THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS REFERENCED IN THIS DOCUMENTATION ARE SUBJECT TO CHANGE WITHOUT NOTICE. EXCEPT AS MAY OTHERWISE BE AGREED BY CISCO IN WRITING, ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS DOCUMENTATION ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED.

The Cisco End User License Agreement and any supplemental license terms govern your use of any Cisco software, including this product documentation, and are located at: <http://www.cisco.com/go/softwareterms>. Cisco product warranty information is available at <http://www.cisco.com/go/warranty>. US Federal Communications Commission Notices are found here <http://www.cisco.com/c/en/us/products/us-fcc-notice.html>.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any products and features described herein as in development or available at a future date remain in varying stages of development and will be offered on a when-and if-available basis. Any such product or feature roadmaps are subject to change at the sole discretion of Cisco and Cisco will have no liability for delay in the delivery or failure to deliver any products or feature roadmap items that may be set forth in this document.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

The documentation set for this product strives to use bias-free language. For the purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

Deployment Overview

Cisco Nexus Dashboard is a central management console for multiple data center sites and a common platform for hosting Cisco data center operation services, such as Nexus Dashboard Insights and Nexus Dashboard Orchestrator. These services are available for all the data center sites and provide real time analytics, visibility, assurance for network policies and operations, as well as policy orchestration for the data center fabrics, such as Cisco ACI or Cisco NDFC.

Nexus Dashboard provides a common platform and modern technology stack for the above-mentioned micro-services-based applications, simplifying the life cycle management of the different modern applications and reducing the operational overhead to run and maintain these applications. It also provides a central integration point for external 3rd party applications with the locally hosted applications.

Nexus Dashboard cluster typically consists of 1 or 3 `master` nodes. For 3-node clusters, you can also provision a number of `worker` nodes to enable horizontal scaling and `standby` nodes for easy cluster recovery in case of a master node failure. For maximum number of `worker` and `standby` nodes supported in this release, see the "Verified Scalability Limits" sections of the [Cisco Nexus Dashboard Release Notes](#).

Note This document describes initial configuration of the base cluster. After your cluster is up and running, you can configure and deploy additional nodes as described in the [Cisco Nexus Dashboard User Guide](#), which is also available directly from the Nexus Dashboard GUI.

Hardware vs Software Stack

Nexus Dashboard is offered as a cluster of specialized Cisco UCS servers (Nexus Dashboard platform) with the software framework (Nexus Dashboard) pre-installed on it. The Cisco Nexus Dashboard software stack

can be decoupled from the hardware and deployed in a number of virtual form factors. For the purposes of this document, we will use "Nexus Dashboard platform" specifically to refer to the hardware and "Nexus Dashboard" to refer to the software stack and the GUI console.

Note Root access to the Nexus Dashboard software is restricted to Cisco TAC only. A special user `rescue-user` is created for all Nexus Dashboard deployments to enable a set of operations and troubleshooting commands. For additional information about the available `rescue-user` commands, see the "Troubleshooting" chapter of the *Nexus Dashboard User Guide*.

This guide describes the initial deployment of the Nexus Dashboard software; hardware setup is described in the *Nexus Dashboard Hardware Setup Guide*, while other Nexus Dashboard operations procedures are described in the *Cisco Nexus Dashboard User Guide*.

Services

Nexus Dashboard is a standard appliance platform to build and deploy services that would allow you to consume all Nexus Dashboard products in a consistent and uniform manner. You can subscribe and consume services like Insights, Orchestrator, Fabric Controller, and Data Broker with the Nexus Dashboard platform providing the necessary capacity and life cycle management operations for these services.

Typically, the Nexus Dashboard platform is shipped with only the software required for managing the lifecycle of these services, but no actual services are packaged with the appliance. If you allow public network connectivity from your data centers, you can download and install the services with a few clicks. However, without public network connectivity, you will need to manually download these services, upload them to the platform, and perform installation operations before you can use them.

If you are ordering the physical Nexus Dashboard servers, you have the option to choose some services to be pre-installed on the hardware before it is shipped to you. For more information, see the *Nexus Dashboard Ordering Guide*. Note that if you are deploying the virtual or cloud form factors of the Nexus Dashboard, you will need to deploy the services separately after the cluster is ready.

Available Form Factors

This release of Cisco Nexus Dashboard can be deployed using a number of different form factors. Keep in mind however, you must use the same form factor for all nodes, mixing different form factors within the same cluster is not supported.

Note Not all services are supported on all form factors. When planning your deployment, ensure to check [Cisco Nexus Dashboard Cluster Sizing](#) for form factor and cluster size requirements.

- Cisco Nexus Dashboard physical appliance (.iso)

This form factor refers to the original physical appliance hardware that you purchased with the Cisco Nexus Dashboard software stack pre-installed on it.

The later sections in this document describe how to configure the software stack on the existing physical appliance hardware to deploy the cluster. Setting up the original Cisco Nexus Dashboard platform hardware is described in *Cisco Nexus Dashboard Hardware Setup Guide*.

- VMware ESX (.ova)

Virtual form factor that allows you to deploy a Nexus Dashboard cluster using three VMware ESX virtual machines.

- Linux KVM (`.qcow2`)

Virtual form factor that allows you to deploy a Nexus Dashboard cluster using three Linux KVM virtual machines.

- Amazon Web Services (`.ami`)

Cloud form factor that allows you to deploy a Nexus Dashboard cluster using three AWS instances.

- Microsoft Azure (`.arm`)

Cloud form factor that allows you to deploy a Nexus Dashboard cluster using three Azure instances.

- In an existing Red Hat Enterprise Linux (RHEL) system

Beginning with Release 2.2(1), you can run Nexus Dashboard node in an existing Red Hat Enterprise Linux server.

Cluster Sizing and Availability Guidelines

As mentioned previously, Nexus Dashboard cluster is first deployed using 1 or 3 `master` nodes. Depending on the type and number of services you choose to run, you may be required to deploy additional worker nodes in your cluster after the initial deployment. For cluster sizing information and recommended number of nodes based on specific use cases, see the [Cisco Nexus Dashboard Cluster Sizing](#) tool.

Note

- Single-node clusters are supported for a limited number of services and cannot be extended to a 3-node cluster after the initial deployment.
- Only 3-node clusters support additional `worker` nodes.
- If you deploy a single-node cluster and want to extend it to a 3-node cluster or add `worker` nodes, you will need to redeploy it as a base 3-node cluster.
- For 3-node clusters, at least 2 `master` nodes are required for the cluster to remain operational. If 2 `master` nodes fail, the cluster will go offline and cannot be used until you recover it as described in the [Cisco Nexus Dashboard User Guide](#).

After your initial cluster is up and running, you can configure and deploy additional nodes as described in the [Cisco Nexus Dashboard User Guide](#), which is also available directly from the Nexus Dashboard GUI.

Supported Services

For the full list of supported applications and the associated compatibility and interoperability information, see the [Nexus Dashboard and Services Compatibility Matrix](#).

Prerequisites and Guidelines

Network Time Protocol (NTP) and Domain Name System (DNS)

The Nexus Dashboard nodes require valid DNS and NTP servers for all deployments and upgrades.

Lack of valid DNS connectivity (such as if using an unreachable or a placeholder IP address) can prevent the system from deploying or upgrading successfully.

Note Nexus Dashboard acts as both a DNS client and resolver. It uses an internal Core DNS server which acts as DNS resolver for internal services. It also acts as a DNS client to reach external hosts within the intranet or the Internet, hence it requires an external DNS server to be configured.

Additionally, Nexus Dashboard does not support DNS servers with wildcard records.

Nexus Dashboard External Networks

Cisco Nexus Dashboard is deployed as a cluster, connecting each service node to two networks. When first configuring Nexus Dashboard, you will need to provide two IP addresses for the two Nexus Dashboard interfaces—one connected to the Data Network and the other to the Management Network.

Individual services installed in the Nexus Dashboard may utilize the two networks for additional purposes, so we recommend consulting the specific service's documentation in addition to this document for your deployment planning.

Table 2: External Network Purpose

Data Network	Management Network
<ul style="list-style-type: none"> • Nexus Dashboard node clustering • Service to service communication • Nexus Dashboard nodes to Cisco APIC, Cloud Network Controller, and NDFC communication <p>For example, the network traffic for services such as Nexus Dashboard Insights.</p>	<ul style="list-style-type: none"> • Accessing Nexus Dashboard GUI • Accessing Nexus Dashboard CLI via SSH • DNS and NTP communication • Nexus Dashboard firmware upload • Accessing Cisco DC App Center (AppStore) <p>If you want to use the Nexus Dashboard App Store to install services, https://dcappcenter.cisco.com must be reachable via the Management Network</p> <ul style="list-style-type: none"> • Intersight device connector

The two networks have the following requirements:

- For all new Nexus Dashboard deployments, the management network and data network must be in different subnets.

- For physical clusters, the management network must provide IP reachability to each node's CIMC via TCP ports 22/443.

Nexus Dashboard cluster configuration uses each node's CIMC IP address to configure the node.

- For Nexus Dashboard Insights service, the data network must provide IP reachability to the in-band network of each fabric and of the APIC.
- For Nexus Dashboard Insights and AppDynamics integration, the data network must provide IP reachability to the AppDynamics controller.
- For Nexus Dashboard Orchestrator service, the data network can have in-band and/or out-of-band IP reachability for Cisco APIC sites but must have in-band reachability for Cisco NDFC sites.
- The data network interface requires a minimum MTU of 1500 to be available for the Nexus Dashboard traffic.

Higher MTU can be configured if desired.

Note If external VLAN tag is configured for switch ports that are used for data network traffic, you must enable jumbo frames or configure custom MTU equal to or greater than 1504 bytes.

- The table below summarize service-specific requirements for the management and data networks.

Note Changing the data subnet requires redeploying the cluster, so we recommend using a larger subnet than the bare minimum required by the nodes and services to account for any additional services in the future. In addition to the requirements listed in this section, ensure that you consult the *Release Notes* for the specific service you plan to deploy.

Allocating persistent IP addresses is done after the cluster is deployed using the External Service Pools configuration in the UI, as described in the [Cisco Nexus Dashboard User Guide](#).

We recommend consulting the specific service's documentation for any additional requirements and caveats related to persistent IP configuration.

Table 3: Service-Specific Network Requirements

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
Nexus Dashboard Orchestrator	Layer 3 adjacent	Layer 3 adjacent	N/A
Nexus Dashboard Insights without SFLOW/NetFlow (ACI fabrics)	Layer 3 adjacent	Layer 3 adjacent	N/A

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
Nexus Dashboard Insights without SFLOW/NetFlow (NDFC fabrics)	Layer 3 adjacent	Layer 2 adjacent	6 IPs in data interface network if using IPv4 7 IPs in data interface network if using IPv6
Nexus Dashboard Insights with SFLOW/NetFlow (ACI or NDFC fabrics)	Layer 3 adjacent	Layer 2 adjacent	6 IPs in data interface network

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
Nexus Dashboard Fabric Controller, Release 12.0(x)	Layer 2 adjacent	Layer 2 adjacent	<p>If LAN Device Management Connectivity is set to <i>Management</i> (default):</p> <ul style="list-style-type: none"> • 2 IPs in the management network for SNMP/Syslog and SCP services • If EPL is enabled, 1 additional IP in the data network for each fabric • If IP Fabric for Media is enabled, 1 additional IP in the management network for telemetry <p>If LAN Device Management Connectivity is set to <i>Data</i>:</p> <ul style="list-style-type: none"> • 2 IPs in the data network for SNMP/Syslog and SCP services • If EPL is enabled, 1 additional IP in the data network for each fabric • If IP Fabric for Media is enabled, 1 additional IP in the data network for telemetry

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
Nexus Dashboard Fabric Controller, Release 12.1.1 and later	Layer 2 or Layer 3 adjacent	Layer 2 or Layer 3 adjacent	

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
			<p>When operating in Layer 2 mode with LAN deployment type and LAN Device Management Connectivity set to Management (default)</p> <ul style="list-style-type: none"> • 2 IPs in the management network for SNMP/Syslog and SCP services • If EPL is enabled, 1 additional IP in the data network for each fabric • If IP Fabric for Media is enabled, 1 additional IP in the management network for telemetry <p>When operating in Layer 2 mode with LAN deployment type and LAN Device Management Connectivity set to Data:</p> <ul style="list-style-type: none"> • 2 IPs in the data network for SNMP/Syslog and SCP services • If EPL is enabled, 1 additional IP in the data network for each fabric • If IP Fabric for Media is enabled, 1 additional IP in the data network for telemetry <p>When operating in Layer</p>

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
			<p>3 mode with LAN deployment type:</p> <ul style="list-style-type: none"> • LAN Device Management Connectivity must be set to <code>Data</code> • 2 IPs for SNMP/Syslog and SCP services • If EPL is enabled, 1 additional IP in the data network for each fabric • All persistent IPs must be part of a separate pool that must not overlap with the management or data subnets <p>For more information about Layer 3 mode for persistent IPs, see the Persistent IPs section in the User's Guide</p> <p>When operating in Layer 2 mode with SAN Controller deployment type:</p> <ul style="list-style-type: none"> • 1 IP for SSH • 1 IP for SNMP/Syslog • 1 IP for SAN Insights functionality

Nexus Dashboard Service	Management Interface	Data Interface	Total Number of Persistent IPs
			Note SAN Controller and IP Fabric for Media are not supported in Layer 3 mode
Nexus Dashboard Data Broker	Layer 3 adjacent	N/A	N/A

- Connectivity between the nodes is required on both networks with the following additional round trip time (RTT) requirements.

Note You must always use the lowest RTT requirement when deploying the Nexus Dashboard cluster and services. For example, if you plan to co-host the Insights and Orchestrator services, site connectivity RTT must not exceed 50ms.

Table 4: RTT Requirements

Service	Connectivity	Maximum RTT
Nexus Dashboard Orchestrator	Between nodes	50 ms
	To sites	For APIC sites: 500 ms For NDFC sites: 150 ms
Nexus Dashboard Insights	Between nodes	50 ms
	To switches	150 ms
Nexus Dashboard Fabric Controller	Between nodes	50 ms
	To switches	200 ms*

* POAP (PowerOn Auto Provisioning) is supported with a max RTT of 50 ms between Nexus Dashboard Fabric Controller and the switches.

Nexus Dashboard Internal Networks

Two additional internal networks are required for communication between the containers used by the Nexus Dashboard:

- **Application overlay** is used for applications internally within Nexus Dashboard

Application overlay must be a /16 network and a default value is pre-populated during deployment.

- **Service overlay** is used internally by the Nexus Dashboard.

Service overlay must be a /16 network and a default value is pre-populated during deployment.

If you are planning to deploy multiple Nexus Dashboard clusters, they can use the same Application and Service subnets.

Note Communications between containers deployed in different Nexus Dashboard nodes is VXLAN-encapsulated and uses the data interfaces IP addresses as source and destination. This means that the Application Overlay and Service Overlay addresses are never exposed outside the data network and any traffic on these subnets is routed internally and does not leave the cluster nodes.

For example, if you had another service (such as DNS) on the same subnet as one of the overlay networks, you would not be able to access it from your Nexus Dashboard as the traffic on that subnet would never be routed outside the cluster. As such, when configuring these networks, ensure that they are unique and do not overlap with any existing networks or services external to the cluster, which you may need to access from the Nexus Dashboard cluster nodes.

For the same reason, we recommend not using 169.254.0.0/16 (the Kubernetes br1 subnet) for the App or Service subnets.

BGP Configuration and Persistent IPs

Previous releases of Nexus Dashboard allowed you to configure one or more persistent IP addresses for services (such as Nexus Dashboard Insights) that require retaining the same IP addresses even in case they are relocated to a different Nexus Dashboard node. However, in those releases, the persistent IPs had to be part of the management and data subnets and the feature could be enabled only if all nodes in the cluster were part of the same Layer 3 network. Here the services used Layer 2 mechanisms like Gratuitous ARP or Neighbor Discovery to advertise the persistent IPs within it's Layer 3 network

Beginning with Release 2.2(1), the Persistent IPs feature is supported even if you deploy the cluster nodes in different Layer 3 networks. In this case, the persistent IPs are advertised out of each node's data links via BGP, which we refer to as "Layer 3 mode". The IPs must also be part of a subnet that is not overlapping with any of the nodes' management or data subnets. If the persistent IPs are outside the data and management networks, this feature will operate in Layer 3 mode by default; if the IPs are part of those networks, the feature will operate in Layer 2 mode.

BGP can be enabled during cluster deployment or from the Nexus Dashboard GUI after the cluster is up and running.

If you plan to enable BGP and use the persistent IP functionality, you must:

- Ensure that the peer routers exchange the advertised persistent IPs between the nodes' Layer 3 networks.
- Choose to enable BGP at the time of the cluster deployment as described in the subsequent sections or enable it afterwards in the Nexus Dashboard GUI as described in the "Persistent IP Addresses" sections of the *User's Guide*.
- Ensure that the persistent IP addresses you allocate do not be overlap with any of the nodes' management or data subnets.

Communication Ports

The following sections provide a reference for ports required by the Nexus Dashboard cluster and services.

Note All services use TLS or mTLS with encryption to protect data privacy and integrity over the wire.

Nexus Dashboard Ports

The following ports are required by the Nexus Dashboard cluster.

