg-term
max-ofdm-spectrum value

rf-chan [id]
type DOCSIS
frequency value
rf-output NORMAL
  qam-profile id
docsis-channel-id id
rf-chan [id]
docsis-channel-id id
  ofdm channel-profile id start-frequency value width value [plc value]
```

The OFDM channel IDs range from 158 to 162.

In the following example, 2 OFDM channels 158 and 159 are configured:

```
Router# configure terminal
Router(config)# cable downstream controller-profile 6
Router(config-controller-profile)# max-carrier 128
Router(config-controller-profile)# max-ofdm-spectrum 384000000
Router(config-controller-profile)# rf-chan 0 23
Router(config-prof-rf-chan)# type DOCSIS
Router(config-prof-rf-chan)# qam-profile 1
Router(config-prof-rf-chan)# frequency 453000000
Router(config-prof-rf-chan)# rf-output NORMAL
Router(config-prof-rf-chan)# docsis-channel-id 1
Router(config-prof-rf-chan)# exit
Router(config-controller-profile)# rf-chan 158
Router(config-prof-rf-chan)# docsis-channel-id 159
Router(config-prof-rf-chan)# ofdm channel-profile 20 start-frequency 645000000 width 192000000 plc 651000000
Router(config-prof-rf-chan)# exit
Router(config-controller-profile)# rf-chan 159
Router(config-prof-rf-chan)# docsis-channel-id 160
Router(config-prof-rf-chan)# ofdm channel-profile 20 start-frequency 837000000 width 192000000 plc 930000000

Router(config)# cable rpd node0
Router(config-rpd)# identifier 0004.9f31.1234
Router(config-rpd)# core-interface Te9/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rp-ds 0 downstream-cable 9/0/12 profile 6
Router(config-rpd-core)# rp-us 0 upstream-cable 9/0/0 profile 3
Router(config-rpd-core)# exit
Router(config-rpd)# r-dti 8
Router(config-rpd)# rp-event profile 0
Router(config-rpd)# rp-55di-us-event profile 0
```
Configure RF Channel Bandwidth in Wideband Interface

To add the RF channel to a wideband interface, and to specify the RF channel bandwidth allocated for the channel, use the following commands:

```
enable
cfg-term
int Wideband-Cable{slot/subslot/port}:wideband-channel
cbl bundle id
cbl rf-channels channel-list groupid bandwidth-percent percentage-bandwidth
```

Verify the Profile Ordering

To view the details of the profile downgrade ordering on a specific OFDM channel, run the following command:

```
Router# show controllers downstream-cable 7/0/0 rf-channel 158 prof-order
```

```
OFDM channel data profile order: [2/0/3:158]
Data Profile:     Downgrade Profile:
Profile 1 -> Profile 0
Profile 2 -> Profile 1
Profile 3 -> Profile 2
```

Verify OFDM Channel Profile

To view the details of an OFDM Channel Profile, run the following command:

```
Router# show controllers downstream-Cable 7/0/0 rf-channel 158 verbose
```

```
Chan State Admin Mod-Type Start Width PLC Profile-ID dcid output

Verify the Drop Counter in DPS

To verify the drop counter, especially in the DPS module, run the following command:

```
RPD-config# show downstream channel counter
```

```
------------------- Packets counter in TPMI -------------------
Level Rx-pkts Rx-sum-pkts
Node Rcv 32690704 32690704
Depi Pkt 32471383 32471383

Information About Virtual Combining of Upstream Channels

Virtual Combining helps in supporting more RPDs than the number of US SGs, similar to the way multiple physical cables are combined to the same upstream RF port in I-CMTS architecture.

In RPHY, a group of Upstream External PHY Interface (UEPI) sessions with different pseudowires are set up for a single upstream channel for both CCAP core and RPD. However, with virtual-combing, multiple UEPI sessions are mapped to one physical channel in Cisco cBR-8 Routers.
Through this feature, Cisco cBR-8 routers support the binding of multiple US ports on RPDs to the same US controller. The USPHY configuration on the combined RPDs is the same. All combined RPDs must use the same type of USPHY chip.

You are notified if an RPD USPHY is incompatible with the USPHY configuration when a new RPD comes online.

The combined US ports may be in the same RPD. The combined US ports may be in different RPDs. The maximum number of combined US ports to the same controller must not exceed 8. The combined USPHY channels share the bandwidth of the combined channel.

At any instance, only one USPHY channel can transmit. Cisco cBR Series routers support the modems under a specific RPD even in combined US channel cases. It also supports all member USPHY channel information in a combined channel.

When monitoring a physical channel, the cable monitor monitors all member UEPI channels. Spectrum surveillance collects and calculates the SNR and CNR for each USPHY channel.

The OFDMA channels supported for the Virtual Combining feature on Remote PHY start from 8192. The number of ATDMA channels supporting this feature are 256 physical channels for IPHY and 1024 for Remote PHY.

**Configure Virtual Combining of Upstream Channels**

To know more about the commands referenced in this section, see the *Cisco IOS Master Command List*.

**Configure RPD for Virtual Combining**

The virtual combining of upstream channels is initiated automatically when users configure the same US controller for more than one US ports. The ports may be in the same RPD or different RPDs, but should be on the same line card).

In the following example, the US port 0 on RPD node_1 and US port 0 and 1 on RPD node_2 are combined to upstream-cable 9/0/2.

```
cable rpd node_<number>
  identifier badb.ad13.5d7e
  core-interface Te9/1/2
  principal
  rpd-ds 0 downstream-cable 9/0/2 profile 100
  rpd-us 0 upstream-cable 9/0/2 profile 221
  r-dti 1
!
cable rpd node_2
  identifier badb.ad13.5d96
  core-interface Te9/1/2
  principal
  rpd-ds 0 downstream-cable 9/0/2 profile 100
  rpd-us 0 upstream-cable 9/0/2 profile 221
  rpd-us 1 upstream-cable 9/0/2 profile 221
  r-dti 1
!
```
Verify Upstream Virtual Combining Details

To view the spectrum analysis measurements of the specified UEPI channels for virtual combining, use the following sample commands:

```
show cable spectrum-analysis Cable <slot/subslot/port> upstream <port> sid <Sid of modem or noise> devID <0-7 Device ID>
```

Load for five secs: 5%/1%; one minute: 5%; five minutes: 5%
No time source, *11:16:00.436 CST Sat Feb 24 2018

Spectrum Analysis Measurements for Cable9/0/7: Upstream 0 Sid 1

CHAPTER 15

Redundant Multicast DEPI Pool

This document describes how to configure redundant multicast DEPI pool.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

</tbody>
</table>
Redundant Multicast DEPI Pool

In DS sharing, the DS controller of the secondary line card uses the same multicast IP address as the primary line card DS controller. For a single RPD, the principal and standby Cores use different source IP addresses, but same group IP address in a multicast group. However, the NCS switch does not support one Group with multiple Sources in a multicast group. Hence, you must assign additional multicast IP addresses for standby cores.

Assign the additional multicast IP addresses to the DS controllers on the secondary line cards if the secondary line card is up.

When you enable the redundant multicast DEPI pool, the secondary line card is up in the redundancy line card group and the multicast IP addresses are assigned to secondary line card from the redundant multicast pool. All RPDs on standby cores are automatically cleared to be offline and later online again.

When you disable the redundant multicast pool, the IP addresses are removed from the redundant multicast pool, and all the RPD standby cores are cleared automatically. If you do not configure redundant pool, the secondary line card downstream controllers use the same IP as the downstream controllers in the primary line card.

You cannot use the redundant multicast pool in the downstream controller profile configuration.

Multicast IP address for the secondary line card is assigned based on the DS controller and the TenGE port. One DS controller can be assigned 8 IPv4/IPv6 addresses from Tx/1/0 to Tex/1/7, where x is the secondary line card slot number. Hence, the redundant multicast DEPI pool needs a minimum of 266 IP addresses (32 controller for 8 ports for DOCSIS, 10 for OOB). If 266 IP addresses are not available, you can assign 4 IPv4/IPv6 addresses to the ports 0,2,4,6 on a single DS controller for multicast DEPI IP addresses on the secondary line card.

Configure Redundant Multicast DEPI Pool

This section describes how to configure the redundant multicast DEPI pool on Cisco cBR-8 routers.

Note
To know more about the commands referenced in this section, see the Cisco IOS Master Command List.

Configuring Redundant Multicast DEPI Pool

When a secondary line card is configured, multicast IP addresses are assigned to its downstream controllers from the redundant multicast DEPI pool.

Procedure

Step 1 Configure the multicast DEPI pool by using the following command:

```
cable depi multicast pool id{ip|ipv6} address ip mask
```
Step 2 Verify the multicast DEPI pool configuration.

show cable depi multicast pool

Example:

show cable depi multicast pool
Load for five secs: 7%/1%; one minute: 7%; five minutes: 7%
No time source, *15:57:05.512 CST Wed Aug 22 2018
POOL ID   Net IP  Net Mask   Redundant   DESCRIPTION
1        227.0.0.0  255.255.255.0   FALSE
127      227.226.225.0 255.255.255.0   FALSE   to TE9/1/1+TE9/1/7

POOL ID   IPv6    Redundant   DESCRIPTION
10  FF3A::9000:0/120   FALSE

Step 3 Configure the redundant multicast DEPI pool.

configure terminal
cable depi multicast pool id redundant

Step 4 Verify the redundant multicast DEPI pool configuration.

show cable depi multicast pool

Example:

show cable depi multicast pool
Load for five secs: 7%/1%; one minute: 7%; five minutes: 7%
No time source, *16:27:05.552 CST Wed Aug 22 2018
POOL ID   Net IP  Net Mask   Redundant   DESCRIPTION
1        227.0.0.0  255.255.255.0   FALSE
127      227.226.225.0 255.255.255.0   FALSE   to TE9/1/1+TE9/1/7

POOL ID   IPv6    Redundant   DESCRIPTION
10  FF3A::9000:0/120   TRUE

Verify Assigned Multicast IP Addresses

Verify the multicast addresses that are assigned to the secondary linecard downstream controllers by running the show cable depi multicast ip/ipv6 all command, similar to the following example:

show cable depi multicast ip/ipv6 all

Load for five secs: 6%/0%; one minute: 6%; five minutes: 7%
No time source, *14:23:14.522 CST Tue Aug 28 2018

Information about DOCSIS3.1 Downstream Resiliency for RPHY

When DOCSIS3.1 cable modem reports non-primary RF channel failure for SCQAM or OFDM channel, actions performed by downstream resiliency is the same as DOCSIS3.0 cable modem. In other words, if RF channel impairment is below the resiliency threshold, CM’s service flows are moved to Resiliency Bonding Group (RBG) or Narrow Band (NB) interface. If RF channel impairment is above the resiliency threshold, the impaired RF channel is temporarily removed from the bonding group.

The following table summarizes the CM-STATUS events for OFDM channel, and the action taken by the downstream resiliency module:

Table 33: CM-STATUS events for OFDM channel

</tbody>
</table>
Configure DOCSIS3.1 Downstream Resiliency for RPHY

User must configure the command `cable rf-change-trigger percent value count number` to enable the downstream resiliency functionality.

To configure the trigger thresholds specific to OFDM RF impairment, follow the steps below:

```
enable
cable ofdm-rf-change-trigger percent value counter number [no-ncp-plc]
```

Trigger thresholds `value` and `number` apply globally to the non-primary OFDM RF channels. If this command is not configured, the trigger thresholds configured by the command `cable rf-change-trigger percent value count number` will be used for the non-primary OFDM channels.

With `no-ncp-plc` configured in the command, this feature will not take any action when CM reports CM-STATUS-EVENT 20 or 21.

The `cable rf-change-trigger percent value count number` command is optional and the configured trigger thresholds apply to non-primary OFDM channels only.

Display OFDM Specific CM-STATUS Events

To display the statistics of the OFDM specific CM-STATUS events, use the `show cable modem wideband rcs-status` command as shown in the example below:

```
router#show cable modem 4800.33ea.7072 wideband rcs-status verbose
CM : 4800.33ea.7072
RF : 3/0/0 0
    Status : UP

CHAPTER 17

Dynamic Bonding Group for RPHY

The Dynamic Bonding Group (DBG) feature enables the system to automatically create bonding groups of different sizes based on the cable modems’ capacity. It helps to manage the resources of all downstream bonding groups. When the number of available bonding groups reaches the lower limit, it reclaims the bonding groups that match the reclaim threshold set by the user. The modems used on these bonding groups are then moved to other bonding groups without primary channel change. This move makes space for new bonding group allocations. This automated way of creating and reclaiming bonding groups greatly reduces the management effort of RCC configuration. DBG also automatically accommodates primary channel and CM capacity distributions.

The load balancing feature leverages DBG to balance traffic among all channels. With DBG, the modem is assigned to the downstream bonding group without any static RCC configuration.

DBG supports the following:
  • DOCSIS 3.0 and DOCSIS 3.1 channel types.
  • DOCSIS 3.0 and DOCSIS 3.1 load balance.
  • Interoperation with modem registration, load balancing, and high availability.
  • Enhanced dynamic load balance to allow movement of modem without a change in the primary channel.
  • Enhanced FPGA to allow channel utilization fairness.

This chapter describes how to configure the DBG feature on the Cisco Remote PHY Device.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

  • Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 120
  • Configure Dynamic Bonding Group, on page 120
  • Configure Load Balancing with Dynamic Bonding Group Enabled, on page 123
  • Feature Information for Dynamic Bonding Group, on page 128
Hardware Compatibility Matrix for Cisco Remote PHY Device

Note
Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

Configure Dynamic Bonding Group

Before configuring DBG, it is assumed that interface Mac domain and fiber node are already configured on the Cisco cbr-8 router. The recommended primary channel distribution is one primary channel for contiguous four channels, such as 0, 4, 8, 12, 16, 20, 24, 28 and so on. For more information, see DOCSIS Interface and Fiber Node Configuration in the Cisco eBR Converged Broadband Routers DOCSIS Software Configuration Guide.

Note
To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Enable Dynamic Bonding Group

DBG is disabled by default. Use `cable dynamic-bonding-group` command to enable DBG as shown in the following example:

```
ROUTER# configure terminal
ROUTER(config)# cable dynamic-bonding-group
ROUTER(config)# end
```

To configure the bonding group reclaim threshold, use `cable dynamic-bonding-group reclaim-threshold` command as shown in the following example:

```
ROUTER# configure terminal
ROUTER(config)# cable dynamic-bonding-group reclaim-threshold percent 5% modems 6
ROUTER(config)# end
```

5% is the default bonding group throughput percentage threshold, and 6 is the default cable modem count threshold. If the throughput of a bonding group is lower than 5% of all bonding groups’ throughput, and this bonding group has less than 6 cable modems assigned to it, then this bonding group is reclaimed when the available bonding groups reach the lower limit (20%).
By default, cable modem registration and load balance trigger DBG creation when needed. If you want to disable the interoperation with cable modem registration and load balance, use the commands in the following example:

```bash
ROUTER# configure terminal
ROUTER(config)# no cable dynamic-bonding-group registration

ROUTER# configure terminal
ROUTER(config)# no cable dynamic-bonding-group load-balance
```

When DBG is enabled, we recommend you to complete the following configurations.

### Enable DS-Resiliency and Configure Resiliency Bonding Group

To make sure that the modem is still in w-online state with maximum downstream capability when several RF channels are impaired, enable the ds-resiliency feature by running the following commands:

```bash
Router# configure terminal
Router(config)# cable resiliency ds-bonding
Router(config)# end

Router# configure terminal
Router(config)# interface wideband-Cable 3/0/1:30
Router(config-if)# cable ds-resiliency
```

Wideband-Cable3/0/1:30 is set to WB resiliency bonding group. Remove any existing bundle and rf-channel configuration.

### Enable ACFE

Enable ACFE feature to make sure that modem registration is not blocked because of QoS failures:

```bash
Router# configure terminal
Router(config)# cable acfe enable
Router(config)# end
```

### Verify Dynamic Bonding Group Configuration

This section describes how to use certain `show` commands to verify if the dynamic bonding groups are created.

