

Release Notes for Cisco Application Policy Infrastructure Controller Enterprise Module, Release 1.6.3.60027 Hot Fix

First Published: 2020-12-10

Last Modified: 2021-02-10

Release Notes for Cisco Application Policy Infrastructure Controller Enterprise Module

This document describes the features, limitations, and bugs for this Cisco APIC-EM controller release.

Introduction

The Cisco Application Policy Infrastructure Controller Enterprise Module (Cisco APIC-EM) is a network controller that helps you manage and configure your network.

The Cisco APIC-EM can support up to the following total number of devices, hosts, and access points:

- Network devices (routers, switches, wireless LAN controllers): 10,000
- Hosts: 100,000
- Access Points: 10,000

What's New in Cisco APIC-EM

In Cisco APIC-EM the root CA certificate that is used to sign the device certificates (sdn-network-infra-iwan) expires after 5 years from the installation date, with no mechanism to renew or roll over. After the certificate expires, all DMVPN tunnels in the entire IWAN environment go down, causing an outage.

This release of Cisco APIC-EM resolves the root CA certificate expiration problem.

This is not a standalone release. Cisco APIC-EM 1.6.3.60027 is a hot patch containing bug fixes, which is to be installed on top of Cisco APIC-EM 1.6.3.

To verify whether the patch has been installed in Cisco APIC-EM, navigate to the **Updates** page, and confirm that the version is **1.6.3.60027**.

For the list of resolved bugs with this hot patch, see [Resolved Bugs, on page 5](#).

Supported Platforms and Software Requirements

For more information about the network devices and software versions supported for this release, see the *Supported Platforms for the Cisco Application Policy Infrastructure Controller Enterprise Module*.

Install the Hot Fix Patch

Before you begin

Review the following before installing the Cisco APIC-EM 1.6.3.60027 hot fix patch:

- In a three-node setup, you only need to install the patch on one of the three nodes.
- If the **reset_grapevine** command is used and all virtual disks are deleted, you must reinstall the patch.
- The patch installation takes approximately 15 to 20 minutes to complete. Administrators can monitor the running services to verify the progress of the installation.
- A tunnel flap might occur during the activation of the rollover certificate (both the CA certificate and the ID certificate). Tunnel connectivity resumes automatically without manual intervention.

Procedure

Step 1 From the Software Download site on cisco.com, download the .zip file that corresponds to your Cisco APIC-EM version.

Step 2 Move the .zip file to a /tmp directory.

Step 3 Enter the following command to unzip the .zip file:

```
unzip -j <patch>.zip
```

Step 4 Enter the following command to run the patch installation script:

```
python3 install.py
```

Step 5 Wait until the `install.py` script finishes successfully.

Step 6 Enter the following command to monitor the status of `apic-em-pki-broker-service` and `apic-em-jboss-service`:

```
watch grape instance status
```

Open Bugs

The following table lists the open bugs for the Cisco APIC-EM controller for this release.

Note For information about open and resolved bugs for a specific application, refer to the release notes for that application.

Bug ID	Headline
CSCuz74785	<p>Any Cisco APIC-EM users who have been authenticated/authorized by an external server and who are locked out of the controller for whatever reason, cannot be manually unlocked.</p> <p>Note There is no GUI to show that the user is actually locked out.</p> <p>Workaround:</p> <ul style="list-style-type: none"> • Wait 15 minutes for the timeout to end before logging into the controller again. <p>Disable user locking for the specific user from the Internal Users window.</p> <p>Note You must have administrator privileges (ROLE_ADMIN) to perform this action.</p>
CSCva37043	<p>A get VLAN and get Topology by VLAN does not work for the Cisco Catalyst 5000 and the Cisco Catalyst 3850.</p> <p>Workaround:</p> <p>There is no workaround at this time.</p>
CSCvc95074	<p>Details of an application remains visible in the controller even after the application has been deleted.</p> <p>Workaround:</p> <p>There is no workaround at this time.</p>
CSCvd14000	<p>When pushing a policy to 2000 devices under a full scale of 10,000 devices, the CPU utilization rises to between 98 and 100 percent.</p> <p>Workaround:</p> <p>There is no workaround at this time.</p>
CSCve78884	<p>While installing the ISO image, the installation fails with the error message below. The mapping to the drive to image is also disassociated and unmounted.</p> <div data-bbox="724 1476 1513 1577" style="background-color: #f0f0f0; padding: 5px;"> <p>Error message: Finish the Installation Failed to run preseeded command</p> </div> <p>Workaround:</p> <p>Unmount the ISO image and mount it again. Next, try to reload the image and install it again. This issue may also occur due to an image corruption, so be sure to verify the checksum as well.</p>