Table 5: Nexus Dashboard Ports (Management Network)

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection
ICMP	ICMP	ICMP	In/Out	Other cluster nodes, CIMC, default gateway
SSH	22	TCP	In/Out	CLI and CIMC of the cluster nodes
TACACS	49	TCP	Out	TACACS server
DNS	53	TCP/UDP	Out	DNS server
HTTP	80	TCP	Out	Internet/proxy
NTP	123	UDP	Out	NTP server
HTTPS	443	TCP	In/Out	UI, other clusters (for multi-cluster connectivity), fabrics, Internet/proxy
LDAP	389 636	TCP	Out	LDAP server
Radius	1812	TCP	Out	Radius server
KMS	9880	TCP	In/Out	Other cluster nodes and ACI fabrics
Infra-Service	30012 30021 30500-30600	TCP/UDP	In/Out	Other cluster nodes

Table 6: Nexus Dashboard Ports (Data Network)

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection
ICMP	ICMP	ICMP	In/Out	Other cluster nodes, CIMC, default gateway
SSH	22	TCP	Out	In-band of switches and APIC
DNS	53	TCP/UDP	In/Out	Other cluster nodes and DNS server
HTTPS	443	TCP	Out	In-band of switches and APIC/NDFC
SSH	1022	TCP/UDP	In/Out	Other cluster nodes
VXLAN	4789	UDP	In/Out	Other cluster nodes
KMS	9880	TCP	In/Out	Other cluster nodes and ACI fabrics
Infra-Service	3379 3380 8989 9090 9969 9979 9989 15223 30002-30006 30009-30010 30012 30014-30015 30018-30019 30025 30027	TCP	In/Out	Other cluster nodes
Infra-Service	30016 30017	TCP/UDP	In/Out	Other cluster nodes
Infra-Service	30019	UDP	In/Out	Other cluster nodes

Service	Port	Protocol	Direction	Connection
			In—towards the cluster	
			Out—from the cluster towards the fabric or outside world	
Infra-Service	30500-30600	TCP/UDP	In/Out	Other cluster nodes

Nexus Dashboard Insights Ports

In addition to the ports required by the Nexus Dashboard cluster nodes, which are listed above, the following ports are required by the Nexus Dashboard Insights service.

Table 7: Nexus Dashboard Insights Ports (Data Network)

Service	Port	Protocol	Direction	Connection
			In—towards the cluster	
			Out—from the cluster towards the fabric or outside world	
Show Techcollection	2022	TCP	In/Out	In-band of switches and APIC/NDFC
Flow Telemetry	5640-5671	UDP	In	In-band of switches
TAC Assist	8884	TCP	In/Out	Other cluster nodes
KMS	9989	TCP	In/Out	Other cluster nodes and ACI fabrics
Kafka	30001	TCP	In/Out	In-band IP of switches and APIC/NDFC
SW Telemetry	5695 30000 57500 30570	TCP	In/Out	Other cluster nodes

Nexus Dashboard Fabric Controller Ports

In addition to the ports required by the Nexus Dashboard (ND) cluster nodes, the following ports are required by the Nexus Dashboard Fabric Controller (NDFC) service.

Note The following ports apply to the Nexus Dashboard management network and/or data network interfaces depending on which interface provides IP reachability from the NDFC service to the switches.

Table 8: Nexus Dashboard Fabric Controller Ports

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
SSH	22	TCP	Out	SSH is a basic mechanism for accessing devices.
SCP	22	TCP	Out	SCP clients archiving NDFC backup files to remote server.
SMTP	25	TCP	Out	SMTP port is configurable through NDFC's Server Settings menu. This is an optional feature.
DHCP	67	UDP	In	If NDFC local DHCP server is configured for Bootstrap/POAP purposes. This applies to LAN deployments only. Note When using NDFC as a local DHCP server for POAP purposes, all ND master node IPs must be configured as DHCP relays. Whether the ND nodes' management or data IPs are bound to the DHCP server is determined by the LAN Device Management Connectivity in the NDFC Server Settings.
DHCP	68	UDP	Out	
SNMP	161	TCP/UDP	Out	SNMP traffic from NDFC to devices.
HTTPS/HTTP (NX-API)	443/80	TCP	Out	NX-API HTTPS/HTTP client connects to device NX-API server on port 443/80, which is also configurable. NX-API is an optional feature, used by limited set of NDFC functions. This applies to LAN deployments only.

Service	Port	Protocol	Direction	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
			In—towards the cluster Out—from the cluster towards the fabric or outside world	
HTTPS (vCenter, Kubernetes, OpenStack, Discovery)	443	TCP	Out	NDFC provides an integrated host and physical network topology view by correlating the information obtained from registered VMM domains, such as VMware vCenter or OpenStack, as well as container orchestrators, such as Kubernetes. This is an optional feature

Note The following ports apply to the External Service IPs, also known as persistent IPs, used by some of the NDFC services. These External Service IPs may come from the Nexus Dashboard management subnet pool or the data subnet pool depending on the configured settings.

Table 9: Nexus Dashboard Fabric Controller Persistent IP Ports

Service	Port	Protocol	Direction	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
			In—towards the cluster Out—from the cluster towards the fabric or outside world	
SCP	22	TCP	In	SCP is used by various features to transfer files between devices and the NDFC service. The NDFC SCP service serves as the SCP server for both downloads and uploads. SCP is also used by the POAP client on the devices to download POAP-related files. The SCP-POAP service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings.

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
TFTP (POAP)	69	TCP	In	<p>Only used for device zero-touch provisioning via POAP, where devices can send (limited jailed write-only access to NDFC) basic inventory information to NDFC to start secure POAP communication. NDFC Bootstrap or POAP can be configured for TFTP or HTTP/HTTPS.</p> <p>The SCP-POAP service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings.</p> <p>This applies to LAN deployments only.</p>
HTTP (POAP)	80	TCP	In	<p>Only used for device zero-touch provisioning via POAP, where devices can send (limited jailed write-only access to NDFC) basic inventory information to NDFC to start secure POAP communication. NDFC Bootstrap or POAP can be configured for TFTP or HTTP/HTTPS.</p> <p>The SCP-POAP service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings.</p> <p>This applies to LAN deployments only.</p>

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
BGP	179	TCP	In/Out	<p>For Endpoint Locator, per fabric where it is enabled, an EPL service is spawned with its own persistent IP. This service is always associated with the Nexus Dashboard data interface. NDFC EPL service peers with the appropriate BGP entity (typically BGP Route-Reflectors) on the fabric to get BGP updates needed to track endpoint information.</p> <p>This feature is only applicable for VXLAN BGP EVPN fabric deployments.</p> <p>This applies to LAN deployments only.</p>
HTTPS (POAP)	443	TCP	In	<p>Secure POAP is accomplished via the NDFC HTTPS Server on port 443. The HTTPS server is bound to the SCP-POAP service and uses the same persistent IP assigned to that pod.</p> <p>The SCP-POAP service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings.</p> <p>This applies to LAN deployments only.</p>
Syslog	514	UDP	In	<p>When NDFC is configured as a Syslog server, Syslogs from the devices are sent out toward the persistent IP associated with the SNMP-Trap/Syslog service pod</p> <p>The SNMP-Trap-Syslog service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings</p>

Service	Port	Protocol	Direction <small>In—towards the cluster</small> <small>Out—from the cluster towards the fabric or outside world</small>	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
SCP	2022	TCP	Out	<p>Transport tech-support file from persistent IP of NDFC POAP-SCP pod to a separate ND cluster running Nexus Dashboard Insights.</p> <p>The SCP-POAP service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings</p>
SNMP Trap	2162	UDP	In	<p>SNMP traps from devices to NDFC are sent out toward the persistent IP associated with the SNMP-Trap/Syslog service pod.</p> <p>The SNMP-Trap-Syslog service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings</p>
GRPC (Telemetry)	33000	TCP	In	<p>SAN Insights Telemetry Server which receives SAN data (such as storage, hosts, flows, and so on) over GRPC transport tied to NDFC Persistent IP.</p> <p>This is enabled on SAN deployments only.</p>
GRPC (Telemetry)	50051	TCP	In	<p>Information related to multicast flows for IP Fabric for Media deployments as well as PTP for general LAN deployments is streamed out via software telemetry to a persistent IP associated with a NDFC GRPC receiver service pod.</p> <p>This is enabled on LAN and Media deployments only.</p>

Nexus Dashboard Fabric Controller Ports for SAN Deployments

Nexus Dashboard Fabric Controller can be deployed on a single-node or 3-node Nexus Dashboard cluster. The following ports are required for NDFC SAN deployments on single-node clusters.

Table 10: Nexus Dashboard Fabric Controller Ports for SAN Deployments on Single-Node Clusters

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection (Applies to both LAN and SAN deployments, unless stated otherwise)
SSH	22	TCP	Out	SSH is a basic mechanism for accessing devices.
SCP	22	TCP	Out	SCP clients archiving NDFC backup files to remote server.
SMTP	25	TCP	Out	SMTP port is configurable through NDFC's Server Settings menu. This is an optional feature.
SNMP	161	TCP/UDP	Out	SNMP traffic from NDFC to devices.
HTTPS (vCenter, Kubernetes, OpenStack, Discovery)	443	TCP	Out	NDFC provides an integrated host and physical network topology view by correlating the information obtained from registered VMM domains, such as VMware vCenter or OpenStack, as well as container orchestrators, such as Kubernetes. This is an optional feature.

Note The following ports apply to the External Service IPs, also known as Persistent IPs, used by some of the NDFC services. These External Service IPs may come from the Nexus Dashboard management subnet pool or the data subnet pool depending on the configured settings.

Table 11: Nexus Dashboard Fabric Controller Persistent IP Ports for SAN Deployments on Single-Node Clusters

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection
SCP	22	TCP	In	SCP is used by various features to transfer files between devices and the NDFC service. The NDFC SCP service functions for both downloads and uploads.
Syslog	514	UDP	In	When NDFC is configured as a Syslog server, syslogs from the devices are sent out towards the persistent IP associated with the SNMP-Trap/Syslog service pod. The SNMP-Trap-Syslog service in NDFC has a persistent IP that is associated with either the management or data subnet. This is controlled by the LAN Device Management Connectivity setting in the NDFC Server Settings.

Service	Port	Protocol	Direction In—towards the cluster Out—from the cluster towards the fabric or outside world	Connection
SNMP Trap	2162	UDP	In	SNMP traps from devices to NDFC are sent out toward the persistent IP associated with the SNMP-Trap/Syslog service pod. The SNMP-Trap-Syslog service in NDFC has a persistent IP that is associated with either the management or data subnet.
GRPC (Telemetry)	33000	TCP	In	SAN Insights Telemetry Server which receives SAN data (such as storage, hosts, flows, and so on) over GRPC transport tied to NDFC Persistent IP. This is enabled on SAN deployments only.

Fabric Connectivity

The following sections describe how to connect your Nexus Dashboard cluster nodes to the management and data networks and how to connect the cluster to your fabrics.

For on-premises APIC or NDFC fabrics, you can connect the Nexus Dashboard cluster in one of two ways:

- The Nexus Dashboard cluster connected to the fabric via a Layer 3 network.
- The Nexus Dashboard nodes connected to the leaf switches as typical hosts.

For Cisco Cloud Network Controller fabrics, you must connect via a Layer 3 network.

Physical Node Cabling

Note If you plan to deploy a virtual or cloud form factor cluster, you can skip this section.

Physical nodes can be deployed in UCS-C220-M5 (SE-NODE-G2) and UCS-C225-M6 (ND-NODE-L4) physical servers with the following guidelines:

Figure 1: mLOM and PCIe Riser 01 Card Used for Node Connectivity

- Both servers come with a Modular LAN on Motherboard (mLOM) card, which you use to connect to the Nexus Dashboard management network.
- The UCS-C220-M5 server includes a 4-port VIC1455 card in the "PCIe-Riser-01" slot (shown in the above diagram), which you use for Nexus Dashboard data network connectivity
- The UCS-C225-M6 server includes either a 2x10GbE NIC (APIC-P-ID10Gc) or 2x25/10GbE SFP28 NIC (APIC-P-I8D25GF) in the "PCIe-Riser-01" slot (shown in the above diagram), which you use for Nexus Dashboard data network connectivity.

When connecting the node to your management and data networks:

- For management network:
 - You must use the `mgmt0` and `mgmt1` on the mLOM card.
 - All ports must have the same speed, either 1G or 10G.
- For data network on the UCS-C220-M5 server, you must use the VIC1455 card:
 - All ports must have the same speed, either 10G or 25G.
 - Port-1 corresponds to `fabric0` in Nexus Dashboard and Port-2 corresponding to `fabric1`.
You can use both `fabric0` and `fabric1` for data network connectivity.
- For data network on the UCS-C225-M6 server, you can use the 2x10GbE NIC (APIC-P-ID10Gc), or 2x25/10GbE SFP28 NIC (APIC-P-I8D25GF), or the VIC1455 card:
 - All ports must have the same speed, either 10G or 25G.
 - If you use 25G connectivity between the Nexus Dashboard node and the fabric, you must use a copper cable.
For a list of compatible transceiver options, see the [Cisco 25GBASE SFP28 Modules Data Sheet](#).
 - Port-1 corresponds to `fabric0` in Nexus Dashboard and Port-2 corresponding to `fabric1`.
You can use both `fabric0` and `fabric1` for data network connectivity.

The interfaces are configured as Linux bonds (one for the data interfaces and one for the management interfaces) running in active-standby mode. All interfaces must be connected to individual host ports, PortChannel or vPC are not supported.

When Nexus Dashboard nodes are connected to Cisco Catalyst switches, packets are tagged with `vlan0` if no VLAN is specified. In this case, you must add `switchport voice vlan dot1p` command to the switch interfaces where the nodes are connected to ensure reachability over the data network.

Connecting via External Layer 3 Network

We recommend connecting the Nexus Dashboard cluster to the fabrics via an external Layer 3 network as it does not tie the cluster to any one fabric and the same communication paths can be established to all sites. Specific connectivity depends on the type of applications deployed in the Nexus Dashboard:

- If you are deploying Nexus Dashboard Orchestrator to manage Cisco ACI fabrics only, you can establish connectivity from the data interface to either the in-band or out-of-band (OOB) interface of each site's APIC or both.
- If you are deploying Nexus Dashboard Orchestrator to manage Cisco NDFC fabrics, you must establish connectivity from the data interface to the in-band interface of each site's NDFC.
- If you are deploying Day-2 Operations applications, such as Nexus Dashboard Insights, you must establish connectivity from the data interface to the in-band network of each fabric and of the APIC.

If you plan to connect the cluster across a Layer 3 network, keep the following in mind:

- For ACI fabrics, you must configure an L3Out and the external EPG for Cisco Nexus Dashboard data network connectivity in the management tenant.

Configuring external connectivity in an ACI fabric is described in [Cisco APIC Layer 3 Networking Configuration Guide](#).

- For NDFC fabrics, if the data interface and NDFC's inband interface are in different subnets, you must add a route on NDFC to reach the Nexus Dashboard's data network address.

You can add the route from the NDFC UI by navigating to **Administration > Customization > Network Preference > In-Band (eth2)**, then adding the route and saving.

- If you specify a VLAN ID for your data interface during setup of the cluster, the host port must be configured as `trunk` allowing that VLAN.

However, in most common deployments, you can leave the VLAN ID empty and configure the host port in `access` mode.

The following two figures show two distinct network connectivity scenarios when connecting the Nexus Dashboard cluster to the fabrics via a Layer 3 network. The primary purpose of each depends on the type of application you may be running in your Nexus Dashboard.

Figure 2: Connecting via Layer 3 Network, Day-2 Operations Applications

504311

Figure 3: Connecting via Layer 3 Network, Nexus Dashboard Orchestrator

504312

Connecting Nodes Directly to Leaf Switches

You can also connect the Nexus Dashboard cluster directly to one of the fabrics. This provides easy connectivity between the cluster and in-band management of the fabric, but ties the cluster to the specific fabric and requires reachability to other fabrics to be established through external connectivity. This also makes the cluster dependent on the specific fabric so issues within the fabric may impact Nexus Dashboard connectivity. Like in the previous example, connectivity depends on the type of applications deployed in the Nexus Dashboard:

- If you are deploying Nexus Dashboard Orchestrator to manage Cisco ACI fabrics only, you can establish connectivity from the data interface to either the in-band or out-of-band (OOB) interface of each site's APIC.
- If you are deploying Nexus Dashboard Insights, you must establish connectivity from the data interface to the in-band interface of each fabric.

For ACI fabrics, the data interface IP subnet connects to an EPG/BD in the fabric and must have a contract established to the local in-band EPG in the management tenant. We recommend deploying the Nexus Dashboard in the management tenant and in-band VRF. Connectivity to other fabrics is established via an L3Out.

- If you are deploying Nexus Dashboard Insights with ACI fabrics, the data interface IP address and the ACI fabric's in-band IP address must be in different subnets.

If you plan to connect the cluster directly to the leaf switches, keep the following in mind:

- If deploying in VMware ESX or Linux KVM, the host must be connected to the fabric via trunk port.
- If you specify a VLAN ID for your data network during setup of the cluster, the Nexus Dashboard interface and the port on the connected network device must be configured as `trunk`

However, in most cases we recommend not assigning a VLAN to the data network, in which case you must configure the ports in `access` mode.

- For ACI fabrics:
 - We recommend configuring the bridge domain (BD), subnet, and endpoint group (EPG) for Cisco Nexus Dashboard connectivity in management tenant.

Because the Nexus Dashboard requires connectivity to the in-band EPG in the in-band VRF, creating the EPG in the management tenant means no route leaking is required.
 - You must create a contract between the fabric's in-band management EPG and Cisco Nexus Dashboard EPG.
 - If several fabrics are monitored with apps on the Nexus Dashboard cluster, L3Out with default route or specific route to other ACI fabric in-band EPG must be provisioned and a contract must be established between the cluster EPG and the L3Out's external EPG.

The following two figures show two distinct network connectivity scenarios when connecting the Nexus Dashboard cluster directly to the fabrics' leaf switches. The primary purpose of each depends on the type of application you may be running in your Nexus Dashboard.

Figure 4: Connecting Directly to Leaf Switches, Day-2 Operations Applications

504313

Figure 5: Connecting Directly to Leaf Switches, Nexus Dashboard Orchestrator

504314

Node Distribution Across Sites

Nexus Dashboard supports distribution of cluster nodes across multiple sites. The following node distribution recommendations apply to both physical and virtual clusters.

Note The diagrams in the following sections provide some examples of possible deployment scenarios for physical or virtual Nexus Dashboard cluster nodes. For details on the exact number of nodes required for your specific use case, see the [Nexus Dashboard Capacity Planning](#) tool.

Node Distribution for Nexus Dashboard Insights

For Nexus Dashboard Insights, we recommend a centralized, single-site deployment. This service does not gain redundancy benefits from distributed cluster, which could instead expose the cluster to interconnection failures when nodes are in different sites.