Check the modem’s primary wideband interface using the `show cable modem wideband channel` command as shown in this example:

```bash
Router# show cable modem 4800.33ee.ebee wideband channel
MAC Address   IP Address   I/F        MAC     DSxUS  Primary State
4800.33ee.ebee 30.132.15.246 C3/0/1/UB w-online 32x2    W13/0:1:3
```

Check the modem’s downstream tuner capability using the `show cable modem verbose | in DS Tuner` command as shown in the following example:

```bash
Router# show cable modem 4800.33ee.ebee verbose | in DS Tuner
DS Tuner Capability : 32
```

Check the related RCC using the `show cable mac-domain rcc` command as shown in the following example:
Check the dynamically created bonding groups using the `show cable dynamic-bonding-group summary` command as shown in the following example:

```
Router# show cable dynamic-bonding-group summary
Dynamic bonding group: Enable
BG ID  BG Name    BG Size  CMs  ServFlows  Create Time  Create Client  BG State
RFid list
24834  W1/0/1:1  8     11    Sep 14 14:36:35.194  MODEM_ONLINE  OPERATIONAL
     24832-24839
24836  W1/0/1:3  32    6     Sep 14 14:43:24.144  MODEM_ONLINE  OPERATIONAL
     24832-24863
24835  W1/0/1:2  8     7     Sep 14 17:20:37.115  MODEM_ONLINE  OPERATIONAL
     24840-24847
24837  W1/0/1:4  8     7     Sep 14 17:21:37.723  STATIC_LOAD_BALANCE OPERATIONAL
     24856-24863
24838  W1/0/1:5  8     7     Sep 14 17:21:39.761  STATIC_LOAD_BALANCE OPERATIONAL
     24848-24855
```

This example shows the DBG with D31 modems:

```
Router# show cable mac-domain c1/0/4 rcc
RCC-ID  RCP  RCs  MD-DS-SG  CMs  WB/RCC-TMPL  D3.0  D3.1
32      00 00 00 00 00  8  0  11  WB (W1/0/0/4:1)  Y  Y
33      00 00 00 00 00 32  0  6  WB (W1/0/0/1:3)  Y  Y
34      00 00 00 00 00  8  0  7  WB (W1/0/0/1:2)  Y  Y
35      00 00 00 00 00  8  0  7  WB (W1/0/0/1:4)  Y  Y
36      00 00 00 00 00  8  0  7  WB (W1/0/0/1:5)  Y  Y
```

```
Router# show cable dynamic-bonding-group summary
Dynamic bonding group: Enable

<td>Ready for reclaim. If no modem is used on the bonding group or match the reclaim in two minutes, the bonding group is reclaimed. The DBG state changes to RECLAIM_HOLD.</td>
</tr>
<tr>
<td>RECLAIM_MODEM_MOVING</td>
<td>Ready for reclaim. The modem is moved out of the bonding group.</td>
</tr>
<tr>
<td>RECLAIM_WAITING_SUP</td>
<td>Line card sends a DBG reclaim request and waits for SUP to reclaim the BG.</td>
</tr>
</tbody>
</table>

To display the detailed channel list information of dynamic bonding group, use the `show derived-config interface wideband` command as shown in the following example:

```bash
Router# show derived-config interface wideband-Cable 3/0/1:1
Building configuration...
Derived configuration: 113 bytes!
  interface Wideband-Cable3/0/1:1
    cable bundle 255
cable rf-channels channel-list 0-7 bandwidth-percent 1
end
```

Check the usage of bonding group resource using the `show cable dynamic-bonding-group quota` command.

```bash
Router# show cable dynamic-bonding-group quota controller 3/0/1
slot/subslot/ctrlr: 3/0/1
Total BG number: 128
Used BG number (static/dynamic): 6(1/5) Available BG number: 122
Available BG list port: 0, 6-29, 31-127
```

Check the reclaimed bonding group using the `show cable dynamic-bonding-group reclaim-history summary` command:

```bash
Router# show cable dynamic-bonding-group reclaim-history summary
BG ID BG Name BG Size Create Time Create Client Reclaim Time Reclaim Client RFId list
24835 Wi3/0/1:2 16 Sep 14 14:40:27 MODEM_ONLINE Sep 14 14:44:27 DBG_INTERNAL
24832-2484
```

## Configure Load Balancing with Dynamic Bonding Group Enabled

If you want to use load balancing with the DBG enabled, we recommend that you configure the load balancing as shown here.

### Enable Load Balancing for DOCSIS 3.0 and DOCSIS 3.1

To enable DOCSIS load balancing, run the following commands:

```bash
Router# config terminal
```
Enable DOCSIS 3.0 and DOCSIS 3.1 Static Load Balance

To balance the load of primary channels, enable static load balance using the following commands:

```
Router# configure terminal
Router(config)# cable load-balance docsis30-enable static
Router(config)# end
```

Enable DOCSIS 3.0 and DOCSIS 3.1 General Load Balance Group

To enable general load balance group, use cable load-balance docsis-group command as shown here:

```
Router# configure terminal
Router(config)# cable load-balance docsis-group fn 1 md c3/0/1
Router(config-lb-group)# no disable
Router(config-lb-group)# end
```

Enable Dynamic Load Balance and Fixed-Primary Channel Movement

To balance the load of all downstream channels based on utilization, enable dynamic load balance by running the following commands:

```
Router# configure terminal
Router(config)# cable load-balance docsis30-enable dynamic downstream
Router(config)# end
```

Fixed primary channel movement is disabled by default. With dynamic load balancing enabled, we recommend that you enable fixed primary channel movement to reduce service outage by running the following commands:

```
Router# configure terminal
Router(config)# cable load-balance fixed-primary-channel
Router(config)# end
```

Verify Static Load Balancing Configuration

This section describes how to use `show` commands to verify the configuration of the static load balancing. Check the load of all primary channels using the `show cable load-balance docsis-group load` command as shown here:

```
Router# show cable load-balance docsis-group fn 1 md c3/0/1 load | in
Interface      State  Group  Utilization  Rsvd NBCM  WB/UB  Weight
```
This command output lists all primary channels and shows the number of cable modems used with these channels. NBCM is the number of narrowband modems used with a channel while WBCM (WB/UB) is the number of wideband modems used with a channel. The total number of WBCMs must be balanced among all channels.

The difference between the total number of WBCMs used with any two channels is smaller or equal to the minimum threshold load. The default value of the minimum threshold load is 5.

This example shows the load in DOCSIS 3.1 static load balancing configuration:

```
Router# show cable load-balance docsis-group fn 33 md c3/0/0 load | i In
Interface State Group Utilization Rsvd NBCM WB/UB Weight
In3/0/0:0(453 MHz) initial 2147557408 1%(0%/1%) 0% 0 16 37
In3/0/0:8(501 MHz) initial 2147557408 1%(0%/1%) 0% 0 16 37
In3/0/0:30(633 MHz) initial 2147557408 1%(0%/1%) 0% 0 12 37
In3/0/0:40(693 MHz) initial 2147557408 1%(0%/1%) 0% 0 15 37
In3/0/0:55(783 MHz) initial 2147557408 1%(0%/1%) 0% 0 12 37
In3/0/0:158(258 MHz initial 2147557408 1%(0%/1%) 0% 0 21 224

- Above example, the modem count balanced with a configured threshold of 5

- Count based load balancing is done only on sc-qam channels of equal weight. OFDM channel is of much higher weight and is excluded from the modem count calculations.

Check the load of all RF channels using the `show cable load-balance docsis-group rfch-util` command as shown in this example:

```
Router# show cable load-balance docsis-group fn 1 md c3/0/1 rfch-util
Interface Pstate Pending-In Pending-Out Throughput(Kbps) Util NBCM WBCM
In3/0/1:0 up No No 0 0% 0 17
In3/0/1:1 NA No No 0 0% 0 17
In3/0/1:2 NA No No 0 0% 0 17
In3/0/1:3 NA No No 0 0% 0 17
In3/0/1:4 up No No 0 0% 0 17
In3/0/1:5 NA No No 0 0% 0 17
In3/0/1:6 NA No No 0 0% 0 17
In3/0/1:7 NA No No 0 0% 0 17
In3/0/1:8 up No No 0 0% 0 17
In3/0/1:9 NA No No 0 0% 0 17
In3/0/1:10 NA No No 0 0% 0 17
In3/0/1:11 NA No No 0 0% 0 17
......
Average: 0.0
Variance: 0.0
```

This command lists the load information of the primary and secondary channels. WBCM is the number of wideband modems used with a channel.

Check the cable modem’s internal state in load balancing using the `show cable load-balance docsis-group modem-list wideband` command as shown in this example:
Table 37: Cable Modem States

<table>
<thead>
<tr>
<th>CM State</th>

<tr>
<td>LB_CM_DISABLED</td>
<td>Modem is not ready for movement. If the modem failure movement count reaches maximum failure threshold, then set the modem in LB_CM_DISABLED to avoid further movement.</td>
</tr>
</tbody>
</table>

**Verify Dynamic Load Balancing Configuration**

This section describes how to use the `show` commands to verify the configuration of the dynamic load balancing. Check the utilization of all RF channels using `show cable load-balance docsis-group rfch-util` command as shown in this example:
The traffic among all RF channels is considered balanced when the difference between any two RF channel utilization is under the threshold load. The default percentage of threshold load is 10%.

To check the potential target bonding group for each of the source bonding group, use the `show cable load-balance docsis-group target dbg` and the `show cable load-balance docsis-group target wide` commands as shown in this example:

If there is no target bonding group in the output, it means that no bonding groups are created to balance traffic among RF channels.

A sample output for DOCSIS 3.1 modems with a configured threshold of 14% is shown. For utilization based load balancing to start on DOCSIS 3.1 modems, the OFDM channel must be utilized 100% and SC-QAM must have traffic. The utilization-based load balancing balances the traffic on the SC-QAM channels in a DOCSIS 3.1 modem.
### Feature Information for Dynamic Bonding Group

---

**Note**

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Information about RPD IPv6

The CableLabs’ MHAv2 standards requires CCAP Core and RPD must support both IPv4 and IPv6, which means the Remote PHY Signaling between the CCAP Core and RPD is able to run on both IPv4 and IPv6 networks.

- CCAP Core can support IPv4/IPv6 dual stack.
- RPD can support either IPv4 or IPv6 network.
- RPD does not support IPv4/IPv6 Dual Stack at the same time.
- RPD will try IPv6 connection first. When DHCPv6 failed, RPD will try DHCPv4.
- For single RPD, all the server addresses, protocols to communicate with it must be in the same IP version.

Configure RPD IPv6 Unicast Online

This section describes how to configure RPD IPv6 Unicast Online on Cisco cBR-8.

Note

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Configure Unicast IPv6

To configure Unicast IPv6, complete the following procedure:

1. Enable IPv6 unicast routing.
   ```
   configure terminal
   ipv6 unicast-routing
   ```

2. Configure IPv6 Address on DPIC interface.
   ```
   configure terminal
   interface TenGigabitEthernet slot/1/port
   ipv6 enable
   ipv6 address ipv6_address
   ```

Configure RPD core interface

To configure RPD core interface, complete the following procedure:

```
configure terminal
cable rpd name
identifier rpd_mac
```
Configure IPv6 PTP Clock Option

To configure the IPv6 PTP Clock Option, complete the following procedure:

1. Configure CBR as PTP slave, see the configuration example below:

   ```
   configure terminal
   interface Loopback1588
   ip address 158.158.158.5 255.255.255.255
   ptp clock ordinary domain 0
   servo tracking-type R-DTI
   clock-port slave-from-903 slave
   delay-req interval -4
   sync interval -5
   sync one-step
   transport ipv4 unicast interface Lo15888 negotiation
   clock source 10.90.3.93
   ```

   Note

   CCAP-Core as PTP slave can only support IPv4.

   ```
   configure terminal
   ptp r-dti number
   ptp-domain domain
   clock-port number
   ethernet number
   transport ipv6
   clock source ipv6 address gateway ipv6 gateway
   ```

   Note

   • PTP domain and 1588 master have same domain number.
   • Clock source IPv6 address is 1588 master IPv6 address.
   • Gateway is next hop to 1588 master, and it is optional.
   • For RPD, ethernet 1=vbh0, ethernet 2=vbh1, ethernet 0 will choose either vbh0 or vbh1 which is functional as clock-port.

3. Associate R-DTI with RPD configuration.

   ```
   configure terminal
   cable rpd id
   r-dti number
   ```
Verify IPv6 PTP Clock Option Configuration

To display the CBR PTP Status, use the `show ptp clock running` command as shown in the example below:

```bash
Router# show ptp clock running
Load for five secs: 6%/2%; one minute: 7%; five minutes: 8%
No time source, *05:11:13.610 UTC Sun Oct 22 2017
PTP Ordinary Clock [Domain 0]

State  Ports  Pkts sent  Pkts rcvd  Redundancy Mode
PHASEAligned  1  2478203  7512533  Hot standby

PORT SUMMARY

Name  Tx Mode  Role  Transport  State  Sessions  Port Addr
slave-from-903  unicast  slave  Lo15888  Slave  1  10.90.3.93
```

To display the RPD PTP Status, use the `show ptp clock` command as shown in the example below:

```bash
Router# show ptp clock 0 config

Verify RPD IPv6 Configuration

To display the RPD IPv6 Status, use the `show cable rpd ipv6` command as shown in the example below:

```
Router# show cable rpd ipv6
Load for five secs: 7%/2%; one minute: 9%; five minutes: 8%
No time source, *14:03:13.622 UTC Sun Oct 22 2017

Configure IPv6 DS Splitting

This section describes how to configure RPD IPv6 DS splitting on Cisco cBR-8. In this configuration, different RPDs share the same DS SG traffic. For each DS sharing controller, one unique IPv6 IP is assigned according to multicast pool. When RPD is IPv6 online, all DS sharing Controller associated multicast IPs are IPv6 type. Multiple DS controllers used by one RPD core must be either IPv4 or IPv6 and cannot be mixed. RPD sharing same DS Controller must only be IPv4 or IPv6 online and cannot be mixed. Multiple RPD cores in one RPD must only be IPv4 or IPv6 online and cannot be mixed.