Bug ID	Headline
CSCve82679	<p>Reset grapevine local needs to be performed multiple times to remove the node in MN.</p> <p>Workaround:</p> <p>In this case, <code>reset grapevine local</code> was performed 3 times to remove from node.</p>
CSCvf60241	<p>When upgrading from 1.5.0.1368 to 1.5.11037 on a single node, some of the services do not come up, even though the cluster is accessible. The error, "Page Temporarily Unavailable. This page is temporarily unavailable because task-service is in the process of starting, please try again at a later time."</p> <p>Workaround:</p> <p>Disable the REO, upgrade the cluster to 1.5.1, and then enable REO after all the services are up.</p>
CSCvh45471	<p>If multiple devices have the same Unique Serial Number, then APIC-EM will consider only the first device, and ignore other devices with the same number.</p> <p>Workaround:</p> <p>There is no workaround at this time.</p>
CSCvi84554	<p>Unable to grow any services on the node after power on/off on the node in 3N Nic-bonding cluster.</p> <p>Workaround:</p> <p>There are two approaches to restore:</p> <ul style="list-style-type: none"> • Run <code>reset_grapevine</code>. • On the power cycled node, restart the RabbitMQ with commands <code>sudo rabbitmqctl stop_app</code> and <code>sudo rabbitmqctl start_app</code>. <p>The second approach may require additional steps to harvest the clients with service instances stuck in "unresponsive" state. To check the service instance status, use the command <code>grape instance status</code>. To harvest a client, use the command <code>grape client harvest <client ID></code>.</p>
CSCvj05802	<p>SFTP settings disappear after running the <code>reset_grapevine</code> command.</p> <p>Workaround:</p> <p>Reconfigure the SFTP server after running the <code>reset_grapevine</code> command.</p>

Bug ID	Headline
CSCvj58457	<p>Services struck in starting state on a scaled 3N NIC-bonding cluster.</p> <p>Workaround:</p> <p>Need to harvest the client on which the service instances were placed manually, after which the services grows on a new client and it goes to running state.</p> <p>To check the service instance status, use command <code>grape instance status</code>; To harvest a client, use command <code>grape client harvest <client_id></code>.</p>
CSCvk65038	<p>While trying to issue <code>reset_grapevine</code> on one of the nodes in the 3N NIC-bonding cluster after a backup and restore on the cluster, the operation fails with <code>500 Server Error: Internal server error: Not connected to broker</code>.</p> <p>Workaround:</p> <p>Rebuild the cluster from scratch and restore the last backup data.</p>

Resolved Bugs

The following table lists the resolved bugs for this release.

Note For a list of bugs resolved in an earlier software release, see the Cisco APIC-EM release notes for the specific release.

Bug ID	Headline
CSCvw43646	<p>In APIC-EM, the root CA certificate is set to expire after 5 years from the original installation date.</p> <p>As there is no mechanism to renew this certificate, any device that has a certificate signed by APIC-EM CA is impacted after the certificate expires.</p>

Using the Bug Search Tool

Use the Bug Search tool to search for a specific bug or to search for all bugs in this release.

Procedure

-
- Step 1** Go to <http://tools.cisco.com/bugsearch>.
- Step 2** At the Log In screen, enter your registered cisco.com username and password; then, click **Log In**. The Bug Search page opens.
- Note** If you do not have a cisco.com username and password, you can register for them at <http://tools.cisco.com/RPF/register/register.do>.
- Step 3** To search for a specific bug, enter the bug ID in the Search For field and press **Return**.

Step 4 To search for bugs in the current release:

- a. In the Search For field, enter **APIC-EM** and press **Return**. Leave the other fields empty.
- b. When the search results are displayed, use the filter tools to find the types of bugs you are looking for. You can search for bugs by modified date, status, severity, and so on.

Note To export the results to a spreadsheet, click the **Export Results to Excel** link.