Node Distribution for Nexus Dashboard Orchestrator

For Nexus Dashboard Orchestrator, we recommend a distributed cluster. Keep in mind that at least two Nexus Dashboard master nodes are required for the cluster to remain operational, so when deploying a Nexus Dashboard cluster across two sites, we recommend deploying a standby node in the site with the single master node as shown in the following figure:

Figure 6: Node Distribution Across Two Sites for Nexus Dashboard Orchestrator

Node Distribution for Fabric Controller

For Nexus Dashboard Fabric Controller, we recommend a centralized, single-site deployment. This service does not support recovery in case if 2_{master} node are not available and thus gains no redundancy benefits from distributed cluster, which could instead expose the cluster to interconnection failures when nodes are in different sites.

Services Co-location Use Cases

This section describes a number of recommended deployment scenarios for specific single-service or multiple services co-hosting use cases.

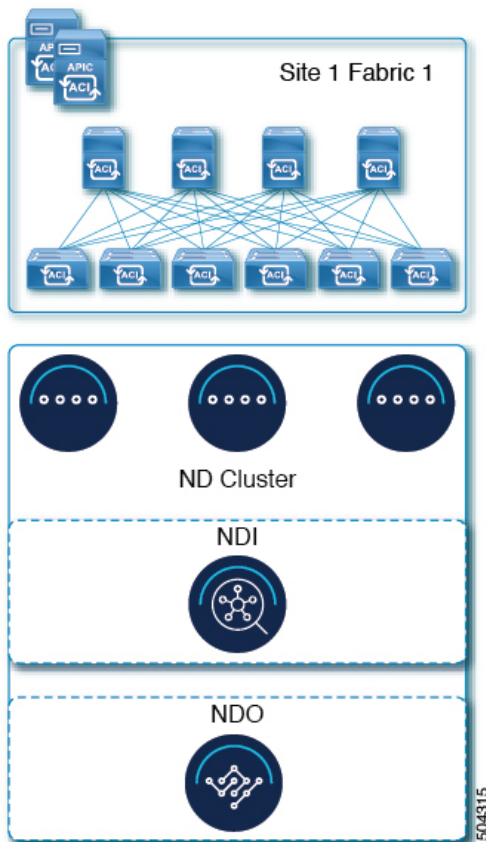

Note This release does not support co-hosting services in Nexus Dashboard clusters that are deployed in Linux KVM, AWS, Azure, or RHEL. All services co-hosting scenarios below apply for physical or VMware ESX cluster form factors only.

Single Site, Nexus Dashboard Insights and Orchestrator

In a single site scenario with Nexus Dashboard Insights and Orchestrator services, a single Nexus Dashboard cluster can be deployed with both services co-hosted on it.

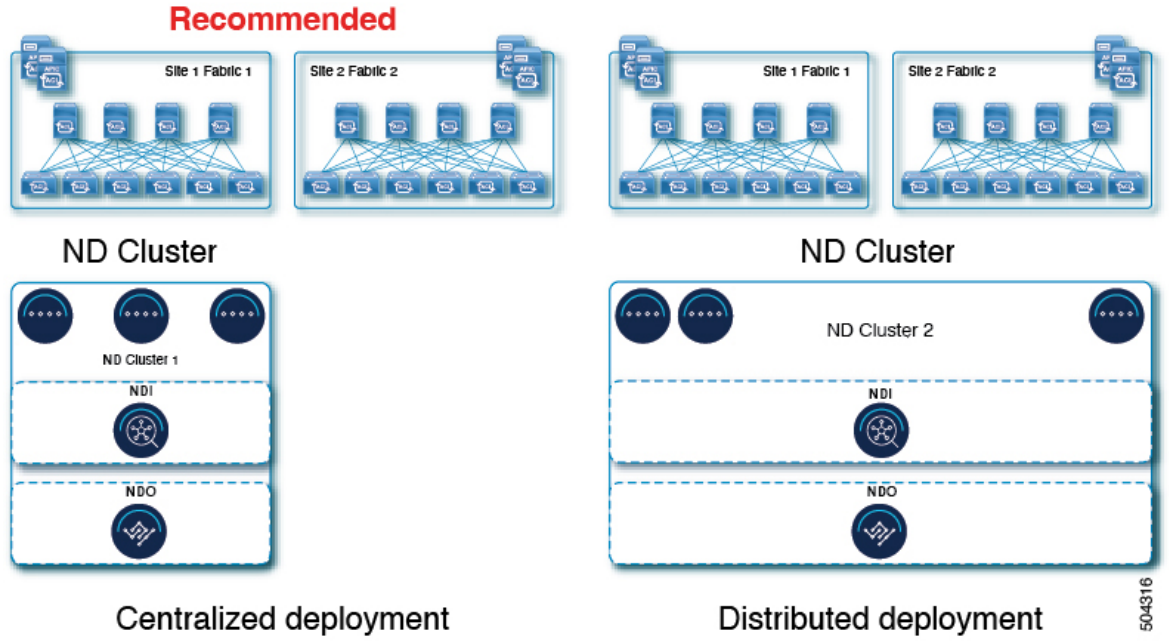

Figure 7: Single Site, Nexus Dashboard Insights and Orchestrator

Multiple Sites, Single Cluster for Nexus Dashboard Insights and Orchestrator

In a multiple sites scenario with Nexus Dashboard Insights and Orchestrator services, a single Nexus Dashboard cluster can be deployed with both services co-hosted on it. In this case, the nodes can be distributed between the sites, however since the Insights service does not gain redundancy benefits from a distributed cluster and could instead be exposed to interconnection failures when nodes are in different sites, we recommend the deployment option on the left:

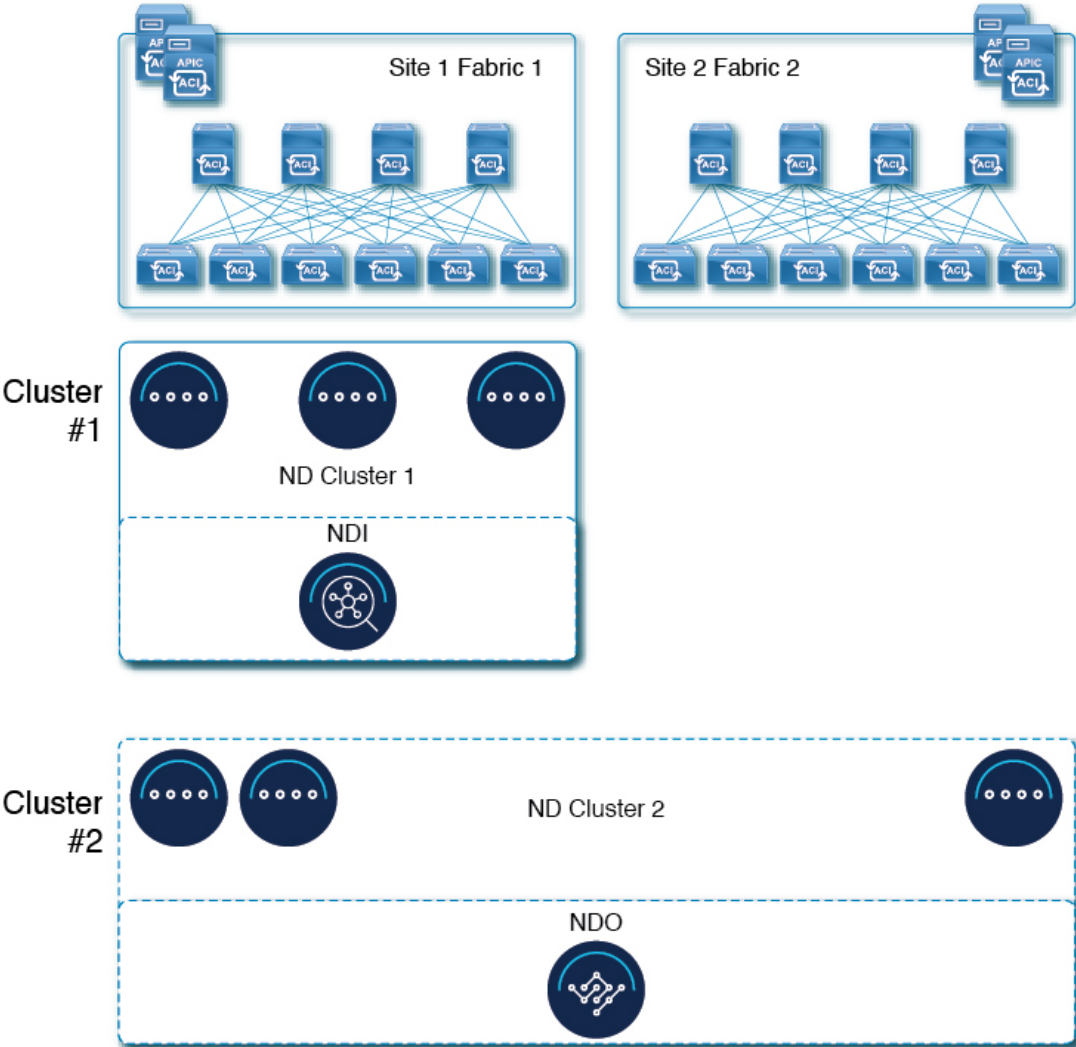

Figure 8: Multiple Sites, Single Cluster for Nexus Dashboard Insights and Orchestrator

Multiple Sites, Multiple Clusters for Nexus Dashboard Insights and Orchestrator

In this case, we recommend deploying two Nexus Dashboard cluster, with one of them dedicated to the Nexus Dashboard Orchestrator service using the virtual or cloud form factor and the nodes distributed across the sites.

Figure 9: Multiple Sites, Multiple Clusters for Nexus Dashboard Insights and Orchestrator

504317

Pre-Installation Checklist

Before you proceed with deploying your Nexus Dashboard cluster, prepare the following information for easy reference during the process:

Table 12: Cluster Details

Parameters	Example	Your Entry
Cluster Name	nd-cluster	
NTP Server	171.68.38.65	
DNS Provider	64.102.6.247 171.70.168.183	

Parameters	Example	Your Entry
DNS Search Domain	cisco.com	
App Network	172.17.0.0/16	
Service Network	100.80.0.0/16	

Table 13: Node Details

Parameters	Example	Your Entry
For physical nodes, CIMC address and login information of the first node	10.195.219.84/24 Username: admin Password: Cisco1234	
For physical nodes, CIMC address and login information of the second node	10.195.219.85/24 Username: admin Password: Cisco1234	
For physical nodes, CIMC address and login information of the third node	10.195.219.86/24 Username: admin Password: Cisco1234	
Password used for each node's <code>rescue-user</code> and the initial GUI password. We recommend configuring the same password for all nodes in the cluster.	Welcome2Cisco!	
Management IP of the first node	192.168.9.172/24	
Management Gateway of the first node.	192.168.9.1	
Data Network IP of the first node	192.168.6.172/24	
Data Network Gateway of the first node	192.168.6.1	
(Optional) Data Network VLAN of the first node	101	
(Optional) ASN of the first node	63331	
(Optional) IP addresses of the first node's BGP Peer(s)	200.11.11.2 or 200:11:11::2	

Parameters	Example	Your Entry
(Optional) ASNs of the first node's BGP Peer(s)	55555	
Management IP of the second node	192.168.9.173/24	
Management Gateway of the second node.	192.168.9.1	
Data Network IP of the second node	192.168.6.173/24	
Data Network Gateway of the second node	192.168.6.1	
(Optional) Data Network VLAN of the second node	101	
(Optional) ASN of the second node	63331	
(Optional) IP addresses of the second node's BGP Peer(s)	200.12.12.2 or 200:12:12::2	
(Optional) ASNs of the second node's BGP Peer(s)	55555	
Management IP of the third node	192.168.9.174/24	
Management Gateway of the third node.	192.168.9.1	
Data Network IP of the third node	192.168.6.174/24	
Data Network Gateway of the third node	192.168.6.1	
(Optional) Data Network VLAN of the third node	101	
(Optional) ASN of the third node	63331	
(Optional) IP addresses of the third node's BGP Peer(s)	200.13.13.2 or 200:13:13::2	
(Optional) ASNs of the third node's BGP Peer(s)	55555	

CHAPTER 3

Deploying as Physical Appliance

- [Prerequisites and Guidelines, on page 39](#)
- [Deploying Nexus Dashboard as Physical Appliance, on page 41](#)

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster, you must:

- Review and complete the general prerequisites described in [Deployment Overview and Requirements, on page 3](#).

Note that this document describes how to initially deploy the base Nexus Dashboard cluster. If you want to expand an existing cluster with additional nodes (such as `worker` or `standby`), see the "Infrastructure Management" chapter of the *Cisco Nexus Dashboard User Guide* instead, which is available from the Nexus Dashboard UI or online at [Cisco Nexus Dashboard User Guide](#)

If you are looking to completely re-image the server, for example in case you cannot log in as the `rescue-user` for manual recovery, see the "Troubleshooting" chapter of the *Cisco Nexus Dashboard User Guide*.

- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- Ensure you are using the following hardware and the servers are racked and connected as described in [Cisco Nexus Dashboard Hardware Setup Guide](#).

The physical appliance form factor is supported on the UCS-C220-M5 and UCS-C225-M6 original Nexus Dashboard platform hardware only. The following table lists the PIDs and specifications of the physical appliance servers:

Table 14: Supported UCS-C220-M5 Hardware

PID	Hardware
SE-NODE-G2=	<ul style="list-style-type: none"> • UCS C220 M5 Chassis • 2x 10-core 2.2GHz Intel Xeon Silver CPU • 256 GB of RAM • 4x 2.4TB HDDs 400GB SSD 1.2TB NVME drive • UCS Virtual Interface Card 1455 (4x25G ports) • 1050W power supply
SE-CL-L3	A cluster of 3x SE-NODE-G2= appliances.

Table 15: Supported UCS-C225-M6 Hardware

PID	Hardware
ND-NODE-L4=	<ul style="list-style-type: none"> • UCS C225 M6 Chassis • 2.8GHz AMD CPU • 256 GB of RAM • 4x 2.4TB HDDs 960GB SSD 1.6TB NVME drive • Intel X710T2LG 2x10 GbE (Copper) Intel E810XXVDA2 2x25/10 GbE (Fiber Optic) • 1050W power supply
ND-CLUSTER-L4	A cluster of 3x ND-NODE-L4= appliances.

Note The above hardware supports Nexus Dashboard software only. If any other operating system is installed, the node can no longer be used as a Nexus Dashboard node.

The UCS-C225-M6 servers are supported with Nexus Dashboard release 2.3(2) or later.

- Ensure that you are running a supported version of Cisco Integrated Management Controller (CIMC).
The minimum supported and recommended versions of CIMC are listed in the "Compatibility" section of the [Release Notes](#) for your Nexus Dashboard release.
- Ensure that Serial over LAN (SOL) is enabled in CIMC.
SOL is required for the `connect host` command, which you use to connect to the node to provide basic configuration information.
- Ensure that all nodes are running the same release version image.
- If your Nexus Dashboard hardware came with a different release image than the one you would like to deploy, we recommend deploying the cluster with the existing image first and then upgrading it to the desired release.
For example, if the hardware you received came with Release 2.0.1 image pre-installed, but you want to deploy Release 2.1.1 instead, we recommend:
 - First, bring up the Release 2.0.1 cluster, as described in the following section.
 - Then upgrade to Release 2.1.1, as described in [Upgrading Nexus Dashboard, on page 113](#).

You must have at least a 3-node cluster. Additional worker nodes can be added for horizontal scaling if required by the type and number of applications you will deploy. For maximum number of `worker` and `standby` nodes in a single cluster, see the [Release Notes](#) for your release.

Deploying Nexus Dashboard as Physical Appliance

When you first receive the Nexus Dashboard physical hardware, it comes preloaded with the software image. This section describes how to configure and bring up the initial 3-node Nexus Dashboard cluster.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 39](#).

Step 1

Configure the first node's basic information.

You must configure only a single ("first") node as described in this step. Other nodes will be configured during the GUI-based cluster deployment process described in the following steps and will accept settings from the first `primary` node. The other two `primary` nodes do not require any additional configuration besides ensuring that their CIMC IP addresses are reachable from the first `primary` node and login credentials are set.

- SSH into the node using CIMC management IP and use the `connect host` command to connect to the node's console.

You will be prompted to run the first-time setup utility:

```
[ OK ] Started atomix-boot-setup.
      Starting Initial cloud-init job (pre-networking)...
      Starting logrotate...
      Starting logwatch...
      Starting keyhole...
[ OK ] Started keyhole.
```

```
[ OK ] Started logrotate.
[ OK ] Started logwatch.
```

Press any key to run first-boot setup on this console...

- b) Enter and confirm the `admin` password

This password will be used for the `rescue-user` CLI login as well as the initial GUI password.

```
Admin Password:
Reenter Admin Password:
```

- c) Enter the management network information.

```
Management Network:
  IP Address/Mask: 192.168.9.172/24
  Gateway: 192.168.9.1
```

- d) Review and confirm the entered information.

You will be asked if you want to change the entered information. If all the fields are correct, choose `n` to proceed. If you want to change any of the entered information, enter `y` to re-start the basic configuration script.

```
Please review the config
Management network:
  Gateway: 192.168.9.1
  IP Address/Mask: 192.168.9.172/24
```

```
Re-enter config? (y/N): n
```

Step 2 Wait for the initial bootstrap process to complete.

After you provide and confirm management network information, the initial setup configures the networking and brings up the UI, which you will use to add two other nodes and complete the cluster deployment.

```
Please wait for system to boot: [#####] 100%
System up, please wait for UI to be online.
```

System UI online, please login to <https://192.168.9.172> to continue.

Step 3 Open your browser and navigate to <https://<node-mgmt-ip>> to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Begin Setup**

**Step 4**

Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.
- b) Click **+Add NTP Host** to add one or more NTP servers.
 You must provide an IP address, fully qualified domain name (FQDN) are not supported.
 After you enter the IP address, click the green checkmark icon to save it.
- c) Click **+Add DNS Provider** to add one or more DNS servers.
 After you enter the IP address, click the green checkmark icon to save it.
- d) Provide a **Proxy Server**.
 For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.
 If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.
- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.
 Under advanced settings, you can configure the following:
 - Provide one or more search domains by clicking **+Add DNS Search Domain**.
 After you enter the IP address, click the green checkmark icon to save it.
 - Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 5

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
 b) In the **Password** field, enter the password for this node and click **Validate**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- c) Provide the node's **Name**.
 d) Provide the node's **Data Network** information.