Note

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Configure the multicast IPv6 DEPI pool

To configure multicast IPv6 DEPI pool, complete the following procedure:

```
configure terminal
cable depi multicast pool id
ipv6 address ip/prefix
```

Enable Multicast Sharing under Downstream Controller Profile

To configure Unicast IPV6, complete the following procedure (same as IPv4 downstream splitting):
Configure the RPD with the Same Downstream Controller and Profile

To configure the RPDs with the same downstream controller and profile, complete the procedure as shown in the example below (same as IPv4 downstream splitting):

```
configure terminal
cable rpd node_1
core-interface tenGigabitEthernet 9/1/0
  rpd-ds 0 controller downstream-cable 9/0/0 profile 0
  rpd-us 0 controller upstream-cable 9/0/0 profile 221
cable rpd node_2
core-interface tenGigabitEthernet 9/1/0
  rpd-ds 0 controller downstream-cable 9/0/0 profile 0
  rpd-us 0 controller upstream-cable 9/0/0 profile 221
```

Configure the RPDs to different fiber-nodes

To configure the RPDs to different fiber-nodes, complete the procedure as shown in the example below (same as IPv4 downstream splitting):

```
configure terminal
cable fiber-node 100
  downstream Downstream-Cable 9/0/0
  upstream Upstream-Cable 9/0/0
cable fiber-node 101
  downstream Downstream-Cable 9/0/0
  upstream Upstream-Cable 9/0/1
```

Configure the RPDs to MAC Domain

To configure the RPDs to the MAC domain, complete the procedure as shown in the example below (same as IPv4 downstream splitting):

```
configure terminal
interface Cable9/0/0
  downstream Downstream-Cable 9/0/0/0 rf-channel 0
downstream Downstream-Cable 9/0/0/0 rf-channel 8
upstream 0 Upstream-Cable 9/0/0/0 us-channel 0
upstream 1 Upstream-Cable 9/0/0/0 us-channel 1
upstream 2 Upstream-Cable 9/0/0/0 us-channel 2
upstream 3 Upstream-Cable 9/0/0/0 us-channel 3
upstream 4 Upstream-Cable 9/0/0/0 us-channel 0
upstream 5 Upstream-Cable 9/0/0/0 us-channel 1
upstream 6 Upstream-Cable 9/0/0/0 us-channel 2
upstream 7 Upstream-Cable 9/0/0/0 us-channel 3
cable upstream bonding-group 1
  upstream 0
  upstream 1
  upstream 2
  upstream 3
  attributes 800000F0
  cable upstream bonding-group 2
  upstream 4
  upstream 5
  upstream 6
```
Or use the following example (same as IPv4 downstream splitting):

```conf
configure terminal
interface Cable9/0/0
  downstream Downstream-Cable 9/0/0 rf-channel 0
  upstream 0 Upstream-Cable 9/0/0 us-channel 0
  upstream 1 Upstream-Cable 9/0/0 us-channel 1
  upstream 2 Upstream-Cable 9/0/0 us-channel 2
  upstream 3 Upstream-Cable 9/0/0 us-channel 3
  cable upstream bonding-group 1
    upstream 0
    upstream 1
    upstream 2
    upstream 3
  attributes 800000F0

configure terminal
interface Cable9/0/1
  downstream Downstream-Cable 9/0/1 rf-channel 8
  upstream 0 Upstream-Cable 9/0/1 us-channel 0
  upstream 1 Upstream-Cable 9/0/1 us-channel 1
  upstream 2 Upstream-Cable 9/0/1 us-channel 2
  upstream 3 Upstream-Cable 9/0/1 us-channel 3
  cable upstream bonding-group 1
    upstream 0
    upstream 1
    upstream 2
    upstream 3
  attributes 800000F0
```

Enable IPv6 multicast on Cisco cBR-8 Router

To enable the IPv6 multicast on cBR-8, complete the following procedure:

```conf
configure terminal
ipv6 multicast-routing
```

If cBR-8 and RPD are connected in L2 network, we recommend to enable MLD Snooping in L2 switches.

Verify the IPv6 DS Splitting Configuration

To display the IPv6 multicast DEPI pool, use the `show cable depi multicast pool ipv6` command as shown in the example below:

```
Router# show cable depi multicast pool ipv6
Load for five secs: 8%/2%; one minute: 7%; five minutes: 8%
No time source, *06:57:11.898 UTC Sun Oct 22 2017
POOL ID  IPv6 DESCRIPTION
22  FF3B::8000:0/100
50  FF3A::8000:0/126  zyq
100 FF39::8000:0/120  zyq
Infra_C05#show cable depi multicast pool ipv6 id 22
Load for five secs: 8%/2%; one minute: 8%; five minutes: 8%
No time source, *07:00:03.577 UTC Sun Oct 22 2017
POOL ID  IPv6 DESCRIPTION
22  FF3B::8000:0/100
```

To display the assigned IPv6 multicast address, use the `show cable depi multicast ipv6` command as shown in the example below:

```
Router# show cable depi multicast ipv6
```

To display the assigned IPv6 multicast address, use the `show cable depi multicast ipv6` command as shown in the example below:
Router# show cable depi multicast ipv6 all
Load for five secs: 10%/3%; one minute: 8%; five minutes: 8%
No time source, *07:01:33.659 UTC Sun Oct 22 2017
IPv6 POOL ID CONTROLLER
FF3A::8000:0 50 9/0/2(291)
FF3A::8000:1 50 9/0/28(317)
FF39::8000:0 100 9/0/29(318)
FF3A::8000:2 50 9/0/30(319)

Infra_C05#show cable depi multicast ipv6 FF3A::8000:0
Load for five secs: 7%/2%; one minute: 8%; five minutes: 8%
No time source, *07:01:44.020 UTC Sun Oct 22 2017
IPv6 POOL ID CONTROLLER
FF3A::8000:0 50 9/0/2(291)

To display the relationship between the downstream controller profile and IPv6 multicast Pool, use the show cable downstream controller-profile command as shown in the example below:

Router# show cable downstream controller-profile 100
Load for five secs: 24%/3%; one minute: 10%; five minutes: 8%
No time source, *07:10:28.074 UTC Sun Oct 22 2017
Downstream controller-profile 100, type RPHY
Description:
Downstream controller-profile 100 is being used by controller Downstream-Cable: 0/0/30,
Admin: UP
MaxOfdmSpectrum: 192000000
MaxCarrier: 158
Mode: normal
Free freq block list has 3 blocks:
45000000 - 44999999
594000000 - 60299999
795000000 - 121799999
DS Splitting: Yes
Multicast Pool ID: 50
OFDM frequency exclusion bands: None
Configured RF Channels:
  Chan Admin Frequency Type Annex Mod srate Qam-profile dcid output
  0 UP 453000000 DOCSIS B 256 5361 1 1 NORMAL
  1 UP 459000000 DOCSIS B 256 5361 1 2 NORMAL
  2 UP 465000000 DOCSIS B 256 5361 1 3 NORMAL

To display the RPD associated with the downstream controller, use the show controllers downstream-Cable command as shown in the example below:

Router# show controllers downstream-Cable 9/0/2 rpd
Load for five secs: 8%/2%; one minute: 9%; five minutes: 8%
No time source, *07:14:20.326 UTC Sun Oct 22 2017
Controller RPD DS Port List:(2 of 2)
  RPD ID I/F Name
  ---------------- --------- ----------------
  badb.ad13.5d7e Te9/1/2 node_3
  0004.9f03.0256 Te9/1/2 node_5

When the DS Controller IPv4/IPv6 type and the RPD IPv4/IPv6 online type conflicts, the RPD log prompts the conflation as shown in the example below:

Router# show cable rpd 0004.9f00.0979 Te3/1/0 log reverse
RPD ID I/F Severity Time LOG INFORMATION

2017-09-23 21:44:50.817 RPD 0004.9f00.0979 CoreTe 3/1/0 reset connection due to unmatched IPv4/IPv6 between GCP connection(IPv6) and Downstream Sharing Controllers 3/1/0(IPv4)

Feature Information for Remote-PHY Device IPv6

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Information About R-PHY Video Configuration

The controller profile specifies the RF channels that belong to this profile and their RF parameters. Profile can either be unicast or multicast.

Multicast profile is used for downstream sharing. Multiple Remote PHY Devices (RPDs) can be configured to receive the same downstream controller. The traffic is multicast to all RPDs configured to receive the downstream controller. Applications include Video on Demand (VOD), Switched Digital Video (SDV) and Broadcast Video.

There is one principal core interface, and up to four auxiliary core interfaces in the RPD configuration. Principal core specifies the DPIC interface with which RPD connects. Auxiliary cores specify external DPIC interfaces that can be used for downstream sharing. Auxiliary core is currently used for narrowcast video, broadcast video and out-of-band data signaling path (OOB) only.

How to Configure R-PHY Video

This section describes how to configure R-PHY video on Cisco cBR-8.

Configuring Downstream Controller Profile

To configure the downstream controller profile, use the example below:

Router# configure terminal
Router(config)# cable depi multicast pool 20
Router(config-multicast-pool)# ip address 225.28.0.0 255.255.0.0
Router(config-multicast-pool)# exit
Router(config)# cable downstream controller-profile 1
Router(config-controller-profile)# multicast-pool 20
Router(config-controller-profile)# rf-chan 0 15
Router(config-prof-rf-chan)# type docsis
Router(config-prof-rf-chan)# frequency 111000000
Router(config-prof-rf-chan)# rf-output normal
Router(config-prof-rf-chan)# qam-profile 1
Router(config-prof-rf-chan)# docsis-channel-id 1
Router(config-prof-rf-chan)# exit
Router(config-controller-profile)# rf-chan 16 19
Router(config-prof-rf-chan)# type video sync
Router(config-prof-rf-chan)# frequency 699000000
Router(config-prof-rf-chan)# rf-output normal
Router(config-prof-rf-chan)# qam-profile 1
Router(config-prof-rf-chan)# exit
Router(config-controller-profile)# exit
Router(config)# cable downstream controller-profile 2
Router(config-controller-profile)# multicast-pool 1
Router(config-controller-profile)# rf-chan 20 47
Router(config-prof-rf-chan)# type video sync
Router(config-prof-rf-chan)# frequency 231000000
Router(config-prof-rf-chan)# rf-output normal
Router(config-prof-rf-chan)# qam-profile 4

In the above example, two profiles are configured, profile 1 is a mixed profile, profile 2 is a video only profile.
Configuring RPD

To configure the RPD to include the controller profile, follow the example below:

Router# configure terminal
Router(config)# cable rpd RPD01
Router(config-rpd)# identifier 0004.9f31.0455
Router(config-rpd)# core-interface Te3/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 3/0/0 profile 1
Router(config-rpd-core)# rpd-ds 0 downstream-cable 3/0/1 profile 2
Router(config-rpd-core)# rpd-us 0 upstream-cable 3/0/0 profile 1
Router(config-rpd-core)# exit
Router(config-rpd)# core-interface te6/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-cable 6/0/0 profile 2
Router(config-rpd-core)# exit
Router(config-rpd)# r-dti 1
Router(config-rpd)# rpd-event profile 0
Router(config-rpd)# rpd-55d1-us-event profile 0

Note

• All channels within the profiles of a RPD must be unique, frequencies must not overlap each other.
• There must be at least one DOCSIS downstream profile in the principal core.
• Auxiliary core must only contain video and out-of-band profiles.
• A downstream controller can only be associated to one profile.

Configuring Downstream Sharing

Downstream sharing is used for multicast (MC) traffic. To configure downstream sharing, follow the example below:

Router# configure terminal
Router(config)# cable rpd RPD01
Router(config-rpd)# core-interface Te3/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 3/0/0 profile 2
Router(config-rpd-core)# exit
Router(config-rpd)# rpd-ds 0 downstream-cable 3/0/0 profile 2
Router(config-rpd-core)# exit
Router(config-rpd)# cable rpd RPD02
Router(config-rpd)# core-interface te3/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 3/0/0 profile 2
Router(config-rpd-core)# exit
Router(config-rpd)# rpd-ds 0 downstream-cable 3/0/0 profile 2
Router(config-rpd-core)# exit
Router(config-rpd)# cable rpd RPD03
Router(config-rpd)# core-interface te6/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 6/0/0 profile 3
Router(config-rpd-core)# exit
Router(config-rpd)# core-interface te3/1/0
Router(config-rpd-core)# rpd-ds 0 downstream-cable 3/0/0 profile 2
All RPDs in the same multicast group have the same controller and profile association.

## Configuring Video

To configure Video, see Cisco Converged Broadband Routers Video Configuration Guide for Cisco IOS XE Everest 16.5.1.

## Configuring Virtual Service Group

Virtual Service Group is supported to allow the controller configuration and removal of an RPD using that controller without removing the video configuration. To configure virtual service group, follow the example below:

1. **Add controller profile:**

   ```
   Router(config)# cable downstream controller-profile 2
   Router(config-controller-profile)# multicast-pool 20
   Router(config-controller-profile)# rf-channel 20 47
   Router(config-prof-rf-chan)# type video sync
   Router(config-prof-rf-chan)# frequency 231000000
   Router(config-prof-rf-chan)# rf-output NORMAL
   Router(config-prof-rf-chan)# qam-profile 7
   Router(config-prof-rf-chan)# exit
   Router(config-controller-profile)# exit
   ```

2. **Assign controller profile to a downstream cable for a virtual service group:**

   ```
   Router(config)# cable virtual-service-group VOD_SG1801 downstream-cable 9/0/1 profile 2
   Router(config)# cable virtual-service-group VOD_SG1802 downstream-cable 9/0/3 profile 2
   Router(config)# cable virtual-service-group BC_Chicago downstream-cable 9/0/31 profile 3
   ```

3. **Create VCG, SDG, RPD downstream cable, bind VCG to SDG, assign VCG to LED, set LED active, and create sessions:**

   ```
   Router(config)# cable video
   Router(config-video)# multicast-uplink Port-channel22 access-list all-multicasts
   Router(config-video)# mgmt-intf VirtualPortGroup 0
   Router(config-video)# service-distribution-group sdg91 id 91
   Router(config-video-sdg)# rpd downstream-cable 9/0/1
   Router(config-video-sdg)# exit
   Router(config-video)# virtual-carrier-group vcg91 id 91
   Router(config-video-vcg)# encrypt
   Router(config-video-vcg)# service-type narrowcast
   Router(config-video-vcg)# rf-channel 40-63 tsid 38001-38024 output-port-number 1-24
   Router(config-video-vcg)# exit
   Router(config-video)# bind-vcg
   Router(config-video-bd)# vcg vcg91 sdg sdg91
   Router(config-video-bd)# exit
   Router(config-video)# logical-edge-device led-1 id 1
   Router(config-video-led)# protocol table-based
   Router(config-video-led-protocol)# virtual-edge-input-ip 174.102.1.1 input-port-number 1
   Router(config-video-led-protocol)# vcg vcg91
   Router(config-video-led-protocol)# active
   Router(config-video-led-protocol)# table-based
   ```
4. Assign controller to RPD, then physical QAM id is allocated and video sessions are online:

```
Router(config)# cable rpd RPD01
Router(config-rpd)# core-interface Te9/1/0
Router(config-rpd)# identifier 0004.9f32.1573
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 9/0/1 profile 2
Router(config-rpd-core)# rpd-ds 0 downstream-cable 9/0/3 profile 2
Router(config-rpd-core)# rpd-us 0 upstream-cable 9/0/0 profile 1
Router(config-rpd-core)# exit
Router(config-rpd)# core-interface Te9/1/6
Router(config-rpd-core)# rpd-ds 0 BC_Chicago
Router(config-rpd-core)# exit
Router(config-rpd)# r-dti 1
Router(config-rpd)# rpd-event profile 0
Router(config-rpd)# rpd-55d1-us-event profile 0
```

5. It is allowed to remove or replace the controller from the RPD configuration as show below, without touching any video configuration, then the video sessions are in off state which is similar to the scenario that the video QAM is shut down.

```
Router(config)# cable rpd RPD01
Router(config-rpd)# core-interface Te9/1/0
Router(config-rpd-core)# no rpd-ds 0 downstream-cable 9/0/1 profile 2
```

Note: If virtual service group doesn’t exist while adding controller downstream to RPD configuration, virtual service group is automatically generated when the controller profile has one or more rf-channels of the video type. If the user changes RPD downstream configuration to use another controller profile different from the one in virtual service group and in the meantime video configuration exists, the user also needs to update the controller profile in the virtual service group for that downstream as well, otherwise all the video sessions will be down.

