

Configuring Infra for Cisco DCNM Sites

- [Prerequisites and Guidelines, on page 1](#)
- [Configuring Infra: General Settings, on page 1](#)
- [Refreshing Site Connectivity Information, on page 2](#)
- [Configuring Infra: DCNM Site Settings, on page 3](#)
- [Deploying Infra Configuration, on page 4](#)

Prerequisites and Guidelines

The following sections describe the steps necessary to configure the general as well as site-specific fabric Infra settings.

Before you proceed with Infra configuration, you must have added the sites as described in previous sections.

In addition, keep in mind the following:

- Adding or removing border gateway switches requires a Multi-Site Orchestrator fabric connectivity information refresh described in the [Refreshing Site Connectivity Information, on page 2](#) as part of the general Infra configuration procedures.

Configuring Infra: General Settings

This section describes how to configure general Infra settings for all the sites.

- Step 1** Log in to the Cisco Multi-Site Orchestrator GUI.
- Step 2** In the left navigation menu, select **Infrastructure** > **Infra Configuration**.
- Step 3** In the main pane, click **Configure Infra**.
- Step 4** In the left sidebar, select **General Settings**.
- Step 5** Configure control plane BGP.
 - a) Choose **BGP Peering Type**.
 - `full-mesh`—All border gateway switches in each site will establish peer connectivity with remote sites' border gateway switches.

- `route-server`—The route-server option allows you to specify one or more control-plane nodes to which each site establishes MP-BGP EVPN sessions. The route-server nodes perform a function similar to traditional BGP route-reflectors, but for EBGP (and not iBGP) sessions. The use of route-server nodes avoids creating MP-BGP EVPN full mesh adjacencies between all the VXLAN EVPN sites managed by MSO.

b) If you set the **BGP Peering Type** to `route-server`, click **+Add Route Server** to add one or more route servers.

In the **Add Route Server** window that opens:

- From the **Site** dropdown, select the site you want to connect to the route server.
- The **ASN** field will be auto-populated with the site's ASN.
- From the **Core Router Device** dropdown, select the route server to which you want to connect.
- From the **Interface** dropdown, select the interface on the core router device.

You can add up to 4 route servers. If you add multiple route servers, every site will establish MP-BGP EVPAN adjacencies to every route server.

a) In the **Keepalive Interval (Seconds)** field, enter the keep alive interval seconds.

We recommend keeping the default value.

b) In the **Hold Interval (Seconds)** field, enter the hold interval seconds.

We recommend keeping the default value.

c) In the **Stale Interval (Seconds)** field, enter stale interval seconds.

We recommend keeping the default value.

d) Choose whether you want to turn on the **Graceful Helper** option.

e) In the **Maximum AS Limit** field, enter the maximum AS limit.

f) In the **BGP TTL Between Peers** field, enter the BGP TTL between peers.

Step 6

Configure DCNM settings.

a) Provide the **L2 VXLAN VNI Range**.

b) Provide the **L3 VXLAN VNI Range**.

c) Provide the **Multi-Site Routing Loopback IP Range**.

This field is used to auto-populate the **Multi-Site TEP** field for each fabric, which is described in [Configuring Infra: DCNM Site Settings, on page 3](#).

For sites that were previously part of a Multi-Site Domain (MSD) in DCNM, this field will be pre-populated with the previously defined value.

d) Provide the **Anycast Gateway MAC**.

Refreshing Site Connectivity Information

Infrastructure changes, such as adding and removing border gateway switches, require a Multi-Site Orchestrator fabric connectivity refresh. This section describes how to pull up-to-date connectivity information directly from each site's controller.

-
- Step 1** Log in to the Cisco Multi-Site Orchestrator GUI.
- Step 2** In the left navigation menu, select **Infrastructure > Infra Configuration**.
- Step 3** In the main pane, click **Configure Infra**.
- Step 4** In the left sidebar, under **Sites**, select a specific site.
- Step 5** In the main window, click the **Refresh** button to pull fabric information from the controller.
- Step 6** (Optional) In the **Confirmation** dialog, check the box if you want to remove configuration for decommissioned border gateway switches.
- If you choose to enable this checkbox, all configuration info for any currently decommissioned border gateway switches will be removed from the database.
- Step 7** Finally, click **Yes** to confirm and load the connectivity information.
- This will discover any new or removed spines and all site-related fabric connectivity will be re-imported from the site's controller.
-

Configuring Infra: DCNM Site Settings

This section describes how to configure site-specific Infra settings for on-premises sites.