The **Management Network** information is already pre-populated with the information you provided for the first node.

You must provide the data network IP address/netmask (for example, `172.31.140.58/24`) and gateway (for example, `172.31.140.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- e) (Optional) Provide IPv6 addresses for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do that now during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- f) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature required by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in detail in the "Persistent IP Addresses" sections of the *Nexus Dashboard User's Guide*.

Note You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
 You can configure the same ASN for all nodes or a different ASN per node.
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- g) Click **Save** to save the changes.

Step 6

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

The **Node Details** window opens.

- a) Provide the node's **Name**.

- b) In the **CIMC Details** section, provide the node's CIMC IP address and login credentials, then click **Verify**.
The IP address and login credentials are used to configure that node.
- c) Provide the node's **Management Network** information.
You must provide the management network IP address, netmask, and gateway.
- d) Provide the node's **Data Network** information.
You must provide the data network IP address, netmask, and gateway. Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.
- e) (Optional) Provide IPv6 information for the management and data networks.
Starting with release 2.1.1, Nexus Dashboard supports dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do it during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- f) Click **Save** to save the changes.

Step 7 Repeat the previous step to add the 3rd node.

Step 8 Click **Next** to continue.

Step 9 In the **Confirmation** screen, review the entered information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 10 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

- a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 11 Configure the **Network Scale** parameters for your cluster.

This is described in the **Infrastructure Management > Cluster Configuration** section of the [Cisco Nexus Dashboard User Guide](#), which is also available directly from your Nexus Dashboard's Help Center.

CHAPTER 4

Deploying in VMware ESX

- [Prerequisites and Guidelines, on page 47](#)
- [Deploying Nexus Dashboard Using VMware vCenter, on page 51](#)
- [Deploying Nexus Dashboard Directly in VMware ESXi, on page 60](#)

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster in VMware ESX, you must:

- Ensure that the ESX form factor supports your scale and services requirements.

Scale and services support and co-hosting vary based on the cluster form factor and the specific services you plan to deploy. You can use the [Nexus Dashboard Capacity Planning](#) tool to verify that the virtual form factor satisfies your deployment requirements.

Note Some services (such as Nexus Dashboard Fabric Controller) may require only a single ESX virtual node for one or more specific use cases. In that case, the capacity planning tool will indicate the requirement and you can simply skip the additional node deployment step in the following section.

- Review and complete the general prerequisites described in [Deployment Overview and Requirements, on page 3](#).

Note that this document describes how to initially deploy the base Nexus Dashboard cluster. If you want to expand an existing cluster with additional nodes (such as `worker` or `standby`), see the "Infrastructure Management" chapter of the *Cisco Nexus Dashboard User Guide* instead, which is available from the Nexus Dashboard UI or online at [Cisco Nexus Dashboard User Guide](#)

- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- When deploying in VMware ESX, you can deploy two types of nodes:
 - Data Node—node profile designed for data-intensive applications, such as Nexus Dashboard Insights
 - App Node—node profile designed for non-data-intensive applications, such as Nexus Dashboard Orchestrator

Note If you plan to add worker nodes to your cluster:

- For NDFC, both the initial cluster and worker nodes can be App nodes.

Detailed scale information is available in the [Verified Scalability Guide for Cisco Nexus Dashboard Fabric Controller](#) for your release.

- For all other services or co-hosting scenarios, the initial cluster must be deployed using Data nodes.

Ensure you have enough system resources:

Table 16: Deployment Requirements

Nexus Dashboard Version	Data Node Requirements	App Node Requirements
Release 2.3.x		<ul style="list-style-type: none"> • VMware ESXi 7.0, 7.0.1, 7.0.2, 7.0.3 • VMware vCenter 7.0.1, 7.0.2 if deploying using vCenter • Each VM requires the following: <ul style="list-style-type: none"> • 16 vCPUs with physical reservation of at least 2.2GHz • 64GB of RAM with physical reservation • 500GB HDD or SSD storage for the data volume and an additional 50GB for the system volume <p>Some services require <small>App</small> nodes to be deployed on faster SSD storage while other services support HDD. Check the Nexus Dashboard Capacity Planning tool to ensure that you use the correct type of storage.</p> • We recommend that each Nexus Dashboard node is deployed in a different ESXi server.

Nexus Dashboard Version	Data Node Requirements	App Node Requirements
	<ul style="list-style-type: none"> • VMware ESXi 7.0, 7.0.1, 7.0.2, 7.0.3 • VMware vCenter 7.0.1, 7.0.2 if deploying using vCenter • Each VM requires the following: <ul style="list-style-type: none"> • 32 vCPUs with physical reservation of at least 2.2GHz • 128GB of RAM with physical reservation • 3TB SSD storage for the data volume and an additional 50GB for the system volume <p>Data nodes must be deployed on storage with the following minimum performance requirements:</p> <ul style="list-style-type: none"> • The SSD must be attached to the data store directly or in JBOD mode if using a RAID Host Bus Adapter (HBA) • The SSDs must be optimized for Mixed Use/Application (not Read-Optimized) • 4K Random Read IOPS: 93000 • 4K Random Write IOPS: 31000 • We recommend that each Nexus Dashboard node is deployed in a different ESXi server. 	

- After each node's VM is deployed, ensure that the VMware Tools' periodic time synchronization is disabled as described in the deployment procedure in the next section.
- VMware vMotion is not supported for Nexus Dashboard cluster nodes.
- VMware Distributed Resource Scheduler (DRS) is not supported for Nexus Dashboard cluster nodes.
- Because Nexus Dashboard is a platform infrastructure, it is not possible to bring down all services. In other words, if you want to take a snapshot of the virtual machine (such as for debugging purposes), the snapshot must have all Nexus Dashboard services running.
- You can choose to deploy the nodes directly in ESXi or using vCenter.

If you want to deploy using vCenter, following the steps described in [Deploying Nexus Dashboard Using VMware vCenter, on page 51](#).

If you want to deploy directly in ESXi, following the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 60](#).

Deploying Nexus Dashboard Using VMware vCenter

This section describes how to deploy Cisco Nexus Dashboard cluster using VMware vCenter. If you prefer to deploy directly in ESXi, follow the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 60](#) instead.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 47](#).

Step 1 Obtain the Cisco Nexus Dashboard OVA image.

- a) Browse to the Software Download page.

<https://software.cisco.com/download/home/286327743/type/286328258/>

- b) Choose the Nexus Dashboard release version you want to download.
c) Click the **Download** icon next to the Nexus Dashboard OVA image (`nd-dk9.<version>.ova`).

Step 2 Log in to your VMware vCenter.

Depending on the version of your vSphere client, the location and order of configuration screens may differ slightly. The following steps provide deployment details using VMware vSphere Client 6.7.

Step 3 Start the new VM deployment.

- a) Right-click the ESX host where you want to deploy.
- b) Then select **Deploy OVF Template...**

The **Deploy OVF Template** wizard appears.

Step 4

In the **Select an OVF template** screen, provide the OVA image.

- a) Provide the image.

If you hosted the image on a web server in your environment, select **URL** and provide the URL to the image as shown in the above screenshot.

If your image is local, select **Local file** and click **Choose Files** to select the OVA file you downloaded.

b) Click **Next** to continue.

Step 5

In the **Select a name and folder** screen, provide a name and location for the VM.

Deploy OVF Template

1 Select an OVF template
 2 Select a name and folder
 3 Select a compute resource
 4 Review details
 5 Select storage
 6 Ready to complete

Select a name and folder
Specify a unique name and target location

Virtual machine name:

Select a location for the virtual machine.

- 172.31.141.49
- Datacenter1**

CANCEL

a) Provide the name for the virtual machine.

b) Select the location for the virtual machine.

c) Click **Next** to continue

Step 6

In the **Select a compute resource** screen, select the ESX host.

Deploy OVF Template

1 Select an OVF template
 2 Select a name and folder
 3 Select a compute resource
 4 Review details
 5 Select storage
 6 Ready to complete

Select a compute resource
Select the destination compute resource for this operation

- Datacenter1
 - 172.23.136.84
 - 172.23.136.86
 - 172.23.136.87
 - 172.23.136.88**

Compatibility

✓ Compatibility checks succeeded.

CANCEL

a) Select the vCenter data center and the ESX host for the virtual machine.

b) Click **Next** to continue

Step 7

In the **Review details** screen, click **Next** to continue.

Step 8

In the **Configuration** screen, select the node profile you want to deploy.

Deploy OVF Template

1 Select an OVF template
 2 Select a name and folder
 3 Select a compute resource
 4 Review details
 5 Configuration
 6 Select storage
 7 Select networks
 8 Customize template
 9 Ready to complete

Configuration
Select a deployment configuration

App
 Data

Description
Use this deployment profile to configure an App OVA with 16vCPUs, 64GB RAM, and 500GB Disk.

2 Items

CANCEL **BA** **Next**

a) Select either **App** or **Data** node profile based on your use case requirements.

For more information about the node profiles, see [Prerequisites and Guidelines](#), on page 47.

b) Click **Next** to continue

Step 9

In the **Select storage** screen, provide the storage information.

Deploy OVF Template

1 Select an OVF template
 2 Select a name and folder
 3 Select a compute resource
 4 Review details
 5 Configuration
 6 Select storage
 7 Select networks
 8 Customize template
 9 Ready to complete

Select storage
Select the storage for the configuration and disk files

Encrypt this virtual machine (Requires Key Management Server)

Select virtual disk format:
 Thick Provision Lazy Zeroed

VM Storage Policy:

Name	Capacity	Provisioned	Free	Type	Cluster
datastore1 (3)	925.25 GB	225.74 GB	707.7 GB	VMFS 5	

Compatibility
 Compatibility checks succeeded.

CANCEL **BA** **Next**

a) From the **Select virtual disk format** drop-down, select **Thick Provision Lazy Zeroed**.

b) Select the datastore for the virtual machine.

We recommend a unique datastore for each node.

c) Click **Next** to continue

Step 10

In the **Select networks** screen, choose the VM network for the Nexus Dashboard's Management and Data networks and click **Next** to continue.

There are two networks required by the Nexus Dashboard cluster:

- **fabric0** is used for the Nexus Dashboard cluster's Data Network
- **mgmt0** is used for the Nexus Dashboard cluster's Management Network.

For more information about these networks, see [Prerequisites and Guidelines, on page 6](#) in the "Deployment Overview and Requirements" chapter.

Step 11 In the **Customize template** screen, provide the required information.

Deploy OVF Template

✓ 1 Select an OVF template
 ✓ 2 Select a name and folder
 ✓ 3 Select a compute resource
 ✓ 4 Review details
 ✓ 5 Configuration
 ✓ 6 Select storage
 ✓ 7 Select networks
 8 **Customize template**
 9 Ready to complete

Customize template
 Customize the deployment properties of this software solution.

✓ All properties have valid values

Resource Configuration	1 settings
1. Data Disk Size (GB)	Data disk size (min 500GB, max 1536GB (1.5TB)) 500
Node Configuration	3 settings
1. Password	Local "rescue-user" password Password: Confirm Password:
2. Management Network Address and subnet	Management network address. Enter IP/subnet 172.31.140.46/24
3. Management Gateway IP	Management network gateway IP address. Enter IP only 172.31.140.1

CANCEL [Back] e NEXT

a) Provide the size for the node's data volume.

We recommend using the default values for the required data volume.

The default values will be pre-populated based on the type of node you are deploying, with App node having a single 500GB disk and Data node having a single 3TB disk.

Note that in addition to the data volume, a second 50GB system volume will also be configured but cannot be customized.

b) Provide and confirm the **Password**.

This password is used for the `rescue-user` account on each node.

Note You must provide the same password for all nodes or the cluster creation will fail.

c) Provide the **Management Network IP** address and netmask.

d) Provide the **Management Network IP** gateway.

e) Click **Next** to continue.

Step 12 In the **Ready to complete** screen, verify that all information is accurate and click **Finish** to begin deploying the first node.

Step 13 Repeat previous steps to deploy the second and third nodes.

Note If you are deploying a single-node cluster, you can skip this step.

You do not need to wait for the first node's VM deployment to complete, you can begin deploying the other two nodes simultaneously. The steps to deploy the second and third nodes are identical to the first node's.

Step 14 Wait for the VM(s) to finish deploying.

Step 15 Ensure that the VMware Tools periodic time synchronization is disabled, then start the VMs.

To disable time synchronization:

- Right-click the node's VM and select **Edit Settings**.
- In the **Edit Settings** window, select the **VM Options** tab.
- Expand the **VMware Tools** category and uncheck the **Synchronize guest time with host** option.

Step 16 Open your browser and navigate to `https://<node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Begin Setup**

Step 17 Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- Provide the **Cluster Name** for this Nexus Dashboard cluster.
- Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to `Yes` and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you enter the IP address, click the green checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 18

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
- b) In the **Password** field, enter the password for this node and click **Validate**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- c) Provide the node's **Name**.
- d) Provide the node's **Data Network** information.

The **Management Network** information is already pre-populated with the information you provided for the first node.

You must provide the data network IP address/netmask (for example, `172.31.140.58/24`) and gateway (for example, `172.31.140.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- e) (Optional) Provide IPv6 addresses for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do that now during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- f) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature required by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in detail in the "Persistent IP Addresses" sections of the *Nexus Dashboard User's Guide*.

Note You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

g) Click **Save** to save the changes.

Step 19

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

Note If you are deploying a single-node cluster, you can skip this step and proceed with Step 21.

The **Node Details** window opens.

a) In the **Deployment Details** section, provide the node's **Management IP Address** and **Password** for the `rescue-user` you configured when deploying the node's VM, then click **Verify**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

b) Provide the node's **Name**.

c) Provide the node's **Data Network** IP address and gateway.

The **Management Network** information will be pre-populated with the information pulled from the node based on the management IP address and credentials you provided in the previous sub-step.

You must provide the data network IP address/netmask (for example, `172.31.141.58/24`) and gateway (for example, `172.31.141.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

d) (Optional) Provide IPv6 information for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do it during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

e) (Optional) If required, **Enable BGP** for the data network.

f) Click **Save** to save the changes.

Step 20

Repeat the previous step to add the 3rd node.

Note If you are deploying a single-node cluster, you can skip this step and proceed with Step 21.

Step 21

In the **Node Details** screen, click **Next** to continue.

After you've provided the information for all 3 nodes in the cluster, continue to the next screen of the bootstrap process.

Cluster Details **Node Details** Confirmation

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the User Interface.

Previous Next

Step 22 In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 23 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 24 Configure the **Network Scale** parameters for your cluster.

This is described in the **Infrastructure Management > Cluster Configuration** section of the *Cisco Nexus Dashboard User Guide*, which is also available directly from your Nexus Dashboard's Help Center.

Deploying Nexus Dashboard Directly in VMware ESXi

This section describes how to deploy Cisco Nexus Dashboard cluster directly in VMware ESXi. If you prefer to deploy using vCenter, follow the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 60](#) instead.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 47](#).

Step 1 Obtain the Cisco Nexus Dashboard OVA image.

- a) Browse to the Software Download page.

<https://software.cisco.com/download/home/286327743/type/286328258/>

- b) Choose the Nexus Dashboard release version you want to download.
c) Click the **Download** icon next to the Nexus Dashboard OVA image (`nd-dk9.<version>.ova`).

Step 2 Log in to your VMware ESXi.

Depending on the version of your ESXi server, the location and order of configuration screens may differ slightly. The following steps provide deployment details using VMware ESXi 6.7.

Step 3 Right-click the host and select **Create/Register VM**.

Step 4 In the **Select creation type** screen, choose `Deploy a virtual machine from an OVF or OVA file`, then click **Next**.

Step 5 In the **Select OVF and VMDK files** screen, provide the virtual machine name (for example, `nd-node1`) and the OVA image you downloaded in the first step, then click **Next**.

Step 6 In the **Select storage** screen, choose the datastore for the VM, then click **Next**.

Step 7 In the **Select OVF and VMDK files** screen, provide the virtual machine name (for example, `nd-node1`) and the OVA image you downloaded in the first step, then click **Next**.

Step 8 In the **Deployment options** screen, choose `Disk Provisioning: Thick`, uncheck the `Power on automatically` option, then click **Next** to continue.

There are two networks, **fabric0** is used for the data network and **mgmt0** is used for the management network.

Step 9 In the **Ready to complete** screen, verify that all information is accurate and click **Finish** to begin deploying the first node.

Step 10 Repeat previous steps to deploy the second and third nodes.

Note If you are deploying a single-node cluster, you can skip this step.

You do not need to wait for the first node deployment to complete, you can begin deploying the other two nodes simultaneously.

Step 11 Wait for the VM(s) to finish deploying.

Step 12 Ensure that the VMware Tools periodic time synchronization is disabled, then start the VMs.

To disable time synchronization:

- a) Right-click the node's VM and select **Edit Settings**.
- b) In the **Edit Settings** window, select the **VM Options** tab.
- c) Expand the **VMware Tools** category and uncheck the **Synchronize guest time with host** option.

Step 13 Open one of the node's console and configure the node's basic information.

- a) Begin initial setup.

You will be prompted to run the first-time setup utility:

```
[ OK ] Started atomix-boot-setup.
      Starting Initial cloud-init job (pre-networking)...
      Starting logrotate...
      Starting logwatch...
      Starting keyhole...
[ OK ] Started keyhole.
[ OK ] Started logrotate.
[ OK ] Started logwatch.
```

Press any key to run first-boot setup on this console...

- b) Enter and confirm the `admin` password

This password will be used for the `rescue-user` SSH login as well as the initial GUI password.

Note You must provide the same password for all nodes or the cluster creation will fail.

```
Admin Password:
Reenter Admin Password:
```

- c) Enter the management network information.

```
Management Network:
  IP Address/Mask: 192.168.9.172/24
  Gateway: 192.168.9.1
```

- d) For the first node only, designate it as the "Cluster Leader".