### Example: R-PHY Video Configuration

The following example shows how to configure Remote-PHY video:

```
Router(config)# cable downstream qam-profile 7
Router(config-qam-prof)# annex B modulation 256
Router(config-qam-prof)# interleaver-depth 132-J4
Router(config-qam-prof)# symbol-rate 5361
Router(config-qam-prof)# spectrum-inversion off
Router(config-qam-prof)# description default-annex-b-256-qam
Router(config-qam-prof)# exit
Router(config)# cable depi multicast pool 20
Router(config-multicast-pool)# ip address 225.28.0.0 255.255.0.0
Router(config-multicast-pool)# exit
Router(config)# cable downstream controller-profile 1
Router(config-controller-profile)# multicast-pool 20
Router(config-controller-profile)# rf-channel 0 15
```

```
Example: R-PHY Video Configuration

The following example shows how to configure Remote-PHY video:

Router(config)# cable downstream qam-profile 7
Router(config-qam-prof)# annex B modulation 256
Router(config-qam-prof)# interleaver-depth 132-J4
Router(config-qam-prof)# symbol-rate 5361
Router(config-qam-prof)# spectrum-inversion off
Router(config-qam-prof)# description default-annex-b-256-qam
Router(config-qam-prof)# exit
Router(config)# cable depi multicast pool 20
Router(config-multicast-pool)# ip address 225.28.0.0 255.255.0.0
Router(config-multicast-pool)# exit
Router(config)# cable downstream controller-profile 1
Router(config-controller-profile)# multicast-pool 20
Router(config-controller-profile)# rf-channel 0 15
```

```
Example: R-PHY Video Configuration

The following example shows how to configure Remote-PHY video:

Router(config)# cable downstream qam-profile 7
Router(config-qam-prof)# annex B modulation 256
Router(config-qam-prof)# interleaver-depth 132-J4
Router(config-qam-prof)# symbol-rate 5361
Router(config-qam-prof)# spectrum-inversion off
Router(config-qam-prof)# description default-annex-b-256-qam
Router(config-qam-prof)# exit
Router(config)# cable depi multicast pool 20
Router(config-multicast-pool)# ip address 225.28.0.0 255.255.0.0
Router(config-multicast-pool)# exit

Feature Information for Remote PHY Video

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 20

Remote PHY DVB Video on Demand

The Digital Video Broadcasting (DVB) protocol for encrypting video services as defined in the ETSI TS 103 197 DVB Simulcrypt specification has been implemented on the line card for DVB R-PHY on Cisco cBR-8. This document contains an overview of the commands for configuring DVB and the commands for viewing the status of the encryption of services.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Information About DVB VOD, on page 152
- How to Configure DVB, on page 154
- Configuration Examples, on page 158
- Additional References, on page 161
- Feature Information for RPHY DVB VoD Support, on page 161

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.
### Information About DVB VOD

#### Overview of DVB VOD

This feature enables the operator to scramble the video sessions on the chassis. It involves the configuration to establish a connection with the Entitlement Control Message Generator (ECMG) and the Event Information Scheduler (EIS).

The two primary modes of scrambling are: session based scrambling and tier-based scrambling. The basic difference between the two modes is that the manner in which the Entitlement Control Messages (ECM) are requested from the ECMG. For session based scrambling, a control word (CW) is generated once every Crypto Period (CP) and the ECM is requested for each session. For tier-based scrambling, the control word is generated once every CP and the ECM generated by the ECMG for the CW is used by all the sessions in the chassis.

#### Session based Scrambling Setup

The connection with the external EIS Server is established via the Virtual Port Group in the Supervisor. The connection with the external ECMG server is established via the linecard.

---

Fail-to-Clear

The fail-to-clear-duration feature is supported on DVB sessions and DualCrypt encryption modes. Based on the session encryption, the following two features are supported on the Cisco cBR Series Converged Broadband Routers.

Fail-to-Clear Duration for DVB Session-based Encryption

This feature is used along with DVB or DualCrypt encryption with external Event Information Scheduler (EIS) configuration. When encryption for a session fails in the Cisco cBR-8, this feature enables the operator to control the configured DVB-encrypted sessions to function without encryption for a configured duration. If the encryption still fails, the DVB session is marked as Fail-to-black after the fail-to-clear duration timeout.

Fail-to-Clear for DVB Tier-based Encryption

This feature is used along with Tier-based configuration. When encryption for a session fails in Cisco cBR-8, this feature enables the operator to control the configured DVB-encrypted sessions to function without encryption.

If fail-to-clear is configured, tier-based configuration is enabled, and then if the encryption fails, the DVB session's Encrypt Status is marked as clear. The status changes to Encrypted when the encryption starts.

This feature is not enabled by default.

Tier based Scrambling Setup

The connection with the external ECMG server is established via the Virtual Port Group in the Supervisor.
Restrictions for DVB

- This feature is applicable only for remapped table based sessions.
- Fail-to-clear-duration feature is applicable only to session-based scrambling for DVB CAS encryption.
- Fail-to-clear feature is applicable only to DVB tier-based scrambling sessions.

How to Configure DVB

Configuring RPHY DVB VoD

Before You Begin

- Virtual Port Group interface must be configured and the management IP for DVB must be identified.
- Management interface is set to this Virtual Port Group interface under cable video configuration.
- Logical Edge Device is configured with the table based protocol.
- The encryption algorithm of the linecard is set to DVB-CSA.
For session based scrambling, the CA interface on the linecard and the route for reaching the ECMG server must be specified.

To configure session based scrambling, follow the steps below:

```
enable
config terminal
interface int_id
  vrf forwarding vrf_script_red_1
  ip address ip-address subnet-mask
  no mop enabled
  no mop sysid
  exit
cable video
  mgmt-intf VirtualPortGroup group_id
  encryption
  linecard slot/bay ca-system dvb scrambler dvb-csa
dvb
  route-ecmg ECMG_Server_IP_Address Netmask Interface Forwarding_Router_IP_Address
  mgmt-ip management ip address
  eis EIS_Name id EIS_id
  listening-port <1-65535> bind led id <led id | led name>
  ca-interface linecard slot/bay IP_Address
  ecmg ECMG_Name id ECMG_ID
  mode vod linecard slot/bay
  type standard
  ca-system-id CA_System_ID CA_Subsystem_ID
  auto-channel-id
  ecm-pid-source sid
  connection-id ID priority connection_priority IP_Address Port
  service-distribution-group sdg name id SDG ID onid onid_number
  rpd downstream-cable slot/subslot/bay
  virtual-carrier-group vcg-name id vcg_id
  encrypt
  service-type narrowcast
  rf-channel channel tsid tsid_number output-port-number number
  bind-vcg
  vcg vcg-name sdg sdg-name
  logical-edge-device led-name id led_id
  protocol gql
  mgmt-ip IP_Address
  mac-address MAC address
  server server_ip_address
  keepalive retry 3 interval 10
  reset interval 8
  virtual-edge-input-ip IP address input-port-number 1
  vcg vcg-name
  active
```

The fail-to-clear-duration is measured in seconds. The valid values are in the range from 0 to 10800 seconds. The default value is 0.

To configure tier based scrambling, follow the steps below:

```
enable
config terminal
interface VirtualPortGroup group_id
  vrf forwarding Mgmt-intf
  ip address ip-address subnet-mask
  no mop enabled
  no mop sysid
  exit
```
Verifying the DVB Configuration

To verify the configuration of the encryption algorithm on the linecard, use the `show cable video encryption linecard` command as shown in the example below:

```
Router# show cable video encryption linecard 7/0
Line card: 7/0
CA System Scrambler DVB-Conformance
-----------------------------------------------
dvb vb-csa Enabled
```

To verify the ECMG connection, use the `show cable video encryption dvb ecmg id id / connection` command as shown in the example below:

```
ECMG ECMG CA Sys CA Subsys PID Lower Upper Streams/ Open Streams/
```

---

**Note**

If the tier-based configuration is already enabled, you must first disable the tier-based configuration using the `no enable` command before you configure the fail-to-clear feature.
The status of the connection with the ECMG Server is indicated by the Conn Status. The Open Streams field indicates the number of Active ECM Streams.

To verify the EIS connection, use the `show cable video encryption dvb eis id` command as shown in the example below:

```
Router# show cable video encryption dvb eis id 1
```

To verify the CA Interface configuration in the case of session based scrambling, use the `show cable video encryption dvb ca-interface brief` command as shown in the example below:

```
Router# show cable video encryption dvb ca-interface brief
```
To verify the encryption status of the sessions, use the **show cable video session logical-edge-device id** command as shown in the example below:

```
Router# show cable video session logical-edge-device id 1
```

<table>
<thead>
<tr>
<th>Session Output Streaming</th>
<th>Session Source</th>
<th>Output</th>
<th>Input</th>
<th>Encrypt</th>
<th>Encrypt Low Session</th>
<th>Status</th>
<th>Latency Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1048576</td>
<td>Remap UDP</td>
<td>10.10.1.1</td>
<td>49167</td>
<td>ACTIVE-PSI</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1695161</td>
<td>1689747 DVB</td>
<td>Encrypted N</td>
<td>dvbss.1.0.1.0.23167</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To verify the ECM PID and whether the CA Descriptor is added to the PMT, use the **show cable video session logical-edge-device id session-id** command as shown in the example below:

```
Router# show cable video session logical-edge-device id 1 session-id 1048576
```

Output PMT Info:

```
Program 20, Version 3, PCR 49, Info len 18, (CA SYS-ID 4748, PID 79)
PID 49: Type 2, Info len 0
PID 50: Type 3, Info len 6, (lang eng)
```

### Troubleshooting Tips

If some configuration errors occur, see the following troubleshooting tips:

- The Management IP must be unique and in the subnet of virtual port group.
- Ensure that the ECGM Server is pingable with source interface as the virtual port group from the Cisco cBR-8 console. This indicates that the ECGM Server is reachable and route is valid.
- Ensure that the TCP port number configured for the ECGM Server in the Cisco cBR-8 is the same as that of the ECGM Server listening port.
- Ensure that the management IP is pingable from the EIS Server. Otherwise, check the routing between the cBR-8 chassis and the EIS server.
- Ensure that the listening port that is configured for the EIS is used for establishing the connection from the EIS Server.
- Ensure that the Virtual Port Group interface is active.
- Ensure that the TenGigabitEthernet interface using which the management traffic reaches the Cisco cBR-8 and the interface through which the CA interface route is configured are active.

### Configuration Examples

This section provides examples for the DVB configuration.
Example: Basic Session-based Scrambling Configuration

```plaintext
enable
config terminal
  interface VirtualPortGroup0
    vrf forwarding vrf_script_red_1
    ip address 10.10.1.1 255.255.255.224

PowerKEY Video-on-Demand refers to video content that is chosen by the subscriber and streamed specifically to the subscriber. The content is encrypted using PowerKEY conditional access through a video session that is created on the line card in R-PHY mode on Cisco cBR-8, specifically for each request.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Information About PowerKEY VOD

The line cards in R-PHY mode on Cisco cBR-8 support session-based PowerKey VOD. In both RPHY and integrated modes, the Cisco cBR-8 router establishes a GQI Remote Procedure Call (RPC) connection to the Edge Resource Manager (SRM), which may be an Explorer Controller (EC), USRM, or any other session manager. The Cisco cBR-8 supports 40G-R line cards, which can be configured for RPHY.

Configure the PowerKey VOD carriers in a GQI protocol LED. The Virtual Carrier Groups (VCG) in the LED, must be bound to a Service Distribution Group (SDG) with downstream-cable ports (instead of the integrated-cable ports).

Overview of PowerKEY VoD

PowerKEY VOD allows the operator to provide secure, encrypted video streams to a particular subscriber over the RF plant. PowerKEY video-on-demand is used in a Cisco cable environment to provide edge-encrypted video-on-demand movies and other content to subscribers. A subscriber can select the content through an on-screen selection and the set-top box (STB) notifies the head-end of the request.

The head-end equipment receives the request from the STB and triggers the Session Resource Manager (SRM) to create an encrypted video session on the Cisco cBR-8. At the same time, the video streamer is triggered to begin streaming the content in a UDP stream to the Cisco cBR-8. The Cisco cBR-8 receives an unscrambled video content, encrypts it using PowerKEY, combines the scrambled stream with other content intended for the RF carrier into a Multi-Program Transport Stream (MPTS), encapsulates it using R-DEPI protocol, and sends it out on Ethernet port to the Converged Interconnect Network (CIN) between the cBR-8 RPHY core and the RPHY Device (RPD).

How to Configure RPHY PowerKey VOD

To know more about the commands referenced in this section, see the Cisco IOS Master Command List.

Configuring the Encryption Type on the Line Card

The Cisco IOS-XE supports PowerKey encryption CA systems, but allows only one encryption type to be installed on the line card. There are two levels in the CA system. The lower level scrambler, which encrypts the actual data streams and the upper level conditional access system, which handles how the control words are transferred from the encrypting device to the decrypting device.

To specify the type of encryption used to scramble the data streams, complete the following procedure:

```
configure terminal
cable video encryption
linecard slot/bay ca-system [powerkey] scrambler scrambler-type
exit
```

PowerKey currently supports DES type of encryption.
Verifying the Encryption Configuration

To verify the encryption type of a line card, use the show cable video encryption linecard command as shown in the following example:

```
show cable video encryption linecard 7/0
Line card: 7/0
CA System Scrambler
================================
powerkey des
```

Configuring the Encrypted Virtual Carrier Groups

For the sessions to be encrypted on the Cisco cBR-8, the Virtual Carrier Groups (VCGs) must be specified as encrypt and the line card must be configured as encrypted. In this way, the operator can choose the carriers on the line card that support encryption and other carriers that support only clear or pre-encrypted sessions. Each encrypted carrier consumes an encrypted carrier license.

For the VCG to be used in a Logical Edge Device (LED) that is configured with the GQI protocol, each RF carrier must be assigned with an output port number. The LED must be configured with the Generic QAM Interface (GQI) protocol in order to support session-based operation.

**Note**

For PowerKEY VOD, you have to specify the session-based operation.

To configure the VCG, complete the following procedure:

```
configure terminal cable video
virtual-carrier-group vcg-name
encrypt
rf-channel channel range tsid tsid range output-port-number port num range
exit
```

Configuring the Encrypted Virtual Carrier Groups

For the sessions to be encrypted on the Cisco cBR-8, the Virtual Carrier Groups (VCGs) must be specified as encrypt and the line card must be configured as encrypted. In this way, the operator can choose the carriers on the line card that support encryption and other carriers that support only clear or pre-encrypted sessions. Each encrypted carrier consumes an encrypted carrier license.

For the VCG to be used in a Logical Edge Device (LED) that is configured with the GQI protocol, each RF carrier must be assigned with an output port number. The LED must be configured with the Generic QAM Interface (GQI) protocol in order to support session-based operation.

**Note**

For PowerKEY VOD, you have to specify the session-based operation.

To configure the VCG, complete the following procedure:

```
configure terminal
cable video
virtual-carrier-group vcg-name
```
Verifying the Encrypted Virtual Carrier Groups Configuration

To verify the encrypted VCGs configuration, use the `show cable video virtual-carrier-group name` command as shown in the example below:

```
show cable video virtual-carrier-group name vod-grp
```

Configuring the Service Distribution Groups and Binding

The Service Distribution Group (SDG) is a collection of one or more RF ports and defines the physical slot/bay/port to be used in a video service. After you configure an SDG, you can bind a VCG to an SDG. The binding connects the carriers defined in the VCG to the physical port listed in the SDG. After binding, a path from the Virtual Edge Input (VEI) is mapped to the RF channels.

The following example shows how to configure the SDGs and binding:

```
configure terminal cable video
mgmt-intf VirtualPortGroup 0
service-distribution-group sdg1 id 1
  rpd downstream-cable 7/0/0
virtual-carrier-group vcg1 id 1
  service-type narrowcast
  encrypt
  rf-channel 0-10 tsid 1-11 output-port-number 1-11
bind-vcg
  vcg vcg1 sdg sdg1
```

Configuring the Logical Edge Device and GQI Protocol

The PowerKEY VOD feature on the Cisco cBR-8 is directed by an external Session Resource Manager (SRM) that creates video sessions in response to a subscriber selecting VOD content to watch on the set top box. You must configure a Logical Edge Device (LED) supporting the GQI protocol on the Cisco cBR-8 to support the PowerKEY VOD.

The LED is configured with the GQI protocol as the LED communicates with an external SRM using the GQI protocol. The GQI protocol supports the creation and deletion of sessions on the carriers owned by this LED.

Use the following command to get the chassis MAC address:

```
Router#show diag all eeprom detail | include MAC
Chassis MAC Address : 54a2.740e.2000
MAC Address block size : 1024
```

Using the Chassis MAC as a basis, increment the least significant number to give a unique identifier (mac-address) for each LED. This number needs to be unique with respect to the GQI server and does not really relate to a true MAC address. Thus, the number is irrelevant, but needs to be unique.
To configure the Logical Edge Device and GQI Protocol, complete the following procedure:

```plaintext
cable video
logical-edge-device led1 id 1
  protocol gqi
  mgmt-ip management ip address
  mac-address mac address from this chassis range
  server ip address of srm
  keepalive retry 3 interval 10
  reset interval 8
  virtual-edge-input-ip ip addr for content input-port-number num
  vcg virtual edge qam name (may be multiple vcgs in an LED)
  active
```

### Verifying the PowerKEY VoD Configuration

The PowerKEY encrypted VOD LED is active and communicates with the external SRM device after configuring the encryption type on the line card, VCGs, binding of SDGs, and LED with GQI protocol are completed.