- Step 1** Log in to the Cisco Multi-Site Orchestrator GUI.
- Step 2** In the left navigation menu, select **Infrastructure > Infra Configuration**.
- Step 3** In the main pane, click **Configure Infra**.
- Step 4** In the left pane, under **Sites**, select a specific DCNM.
- Step 5** In the right **<Site> Settings** sidebar, specify the **Multi-Site TEP**.
- This address is used for the inter-site L2 BUM and L3 multicast traffic. This IP address is deployed on all border gateway switches that are part of the same fabric.
- Note** If the site you are configuring is part of the DCNM Multi-Site Domain (MDS), this field will be pre-populated with the information imported from DCNM. In this case, changing the value and re-deploying the infra configuration, will impact traffic between the sites that are part of the MDS.
- You can choose to **Auto Allocate** this field, which will allocate the next available address from the **Multi-Site Routing Loopback IP Range** you defined in previous section.
- Step 6** Within the **<fabric-name>** tile, select the border gateway.
- Step 7** In the right **<border-gateway>** setting sidebar, specify the **Control Plane TEP** and **Data Plane TEP**.
- Step 8** Click **Add Port** to configure the port that connects to the IPN.
- Note** This release does not support importing the port configuration from the DCNM. If the site you are configuring is already part of the DCNM Multi-Site Domain (MDS), you must use the same values that are already configured in DCNM.

Update Port ✕

* Ethernet Port ID
Ethernet1/1 ✕ ▾

* IP Address
10.10.1.9/30

* Remote Address
10.10.1.10

* Remote ASN
65002

* MTU
9216

BGP Authentication
 None Simple

[Save](#)

Provide the following information specific to your deployment for the port that connects this border gateway to a core switch or another border gateway:

- From the **Ethernet Port ID** dropdown, select the port that connects to the IPN.
- In the **IP Address** field, enter the IP address and netmask.
- In the **Remote Address** field, provide the IP address of the remote device to which the port is connected.
- In the **Remote ASN** field, provide the remote site's ID.
- In the **MTU** field, enter the port's MTU.

MTU of the spine port should match MTU on IPN side.

You can specify either `inherit` or a value between 576 and 9000.

- For **BGP Authentication**, you can pick either `None` or `Simple` (MD5).
If you select `Simple`, you must also provide the **Authentication Key**.

Deploying Infra Configuration

This section describes how to deploy the Infra configuration to each DCNM site.

Before you begin

You must have the general and site-specific infra configurations completed as described in previous sections of this chapter.

Step 1 Ensure that there are no configuration conflicts or resolve them if necessary.

The **Deploy** button will be disabled and a warning will be displayed if there are any configuration conflicts from the already configured settings in each site. For example, if a VRF or network with the same name exists in multiple sites but uses different VNI in each site.

In case of configuration conflicts:

- a) Click **Click to View** link in the conflict notification pop-up.

- b) Note down the specific configurations that are causing the conflicts.

For example, in the following report, there are ID mismatches between VRFs and networks in `fab1` and `fab2` sites.

Error Type	Error Message
IDMismatch	Policy Name MyVRF_50001 Policy ID 50001 Sites [fab2] conflicting with Policy Name MyVRF_50001 Policy ID 60001 Sites [fab1]
IDMismatch	Policy Name MyNetwork_30000 Policy ID 40000 Sites [fab2] conflicting with Policy Name MyNetwork_30000 Policy ID 30000 Sites [fab1]

- c) Click the **X** button to close the report, then exit Infra configuration screen.

- d) Unmanage the site in MSO, as described in [Removing Sites](#).

You do not need to remove the site from the Nexus Dashboard, simply unmanage it in MSO GUI.

- e) Resolve the existing configuration conflicts.

- f) Manage the site again, as described in [Adding Cisco DCNM Sites](#).

Since the site is already added in Nexus Dashboard, simply enable it for management in MSO.

- g) Verify that all conflicts are resolved and the **Deploy** button is available.

Step 2 Deploy configuration.

- a) In the top right of the **Fabric Connectivity Infra** screen, choose the appropriate **Deploy** option to deploy the configuration.

If you are configuring only DCNM sites, simply click **Deploy** to deploy the Infra configuration.

- b) Wait for configuration to be deployed.

When you deploy infra configuration, MSO will signal the DCNM to configure the underlay and the EVPN overlay between the border gateways.

When configuration is successfully deployed, you will see a green checkmark next to the site in the **Fabric Connectivity Infra** screen:
