

Performing the Initial Setup of Intercloud Fabric

This chapter contains the following sections:

- [Intercloud Fabric Initial Setup Workflow, page 1](#)

Intercloud Fabric Initial Setup Workflow

After you install the Intercloud Fabric OVA, you must complete the installation of other infrastructure components as additional VMs. For this purpose, you must provide the VM Manager, network, and VM placement details for the Intercloud Fabric infrastructure component. The network that you specified for the infrastructure component will be automatically extended to the public cloud. We recommend that you use this network to deploy the Intercloud Fabric cloud components.

Initial setup of Intercloud Fabric consists of the following steps:

Procedure

- Step 1** Creating a public virtual account.
See [Providing Public Cloud Credentials](#).
 - Step 2** Creating an Intercloud Fabric cloud.
See [Creating an Intercloud Fabric Cloud](#).
 - Step 3** Creating a virtual data center (VDC).
See [Creating a Virtual Data Center](#).
 - Step 4** Creating networks.
See [Creating Networks](#).
 - Step 5** Creating VM policies.
See [Managing Virtual Machine Policies](#).
 - Step 6** Creating a virtual machine.
See [Managing Virtual Machines](#).