To verify the Logical Edge Device configuration, use the `show cable video logical-edge-device name led` command or the `show cable video logical-edge-device id led number` command as shown in the example below:

```plaintext
show cable video logical-edge-device name pkvodled
Logical Edge Device: pkvodled
Id: 1
Protocol: gqi
Service State: Active
Discovery State: Disable
Management IP: 1.23.2.10
MAC Address: 54a2.740d.dc99
Number of Servers: 1
Server 1: 1.200.3.75
Reset Interval: 8
Keepalive Interval: 10
Retry Count: 3
Number of Virtual Carrier Groups: 1
Number of Share Virtual Edge Input: 1
Number of Physical Qams: 20
Number of Sessions: 0
No Reserve PID Range
Virtual Edge Input:
  Input Port VEI Slot/Bay Bundle Gateway
  ID IP ID IP
  1 174.10.2.1 7/0 - -
```

Verify the following:

- The service state of the LED should be active and the other fields must be same as the configured values.
- The connection to the remote SRM should be displayed to ensure that there is a valid network connection to the SRM.
- Execute the `show cable video gqi connections` command. The following is the sample output when the connection is not established to the SRM:

```
LED Management Server Connection Version Event Reset Encryption
ID IP IP Status Pending Indication Discovery
```

---

**Cisco Remote PHY Device Software Configuration Guide for Cisco 2x2 RPD Software 2.x**

---

**RPHY System Video Configuration**

---

**Verifying the PowerKEY VoD Configuration**
After the connection is established, the SRM may create encrypted sessions on the carriers of the LED.

• To view the encrypted sessions, use the show cable video session logical-edge-device id led name summary command as shown in the example below:

```plaintext
show cable video session logical-edge-device id 1 summary
```

Video Session Summary:

- Active : 1
- Init : 0
- Idle : 0
- Off : 0
- Blocked : 0
- PSI-Ready : 1
- UDP : 1
- ASM : 0
- SSM : 0
- Remap : 1
- Data : 0
- Passthru : 0
- Total Sessions: 1

• The individual session information can be displayed for the entire LED, for a particular port or line card. The details of a single session may be displayed by specifying a session-id or session-name. To display all the sessions on the LED, use the show cable video session logical-edge-device name led name command as shown in the example below:

```plaintext
show cable video session logical-edge-device name pkvodled
```

Total Sessions = 1

<table>
<thead>
<tr>
<th>Id</th>
<th>Port</th>
<th>Type</th>
<th>Type</th>
<th>Destination</th>
<th>UDP</th>
<th>Input</th>
<th>Output</th>
<th>Program</th>
<th>State</th>
<th>Bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1048576</td>
<td>1</td>
<td>Remap</td>
<td>UDP</td>
<td>174.101.1.1</td>
<td>0</td>
<td>1</td>
<td>ACTIVE-PSI</td>
<td>ON</td>
<td>732788</td>
<td></td>
</tr>
</tbody>
</table>

If the session is encrypted and transmitted properly, the session is displayed as shown in the above example. The input state is "ACTIVE-PSI". The output state is "ON". For PowerKEY encrypted sessions, the Encrypt Type will be "PowerKey" and the Encrypt Status will be "Encrypted".

If the session is created as a clear session, then the Encrypt Type will be "CLEAR" and the Encrypt Status will be "-".

### Configuration Examples

This section provides configuration examples for the PowerKEY VOD feature:

#### Example: Configuring Encryption Type on the Line Card

The following example shows how to create a management IP interface:
Example: Configuring Encrypted Virtual Carrier Groups

The following example shows how to configure the QAM channels from 64 to 158. These channels are encryption capable once the VCG is successfully bound to a Service Distribution Group. The sessions created on these QAM carriers are encrypted using the scrambler installed on the line card.

```plaintext
configure terminal cable video encryption
linecard 6/0 ca-system powerkey scrambler des
exit
```

Example: Configuring Service Distribution Groups and Binding

The following example shows how to configure the service distribution groups and binding:

```plaintext
configure terminal cable video
mgmt-intf VirtualPortGroup 0

service-distribution-group sdg1 id 1
  rpd downstream-cable 7/0/0
virtual-carrier-group vcg1 id 1
  service-type narrowcast
  encrypt
    rf-channel 0-10 tsid 1-11 output-port-number 1-11
bind-vcg
  vcg vcg1 sdg sdg1
logical-edge-device led1 id 1
  protocol gqi
  mgmt-ip 1.22.2.10
  mac-address c414.3c17.e001
  server 1.200.1.189
  keepalive retry 3 interval 10
  reset interval 8
  virtual-edge-input-ip 174.102.1.1 input-port-number 1
  vcg vcg2
active
```

Feature Information for Remote PHY PowerKEY VoD

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.
The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

</tbody>
</table>
Information About Pre-encrypted Broadcast Video

The Cisco cBR-8 line card supports broadcast video. It also provides support to the WAN ports for receiving Multi program Transport Streams (MPTS). The Cisco cBR passes the MPTS streams in its entirety to multiple RPDs in the network to provide an output on their RF ports.

The content is multiplexed and encrypted during upstream traffic and reaches Cisco cBR-8 router as pre-encrypted in a constant bit-rate MPTS with all the PSI present. The Cisco cBR routers perform the following:

- De-jittering
- Clock recovery
- PCR re-stamping
- Regenerates PAT with correct TSID

Typically, multi-system operators (MSO) have between 64 and 75 carriers of Broadcast video content in their system. In the RPHY environment, the Cisco cBR routers convert the Broadcast carriers into DEPI multicast streams and send them to an unlimited number of RPDs over the Converged Interconnect Network.

Multicast Table-based Sessions

Similar to table-based unicast session configuration, sessions can be configured as individual sessions under each QAM carrier that is assigned to a table-based LED. To configure multicast video session, you must configure a port-channel interface.

A multicast session can be configured with a single input multicast input source or multiple input sources for backup purpose. For multiple backup sources, a label is required to be associated with the session configuration. Same label can be applied to multiple sessions on different QAM channel. These sessions are considered as cloned sessions.

For session cloning on multiple QAMs within the same line card, only one copy of the traffic is forwarded to the line card. The line card replicates the input packets and forwards them to multiple QAMs. Each cloned copy of a remapped session will have the same or different output program number.

MPTS Pass-through Session

The Cisco cBR-8 router supports multicast MPTS pass-session type. For a pass-through session:

- The PMT and other program data are not changed.
- PID remapping is not performed.
- Input NULL packets are dropped.
- Oversubscription results in random TP dropping, and all ghost PIDs are preserved in the output.
How to Configure Pre-encrypted Broadcast Video Sessions

---

**Note**

To know more about the commands referenced in this section, see the Cisco IOS Master Command List.

This section contains the following:

### Configure a Port-Channel Interface

The following example shows how to configure a port-channel interface.

```bash
interface Port-channel27
description connection for Core A
ip address 2.27.1.1 255.255.255.252
ip pim sparse-mode
ip access-group 101 out
ip igmp version 3
ip ospf 64512 area 27
load-interval 30
carrier-delay msec 500
```

### Configuring Pre-encrypted Broadcast Sessions

The following example shows how to configure the pre-encrypted Broadcast Video sessions on Cisco cBR routers.

```bash
cable video
multicast-uplink Port-channel32 access-list all-multicasts
table-based
  multicast-label label group group-ip source source-ip source2 source-ip source3 source-ip source4 source-ip
  multicast-label label group group-ip source source-ip source2 source-ip source3 source-ip source4 source-ip
  vcg vcg-name
  rf-channel channel
  session session-name multicast-label label processing-type {remap | passthru | data}
cbr
  rf-channel channel
  session session-name multicast-label label processing-type {remap | passthru | data}
cbr
```

### Configuring the Service Distribution Groups and Binding

The Service Distribution Group (SDG) defines the physical slot/bay/port to be used in a video service. After you configure an SDG, you can bind a VCG to an SDG. The binding connects the carriers defined in the VCG to the physical port listed in the SDG. After binding, a path from the Virtual Edge Input (VEI) is mapped to the RF channels.

The following example shows how to configure the SDGs and binding:
Configuration Example for Pre-encrypted Broadcast Video Session

CHAPTER 23

Remote PHY BFS QAM Configuration

This document provides information on how to configure Cisco cBR-8 as a Broadcast File System (BFS) Quadrature Amplitude Modulation (QAM), which interfaces with Explorer Controller (EC) versions 7.x and 8.x.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Information About BFS QAM Support

The BFS provides a mechanism for a standardized downloading of applications, games, images, and other data formats required by the applications. The BFS QAM enables the router to transfer the broadcast data from an EC to the target platform such as a set-top unit. All forms of BFS data from EC flows as IP multicast, except the CVT carousel, which is through the GQI insert packets.

The BFS QAM configuration on the Cisco cBR-8 router varies based on the version of EC, which interfaces with the router.

- For EC 7.x-Model a GQI-based LED as BFS QAM. One for each LC on Cisco cBR-8.
  
  For Remote PHY-A single GQI-based LED as BFS QAM for the entire Cisco cBR-8 chassis, as the Cisco cBR-8 can support DEPI multicast for all Remote PHY devices (RPD).
  
  For EC 8.x-EC 8.x multicasts CVT carousel data in addition to GQI insert packets, but only in the presence of GQAM configured as BFS QAM. Hence, in this setup, a single table-based LED, modeled as BFS QAM, for each Cisco cBR-8 chassis is sufficient. Using cross LC replication, this BFS data can be replicated to other LCs on the Cisco cBR.

How to Configure BFS QAM for EC 7.x

This configuration applies to Cisco cBR-8 routers running Converged Cable Access Platform (CCAP) with Ethernet input and RF output.

If Cisco cBR-8 interacts with EC 7.x, configure an LED on each line card. Use the following procedure to configure BFS QAM on Cisco cBR router.

- Configure an LED with GQI protocol on each line card.
- On EC 7.x, provision BFS QAM.
- Manually create sessions on EC 7.x.
- Generate the QAM, based on GQI model.
- Generate a new source definition and use the new QAM as a target using the same PIDs.
- Ensure that everything is set up on the EC to match the Cisco cBR-8 LED configuration.

Note

To know more about the commands referenced in this section, see the Cisco IOS Master Command List.
This section contains the following:

**Mapping Cisco cBR-8 as a GQI QAM**

On the EC 7.x, configure BFS sessions on the registered BFS QAM by using one of the following:

- Proprietary Remote Procedure Call (RPC) (with GQAM)
- GQI (with RFGW-1)

You can use a standard GQI model where the sessions will be generated on the individual line card on a single LED per line card basis. Individual BFS sessions are added to the LEDs at the Source Definition for all in-band BFS sources. Sessions must be unique in numbering and QAM selection, although all other settings must be duplicates of the original settings.

**Creating VCG with One QAM Channel**

The following example shows how to create a video virtual carrier group (VCG) with one QAM channel, which can carry the BFS data.

```plaintext
enable
configure terminal
cable video

virtual-carrier-group (name) id (id)
  service-type broadcast
  rf-channel (rf-channel number 1) tsid (id) output-port-number (port number 1)
virtual-carrier-group (name 2) id (id 2)
  service-type broadcast
  rf-channel (rf-channel number 1) tsid (id 2) output-port-number (port number 1)
```

**Creating SDG for BFS Sessions on Cisco cBR**

The following example shows how to create Service Distribution Group (SDG) for BFS sessions and map this to as many RF ports as required.

```plaintext
enable
configure terminal
cable video

service-distribution-group sdg_bdcast id 20
  rf-port integrated-cable 8/0/0
  rf-port integrated-cable 8/0/1
  rf-port integrated-cable 8/0/2
  rf-port integrated-cable 8/0/3
  rf-port integrated-cable 8/0/4
  rf-port integrated-cable 8/0/5
  rf-port integrated-cable 8/0/6
  rf-port integrated-cable 8/0/7
service-distribution-group sdg_bdcast-9 id 21
  rf-port integrated-cable 9/0/0
  rf-port integrated-cable 9/0/1
  rf-port integrated-cable 9/0/2
  rf-port integrated-cable 9/0/3
  rf-port integrated-cable 9/0/4
  rf-port integrated-cable 9/0/5
  rf-port integrated-cable 9/0/6
```
Create VCG for BFS

The following example shows how to create VCG for BFS.

```
configure terminal
cable video

virtual-carrier-group vcg_bdcast id 20
    service-type broadcast
    rf-channel 76 tsid 1011 output-port-number 1
virtual-carrier-group vcg_bdcast-9 id 21
    service-type broadcast
    rf-channel 76 tsid 1012 output-port-number 1

vcg vcg_bdcast sdg sdg_bdcast
    vcg vcg_bdcast-9 sdg sdg_bdcast-9
bind-vcg
    vcg vcg_bdcast sdg sdg_bdcast
    vcg vcg_bdcast-9 sdg sdg_bdcast-9
```

Creating Logical Edge Device

The following example shows how to create an LED.

```
Note

Ensure that the LED settings are the same as GQI QAM settings on the EC. For more details, see Creating GQI QAM for BFS on EC 7.x
```

```
enable
configure terminal
cable video

logical-edge-device led_BFS id 20
    protocol gqi
        mgmt-ip 192.0.2.1
        mac-address <MAC address>
        server 198.51.100.1
        keepalive retry 3 interval 10
        reset interval 8
        virtual-edge-input-ip 203.0.113.1 input-port-number 1
        vcg vcg_bdcast
        active
logical-edge-device led_BFS-9 id 21
    protocol gqi
        mgmt-ip 192.0.2.1
        mac-address <MAC address>
        server 198.51.100.1
        keepalive retry 3 interval 10
        reset interval 8
        virtual-edge-input-ip 203.0.113.1 input-port-number 1
        vcg vcg_bdcast-9
```
Creating GQI QAM for BFS on EC 7.x

Prerequisites

- To create the GQI QAM on the EC, enable packet insertion in the QAM Model.
- You can duplicate the standard RFGW model to ensure that no interference occurs with the current operations.
- The router must have a GQI QAM per LED.
- The individual QAM must be BFS-capable.

Procedure

Use the following procedure to create GQI QAM for BFS.

1. Choose EC > GQI Based QAM Model List > Edit GQI Based QAM.
2. (Optional) Select the BFS Capable checkbox.
3. Choose RF Carriers from the left pane.
4. Ensure that the Carriers and Ethernet Port values are the same as those on the LEDs.

You can create the sessions for each BFS source by generating a Multicast Through GQI Based QAM session through each BFS source's Source Definition.

How to Configure BFS QAM for RPD

This configuration applies to Cisco cBR-8 routers running CCAP with Ethernet input and Ethernet output. The configuration procedure for RPD is similar to the configuration on Cisco cBR-8 routers with EC 7.x. However, only one LED is needed for BFS QAM configuration.

You can use the sessions configured on the LED on every RPD by defining an Auxiliary Core on each RPD as needed for BFS distribution.

Creating SDG for BFS Sessions for RPD

The following example shows how to create SDG for BFS sessions on RPDs.

```
service-distribution-group sdg_bdcast id 20
rpd downstream-cable 2/0/30

virtual-carrier-group vcg_bdcast id 20
service-type broadcast
rf-channel 79 tsid 1013 output-port-number 1
```
Creating LED for RPD

The following example shows how to create an LED.

```
logical-edge-device led_BFS id 20
  protocol gqi
  mgmt-ip 192.0.2.1
  mac-address <MAC address>
  server 198.51.100.1
  keepalive retry 3 interval 10

Defining Cable RPD

The RPD definition must include the RPD defined in the BFS SDG for every RPD to which you want to distribute BFS data: The following example shows how to define RPD.