You will log into the cluster leader node to finish configuration and complete cluster creation.

```
Is this the cluster leader?: y
```

- e) Review and confirm the entered information.

You will be asked if you want to change the entered information. If all the fields are correct, choose `n` to proceed. If you want to change any of the entered information, enter `y` to re-start the basic configuration script.

```

Please review the config
Management network:
  Gateway: 192.168.9.1
  IP Address/Mask: 192.168.9.172/24
Cluster leader: no

Re-enter config? (y/N): n

```

Step 14 Repeat previous step to configure the initial information for the second and third nodes.

You do not need to wait for the first node configuration to complete, you can begin configuring the other two nodes simultaneously.

Note You must provide the same password for all nodes or the cluster creation will fail.

The steps to deploy the second and third nodes are identical with the only exception being that you must indicate that they are not the **Cluster Leader**.

Step 15 Open your browser and navigate to `https://<node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Begin Setup**

Step 16 Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- Provide the **Cluster Name** for this Nexus Dashboard cluster.
- Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- c) Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- d) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you enter the IP address, click the green checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 17

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
- b) In the **Password** field, enter the password for this node and click **Validate**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- c) Provide the node's **Name**.
- d) Provide the node's **Data Network** information.

The **Management Network** information is already pre-populated with the information you provided for the first node.

You must provide the data network IP address/netmask (for example, `172.31.140.58/24`) and gateway (for example, `172.31.140.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- e) (Optional) Provide IPv6 addresses for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do that now during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- f) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature required by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in detail in the "Persistent IP Addresses" sections of the *Nexus Dashboard User's Guide*.

Note You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.

You can configure the same ASN for all nodes or a different ASN per node.

- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- g) Click **Save** to save the changes.

Step 18

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

Note If you are deploying a single-node cluster, you can skip this step.

The **Node Details** window opens.

- a) In the **Deployment Details** section, provide the node's **Management IP Address** and **Password** for the `rescue-user` you configured when deploying the node's VM, then click **Verify**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- b) Provide the node's **Name**.
c) Provide the node's **Data Network** IP address and gateway.

The **Management Network** information will be pre-populated with the information pulled from the node based on the management IP address and credentials you provided in the previous sub-step.

You must provide the data network IP address/netmask (for example, `172.31.141.58/24`) and gateway (for example, `172.31.141.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- d) (Optional) Provide IPv6 information for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do it during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.
f) Click **Save** to save the changes.

Step 19

Repeat the previous step to add the 3rd node.

Note If you are deploying a single-node cluster, you can skip this step.

Step 20

In the **Node Details** screen, click **Next** to continue.

After you've provided the information for all 3 nodes in the cluster, continue to the next screen of the bootstrap process.

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the User Interface.

General

Serial Number	Name	Management Network	Data Network		
EA986C528737	node-ova-app1	IPv4/mask: 172.31.140.46/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.58/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️
B734BC2033AD	node-ova-app2	IPv4/mask: 172.31.140.60/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.68/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️
AED5046A16E2	node-ova-app3	IPv4/mask: 172.31.140.70/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.72/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️

Previous Next

Step 21 In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 22 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health  
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 23 Configure the **Network Scale** parameters for your cluster.

This is described in the **Infrastructure Management > Cluster Configuration** section of the [Cisco Nexus Dashboard User Guide](#), which is also available directly from your Nexus Dashboard's Help Center.

CHAPTER 5

Deploying in Linux KVM

- [Prerequisites and Guidelines, on page 67](#)
- [Deploying Nexus Dashboard in Linux KVM, on page 70](#)

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster in Linux KVM, you must:

- Ensure that the KVM form factor supports your scale and services requirements.
Scale and services support and co-hosting vary based on the cluster form factor. You can use the [Nexus Dashboard Capacity Planning](#) tool to verify that the virtual form factor satisfies your deployment requirements.
- Review and complete the general prerequisites described in [Deployment Overview and Requirements, on page 3](#).
- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- Ensure you have enough system resources:

Table 17: Deployment Requirements

Orchestrator Version	Requirements
Release 2.3.x	

Orchestrator Version	Requirements
	<ul style="list-style-type: none"> • KVM deployments are supported for Nexus Dashboard Fabric Controller and Nexus Dashboard Orchestrator services only. Specific versions of the required OS and libraries for each service are listed below. • For Nexus Dashboard Fabric Controller: <ul style="list-style-type: none"> • You must deploy in CentOS 7.9 or Red Hat Enterprise Linux 8.6 • You must have the supported versions of Kernel and KVM: <ul style="list-style-type: none"> • For CentOS 7.9, Kernel version 3.10.0-957.el7.x86_64 and KVM version libvirt-4.5.0-23.el7_7.1.x86_64 • For RHEL 8.6, Kernel version 4.18.0-372.9.1.el8.x86_64 and KVM version libvirt 8.0.0 • For Nexus Dashboard Fabric Orchestrator: <ul style="list-style-type: none"> • You must deploy in CentOS 7.7 • You must have the supported versions of Kernel and KVM: <ul style="list-style-type: none"> • Kernel 3.10.0-1062.el7.x86_64 • KVM libvirt 4.5.0 • 16 vCPUs • 64 GB of RAM • 550 GB disk Each node requires a dedicated disk partition • The disk must have I/O latency of 20ms or less. To verify the I/O latency: <ol style="list-style-type: none"> 1. Create a test directory. For example, test-data. 2. Run the following command: <pre># fio --rw=write --ioengine=sync --fdatasync=1 --directory=test-data --size=22m --bs=2300 --name=mytest</pre>

Orchestrator Version	Requirements
	<p>3. After the command is executed, confirm that the <code>99.00th=[<value>]</code> in the <code>fsync/fdatasync/sync_file_range</code> section is under 20ms.</p> <ul style="list-style-type: none"> • We recommend that each Nexus Dashboard node is deployed in a different KVM hypervisor.

Deploying Nexus Dashboard in Linux KVM

This section describes how to deploy Cisco Nexus Dashboard cluster in Linux KVM.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 67](#).

Step 1

Download the Cisco Nexus Dashboard image.

- Browse to the Software Download page.

<https://software.cisco.com/download/home/286327743/type/286328258>

- Click **Nexus Dashboard Software**.
- From the left sidebar, choose the Nexus Dashboard version you want to download.
- Download the Cisco Nexus Dashboard image for Linux KVM (`nd-dk9.<version>.qcow2`).

Step 2

Copy the image to the Linux KVM servers where you will host the nodes.

You can use `scp` to copy the image, for example:

```
# scp nd-dk9.<version>.qcow2 root@<kvm-host-ip>:/home/nd-base
```

The following steps assume you copied the image into the `/home/nd-base` directory.

Step 3

Create the required disk images for the first node.

You will create a snapshot of the base `qcow2` image you downloaded and use the snapshots as the disk images for the nodes' VMs. You will also need to create a second disk image for each node.

- Log in to your KVM host as the `root` user.
- Create a directory for the node's snapshot.

The following steps assume you create the snapshot in the `/home/nd-node1` directory.

```
# mkdir -p /home/nd-node1/
# cd /home/nd-node1
```

- Create the snapshot.

In the following command, replace `/home/nd-base/nd-dk9.<version>.qcow2` with the location of the base image you created in the previous step.

```
# qemu-img create -f qcow2 -b /home/nd-base/nd-dk9.<version>.qcow2
/home/nd-node1/nd-node1-disk1.qcow2
```

Note If you are deploying in RHEL 8.6, you may need to provide an additional parameter to define the destination snapshot's format as well. In that case, update the above command to the following:

```
# qemu-img create -f qcow2 -b /home/nd-base/nd-dk9.2.1.1a.qcow2
/home/nd-node1/nd-node1-disk1.qcow2 -F qcow2
```

d) Create the additional disk image for the node.

Each node requires two disks: a snapshot of the base Nexus Dashboard `qcow2` image and a second 500GB disk.

```
# qemu-img create -f qcow2 /home/nd-node1/nd-node1-disk2.qcow2 500G
```

Step 4

Repeat the previous step to create the disk images for the second and third nodes.

Before you proceed to the next step, you should have the following:

- For the first node, `/home/nd-node1/` directory with two disk images:
 - `/home/nd-node1/nd-node1-disk1.qcow2`, which is a snapshot of the base `qcow2` image you downloaded in Step 1.
 - `/home/nd-node1/nd-node1-disk2.qcow2`, which is a new 500GB disk you created.
- For the second node, `/home/nd-node2/` directory with two disk images:
 - `/home/nd-node2/nd-node2-disk1.qcow2`, which is a snapshot of the base `qcow2` image you downloaded in Step 1.
 - `/home/nd-node2/nd-node2-disk2.qcow2`, which is a new 500GB disk you created.
- For the third node, `/home/nd-node3/` directory with two disk images:
 - `/home/nd-node3/nd-node3-disk1.qcow2`, which is a snapshot of the base `qcow2` image you downloaded in Step 1.
 - `/home/nd-node3/nd-node3-disk2.qcow2`, which is a new 500GB disk you created.

Step 5

Create the first node's VM.

a) Open the KVM console and click **New Virtual Machine**.

You can open the KVM console from the command line using the `virt-manager` command.

b) In the **New VM** screen, choose **Import existing disk image option** and click **Forward**.

c) In the **Provide existing storage path** field, click **Browse** and select the `nd-node1-disk1.qcow2` file.

We recommend that each node's disk image is stored on its own disk partition.

d) Choose `Generic` for the **OS type** and **Version**, then click **Forward**.

e) Specify 64GB memory and 16 CPUs, then click **Forward**.

f) Enter the **Name** of the virtual machine, for example `nd-node1` and check the **Customize configuration before install** option. Then click **Finish**.

Note You must select the **Customize configuration before install** checkbox to be able to make the disk and network card customizations required for the node.

The VM details window will open.

In the VM details window, change the NIC's device model:

- Select **NIC <mac>**.
- For **Device model**, choose `e1000`.
- For **Network Source**, choose the bridge device and provide the name of the "mgmt" bridge.

In the VM details window, add a second NIC:

- Click **Add Hardware**.
- In the **Add New Virtual Hardware** screen, select **Network**.
- For **Network Source**, choose the bridge device and provide the name of the created "data" bridge.
- Leave the default **Mac address** value.
- For **Device model**, choose `e1000`.

In the VM details window, add the second disk image:

- Click **Add Hardware**.
- In the **Add New Virtual Hardware** screen, select **Storage**.
- Select **Select or create custom storage**, click **Manage**, and select the `nd-node1-disk2.qcow2` file you created.
- Click **Finish** to add the second disk.

Finally, click **Begin Installation** to finish creating the node's VM.

Step 6

Repeat the previous step to create the VMs for the second and third nodes, then start all VMs.

Step 7

Open one of the node's console and configure the node's basic information.

- Press any key to begin initial setup.

You will be prompted to run the first-time setup utility:

```
[ OK ] Started atomix-boot-setup.
      Starting Initial cloud-init job (pre-networking)...
      Starting logrotate...
      Starting logwatch...
      Starting keyhole...
[ OK ] Started keyhole.
[ OK ] Started logrotate.
[ OK ] Started logwatch.
```

Press any key to run first-boot setup on this console...

- Enter and confirm the `admin` password

This password will be used for the `rescue-user` SSH login as well as the initial GUI password.

```
Admin Password:
Reenter Admin Password:
```

- Enter the management network information.

```
Management Network:
  IP Address/Mask: 192.168.9.172/24
  Gateway: 192.168.9.1
```

- For the first node only, designate it as the "Cluster Leader".

You will log into the cluster leader node to finish configuration and complete cluster creation.

```
Is cluster leader?: y
```

- e) Review and confirm the entered information.

You will be asked if you want to change the entered information. If all the fields are correct, choose `n` to proceed. If you want to change any of the entered information, enter `y` to re-start the basic configuration script.

```
Please review the config
Management network:
  Gateway: 192.168.9.1
  IP Address/Mask: 192.168.9.172/24
Cluster leader: yes

Re-enter config? (y/N): n
```

Step 8 Repeat previous step to configure the initial information for the second and third nodes.

You do not need to wait for the first node configuration to complete, you can begin configuring the other two nodes simultaneously.

Note The steps to deploy the second and third nodes are identical with the only exception being that you must indicate that they are not the **Cluster Leader**.

Step 9 Wait for the initial bootstrap process to complete on all nodes.

After you provide and confirm management network information, the initial setup on the first node (`Cluster Leader`) configures the networking and brings up the UI, which you will use to add two other nodes and complete the cluster deployment.

```
Please wait for system to boot: [#####] 100%
System up, please wait for UI to be online.
```

```
System UI online, please login to https://192.168.9.172 to continue.
```

Step 10 Open your browser and navigate to `https://<node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Begin Setup**

Step 11 Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.
- b) Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- c) Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- d) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you enter the IP address, click the green checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 12

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
b) In the **Password** field, enter the password for this node and click **Validate**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- c) Provide the node's **Name**.
d) Provide the node's **Data Network** information.

The **Management Network** information is already pre-populated with the information you provided for the first node.

You must provide the data network IP address/netmask (for example, `172.31.140.58/24`) and gateway (for example, `172.31.140.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- e) (Optional) Provide IPv6 addresses for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do that now during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- f) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature required by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in detail in the "Persistent IP Addresses" sections of the *Nexus Dashboard User's Guide*.

Note You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- g) Click **Save** to save the changes.

Step 13

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

The **Node Details** window opens.

- a) In the **Deployment Details** section, provide the node's **Management IP Address** and **Password** for the `rescue-user` you configured when deploying the node's VM, then click **Verify**.

This will auto-populate the **Serial Number** and **Management Network** information for the node.

- b) Provide the node's **Name**.
- c) Provide the node's **Data Network IP** address and gateway.

The **Management Network** information will be pre-populated with the information pulled from the node based on the management IP address and credentials you provided in the previous sub-step.

You must provide the data network IP address/netmask (for example, `172.31.141.58/24`) and gateway (for example, `172.31.141.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- d) (Optional) Provide IPv6 information for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do it during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.
- f) Click **Save** to save the changes.

Step 14 Repeat the previous step to add the 3rd node.

Step 15 In the **Node Details** screen, click **Next** to continue.

After you've provided the information for all 3 nodes in the cluster, continue to the next screen of the bootstrap process.

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the User Interface.

General

Serial Number	Name	Management Network	Data Network		
EA986C528737	node-ova-app1	IPv4/mask: 172.31.140.46/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.58/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️
B734BC2033AD	node-ova-app2	IPv4/mask: 172.31.140.60/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.68/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️
AED5046A16E2	node-ova-app3	IPv4/mask: 172.31.140.70/24 IPv4 Gateway: 172.31.140.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: 172.31.141.72/24 IPv4 Gateway: 172.31.141.1 IPv6/mask: - IPv6 Gateway: - VLAN: -	/	🗑️

Previous Next

Step 16 In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 17 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health  
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

CHAPTER 6

Deploying in Amazon Web Services

- [Prerequisites and Guidelines, on page 79](#)
- [Deploying Nexus Dashboard in AWS, on page 81](#)

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster in Amazon Web Services (AWS), you must:

- Ensure that the AWS form factor supports your scale and services requirements.

Scale and services support and co-hosting vary based on the cluster form factor. You can use the [Nexus Dashboard Capacity Planning](#) tool to verify that the cloud form factor satisfies your deployment requirements.

- Review and complete the general prerequisites described in the [Deployment Overview, on page 3](#).
- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- Have appropriate access privileges for your AWS account.

You must be able to launch multiple instances of Elastic Compute Cloud (`m5.2xlarge`) to host the Nexus Dashboard cluster.

- Have at least 6 AWS Elastic IP addresses.

A typical Nexus Dashboard deployment consists of 3 nodes with each node requiring 2 AWS Elastic IP addresses for the management and data networks.

By default, your AWS account has lower elastic IP limit, so you may need to request an increase. To request IP limit increase:

1. In your AWS console, navigate to **Computer** > **EC2**.
2. In the EC2 Dashboard, click **Network & Security** > **Elastic IPs** and note how many Elastic IPs are already being used.
3. In the EC2 Dashboard, click **Limits** and note the maximum number of **EC2-VPC Elastic IPs** allowed. Subtract the number of IPs already being used from the limit to get. Then if necessary, click **Request limit increase** to request additional Elastic IPs.

- Create a Virtual Private Cloud (VPC).

A VPC is an isolated portion of the AWS cloud for AWS objects, such as Amazon EC2 instances. To create a VPC:

1. In your AWS console, navigate to **Networking & Content Delivery Tools > VPC**.
2. In the VPC Dashboard, click **Your VPCs** and choose **Create VPC**. Then provide the **Name Tag** and **IPv4 CIDR block**.

The CIDR block is a range of IPv4 addresses for your VPC and must be in the /16 to /24 range. For example, 10.9.0.0/16.

- Create an Internet Gateway and attach it to the VPC.

Internet Gateway is a virtual router that allows a VPC to connect to the Internet. To create an Internet Gateway:

- In the VPC Dashboard, click **Internet Gateways** and choose **Create internet gateway**. Then provide the **Name Tag**.
- In the **Internet Gateways** screen, select the Internet Gateway you created, then choose **Actions > Attach to VPC**. Finally, from the **Available VPCs** dropdown, select the VPC you created and click **Attach internet gateway**.

- Create a routes table.

Routes table is used for connecting the subnets within your VPC and Internet Gateway to your Nexus Dashboard cluster. To create a routes table:

- In the VPC Dashboard, click **Route Tables**, choose the **Routes** tab, and click **Edit routes**.
- In the **Edit routes** screen, click **Add route** and create a 0.0.0.0/0 destination. From the **Target** dropdown, select `Internet Gateway` and choose the gateway you created. Finally, click **Save routes**.

- Create a key pair.

A key pair consists of a private key and a public key, which are used as security credentials to verify your identity when connecting to an EC2 instance. To create a key pair:

- Navigate to **All services > Compute > EC2**.
- In the EC2 Dashboard, click **Network & Security > Key Pairs**. Then click **Create Key Pairs**.
- Provide a name for your key pair, select the **pem** file format, and click **Create key pair**.

This will download the `.pem` private key file to your system. Move the file to a safe location, you will need to use it the first time you log in to an EC2 instance's console.

