Create Device Groups

Creating device groups allows you to view and perform actions on a group of similar device types. A device can belong to only one device group.

Procedure

- Step 1** In the main window, click **Traffic Analysis > Configure > Device Groups**.
- Step 2** Click **Add Device Group**.
- Step 3** Enter a name for the device group and a description (optional).
- Step 4** Click **Save**.
- Step 5** Click on the name of the device group you just created.
- Step 6** To add devices to the device group, click **Link Devices**.
- Step 7** Select the devices to add to the device group, then click **Link**.

A device can belong to one device group only. If any devices were previously added to a different device group, they are removed from the previous device group and added to the device group you selected.