```
cable rpd RPD07
  identifier xxxx.xxxx.xxxx
  core-interface Te2/1/4
  principal
  rpd-ds 0 downstream-cable 2/0/16 profile 11
  rpd-us 0 upstream-cable 2/0/12 profile 1
  core-interface Te2/1/6
  rpd-ds 0 downstream-cable 2/0/30 profile 10
  r-dti 3
  rpd-event profile 0
  rpd-55d1-us-event profile 0

! cable rpd RPD08
  identifier xxxx.xxxx.xxxx
  core-interface Te2/1/4
  principal
  rpd-ds 0 downstream-cable 2/0/17 profile 11
  rpd-us 0 upstream-cable 2/0/14 profile 1
  core-interface Te2/1/6
  rpd-ds 0 downstream-cable 2/0/30 profile 10
  r-dti 3
  rpd-event profile 0
  rpd-55d1-us-event profile 0
```

For information on how to create GQI QAM on the EC, see Creating GQI QAM for BFS.

How to Configure BFS QAM for EC 8.x

When Cisco cBR-8 interfaces with EC 8.x, all sessions on the router are configured as multicast and perform a multicast join.

The Cisco cBR routers are not directly mapped on the EC. Hence, this BFS QAM configuration requests and processes the multicast BFS sessions that are setup on the actual BFS QAM. If the Cisco cBR-8 routers have to process these sessions, you must set up table-based multicast sessions, which are similar to the ones available on the BFS QAM.
Configure QAM replication group (QRG), spanning across line cards (LC) to replicate these BFS sessions on every RF port (if each RF port is a service group) of every LC.

To replicate across line cards, you must configure table-based sessions. You can perform cross-line-card-replication only through table-based sessions.

Use the following procedure to configure BFS QAM on Cisco cBR router for EC 8.x.

1. Create a VCG with one QAM channel for carrying this BFS data.
2. Within the same VCG, allocate a few more QAM channels for MPTS pass-through sessions.
3. Create VCG for VoD QAM channels.
4. Create VCG for SDV QAM channels.

### Creating VCG for VoD QAM Channels

The following example shows how to create VCG for VoD QAM channels.

```plaintext
enable
cfgiure terminal
cable video

virtual-carrier-group vcg_VoD
service-type narrowcast
rf-channel 1-32 tsid 2-33 output-port 2-33
```

### Creating VCG for SDV QAM Channels

The following example shows how to create VCG for SDV QAM channels.

```plaintext
enable
cfgiure terminal
cable video

virtual-carrier-group vcg_SDV
service-type narrowcast
rf-channel 33-48 tsid 34-49 output-port 34-49
```

### Creating SDG

The following procedures are applicable when you create an SDG.

1. Create SDG for broadcast sessions and map this to as many RF ports as required, depending on the Service Groups which need this broadcast data.

2. Create separate SDG for VoD.

3. Create separate SDG for SDV, which probably contains replication.

```plaintext
enable
cfgiure terminal
cable video

service-distribution-group sdg_bdcast
```
Creating LEDs

The following procedures are applicable for creating LEDs.

1. Create a table based LED for broadcast carrying BFS and MPTS pass-through sessions.

2. Create separate LEDs for VoD and SDV.

```"logical-edge-device led_BFS id 1
protocol table-based
  virtual-edge-input-ip 203.0.113.1 input-port-number 1
  vcg vcg_bdcast
  active
  table-based
  vcg vcg_bdcast
  rf-channel 0
  session BFS group 203.0.113.4 start-udp-port 49152 num-sessions-per-qam 1
  processing-type remap start-program 20 bit-rate 300000 jitter 100 vbr
  rf-channel 48 session MPTS_passthru group 203.0.113.5 start-udp-port 49152
  num-sessions-per-qam 1 processing-type passthru jitter 100 vbr
  rf-channel 49 session MPTS_passthru group 203.0.113.6 start-udp-port 49152
  num-sessions-per-qam 1 processing-type passthru jitter 100 vbr

logical-edge-device led_VoD id 2
protocol gqi
  virtual-edge-input-ip 203.0.113.1 input-port-number 1
  vcg vcg_VoD
  active
```

Configuration Example for BFS QAM Configuration

This section provides examples for BFS QAM support.
Example: BFS QAM Configuration on Cisco cBR for EC 7.x

The following example shows the BFS QAM configuration for EC 7.x.

```
virtual-carrier-group vcg_bdcast id 20
  service-type broadcast
  rf-channel 76 tsid 1011 output-port-number 1

  rpd-event profile 0
  rpd-55d1-us-event profile 0
```

Example: BFS QAM Configuration on Cisco cBR for EC 8.x

The following example shows the BFS QAM configuration for EC 8.x.

```plaintext
virtual-carrier-group vcg_bdcast
  service-type broadcast
  rf-channel 0 tsid 1 out 1
  rf-channel 49-63 tsid 50-64 output-port 50-64

virtual-carrier-group vcg_VoD
  service-type narrowcast
  rf-channel 1-32 tsid 2-33 output-port 2-33
```
Feature Information for BFS QAM Configuration

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.
The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 50: Feature Information for BFS QAM Configuration

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>

</table>
CHAPTER 24

Remote PHY Switched Digital Video

This document provides information on how to configure Switched Digital Video for Cisco Remote PHY Device.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Switched Digital Video Services

The Switched Digital Video (SDV) services are supported for the MPEG video subsystem on the Cisco Remote PHY Device. It consists of Multicast IP Packet based video streams that are managed as "Video Sessions". The Cisco Remote PHY Device supports both Any Source Multicast (ASM) and Source Specific Multicast (SSM) sessions.

- For ASM, the input is identified by the group IP address.
- For SSM, the input is identified by the source and group IP address pair.

In both cases, the UDP ports are ignored. Both ASM and SSM can co-exist but cannot overlap in a group IP address. Hence, for a group IP address, either a single ASM, or one or more SSM can be used.

Session Cloning

Session cloning refers to the ability of forwarding an input to multiple output QAM channels. Only multicast sessions can be cloned. The output QAM channels are located on the same or different line cards. However, an input cannot be cloned on the same QAM channel. Cloning is available on session-based GQIv2 or Table-based sessions. It is applicable to re-mapped, pass-through, and data piping sessions. All cloned sessions must have the same processing type, bitrate and jitter value. For re-mapped sessions, each output copy will have a different output program number.

Redundant Multicast Sources

The redundant multicast sources feature supports up to four SSM/ASM multicast address pairs per video session. However, only multicast traffic from one source is forwarded to the output QAMs. When the active source fails, another source is chosen automatically. Multicast sources must be unique within a redundant group and cannot overlap across redundant groups.

The order of the sources is critical when multicast sessions are configured via GQI or VSRM. For a given group IP address, the source IP addresses must be specified in the same order.

For example: The group IP address 232.1.2.3 used with two sessions must have the source IP addresses specified in the same order.

Session A configured with group IP 232.1.2.3 source 174.2.3.4 source2 174.4.5.6 source3 174.7.8.9 and session B or any session created after session A configured using group IP 232.1.2.3, must have the source IP addresses in this same order as specified for session A. That is, source 174.2.3.4 source2 174.4.5.6 source3 174.7.8.9.

This ensures that all sessions switch to the same source IP address when a source switch occurs. Additionally, sessions configured via GQI have up to three sources available for redundancy, whereas multicast labels configured for table-based sessions have up to four sources available for redundancy.

Multicast labels must use unique groups and S/G pairs. These pairs cannot be used by other multicast labels or by multicast sessions that use S/G pairs. For example, when one multicast session uses \{[S1, G], [S2, G] and [S3, G]\}, another session cannot use \{[S1, G], [S4, G]\}.

Multicast source change is based on the session state; INIT, IDLE, ACTIVE or OFF. A session configured for the first time is in INIT state and stays in this state for a brief time. If traffic starts before the INIT timer expires, it moves to the ACTIVE state, otherwise to the IDLE state.
When traffic starts, the session remains in ACTIVE state as long as traffic continues to flow. When traffic stops for a time longer than the IDLE timer, the session moves to IDLE state. During IDLE state, PAT and PMT of the session is retained as the output. If traffic resumes in this state, the session moves to ACTIVE state again with all its previous PSI and remapping information unaltered.

In IDLE state, if traffic does not start or resume before the OFF timer expires, the session transitions to OFF state. When traffic resumes for a session in OFF state, it is treated as a new session.

Sessions that transition from ACTIVE to IDLE have higher priority and will be moved to the backup source than those that were newly created and have changed from INIT to IDLE.

**Benefits of Switched Digital Video**

Switched Digital Video provides the following benefits:

- Saves space, maintenance and cost.
- Allows customers to oversubscribe bandwidth.

**Prerequisites for Switched Digital Video**

- To access multicast capability, configure multicast routing.
- To switch sources for table-based sessions, configure at least two sources for a multicast label and then associate with the desired session.

**Restrictions for Switched Digital Video**

- While creating a multicast label, up to four sources can be associated with one group IP address.
- Labels are used with table-based video sessions only.
- Sessions created with GQI Tools do not use labels. However, they can have up to three sources associated with one group IP address.
Information About Switched Digital Video

QAM Sharing

Unicast and multicast video sessions can co-exist on the same QAM channel for VOD, SDV or Gaming sessions. QAM sharing requires a common Edge Resource Manager to avoid oversubscription of QAM resources between services.

Note

QAM sharing with MPTS pass-thru sessions is not supported.

QAM Replication

Multicast sessions can be replicated from one port to other ports on the same line card and/or across line cards. The difference between a cloned session and replicated sessions is:

- Cloned sessions are initiated by a user on session creation. Each session has a unique session id and may have different output configuration.
- Replicated sessions have the same output configuration attributes. For sessions that are replicated across line cards, session on each line card will have its own unique session id.

MPTS Pass-through Session

Switched digital video (SDV) sessions are typically multicast SPTS remap type. The Cisco Remote PHY Device also supports multicast MPTS pass-through and data-piping session types. The MPTS session is assumed to have no collision in the PID space and program number space with other sessions that already exist within a QAM. Hence, SPTS remap and MPTS pass-through sessions cannot co-exist on the same QAM. Otherwise, there might be conflict when the PID and program numbers in the MPTS and SPTS remuxing are not unique on the output QAM channel.

For a pass-through session:

- The PAT is snooped and regenerated with the correct TSID.
- The PMT and other program data are not changed.
- PID remapping is not performed.
- Input NULL packets are dropped.
- Oversubscription results in random TP dropping, and all ghost PIDs are preserved in the output.
How to Configure the Switched Digital Video Services

Configuring Multicast Routing

You can enable IP Multicast Distributed Switching (MDS) to provide distributed switching of multicast packets received at the line cards.

```
enable
cfg = terminal
ip multicast-routing distributed
ip pim ssm range all-multicasts
ip pim rp-address ip-address
interface type number
ip pim sparse-dense-mode
ip igmp version 3
cable video
multicast-uplink interface-name access-list access-list-name
```

Configuring Multicast Label

The Cisco Remote PHY Device supports up to four multicast address pairs per multicast session for backup purpose. To specify additional sources for a multicast session for table-based, a label needs to be configured and attached to the session configuration. A maximum of 2000 multicast labels can be created but only 2048 multicast addresses can be active at a time.

Multicast label is used for table-based session configuration when more than one multicast source [S, G] is used as backup for the sessions. A multicast label can only be created or deleted; it cannot be modified. The multicast label cannot be deleted before the sessions using it are removed.

Groups used by multicast labels must be unique like the multicast S/G pairs. However, sources may be used by more than one label as long as the group is unique. A maximum of 4 multicast sources is allowed in one label. If the label is used in multiple sessions, the sessions are considered as cloned sessions.

```
enable
cfg = terminal
cable video
table-based
multicast-label label group group-ip source source-ip source2 source-ip source3 source-ip source4 source-ip
```

Configuring Multicast Table-based Sessions

Similar to table-based unicast session configuration, sessions can be configured as individual sessions under each QAM carrier that is assigned to a table-based LED.

A multicast session can be configured with a single input multicast input source or multiple input sources for backup purpose. For multiple backup sources, a label is required to be associated with the session configuration.
Same label can be applied to multiple sessions on different QAM channel. These sessions are considered as cloned sessions.

For session cloning on multiple QAMs within the same line card, only one copy of the traffic is forwarded to the line card. The line card replicates the input packets and forwards them to multiple QAMs. Each cloned copy of a remapped session will have the same or different output program number.

```
enable
configure terminal
cable video
table-based
vcg vcg-name
rf-channel channel
  session session-name group group-ip source source-ip processing-type { remap | passthru | data } start-program program-num [ bit-rate bit-rate-number ] [ jitter jitter-number ] { cbr | vbr }
```

**Configuring Source Switching**

Source switching happens automatically when the current source goes down. If more than one source IP is configured, the software will automatically switch to the next valid source IP, if it is available. However, to force switch from one valid source to another valid source, use the following commands:

```
Router(config)# cable video source-switch from-group group-ip from-source source-ip

or

Router(config)# cable video source-switch to-group group-ip to-source source-ip
```

**Verifying Switched Digital Video Configuration**

```
Router# show cable video session logical-edge-device id 2
Total Sessions = 4

CHAPTER 25

Remote PHY QAM Profile Configuration

This document describes how to configure the QAM profile on the Cisco cBR Series Converged Broadband Router.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 201
- Information About QAM Profile, on page 202
- How to Configure Remote PHY QAM Profile, on page 202
- Configuration Example, on page 203
- Feature Information for QAM Profile Configuration, on page 204

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

|                    | PID—RPD-2X2— |
Information About QAM Profile

A QAM profile describes the common downstream channel modulator settings, referred to as physical layer parameters. This includes QAM constellation, symbol rate, interleaver-depth, spectrum-inversion, and annex.

The QAM profile is described by CCAP DownPhyParams object. Default QAM profiles are supported and customized for DOCSIS or MPEG Video, which are described as DocsisPhyDefault and VideoPhyDefault objects, respectively.

A maximum of 32 QAM profiles can be defined. There are four system-defined QAM profiles (0 to 3), which cannot be deleted or modified. You can define profiles 4 to 31.

The system defined profiles are:

- Profile 0 - default-annex-b-64-qam
  - interleaver-depth: I32-J4
  - symbol rate: 5057 kilo-symbol/second
  - spectrum-inversion: off

- Profile 1 - default-annex-b-256-qam
  - interleaver-depth: I32-J4
  - symbol rate: 5361 kilo-symbol/second
  - spectrum-inversion: off

- Profile 2 - default-annex-a-64-qam
  - interleaver-depth: I12-J17
  - symbol rate: 6952 kilo-symbol/second
  - spectrum-inversion: off

- Profile 3 - default-annex-a-256-qam
  - interleaver-depth: I12-J17
  - symbol rate: 6952 kilo-symbol/second
  - spectrum-inversion: off

How to Configure Remote PHY QAM Profile

To know more about the commands referenced in this section, see the Cisco IOS Master Command List.
Configuring the QAM Profile on Downstream Channels

Enable
configure terminal
  cabledownstream qam-profile Qam_Profile_ID D

  annex {A | B | C}
  description LINE
  modulation {256 | 64}
  spectrum-inversion {off | on}
  symbol-rate value

exit

You can configure symbol rate for Annex A video and Annex C video. The valid range for Annex A video is 3500 to 7000 kilo-symbols/sec. The valid range for Annex C video is 3500 to 5309 kilo-symbols/sec. The channel width in kHz is symbol-rate * (1 + alpha) with 0.15 alpha for Annex A and 0.13 alpha for Annex C.

Verifying QAM Profile on Downstream Channels

Use the following commands to verify the QAM Profile on Downstream Channels:

Router#show running-config | section downstream controller-profile
cable downstream controller-profile 0
  type DOCSIS
  frequency 111000000
  rf-output NORMAL
  qam-profile 1
docsis-channel-id 1

Configuration Example

QAM Profile Configuration

configure terminal
cable downstream controller-profile 1
  multicast-pool 20
  Rf-channel 0 15
  Type docsis
  Frequency 111000000
  Rf-output NORMAL
  Qam-profile 1
  Docsis-channel-id 1
cable downstream controller-profile 2
  multicast-pool 20
  Rf-channel 20 47
  Type video sync
  Frequency 231000000
  Rf-output NORMAL
  Qam-profile 14
Feature Information for QAM Profile Configuration

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Information About Out of Band

Out of Band (OOB) data is used by set-top boxes on the cable plant for the delivery of data streams that support set-top box operation in the downstream and to convey responses and commands from the STB in the upstream.