Note By default only PEM-based login is enabled for each node. To be able to SSH into the nodes using a password, as required by the GUI setup wizard, you will need to explicitly enable password-based logins by logging in to each node using the generated key and running the required command as described in the setup section below.

Deploying Nexus Dashboard in AWS

This section describes how to deploy Cisco Nexus Dashboard cluster in Amazon Web Services (AWS).

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines](#), on page 79.

Step 1

Subscribe to Cisco Nexus Dashboard product in AWS Marketplace.

- a) Log into your AWS account and navigate to the AWS Management Console
The Management Console is available at <https://console.aws.amazon.com/>.
- b) Navigate to **Services > AWS Marketplace Subscriptions**.
- c) Click **Manage Subscriptions**.
- d) Click **Discover products**.
- e) Search for **Cisco Nexus Dashboard** and click the result.
- f) In the product page, click **Continue to Subscribe**.
- g) Click **Accept Terms**.

It may take a couple of minutes for the subscription to be processed.

- h) Finally click **Continue to Configuration**.

Step 2

Select software options and region.

- a) From the **Delivery Method** dropdown, select `Cisco Nexus Dashboard for Cloud`.
- b) From the **Software Version** dropdown, select the version you want to deploy.
- c) From the **Region** dropdown, select the regions where the template will be deployed.

This must be the same region where you created your VPC.

- d) Click **Continue to Launch**.

The product page appears, which shows a summary of your configuration and enables you to launch the cloud formation template.

Step 3

From the **Choose Action**, select `Launch CloudFormation` and click **Launch**.

The **Create stack** page appears.

Step 4

Create stack.

- a) In the **Prerequisite - Prepare template** area, select `Template is ready`.
- b) In the **Specify Template** area, select `Amazon S3 URL` for the template source.

The template will be populated automatically.

- c) Click **Next** to continue.

The **Specify stack details** page appears.

Step 5

Specify stack details.

- a) Provide the **Stack name**.
- b) From the **VPC identifier** dropdown, select the VPC you created.
For example, `vpc-038f83026b6a48e98 (10.176.176.0/24)`.
- c) In the **ND cluster Subnet block**, provide the VPC subnet CIDR block.
Choose a subnet from the VPC CIDR that you defined. You can provide a smaller subnet or use the whole CIDR. The CIDR can be a /24 or /25 subnet and will be segmented to be used across the availability zones.
For example, `10.176.176.0/24`.
- d) From the **Availability Zones** dropdown, select one or more available zones.
We recommend you choose 3 availability zones. For regions that support only 2 availability zones, 2nd and 3rd nodes of the cluster will launch in the second availability zone.
- e) From the **Number of Availability Zones** dropdown, select the number of zones you added in the previous substep.
Ensure that the number matches the number of availability zones you selected in the previous substep.
- f) Enable **Data Interface EIP support**.
This field enables external connectivity for the node. External connectivity is required for communication with Cisco ACI fabrics outside AWS.
- g) In the **Password** and **Confirm Password** fields, provide the password.
This password will be used for the Nexus Dashboard's `rescue-user` login, as well as the initial password for the GUI's `admin` user.
Note You must provide the same password for all nodes or the cluster creation will fail.
- h) From the **SSH key pair** dropdown, select the key pair you created.
- i) In the **Access control** field, provide the external network allowed to access the cluster.
For example, `0.0.0.0/0` to be able to access the cluster from anywhere.
- j) Click **Next** to continue.

Step 6 In the **Advanced options** screen, simply click **Next**.

Step 7 In the **Review** screen, verify template configuration and click **Create stack**.

Step 8 Wait for the deployment to complete, then start the VMs.

You can view the status of the instance deployment in the **CloudFormation** page, for example `CREATE_IN_PROGRESS`. You can click the refresh button in the top right corner of the page to update the status.

When the status changes to `CREATE_COMPLETE`, you can proceed to the next step.

The screenshot shows the AWS CloudFormation console for the stack 'NDwestus2'. The stack is in the 'CREATE_COMPLETE' state. The 'Events' tab is selected, showing a list of events with the following data:

Timestamp	Logical ID	Status	Status reason
2021-04-14 17:09:30 UTC-0700	NDwestus2	CREATE_COMPLETE	-
2021-04-14 17:09:27 UTC-0700	NDNode3	CREATE_COMPLETE	-
2021-04-14 17:09:27 UTC-0700	NDNode1	CREATE_COMPLETE	-

Step 9 Note down all nodes' public IP addresses.

- After all instances are deployed, navigate to the AWS console's **EC2 > Instances** page.
- Note down which node is labeled as `FirstMaster`.
You will use this node's public IP address to complete cluster configuration.
- Note down all nodes' public IP addresses.
You will provide this information to the GUI bootstrap wizard in the following steps.

Step 10 Enable password-based login on all nodes.

By default only PEM-based login is enabled for each node. To be able to SSH into the nodes using a password, as required by the GUI setup wizard, you will need to explicitly enable password-based logins.

Note You must enable password-based login on all nodes before proceeding to cluster bootstrap described in the following steps or you will not be able to complete the cluster configuration.

- SSH into one of the instances using its public IP address and the PEM file.
Use the PEM file you created for this as part of [Prerequisites and Guidelines, on page 79](#).

```
# ssh -i <pem-file-name>.pem rescue-user@<node-public-ip>
```

- Enable password-based login.
On each node, run the following command:

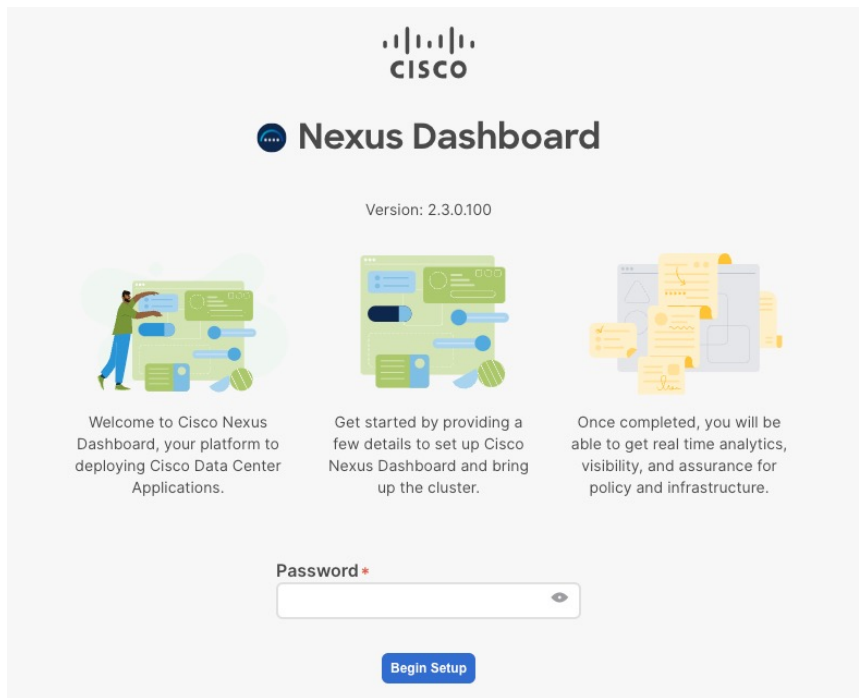

```
# acs login-prompt enable
```
- Repeat this step for the other two instances.

Step 11 Open your browser and navigate to `https://<first-node-public-ip>` to open the GUI.

Note You must use the public IP address of the first node (`FirstMaster`) or cluster configuration cannot be completed.

The rest of the configuration workflow takes place from the first node's GUI. You do not need to log in to or configure the other two nodes directly.

Enter the password you provided during template deployment and click **Begin Setup**

Step 12 Enter the password you provided for the first node and click **Begin Setup**.

Step 13 Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.
- b) Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- c) Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- d) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.
After you enter the IP address, click the green checkmark icon to save it.
- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 14 In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
- b) Provide the node's **Name**.

The **Management Network** and **Data Network** information will be already populated from the VPC subnet you have configured before deploying the cluster.

The cluster creates six subnets from the given VPC CIDR, from which the data and management networks will be allocated for the cluster's three nodes.

- c) Leave IPv6 addresses and VLAN fields blank.
Cloud Nexus Dashboard clusters do not support these options.
- d) Click **Save** to save the changes.

Step 15 Click **Add Node** to add the second node to the cluster.

The **Node Details** window opens.

- a) Provide the node's **Name**.
- b) In the **Credentials** section, provide the node's **Public IP Address** and the password you provided during template deployment, then click **Verify**.

The IP address and password are used to pull that node's **Management Network** and **Data Network** information, which will be populated in the fields below.

- c) Click **Save** to save the changes.

Step 16 Repeat the previous step to add the 3rd node.

Step 17 Click **Next** to continue.

Step 18 In the **Confirmation** screen, review the entered information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 19 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

- a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress

$ acs health
k8s services not in desired state - [...]

$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 20

Update the nodes' security group with required ports.

This step describes how to update the Nexus Dashboard nodes' instances with the required port configuration for on-boarding Cisco NDFC sites. If you do not plan on on-boarding any NDFC sites to your Nexus Dashboard cluster, you can skip this step.

Navigate to one of the nodes' data interface:

The screenshot shows the AWS Management Console interface. On the left, the navigation pane is expanded to 'Instances'. The 'Instances' link is circled in blue with the letter 'a'. In the main content area, a table of instances is displayed. The instance 'ND1-FirstMaster' is selected, and its details are shown below. A modal window for 'Network interface eth1' is open, showing details for the interface 'eni-0dcd5791b3f445dd01', which is circled in blue with the letter 'd'. A blue circle 'c' is positioned over the 'Network interfaces' section in the instance details pane. A blue circle 'b' is positioned over the 'ND1-FirstMaster' instance in the table.

- a) In the AWS console, navigate to **Instances**.
- b) Select one of the Nexus Dashboard instances.

You will make changes to the default security group, so you only need to select one of the nodes.

- c) Click the data interface (`eth1`).
- d) Click the **Interface ID**.

The **Network Interface** properties page opens.

- e) In the **Network Interface** page, click `default` in the **Security groups** column of the interface.

Add the new rules:

- a) In the default security group's page, select the **Inbound rules** tab.
- b) Click **Edit inbound rules**.
- c) In the **Edit inbound rules** page, click **Add rule** to add a new inbound security rule, then provide the details to allow inbound communication on port 443.

Provide the following information for the new rule:

- For **Type**, select `Custom TCP`.
- For **Port range**, enter `443`.

- For **Source**, provide the IP addresses of the NDFC controllers which you plan to onboard to your Nexus Dashboard.
- d) Still in the **Edit inbound rules** page, click **Add rule** to add another inbound security rule, then provide the details to allow inbound communication on port 9092.

Provide the following information for the new rule:

- For **Type**, select `Custom TCP`.
 - For **Port range**, enter `9092`.
 - For **Source**, provide the IP addresses of the NDFC controllers which you plan to onboard to your Nexus Dashboard.
-

CHAPTER 7

Deploying in Microsoft Azure

- [Prerequisites and Guidelines, on page 89](#)
- [Deploying Nexus Dashboard in Azure, on page 93](#)

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster in Microsoft Azure, you must:

- Ensure that the Azure form factor supports your scale and services requirements.
Scale and services support and co-hosting vary based on the cluster form factor. You can use the [Nexus Dashboard Capacity Planning](#) tool to verify that the cloud form factor satisfies your deployment requirements.
- Review and complete the general prerequisites described in the [Deployment Overview, on page 3](#).
- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- Have appropriate access privileges for your Azure account and subscription.
- Have created a resource group for your Nexus Dashboard cluster resources.

Note The resource group must be empty and not contain any existing objects. Resource groups with existing objects cannot be used for Nexus Dashboard deployment.

To create a resource group:

- In the Azure portal, navigate to **All Resources > Resource Groups**.
 - Click **+Add** to create a new resource group.
 - In the **Create a resource group** screen, provide the name of the subscription you will use for your Nexus Dashboard cluster, the name for the resource group (for example, `nd-cluster`), and the region.
- Create an SSH key pair.

A key pair consists of a private key and a public key, you will be asked to provide the public key when creating the Nexus Dashboard nodes.

Note You will need to use the same machine where you create the public key for a one-time login into each node to enable general SSH login during cluster deployment procedure.

Creating SSH keys is described in [Generating an SSH Key Pair in Linux or MacOS, on page 90](#) and [Generating an SSH Key Pair in Windows, on page 91](#) sections below.

Generating an SSH Key Pair in Linux or MacOS

These procedures describe how to generate an SSH public and private key pair in Linux or MacOS. For instructions on generate an SSH public and private key pair in Windows, see [Generating an SSH Key Pair in Windows, on page 91](#).

Step 1 On your Linux virtual machine or Mac, create a public and private key pair using `ssh-keygen`, directing the output to a file.

```
# ssh-keygen -f filename
```

For example:

```
# ssh-keygen -f azure_key
```

Output similar to the following appears. Press the Enter key without entering any text when you are asked to enter a passphrase (leave the field empty so that there is no passphrase).

```
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in azure_key.
Your public key has been saved in azure_key.pub.
The key fingerprint is:
SHA256:gTsQIIAadjgNsgcguifIloh4XGpVWMdcXV6U0dyBNs
...
```

Step 2 Locate the public and private key files that you saved.

```
# ls
```

Two files should be displayed, where:

- The file with the `.pub` suffix contains the public key information
- The file with the same name, but with no suffix, contains the private key information

For example, if you directed the output to a file named `azure_key`, you should see the following output:

```
# ls
azure_key
azure_key.pub
```

In this case:

- The `azure_key.pub` file contains the public key information

- The `azure_key` file contains the private key information

Step 3 Open the public key file and copy the public key information from that file, without the `username@hostname` information at the end.

Note The private key file is not used in the installation process. However, you might need it for other reasons, such as logging into your Nexus Dashboard nodes through SSH.

Generating an SSH Key Pair in Windows

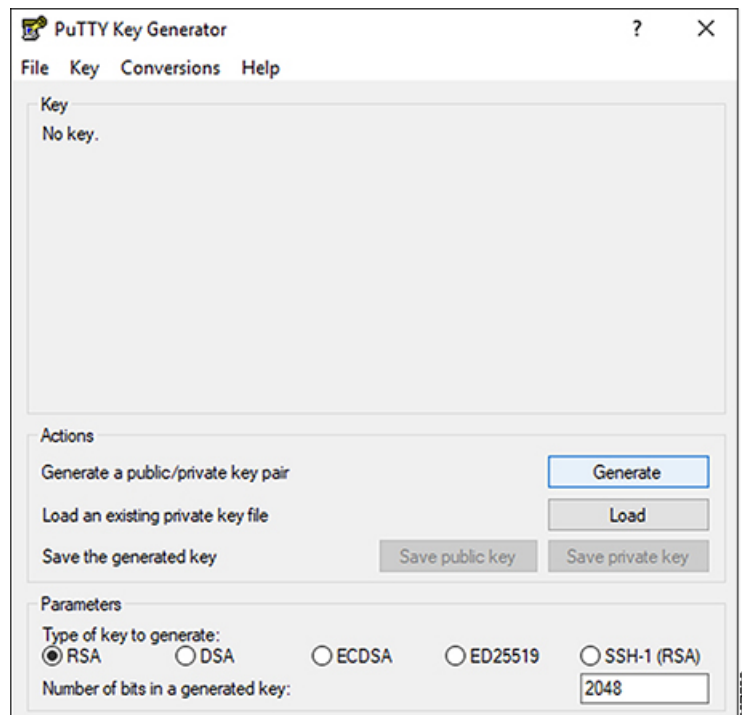

These procedures describe how to generate an SSH public and private key pair in Windows. For instructions on generate an SSH public and private key pair in Linux, see [Generating an SSH Key Pair in Linux or MacOS, on page 90](#).

Step 1 Download and install the PuTTY Key Generator (`puttygen`):

<https://www.puttygen.com/download-putty>

Step 2 Run the PuTTY Key Generator by navigating to **Windows** > **Start Menu** > **All Programs** > **PuTTY** > **PuTTYgen**.

You will see a window for the PuTTY Key Generator on your screen.

Step 3 Click **Generate**.

A screen appears, asking you to move the mouse over the blank area to generate a public key.

Step 4 Move your cursor around the blank area to generate random characters for a public key.

Step 5 Save the public key.

- Navigate to a folder on your laptop where you want to save the public key file and create a text file for this public key.
- Copy the information in the PuTTY Key Generator.

Copy the public key information in the window, with these inclusions and exclusions:

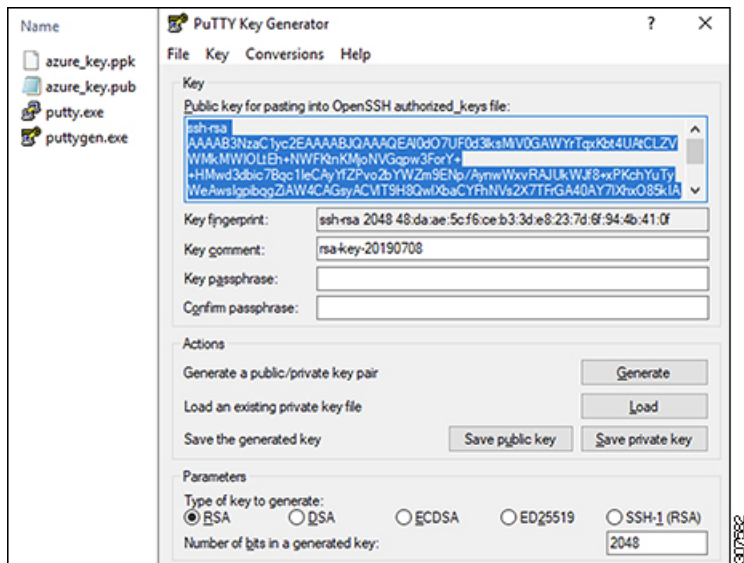

- Including the **ssh-rsa** text at the beginning of the public key.
- Excluding the following text string at the end:

```
== rsa-key-<date-stamp>
```

Truncate the key so that it does not include the **== rsa-key-<date-stamp>** text string at the end.