The two OOB systems are OOB 55-1 and OOB 55-2. The OOB 55-2 system has a scheduled TDMA upstream, which is intolerant of packet network latency. The SCTE 55-1 system does not include such upstream scheduling capabilities, however requires multiple upstream frequencies to operate.

OOB 55-1

To facilitate the delivery of OOB streams from the headend to the customer-facing CPE via the Remote PHY (R-PHY) architecture, a solution is needed that delivers the OOB streams to the RPD via the same Ethernet carriers that the rest of the services traverse. The following sections describe 55-1 OOB approaches to this transport:

For downstream:

- Ethernet from the OM device: The OM processes OOB source streams per SCTE-55-1 and outputs datagrams via IP multicast.
- CCAP-Core forward as virtual OM: The CCAP joins and processes streams from OM device per SCTE-55-1 and forwards them downstream to the RPD.

For upstream:

- ATM from STB: The STB send augment ATM upstream packet to RPD per SCTE-55-1, RPD build up upstream packet per ARPD protocol (version 2) and forward it to CCAP core.
- CCAP-Core forward as virtual ARPD: The CCAP receive 55-1 packet via UEPI and forwards them upstream to the NC.

The Out-of-Band Modulator (OM) handles the receiving of OOB source data streams and creating a multiplexed signal in accordance with OOB 55-1. The MPEG transport stream, containing the OOB is IP multicast using the UDP to the CCAP Core over an Ethernet link.

Each OM can output only a single OOB multiplex. Hence, a CCAP Core may receive OOB streams from multiple OMs. Each of these streams is intended for a different set of RPDs.

OM2000 does not include null frames in its Ethernet output stream. The OM provides an output of non-null packets in its Ethernet output transport streams. Hence, the downstream QPSK modulator should insert nulls when necessary. The Remote PHY device inserts null packets as necessary to maintain the required module rate of the OOB 55-1 downstream QPSK channel. The downstream modulator need not maintain precise inter-packet timing. The modulator can effectively insert null packets wherever necessary without checking for excessive data packet displacement.

Each virtual ARPD uses a unique source IP address and a unique destination UDP port in packets that are sent to the NC. The NC relies on IP address and UDP port to identify the ARPD from which the traffic is arriving.

Using GCP, the CCAP Core configures the attached RPDs with the appropriate ARPD source ID, RF port ID, and demodulator ID corresponding to each UEPI tunnel. The RPD uses this information when forming the ARPD datagram.
The RPD aggregates multiple physical demodulators into a single virtual ARPD demodulator ID. The RPD also supports power level setting of the OOB 55-1 FDC in a range of -7 dBC to 0 dBC relative to the 256-QAM level, in 0.2 dB steps.

**Forward Channels**

To support the orderly transition of set-top boxes to a higher frequency, the SCTE 55-1 forward data can be carried on two forward channels with distinct frequencies. The data content sent on both channels is identical. The RPD can support two SCTE 55-1 forward channels on any of its downstream RF port.

**OOB 55-2**

In the video headend, the OOB 55-2 Controller maintains all interfaces with the existing applications and services but contains only a subset of the functions available with the existing 55-2 Modulator/Demodulator. The remaining functions are moved to the RPD.

The OOB 55-2 Remote PHY solution places components necessary for performing ATM slot receipt acknowledgement within the RPD, and all other components of the OOB 55-2 MAC located in the 55-2 Controller where feasible. The OOB 55-2 Controller handles the configuration and monitoring of 55-2 specific functions within the RPD. Some monitoring is also included in the upstream data packets sent by the RPD to the 55-2 Controller.

The current 55-2 Digital Home Communication Terminal (DHCT) service group sizes are more than 10,000 DHCTs, versus the expected RPD DHCT counts which can be 1000 or lower. For compatibility with existing infrastructure, RPDs are grouped with a single 55-2 Controller as follows:

- Multiple RPDs are bound by operator configuration to a single 55-2 Controller which can service >10,000 DHCTs.
- RPD demodulators are assigned an Upstream Group ID between 0 and 7. All demodulators in the same Upstream Group logically-share the same upstream slot assignments for 55-2 compatibility. Upstream Group ID is equivalent to SCTE 55-2 Demodulator Number, but is zero indexed instead of 1 indexed. Upstream Group ID 0 corresponds to SCTE 55-2 Demodulator Number 1 (R1), Upstream Group ID 7 corresponds to SCTE 55-2 Demodulator Number 8 (R8).
- All RPDs bound to a single 55-2 Controller share a single L2TPv3 multicast tunnel for downstream data.

An RPD can incorporate a number of SCTE 55-2 modules, each represented by Oob55d2Module object. The number of SCTE 55-2 Modules is communicated using RPD capabilities. Common parameters for all 55-2 modules are grouped into an Oob55-2Config object.

Each SCTE55-2 module consists of one modulator and one to eight demodulators. The Oob55-2Modulator can be associated with one or more downstream RF ports, and the Oob55-2Demodulator can be associated with zero or one upstream RF ports.

The RPD reports these associations to the CCAP Core.

**Prerequisites**

The RPD must support the following:

- RPD connects to only one 55-2 controller.
• OOB 55-2 specific L2TPv3 multicast packets containing downstream ATM cells and metadata.
• OOB 55-2 specific IP and L2TPv3 encapsulation of upstream ATM cells and metadata.
• Sending at least one L2TPv3 upstream tunnel per RPD to the 55-2 Controller.
• Forwarding the IP unicast packets to the 55-2 Controller.
• GCP configuration by the 55-2 Controller using authenticated and secured connections.
• An authenticated and secured L2TPv3 control connection with the 55-2 Controller.

How to Configure 55-1 OOB

This section describes how to configure OOB on Cisco cBR-8.

Configuring Global 55-1 OOB

To configure OOB, complete the following procedure:

```plaintext
configure terminal
cable oob
virtual-om o-id
ip ip subnet_mask
join-group ip source-ip ip out-group ip
virtual-arpd id
ip ip subnet_mask
nc ip udp-port number
source-id s-id
```

Note

By default, the source ID is set to virtual-arpd ip. If you want to configure a different value for the source ID, then configure the source ID that is applicable to the Network Controller (NC).

Caution

The NC may drop upstream packets from this virtual-arpd, if the source ID is not compatible with the NC.

Configuring Profile for 55-1 OOB

To configure profile to use OOB, complete the following procedure:

```plaintext
configure terminal
controller downstream-oob 55d1-profile dp-id
no ds-channel 0 rf-mute
no ds-channel 0 shutdown
ds-channel 0 frequency f-value
ds-channel 0 poweradjust p-value
controller upstream-oob 55d1-profile up-id
no us-channel 0 shutdown
```
Configuring Remote PHY Device for 55-1 OOB

To configure the RPD to use OOB, complete the following procedure:

```bash
configure terminal
cable rpd name
identifier id
no sbfd enable
core-interface TenGigabitEthernet slot/subslot/port principal
rpd-ds 0 downstream-oob-vom o-id profile dp-id
rpd-us 0 upstream-oob-varpd a-id profile up-id
rpd-us 1 upstream-oob-varpd a-id profile up-id
r-dti value
rpd-event profile id
rpd-55d1-us-event profile id
```

Configuring OOB with VRF

The following example shows how to configure the OOB with VRF:

```bash
cable oob
  virtual-om 1
    ip 100.100.100.100 255.255.255.0 vrf xxx
    join-group 235.1.1.1 source-ip 2.3.4.5 out-group 239.2.2.2
  virtual-arpd 1
    ip 20.20.20.20 255.255.255.0 vrf xxx
    nc 200.1.1.100 udp-port 100
```

Configuring Two Forward Channels

The following example shows how to configure two forward channels. This configuration is OOB DS profile:
(1 port per RPD, 1 channel per port, 2 output RF frequency per channel):

```bash
controller downstream-oob 55d1-profile 100
  no ds-channel 0 rf-mute
  no ds-channel 0 shutdown
  ds-channel 0 frequency 70000000
  ds-channel 0 poweradjust 0
  no ds-channel 0 sf-mute
  no ds-channel 0 sf-shutdown
  ds-channel 0 second-frequency 130000000
  ds-channel 0 sf-poweradjust -10
```
Verifying OOB DS Details

Use the following commands to verify the DS details.

- `show platform software cable F0 oob-ds`
- `show platform software cable F0 oob-ds statistics`
- `clear platform software cable F0 oob-ds statistics`
- `show platform software cable F0 oob-ds group <G2 address>`

Verifying OOB US Details

Use the following commands to verify the US details.

- `show platform software cable F0 oob-us`
- `show platform software cable F0 oob-us statistics`
- `clear platform software cable F0 oob-us statistics`
- `show platform software cable F0 oob-us source-id <RPD source id>`

Verifying OOB Channel Details

Use the following commands to view the OOB channel details.

- `show cable rpd db-dump rpd-oob-ds-chan (all)`
- `show cable rpd db-dump rpd-oob-us-chan (all)`

Debugging OOB

Use the following commands to view the OOB channel details.

- `debug cable rphy-oob`

Example: OOB Configuration

The following example shows how to configure OOB:

```
Router#configure terminal
Router(config)# cable oob
Router(config-oob)# virtual-om 1
Router(config-oob-vom)# ip 100.100.100.100 255.255.255.0
Router(config-oob-vom)# join-group 235.1.1.1 source-ip 2.3.4.5 out-group 239.2.2.2
Router(config-oob-vom)# exit

Router(config-oob)# virtual-arpd 1
Router(config-oob-varpd)# ip 32.32.32.32 255.255.255.0
Router(config-oob-varpd)# nc 3.3.3.3 udp-port 100
Router(config-oob-varpd)# exit
Router(config-oob)# exit

Router(config)# controller downstream-OOB 55d1-profile 1
Router(config-profile)# no ds-channel 0 rf-mute
Router(config-profile)# no ds-channel 0 shutdown
Router(config-profile)# ds-channel 0 frequency 70000000
Router(config-profile)# ds-channel 0 poweradjust 1
Router(config-profile)# exit
```
Router(config)# controller upstream-OOB 55d1-profile 1
Router(config-profile)# no us-channel 0 shutdown
Router(config-profile)# us-channel 0 frequency 5216000
Router(config-profile)# us-channel 0 varpd-portid 3 varpd-demodid 2
Router(config-profile)# no us-channel 1 shutdown
Router(config-profile)# us-channel 1 frequency 6000000
Router(config-profile)# us-channel 1 varpd-portid 3 varpd-demodid 4
Router(config-profile)# no us-channel 2 shutdown
Router(config-profile)# us-channel 2 frequency 8000000
Router(config-profile)# us-channel 2 varpd-portid 3 varpd-demodid 6
Router(config-profile)# exit

Router(config)# cable rpd node1
Router(config-rpd)# identifier 0004.9f00.0685
Router(config-rpd)# no sbfd enable
Router(config-rpd)# core-interface Te7/1/0
Router(config-rpd-core)# principal
Router(config-rpd-core)# rpd-ds 0 downstream-cable 7/0/0 profile 3
Router(config-rpd-core)# rpd-ds 0 downstream-oob-vom 1 profile 1
Router(config-rpd-core)# rpd-us 0 upstream-cable 7/0/0 profile 3
Router(config-rpd-core)# rpd-us 0 upstream-oob-varpd 1 profile 1
Router(config-rpd-core)# exit

Router(config-rpd)# r-dti 1
Router(config-rpd)# rpd-event profile 0
Router(config-rpd)# rpd-55d1-us-event profile 0

Feature Information for OOB

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Secure Software Download

The secure software download (SSD) feature allows you to authenticate the source of a code file and verify the downloaded code file before using it in your system. The SSD is applicable to Remote PHY (R-PHY) devices installed in unsecure locations.

The Remote PHY architecture allows RPDs to download code. Hence, authenticating the source and checking the integrity of the downloaded code is important.
To authenticate and verify downloading of the code, SSD helps in verifying the manufacturer signature and the operator signature, if any. The manufacturer signature affirms the source and integrity of the code file to the RPD. If an additional signature is available from the operator, the RPD verifies both signatures with a certificate chain before accepting a code file.

Prerequisites for Upgrading Software using SSD

The following prerequisites are applicable to upgrading RPD software using SSD:

• The R-PHY node supports downloading software initiated through the GCP message sent from Cisco cBR.

• RPD supports a secure software download initiated using SSH and CLI directly on the RPD.

• R-PHY uses TFTP or HTTP to access the server to retrieve the software update file.

How to Upgrade Software from RPD and Cisco cBR Using SSD

Note

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Initiating RPD Software Upgrade from Cisco cBR

The RPD software upgrade can be initiated from Cisco cBR-8 Router. Use the following commands for initiating the upgrade:

cable rpd {all|oui|slot|RPD IP|RPD MAC} ssd server_IP {tftp|http} file_name [c-cvc-c|m-cvc-c] [CVC Chain File Name]

Initiating Software Upgrade from RPD Using SSD

If you want to initiate the software upgrade from RPD, set the SSD parameters on RPD. Use the following commands.

Setting the value for SSD CVC (Manufacturer's and Co-signer Code Validation Certificates) parameter is optional.

Configure the values for the following parameters

• SSD server IP address

• Filename

• Transport method

ssd set server server_IP filename file_name transport {tftp|http}
ssd set cvc {manufacturer|co-signer} cvc_chain_file_name
ssd control start
Verifying Software Upgrade Using SSD Configuration

To display the RPD SSD status, use the `cable rpd [all|oui|slot|RPD IP|RPD MAC] ssd status` command as given in the following example.

```
Router# cable rpd all ssd status
RDP-ID ServerAddress Protocol Status Filename
0004.9f00.0591 192.0.2.0 TFTP ImageDownloading image/RPD_seress_rpd_20170216_010001.itb.SSA
0004.9f00.0861 192.0.2.2 TFTP CodeFileVerified userid/RPD_seress_rpd_20170218_010001.itb.SSA
0004.9f03.0091 192.0.2.1 TFTP ImageDownloadFail chuangle/openwrt-seress-rpd-rdb.itb.SSA
```

The available statuses are the following:

- CVCVerified
- CVCRejected
- CodeFileVerified
- CodeFileRejected
- ImageDownloading
- ImageDownloadSucceed
- ImageDownloadFail
- MissRootCA

Examples for Upgrading HA RPHY Software

See examples for the software upgrade from cBR-8 and FCC or master eRPD.

**Example: HA RPHY Software Upgrade from Cisco cBR**

```
Router# upgrade set server 203.0.113.1 filename bundle/test.itb.sign transport http
Router# upgrade control show config
file path: bundle/test.itb.sign
server: 203.0.113.1
transport: HTTP
Router# upgrade control start
Router# upgrade control show status.
Downloading image on FCC.
```

```
Router# cable rpd group all upgrade 203.0.113.2 http bundle/test.itb.sign
Router# cable rpd group all upgrade status
This group 0027.900a.4c1a is not HA-Shelf group.
GROUP-ID: 7abd.44a1.0000
ServerAddress: 203.0.113.2
Protocol: HTTP
Status: Image downloading on RPDLC
Filename: bundle/test.itb.sign
```
Example: HA RPHY Software Upgrade from FCC or Master eRPD

Router# upgrade set server 203.0.113.2 filename bundle/test.itb.sign transport http
Router# upgrade control start
Router# upgrade control show status
Downloading image on FCC.
Router# upgrade control abort
Abort software upgrade process successfully.
Router# upgrade control show status
Image download aborted.

Router# show cable rpd-upgrade group all status
GROUP-ID: 7abd.44a1.0000
ServerAddress: 203.0.113.2
Protocol: HTTP
Status: Idle
Filename: bundle/test.itb.sign

Feature Information for Secure Software Download

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>
<th>Feature Name</th>

</tbody>
</table>

Information About Fault Management

Fault management on RPD is required for remote monitoring, detection, diagnosis, reporting, and correcting the issues.

The Fault management module provides the following support:

- RPD can send events to the CCAP core
- CCAP core can get events from RPD
• Send RPD events using SNMP traps
• On the CCAP core, view log in to the CLI
• SNMP poll events are supported

RPD Event Reporting

An RPD logs events, generates asynchronous notifications that indicate malfunction situations, and notifies the operator about important events. The RPD event reporting includes two methods of reporting.
• During the initialization of RPD, CCAP core synchronizes events from the RPD.
• During run-time operations, RPD notifies the CCAP Core of the events

Restrictions for Configuring RPD Events

Following restrictions are applicable:

A maximum of 1000 events are retained on Cisco cBR. The RPD retains 1000 events locally and 1000 events in pending state.

How to Configure RPD Events

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Configuring RPD Events

You can configure an event profile and apply it to RPD. Use the following commands to configure RPD events:

```
enable
cable profile rpd-event profile_id
cable priority {emergency|alert|critical|error|warning|notice|informational|debug}
```

• 0x0—No log
• 0x1—Save log in RPD local storage
• 0x2—Report to Cisco cBR
• 0x3—Save log in RPD local storage and report to Cisco cBR

You must enable-notifications for the RPD to report any event to the Core.
Applying the Event Profile to RPD

Use the following commands to apply the Event Profile to an RPD:

```shell
enable
cable rpd rpd_name
rpd-event profile profile_id
rpd-55d1-us-event profile profile_id
```

**Note**

If RPD is online when changing the profile, ensure that you have reset the RPD after you change the profile.

Enable RPD Event Trap

You can enable RPD event traps to send RPD events using SNMP traps. Use the following commands to configure RPD event traps:

```shell
enable
cable rpd rpd_name
rpd-event profile profile_id
rpd-55d1-us-event profile profile_id
```

Priority can be 1-8, where:

- 1 — Enable RPD event trap for emergency priority
- 2 — Enable RPD event trap for alert priority
- 3 — Enable RPD event trap for critical priority
- 4 — Enable RPD event trap for error priority
- 5 — Enable RPD event trap for warning priority
- 6 — Enable RPD event trap for notice priority
- 7 — Enable RPD event trap for informational priority
- 8 — Enable RPD event trap for debug priority

The priority higher than the selected priority is also displayed.

Configure SNMP Trap Server

You can configure SNMP trap server on the cable modem using the following commands:

```shell
enable
rpd-event profile profile_id
rpd-55d1-us-event profile profile_id
```

where,

- `ip_address` — IP address of the server
- `port_number` — UDP port number assigned to receive the SNMP traps. The same port number must also be configured on the SNMP server.
Getting RPD Events

To retrieve events from RPD, use the `cable rpd [RPD IP|RPD MAC|all] event {locallog|pending}` command, as given in the following example:

```
Router# cable rpd 30.84.2.111 event pending
```

Clearing All Events on Cisco cBR Database

To remove all Events on Cisco cBR, use the `clear cable rpd all event` command, as given in the following example:

```
Router# clear cable rpd all event
```

Viewing the RPD Events

To view all RPD Events, use the `show cable rpd [RPD IP|RPD MAC] event` command as given in the following example.

```
Router# show cable rpd 93.3.50.7 event
RPD  EventId  Level  Count  LastTime  Message
0004.9f00.0861 66070204  Error  1  Feb21 12:11:06  GCP Connection Failure
0004.9f00.0861 2148074241  Error  1  Feb21 12:11:25  Session failed: connecting timeout,
 RCCAP-IP=30.85.33.2;RPD-ID=0004.9f00.0861;
```

To view specific RPD event groups, use the `show cable rpd event group [RPD IP|RPD MAC] [fcc|slot]` command as shown in this example.

```
Router# show cab rpd event group 7abd.44a1.0000 fcc
RPD  EventId  Level  Count  LastTime  Message
7abd.44a1.0040 66070303  Criti  2  Oct16 20:50:34  FCC event
example;GROUP-ID=7abd.44a1.0000;
SLOT-ID=FCC;RPD-ID=7abd.44a1.0040;
```

Viewing RPD Events Using Log

To view all RPD Events, use the `show logging` command, as given in the following example.

```
Router# show logging | include RPD-ID=0004.9f00.0861
004181: Feb 21 12:18:59.649 CST: %RPHYMAN-3-RPD_EVENT_ERROR: CLC5: rphyman: GCP Connection Failure CCAP-IP=30.85.33.2;RPD-ID=0004.9f00.0861;EVENT-ID=66070204;
FirstTime=2017-2-21,12:11:6.0;
LastTime=2017-2-21,12:11:6.0;
Count=1;PendingQueue;
004185: Feb 21 12:19:18.875 CST: %RPHYMAN-3-RPD_EVENT_ERROR: CLC5: rphyman:
```
Configuration Examples

This section provides examples for the fault management configuration on Cisco cBR-8.

Example: RPD Event Configuration

```
enable
configure terminal
cable profile rpd-event 6
  priority warning 0x3
  enable-notify
cable rpd node6
  identifier badb.ad13.5e08
  core-interface Te3/1/5
    principal
      rpd-ds 0 downstream-cable 3/0/17 profile 10
      rpd-us 0 upstream-cable 3/0/34 profile 13
    r-dti 16
    rpd-event profile 6
```

The following event reportings are supported:

- **alert**: Event reporting for alert priority.
- **critical**: Event reporting for critical priority.
- **debug**: Event reporting for debug priority.
- **emergency**: Event reporting for emergency priority.
- **error**: Event reporting for error priority.
- **informational**: Event reporting for informational priority.
- **notice**: Event reporting for notice priority.
- **warning**: Event reporting for warning priority.

Example: RPD 55-1 Upstream Event Configuration

```
cable profile rpd-event 6
  priority warning 0x3
  enable-notify
cable profile rpd-55d1-us-event 10
  corrected-cells-threshold 11
  high-power-threshold 7
  low-power-threshold 2
  total-cells-threshold 20
  uncorrectable-cells-threshold 8
```
Feature Information for R-PHY Fault Management

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>

Information about RPD Operations and Debugging

The operators might need secure remote access to the RPD for activities such as setting up the RPD before the installation, maintenance, or troubleshooting. The RPD supports Secure Shell (SSH) server that allows secure access to the RPD.
Prerequisites for RPD Operations

The following prerequisites are applicable for debugging or checking RPD operations:

- RPD has established GCP connection with the CCAP-core, and RPD IP address is retrievable from CCAP-core.
- RPD is assigned an IP address through the DHCP process, and the IP address is retrievable from the DHCP server.

How to Access and Debug RPD

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

Accessing RPD using SSH

After logging in to the RPD for the first time, the system shows a security warning.

SECURITY WARNING: ssh password login is accessible!
Please use pubkey login and set password login off!

The following procedure shows how to use SSH to access RPD without password from NMS.

1. Check whether NMS already has an SSH key. If yes, do not generate a new key.

2. Generate a new SSH key in NMS.
   
cat ~/.ssh/id_rsa.pub
   ssh-keygen -t rsa

3. Add the NMS public key in RPD.
   
   ssh pubkey add ?
   LINE NMS's pubkey

4. Verify whether NMS can connect using SSH to RPD without a password.
   
   ssh -l admin <RPD ip>

Disabling SSH Login Password

Use the following commands to apply the Event Profile to an RPD:

R-PHY#conf t
R-PHY(config)#ssh password ?
off disable ssh password login
on enable ssh password login
R-PHY(config)#ssh password off
R-PHY(config)#end
Debugging RPD

Use the following procedure to debug RPD:

1. Disable RPD auto reboot by setting the reboot hold.
   
   R-PHY# set reboot hold

2. Secure copy the logs of RPD to the server using the following command.

   logging provision-archive scp server_ip user_id dst_location

3. Collect the show CLI output.

   For RPD online issues, check which status is failed. You can check the following outputs:
   - show provision all
   - show provision history
   - show dot1x detail
   - show dhcp
   - show tod
   - show ptp clock 0 config
   - show ptp clock 0 state

   For modem online issue, check ds/us config and l2tp session.
   You can collect the following outputs:
   - show downstream channel configuration
   - show downstream channel counter dps (show multiple times)
   - show downstream depi configuration
   - show upstream channel configuration <port number> <channel number>
   - show upstream iuc counter <port number> <channel number> (show multiple times)
   - show upstream map counter <port number> <channel number> (show multiple times)
   - show upstream uepi configuration
   - show l2tp tunnel
   - show l2tp session

4. Enable RPD auto reboot, after collecting all logs and CLI output.

   R-PHY# clear reboot hold

Verifying Disabled SSH Password Login

To check whether the SSH logging in using a password is disabled, use the show ssh session command as given in the following example.
Configuration Examples

This section provides example for the fault management configuration on R-PHY.

Example: Generating a New NMS pubkey

```
$ cat ~/.ssh/id_rsa.pub

$ ssh-keygen -t rsa

$ cat ~/.ssh/id_rsa.pub

ssh-rsa AAAAB3NzaC1yc2EAAAABAgEAAtQCXVFmRIwemejbjTx0+U8taMq5n4Zetu71xb+dtHV8r0wejik1YJkT93n9hcBxsjJRhu76blp991+DDNL3+THljwnMQ1cadvRmGXoeGfim9Ta1GDF/ R9ZYwyr9t8Ke9vN9u2WSo0wq2pe49HFOJAbGfuF0vFEdw2 ggDMQWnsEq/3kAqJbXajQqgfu41q3YzKoo4PM/xx9X4Z1aMwxs5D1vYn7LB0o33mcD9nas13s11jMMSnqYpwoFVQve82onrYHU2p3BwQOB/b0BzFQ9zNTMBXm/pD9XqFkkD0uguk1xOQgqATTMjsSHIN0QOdvbzhmmRMFBMNNaqGQ5KNT7R9nWgE7HdalERwMyBC2MCgbFShmQFYwNhHBPFpMIXAK98M XutoR8fzzs+4hing49X5KMNwT6W0zjuKq61u- userid@example.cisco.com
```

Example: Adding NMS pubkey in RPD

```
R-PHY#conf t
R-PHY(config)#ssh pubkey add
LINE NMS's pubkey
R-PHY(config)#ssh pubkey add ssh-rsa AAAAB3NzaC1yc2EAAAABAgEAAtQCXVFmRIwemejbjTx0+U8taMq5n4Zetu71xb+dtHV8r0wejik1YJkT93n9hcBxsjJRhu76blp991+DDNL3+THljwnMQ1cadvRmGXoeGfim9Ta1GDF/R9ZYwyr9t8Ke9vN9u2WSo0wq2pe49HFOJAbGfuF0vFEdw2ggDMQWnsEq/3kAqJbXajQqgfu41q3YzKoo4PM/xx9X4Z1aMwxs5D1vYn7LB0o33mcD9nas13s11jMMSnqYpwoFVQve82onrYHU2p3BwQOB/b0BzFQ9zNTMBXm/pD9XqFkkD0uguk1xOQgqATTMjsSHIN0QOdvbzhmmRMFBMNNaqGQ5KNT7R9nWgE7HdalERwMyBC2MCgbFShmQFYwNhHBPFpMIXAK98M XutoR8fzzs+4hing49X5KMNwT6W0zjuKq61u- xxx@xxx.xxx.com

R-PHY(config)#end
```

Feature Information for RPD Operations and Debugging

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.
The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

CHAPTER 30

RPD Reset

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

- Hardware Compatibility Matrix for Cisco Remote PHY Device, on page 231
- Information about RPD Reset, on page 232
- Resetting RPD, on page 232
- Feature Information for RPD Reset, on page 232

Hardware Compatibility Matrix for Cisco Remote PHY Device

Note

Unless otherwise specified, the hardware components introduced in a given Cisco Remote PHY Device Software Release are supported in all subsequent releases.

<td>Cisco Remote PHY Device 2x2</td>
</tr>
<tr>
<td></td>
<td>PID—RPD-2X2=</td>
</tr>
</tbody>
</table>
Information about RPD Reset

Starting from Cisco 2x2 RPD Software x.x, factory reset and NVRAM reset via TLV and CLI are supported. In the factory reset, RPD restores the factory configuration and performs cold reboot. In this case, it is better for the RPD to have golden image, otherwise users need to boot the RPD manually. In the NVRAM reset, RPD clears the non-volatile configuration and performs cold reboot.

Resetting RPD

To know more about the commands referenced in this module, see the Cisco IOS Master Command List.

To clear the configuration, image and logs of the RPD, perform factory reset as shown in the following example:

```
R-PHY#reboot factory-reset
Warning: This action will restore the factory configuration. Are you sure you want to do the factory reset (yes/no)?
```

To clear the non-volatile configuration of the RPD, perform NVRAM reset as shown in the following example:

```
R-PHY#reboot nv-reset
Warning: This action will clear the non-volatile configuration. Are you sure you want to do the nvreset (yes/no)?
```

Feature Information for RPD Reset

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

</tr>
</tbody>
</table>

**Note**

The -PKEY suffix in the PID indicates units that enable the SCTE-55-2 Out-of-Band protocol support.

### Information About Archiving Logs

You can use SCP and TFTP to archive logs to the server.

When an RPD SSH session is closed during an RPD logging archive process, the RPD logging temp file is retained in the RPD file system. In this release, only the latest temp file is retained. The legacy temp files are removed.

### Archiving Logs Using SCP or TFTP

**Note**

Use the absolute path for the save_path parameter.

To archive logs, use the `logging` command.

To use TFTP to transfer files, use the `logging [provision-archive|1588-archive|corefile] tftp <server_ip> <save_path>` command.
To use SCP to transfer files, use the `logging [provision-archive]1588-archive[corefile] scp <server_ip> <user> <save_path>` command.

To archive logs created during RPD provisioning using scp, use the `logging provision-archive scp <server_ip> <user> <save_path>` command. This is an example of how to archive logs created during RPD provisioning using scp.

**Note**

- Use **provision-archive** to archive logs created during RPD provisioning.
- Use **1588-archive** to archive PTP logs.
- Use **corefile** to archive logs created during system crashes.

- `<user>` is the username of the SCP or TFTP server account to which files are transferred.
- `<save_path>` is the absolute or relative path of the folder in the SCP or TFTP server. You must have write permission to access the folder. Make sure that the folder has sufficient space.
- `<server_ip>` can be IPv4 or IPv6 address. The server IP address type must be the same as the RPD IP address.
- For SCP file transfer, type the password of your server account when prompted. For TFTP file transfer, password is not required.
- RPD should be able to successfully ping the SCP or TFTP server. If the ping is unsuccessful, files are not archived.

```
R-PHY#logging provision-archive scp 198.51.100.1 <user> <save_path>
Wait for archiving logs

Feature Information for Archiving Logs

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.
The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

### Table 65: Feature Information for Archiving Logs

SSH Account Management

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Information About SSH Account Management

Manage your SSH account for an RPD SSH login. This feature enables you to add, delete, and change password of an SSH account.

Configure SSH Account Management

Add, delete, or modify your SSH account. You can also view your account details.

Add a New SSH Account

Note: You can add a maximum of ten accounts at a time.

To add a new SSH account, run the `ssh adduser <newuser>` command. This example shows how to add a new SSH account.

```
R-PHY>enable
R-PHY#configure terminal
R-PHY(config)#ssh adduser <newuser>
Changing password for <newuser>
New password:
Retype password:
Password for <newuser> changed by root
R-PHY(config)#end
```

Delete an SSH Account

Note: You cannot delete the last account.

To delete an SSH account, run the `ssh delete <newuser>` command. This example shows how to delete an SSH account.

```
R-PHY>enable
R-PHY#configure terminal
R-PHY(config)#ssh delete <newuser>
Warning: Are you sure to delete this account? [No/Yes]
Yes
delete account '<newuser>' successfully
R-PHY(config)#end
```

Change an SSH Account Password

To change an SSH account password, run the `ssh chpasswd <user>` command. This example shows how to change an SSH account password.
R-PHY>enable
R-PHY#configure terminal
R-PHY(config)#ssh chpasswd <user>
Please enter password for '&lt;user&gt;':
Please re-enter your password:
Password for '&lt;user&gt;' changed
R-PHY(config)#end

View SSH Account Details

To view an SSH account details, run the show ssh account command. This example shows how to view an SSH account details.

R-PHY#show ssh account
Account Num: 2
Current SSH Accounts:
  admin
  user

Feature Information for SSH Account Management

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on http://www.cisco.com/ is not required.

Note

The below table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