Note In the next set of procedures, you will paste the public key information into the Azure ARM template. If the form does not accept the key in this format, add **==** back to the end of the key, as this format is required in some regions.

If the key is not in the correct format, the Nexus Dashboard will not complete its installation.

- c) Paste the information in the public key text file that you created in [5.a, on page 92](#) and save the file, giving it a unique file name.

This public key text file will now contain a key that is on a single line of text. You will need the information in this public key text file in the next set of procedures.

Note Do not save the public key using the **Save public key** option in the PuTTY Key Generator. Doing so saves the key in a format that has multiple lines of text, which is not compatible with the Nexus Dashboard deployment process.

Step 6 Save the private key.

- a) Click **Save private key**.

A screen appears, asking if you want to save the file without a passphrase. Click **Yes** on this screen.

- b) Navigate to a folder on your laptop and save the private key file, giving it a unique file name.

Note The private key file is not used in the installation process. However, you might need it for other reasons, such as logging into your Nexus Dashboard nodes through SSH.

Deploying Nexus Dashboard in Azure

This section describes how to deploy Cisco Nexus Dashboard cluster in Microsoft Azure.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 89](#).

-
- Step 1** Subscribe to Cisco Nexus Dashboard product in Azure Marketplace.
- Log into your Azure account and browse to <https://azuremarketplace.microsoft.com>
 - In the search field, type `Cisco Nexus Dashboard` and select the option that is presented.
You will be re-directed to the Nexus Dashboard Azure Marketplace page.
 - Click **Get it now**.
 - In the **Select a plan** dropdown, select the version and click **Create**.
- Step 2** Provide **Basic** information.
- From the **Subscription** dropdown, select the subscription you want to use for this.
 - From the **Resource group** dropdown, select the resource group you created for this as part of [Prerequisites and Guidelines, on page 89](#).
 - From the **Region** dropdown, select the region where the template will be deployed.
 - In the **Password** and **Confirm Password** fields, provide the admin password for the nodes.
This password will be used for the Nexus Dashboard's `rescue-user` login, as well as the initial password for the GUI's `admin` user.
Note You must provide the same password for all nodes or the cluster creation will fail.
 - In the **SSH public key** field, paste the public key from the key pair you generated as part of the [Prerequisites and Guidelines, on page 89](#) section.
 - Click **Next** to proceed to the next screen.
- Step 3** Provide **ND Settings** information.
- Provide the **Cluster Name**.
 - In the **Image Version** dropdown, verify that the correct version is selected.
 - In the **Virtual Network Name** field, provide the name for a VNET that will be created for your cluster.
The VNET must not already exist and will be created for you during deployment. If you provide an already existing VNET, the deployment cannot proceed.
 - In the **Subnet Address Prefix** field, provide a subnet within the VNET.
The subnet must be a /24 subnet and it must be different from the default VNET subnet you defined when creating the VNET.
 - In the **External Subnets** field, provide the external network allowed to access the cluster.
For example, `0.0.0.0/0` to be able to access the cluster from anywhere.
 - Click **Next** to proceed to the next screen.
- Step 4** In the **Review + create** page, review information and click **Create** to deploy the cluster.
- Step 5** Wait for the deployment to complete, then start the VMs.
- Step 6** Note down all nodes' public IP addresses.
After all instances are deployed, navigate to the Azure console, select each VM, and note down all nodes' public IP addresses. You will provide this information to the GUI bootstrap wizard in the following steps.
Also note which is the "first" node, which will be indicated by the node's VM name `vm-node1-<cluster-name>`. You will use this node's public IP address to complete cluster configuration.
- Step 7** Enable password-based login on all nodes.

By default only key-based login is enabled for each node. To be able to SSH into the nodes using a password, as required by the GUI setup wizard, you will need to explicitly enable password-based logins.

Note You must enable password-based login on all nodes before proceeding to cluster bootstrap described in the following steps or you will not be able to complete the cluster configuration.

a) SSH in to one of the nodes as `rescue-user`.

Note You must use the same machine as you used to create the public key for the deployment during the [Prerequisites and Guidelines, on page 89](#) section.

You can log in as `rescue-user` using the password you provided in template's **Basic** settings:

```
# ssh rescue-user@<node-public-ip>
```

b) Enable password-based login.

```
# acs login-prompt enable
```

c) Repeat this step for the other two nodes.

Step 8

Open your browser and navigate to `https://<first-node-public-ip>` to open the GUI.

Note You must use the public IP address of the first node (`vm-node1-<cluster-name>`) or cluster configuration cannot be completed.

The rest of the configuration workflow takes place from the first node's GUI. You do not need to log in to or configure the other two nodes directly.

Enter the password you provided during template deployment and click **Begin Setup**

Step 9

Enter the password you provided for the first node and click **Begin Setup**.

Step 10

Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.
- b) Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- c) Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- d) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- e) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to `Yes` and provide the login credentials.
- f) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you enter the IP address, click the green checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 11

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
- b) Provide the node's **Name**.

The **Management Network** and **Data Network** information will be already populated from the VNET subnet you have configured before deploying the cluster.

The cluster creates six subnets from the given VNET, from which the data and management networks will be allocated for the cluster's three nodes.

- c) Leave IPv6 addresses and VLAN fields blank.

Cloud Nexus Dashboard clusters do not support these options.

- d) Click **Save** to save the changes.

Step 12

Click **Add Node** to add the second node to the cluster.

The **Node Details** window opens.

- a) Provide the node's **Name**.
- b) In the **Credentials** section, provide the node's **Public IP Address** and the password you provided during template deployment, then click **Verify**.

The IP address and password are used to pull that node's **Management Network** and **Data Network** information, which will be populated in the fields below.

- c) Click **Save** to save the changes.

Step 13 Repeat the previous step to add the 3rd node.

Step 14 Click **Next** to continue.

Step 15 In the **Confirmation** screen, review the entered information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 16 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH and run the following command to verify cluster health:

- a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

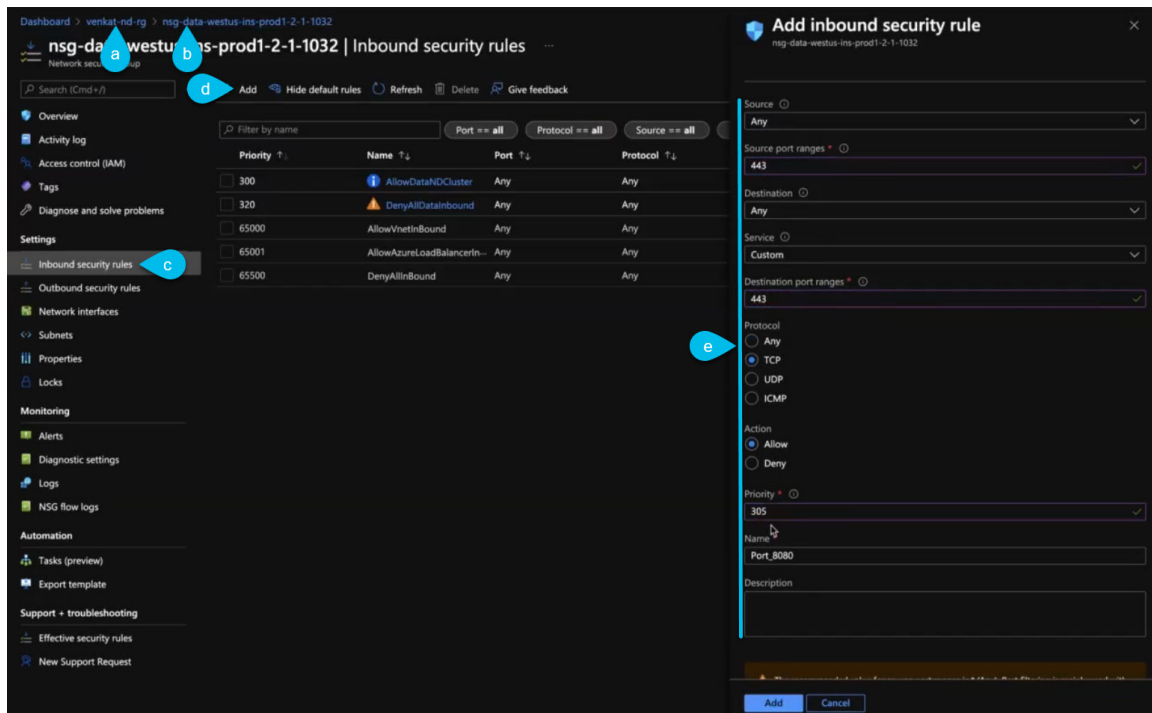

```
$ acs health
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 17 Update the nodes' security group with required ports.

This step describes how to update the Nexus Dashboard nodes' instances with the required port configuration for on-boarding Cisco NDFC sites. If you do not plan on on-boarding any NDFC sites to your Nexus Dashboard cluster, you can skip this step.

- a) In the Azure portal, navigate to the resource group where you deployed your Nexus Dashboard. This is the same resource group you selected in Step 2.
- b) Select the security group attached to the nodes' data interfaces. The name of the security group will begin with `nsg-data-<region>-...`
- c) In the security group's setting navigation bar, select **Inbound security rules**.
- d) Click **+Add** to add a new inbound security rule, then provide the details to allow inbound communication on port 443.

Provide the following information for the new rule:

- For **Source**, select `Any`.
 - For **Source port ranges**, enter 443.
 - For **Destination**, select `Any`.
 - For **Destination port ranges**, enter 443.
 - For **Protocol**, choose `TCP`.
 - For **Action**, choose `Allow`.
 - For **Priority**, choose a priority between 300 and 320. For example, 305.
 - Provide a **Name** for the rule.
- e) Click **+Add** to add a new inbound security rule, then provide the details to allow inbound communication on port 9092.

Repeat the previous substep to add another rule with the following details:

- For **Source**, select `Any`.
 - For **Source port ranges**, enter `9092`.
 - For **Destination**, select `Any`.
 - For **Destination port ranges**, enter `9092`.
 - For **Protocol**, choose `TCP`.
 - For **Action**, choose `Allow`.
 - For **Priority**, choose a priority between `300` and `320`.
For example, `310`.
 - Provide a **Name** for the rule.
-

CHAPTER 8

Deploying in Existing Red Hat Enterprise Linux Installation

- [Prerequisites and Guidelines](#), on page 101
- [Deploying Nexus Dashboard in Existing Red Hat Enterprise Linux Installation](#), on page 103
- [Uninstalling Nexus Dashboard Software](#), on page 110
- [Troubleshooting Nexus Dashboard Deployments in RHEL](#), on page 110

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster, you must:

- Review and complete the general prerequisites described in the [Deployment Overview](#), on page 3.
The guide is available from the Nexus Dashboard UI or online at [Cisco Nexus Dashboard User Guide](#)
- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- Ensure that your server is running Red Hat Enterprise Linux (RHEL) release 8.4 or 8.6.
This release of Nexus Dashboard support both physical and virtual deployments of RHEL.

Note For non-production deployments, such as labs or testing, you can deploy in other Linux distributions by passing an additional parameter to the installer in **Step 4** of the [Deploying Nexus Dashboard in Existing Red Hat Enterprise Linux Installation](#), on page 103 section:

```
./nd-installer setup ./examples/nd-linux-input.yaml  
skip-os-version-check
```

- You can deploy only a single-node or three-node (all `master` nodes) cluster in RHEL.
Adding `worker` or `standby` node is not supported for this cluster form factor.
- Clusters deployed in RHEL support only Nexus Dashboard Fabric Controller (NDFC), Release 12.1(1) or later service with **SAN Controller** deployment type.

You must deploy one of the other form factors if you want to run any other Nexus Dashboard services or another deployment type of NDFC. For more information about services supported one each Nexus Dashboard cluster form factor, see [Cisco Nexus Dashboard Cluster Sizing](#) and [Nexus Dashboard and Services Compatibility Matrix](#).

- Ensure that the following system-level requirements are satisfied:
 - An existing Linux user on each cluster node, which you will provide to the installer and which can be used to manage and troubleshoot the node.
Only one system user can connect to the Nexus Dashboard node's system. For more information, see [Troubleshooting Nexus Dashboard Deployments in RHEL, on page 110](#) after the deployment.
 - System clocks across all nodes must be synchronized.
You can use a system utility such as `chrony` to ensure proper time synchronization between the nodes.

Note By default, the Nexus Dashboard installer for RHEL verifies that the system clock is synchronized using `chrony`. If you use a different system to synchronize the clock, you can use `./nd-installer setup input.yaml skip-ntp-check` during installation to bypass the default verification.

- Skopeo package is installed.
Skopeo is outside the scope of this document, but in short you can use `yum install skopeo` command to install the package.
- Swap file is disabled.
You can disable swap by removing its entry from the `/etc/fstab` file and restarting the server.
- The `firewalld` and `libvirt` services are stopped and disabled.

Note The following additional system-level changes will be applied when you deploy Nexus Dashboard software to allow executables from additional directories and the cluster's own SSH server:

```
/usr/bin/chcon -R -t bin_t /mnt/atom
/usr/bin/chcon -R -t bin_t /mnt/linux
/usr/bin/chcon -R -t bin_t /opt/apic-sn

/usr/bin/chcon -t ssh_home_t -R /data/services/issh/ssh_host_rsa_key
/usr/bin/chcon -t ssh_home_t -R /data/services/issh/intssh
/usr/sbin/semanage port -a -t ssh_port_t -p tcp 1022
```

- Ensure you have enough system resources.

When deploying in RHEL, you can deploy two types of nodes:

Table 18: Deployment Requirements

Nexus Dashboard Version	Default Node Profile	Large Node Profile
Release 2.3.x	<ul style="list-style-type: none"> • 16 vCPUs • 64 GB of RAM • 500GB SSD storage for the data volume and an additional 100GB for the system volume. <p>All nodes must be deployed on SSD or faster storage.</p> <ul style="list-style-type: none"> • Two network interfaces in addition to the RHEL's management interface. 	<ul style="list-style-type: none"> • 32 vCPUs • 128 GB of RAM • 3TB SSD storage for the data volume and an additional 100GB for the system volume. <p>The data volume may be a combination of multiple drives (such as in RAID configuration) as long as the drive is presented as a single device to the operating system.</p> <p>All nodes must be deployed on SSD or faster storage.</p> <ul style="list-style-type: none"> • Two network interfaces in addition to the RHEL's management interface.

Deploying Nexus Dashboard in Existing Red Hat Enterprise Linux Installation

This section describes how to configure and bring up a Nexus Dashboard cluster in RHEL.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 101](#).

Step 1

Obtain the Cisco Nexus Dashboard software archive package (tarball).

- Browse to the Software Download page.

<https://www.cisco.com/c/en/us/support/data-center-analytics/nexus-dashboard/series.html>

- Click the **Downloads** tab.
- Choose the Nexus Dashboard release version you want to download.
- Click the **Download** icon next to the Nexus Dashboard tarball (`nd-rhel-<version>.tar`).

Step 2

Extract the downloaded archive.

```
tar -xvf nd-rhel-<version>.tar
```

Step 3 Modify the installation `yaml` file.

The distribution tarball includes a sample YAML file (`./nd-linux/examples/nd-linux-input.yaml`), which you can modify to provide the values appropriate to your deployment.

For example, the following sample node configuration YAML file highlights the specific fields which you must provide:

- For `blkdev`, provide the SSD devices for the node's image and data volumes.

You must provide two devices, one for the image and one for the data. The order of the devices in the YAML file does not matter—the smaller disk will be used for image and the larger disk will be used for data.

Note Both devices will be erased and consumed for the Nexus Dashboard node.

For more information on the node device requirements, see [Prerequisites and Guidelines, on page 101](#).

- For `oobNetwork`, provide the management network information:
 - For `uplinks`, provide the names of the network interfaces which will be used for the cluster's Management and Data networks.

These interfaces must be dedicated exclusively to the Nexus Dashboard.
 - For `ipNet`, provide the node's management network IPv4 address and netmask in the `172.23.152.214/24` format.
 - For `gatewayIP`, provide the node's management network IPv4 gateway.
 - For `ipv6Net`, provide the node's management network IPv6 address and netmask in the `2001:420:286:2000:6:15:152:220/112` format.

You can leave this parameter out if you are not configuring dual stack IPv4/IPv6 for your cluster.
 - For `gatewayIPv6`, provide the node's management network IPv6 gateway.

You can leave this parameter out if you are not configuring dual stack IPv4/IPv6 for your cluster.
- For `inbandNetwork`, you must provide only the interface(s) in the `uplinks` section as the rest of the configuration is defined during the GUI bootstrap process.
- For `firstMaster`, ensure that only one of the node is set to `true` and the other 2 nodes are set to `false`.

You will use the `firstMaster` node to complete the cluster bootstrap process using the GUI.
- For `clusterName`, provide the name of the cluster.
- For `installProfile`, choose either `Default` or `Large`.

For more information on the node profile requirements, see [Prerequisites and Guidelines, on page 101](#).
- For `serviceUser`, provide an existing Linux account name which will be used for managing and troubleshooting the Nexus Dashboard node.

Note The `serviceUser` must be different from the system's `root` user.

```
# Node Definition
# 'Master' / 'Worker' / 'Standby'. Only Master supported in 2.2
nodeRole: Master

# Block devices. Can be complete device or partition. Should meet profile requirements.
blkdev:
```

```

- type: SSD
  name: "/dev/sdb"
- type: SSD
  name: "/dev/sdc"

# Networking
# ND needs exclusively 2 interfaces. Has to be separate from the linux management interface.
oobNetwork:
  uplinks:
    - ens924
  ipNet: 172.23.152.214/24
  gatewayIP: 172.23.152.1
  ipv6Net: 2001:420:286:2000:6:15:152:220/112
  gatewayIPv6: 2001:420:286:2000:6:15:152:1

# Just the interface for the inbandNetwork, rest can be provided at ND bootstrap UI
inbandNetwork:
  uplinks:
    - ens956

# 'true' for one of the masters in a cluster
firstMaster: true

clusterName: nd-cluster

#Installation Profile. Default / Large. Large is used for NDFC SAN installations
installProfile: Default

#Linux username. Cannot be root. Only this user will have privileges to execute certain ND diag
commands.
serviceUser: nduser

```

Step 4 Install Nexus Dashboard node software.

```

cd nd-linux
./nd-installer setup ./examples/nd-linux-input.yaml

```

You will be asked to provide the password, which will be used for the Nexus Dashboard cluster `admin` account.

Note By default, the installer verifies that the system clock is synchronized using `chrony`. If you use a different system to synchronize the clock, you can use `./nd-installer setup ./examples/nd-linux-input.yaml skip-ntp-check` to bypass the default verification.

Step 5 Repeat the previous steps to deploy the 2nd and 3rd nodes.

If you are deploying a single-node cluster, you can skip this step.

You do not need to wait for the first node's installation to complete, you can begin deploying the other two nodes simultaneously.

Note When providing the node details in the configuration YAML file for the 2nd and 3rd nodes, ensure that `firstMaster` parameter is set to `false`.

Step 6 Wait for all three nodes to finish deploying.

Step 7 Open your browser and navigate to `https://<first-node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You must use the IP address you provided for the node which you designated as `firstMaster`.

Enter the password you provided in a previous step and click **Begin Setup**

Step 8 Provide the **Cluster Details**.

In the **Cluster Details** screen of the initial setup wizard, provide the following information:

- Provide the **Cluster Name** for this Nexus Dashboard cluster.
- Click **+Add NTP Host** to add one or more NTP servers.

You must provide an IP address, fully qualified domain name (FQDN) are not supported.

After you enter the IP address, click the green checkmark icon to save it.

- Click **+Add DNS Provider** to add one or more DNS servers.

After you enter the IP address, click the green checkmark icon to save it.

- Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity, which will allow you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

If you want to skip proxy configuration, click the information (i) icon next to the field, then click **Skip**.

- (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you enter the IP address, click the green checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

Application and Services networks are described in the [Prerequisites and Guidelines, on page 6](#) section earlier in this document.

- g) Click **Next** to continue.

Step 9

In the **Node Details** screen, provide the node's information.

- a) Click the **Edit** button next to the first node.
b) In the **Password** field, enter the password for this node and click **Validate**.

This will auto-populate the **Name**, **Serial Number**, and **Management Network** information for the node.

The hostname of the RHEL server where the node software is installed is used for the node's **Name**.

- c) Provide the node's **Data Network** information.

The **Management Network** information is already pre-populated with the information you provided for the first node.

You must provide the data network IP address/netmask (for example, `172.31.140.58/24`) and gateway (for example, `172.31.140.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- d) (Optional) Provide IPv6 addresses for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do that now during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature required by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in detail in the "Persistent IP Addresses" sections of the *Nexus Dashboard User's Guide*.

Note You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- f) Click **Save** to save the changes.

Step 10

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

The **Node Details** window opens.

- a) In the **Deployment Details** section, provide the node's **Management IP Address** and **Password**, then click **Verify**.

This is the password you provided to the `./nd-installer setup` command during installation in Step 4.

Verifying the IP and password will auto-populate the **Name**, **Serial Number**, and **Management Network** information for the node.

The hostname of the RHEL server where the node software is installed is used for the node's **Name**.

- b) Provide the node's **Name**.
- c) Provide the node's **Data Network** IP address and gateway.

The **Management Network** information will be pre-populated with the information pulled from the node based on the management IP address and credentials you provided in the previous sub-step.

You must provide the data network IP address/netmask (for example, `172.31.141.58/24`) and gateway (for example, `172.31.141.1`). Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

- d) (Optional) Provide IPv6 information for the management and data networks.

Nexus Dashboard supports either IPv4 or dual stack IPv4/IPv6 for the management and data networks.

Note If you want to provide IPv6 information, you must do it during cluster bootstrap process. If you deploy the cluster using only IPv4 stack and want to add IPv6 information later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4 or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.
- f) Click **Save** to save the changes.

Step 11 Repeat the previous step to add the 3rd node.

Step 12 In the **Node Details** screen, click **Next** to continue.

After you've provided the information for all 3 nodes in the cluster, continue to the next screen of the bootstrap process.

Cluster Details **Node Details** Confirmation

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the User Interface.

Site Site Site

Previous **Next**

Step 13

In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 14

Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH using the `serviceUser` you provided in the configuration YAML and run the following command to verify cluster health:

- After logging in to the Linux system, connect to the node using the `/usr/bin/attach-nd` command.

This command can be used only by the `serviceUser` user.

- Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

- c) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the password you provided to the `./nd-installer setup` command during installation in Step 4.

Uninstalling Nexus Dashboard Software

When the Nexus Dashboard node software is deployed, the uninstaller is copied into the `/usr/bin` directory.

If at any point you want to uninstall the software, simply run the following command as the `root` user:

```
/usr/bin/nd-installer uninstall
```

Note If you log in to the RHEL system using SSH, you must connect to the system's management IP address to uninstall; you must not use the Nexus Dashboard's management IP addresses.

This will remove the software and undo the file system changes done during the installation process.

Troubleshooting Nexus Dashboard Deployments in RHEL

This section describes common troubleshooting steps for Nexus Dashboard software deployed in RHEL.

Step 1 Check installation logs.

Nexus Dashboard installation logs are available in the following directory:

```
/logs/ndlinux/
```

Step 2 Access the Nexus Dashboard environment after installation.

- Log in to your RHEL system using the Nexus Dashboard user you provided in the YAML configuration file during installation.
- Access the Nexus Dashboard environment.

```
/usr/bin/attach-nd
```

- Use the common Nexus Dashboard troubleshooting commands.

After you access the Nexus Dashboard environment, you can use all the common Nexus Dashboard commands described in the "Troubleshooting" section of the *Cisco Nexus Dashboard User Guide*.

CHAPTER 9

Upgrading Nexus Dashboard

- [Prerequisites and Guidelines](#), on page 113
- [Upgrading Nexus Dashboard](#), on page 116

Prerequisites and Guidelines

Before you upgrade your existing Nexus Dashboard cluster:

- Ensure that you have read the target release's [Release Notes](#) for any changes in behavior, guidelines, and issues that may affect your upgrade.

The upgrade process is the same for all Nexus Dashboard form factors. However, if your existing cluster is deployed using physical servers, VMware ESX, Linux KVM, Azure, or AWS, you will use the target release's ISO image (`nd-dk9.<version>.iso`) to upgrade; if your existing cluster is deployed in Red Hat Enterprise Linux, you will use the RHEL-specific image (`nd-rhel-<version>.tar`).

- Ensure that you have read the [Release Notes](#) and upgrade guides for any services you run in the existing cluster and plan to run on the target release for service-specific changes in behavior, guidelines, and issues that may affect your upgrade.

You can find the service-specific documents at the following links:

- [Nexus Dashboard Fabric Controller Release Notes](#)
 - [Nexus Dashboard Fabric Controller Upgrade Guide](#)
 - [Nexus Dashboard Insights Release Notes](#)
 - [Nexus Dashboard Insights Upgrade Guide](#)
 - [Nexus Dashboard Orchestrator Release Notes](#)
 - [Nexus Dashboard Orchestrator Upgrade Guide](#)
- If you are upgrading a physical Nexus Dashboard cluster, ensure that the nodes have the minimum supported CIMC version for the target Nexus Dashboard release.

Supported CIMC versions are listed in the [Nexus Dashboard Release Notes](#) for the target release.

CIMC upgrade is described in detail in the "Troubleshooting" sections of the [Nexus Dashboard User Guide](#).

- You must perform configuration backups of your Nexus Dashboard and services before the upgrade to safeguard data and minimize any potential risk before proceeding with the upgrade.
- You must be running Nexus Dashboard release 2.1(2) or later to upgrade directly to release 2.3(x).

If you are running a version prior to the minimum required release, we recommend that you upgrade to release 2.2(2) as described in [Cisco Nexus Dashboard Deployment Guide, Release 2.2\(x\)](#) before upgrading to a 2.3(x) release.

Note Additional upgrade path and minimum version requirements may depend on the specific services you have installed in your cluster. Check the service-specific *Release Notes* and *Upgrade Guides* linked above for more information.

- You must disable all services running in the cluster before upgrading to a 2.3(x) release.
 - If you are upgrading Nexus Dashboard from one patch to another patch within the same release (for example, from 2.3.2b to 2.3.2d), simply re-enable the services after Nexus Dashboard upgrade is completed.
 - If you are upgrading Nexus Dashboard from one release to another release (for example, 2.3.1 to 2.3.2), your existing services may not be compatible with your target Nexus Dashboard release, in which case you must also upgrade the services after the platform upgrade is completed.

For a complete list of Nexus Dashboard and services interoperability support, see the [Nexus Dashboard and Services Compatibility Matrix](#) or the service-specific upgrade guides listed earlier in this section.

**Note**

- For Nexus Dashboard Fabric Controller, you must keep the service disabled after the cluster is upgraded until you upgrade the service as well.

After the Nexus Dashboard cluster is upgraded, you may see that the existing version of the service is listed with the `App Version not compatible. Upgrade required. warning`.

You **must not delete or re-enable** this version before uploading the Fabric Controller upgrade image. After you upload the new version, you must enable it and complete the service upgrade before you can delete the older release. Deleting the older service version before the new release is activated may cause the upgrade to fail.

- For Nexus Dashboard Insights, you must keep the service disabled after the cluster is upgraded until you upgrade the service as well.

After the Nexus Dashboard cluster is upgraded, you may see that the existing version of the service is listed with the `App Version not compatible. Upgrade required. warning`.

You **must not delete or re-enable** this version before uploading the Insights upgrade image. After you upload the new version, you must enable it and complete the service upgrade before you can delete the older release. Deleting the older service version before the new release is activated may cause the upgrade to fail.

- For Nexus Dashboard Orchestrator, you must re-enable the existing version of the service before uploading and activating the new version.

- You must have valid DNS and NTP servers configured and reachable by all cluster nodes.
- Ensure that your current Nexus Dashboard cluster is healthy.

You can check the system status on the **Overview** page of the Nexus Dashboard's **Admin Console** or by logging in to one of the nodes as `rescue-user` and ensuring that the `acs health` command returns `All components are healthy`.

- Ensure that no configuration changes are made to the cluster, such as adding worker or standby nodes, while the upgrade is in progress.
- Nexus Dashboard does not support platform downgrades.

If you want to downgrade to an earlier release, you will need to deploy a new cluster and reinstall the services.

Upgrading Nexus Dashboard

This section describes how to upgrade an existing Nexus Dashboard cluster.

Before you begin

- Ensure that you have completed the prerequisites described in [Prerequisites and Guidelines, on page 113](#)

Step 1

Download the Nexus Dashboard image.

- Browse to the Software Download page.

<https://software.cisco.com/download/home/286327743/type/286328258>

- Choose the Nexus Dashboard version you want to download.
- Download the Cisco Nexus Dashboard image for your target release.

Note

- If your Nexus Dashboard is deployed in Red Hat Enterprise Linux, you must download the `.tar` image (`nd-rhel-<version>.tar`) to perform the upgrade.

More information about RHEL deployments is available in [Deploying in Existing Red Hat Enterprise Linux Installation, on page 101](#).

- For all other form factors, you must download the `.iso` image (`nd-dk9.<version>.iso`) to perform the upgrade.

For example, even if you used the virtual form factors, such as the `.ova` image for deploying in VMware ESX, or a cloud provider's marketplace for initial cluster deployment, you must still use the `.iso` image for upgrades.

- (Optional) Host the image on a web server in your environment.

When you upload the image to your Nexus Dashboard cluster, you will have an option to provide a direct URL to the image.

Step 2

Log in to your current Nexus Dashboard GUI as an `Administrator` user and navigate to the **Admin Console**.

Step 3

Disable any existing services installed in the cluster.

Note

You must disable all services before you upgrade the cluster.

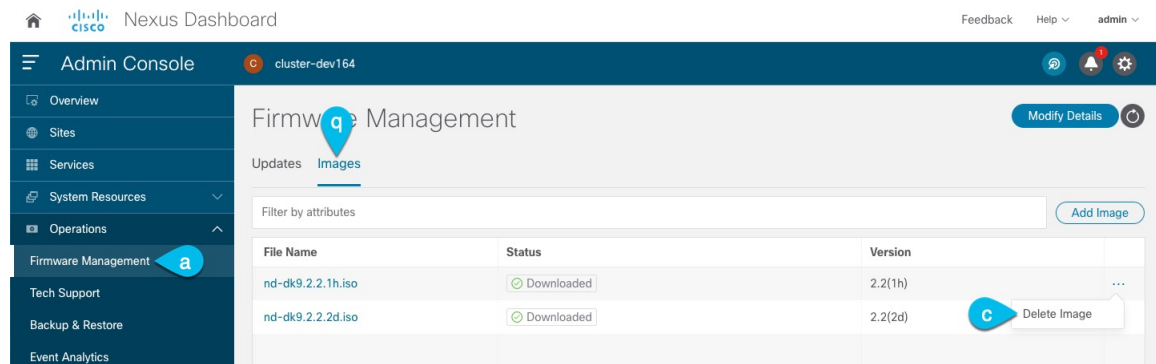

- From the main navigation menu, select **Services**.

- b) In the service's tile, click the **Actions (...)** menu and choose **Disable**.
- c) Repeat this step for all other services deployed in the cluster.

Step 4 Delete any existing upgrade images from your cluster.

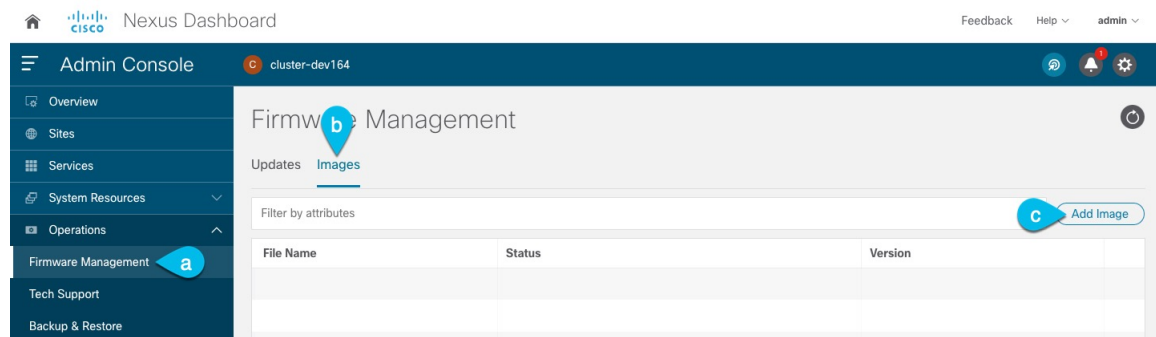

If this is the first time you're upgrading your cluster, you can skip this step.

If you had previously upgraded your cluster to your current version, you must delete the upgrade image used in the previous upgrades.

- a) Navigate to **Operations > Firmware Management**.
- b) Select the **Images** tab.
- c) From the actions menu (...) next to an existing upgrade image, choose **Delete Image**.
- d) Repeat this step for all existing upgrade images.

Step 5 Upload the new image to the cluster.

- a) Navigate to **Operations > Firmware Management**.
- b) Select the **Images** tab.
- c) Click **Add Image**.

Step 6 Select the new image.

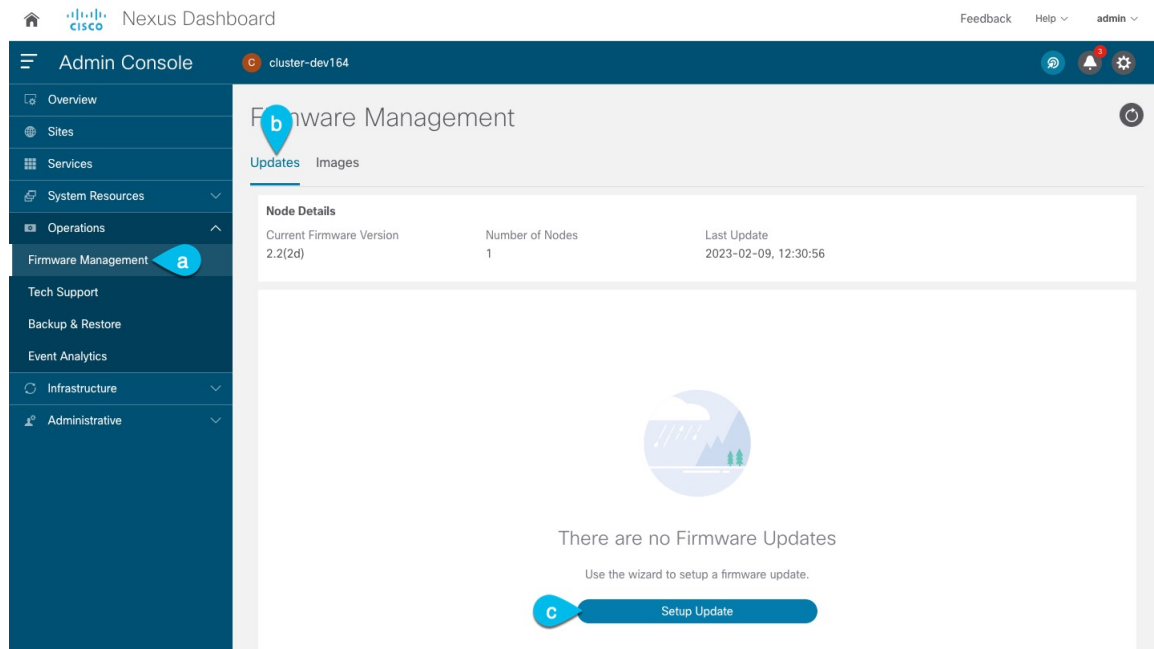

- a) In the **Add Firmware Image** window, select **Local**.
Alternatively, if you hosted the image on a web server, choose **Remote** instead.
- b) Click **Select file** and select the `.iso` or `.tar` image you downloaded in the first step.
For RHEL deployments, use the `.tar` file to upgrade. For all other deployment factors, use the `.iso` file.
If you chose to upload a remote image, provide the file path for the image on the remote server.
- c) Click **Upload** to add the image.

The image will be uploaded to the Nexus Dashboard cluster, unpacked, processed, and made available for the upgrade. The whole process may take several minutes and you will be able to see the status of the process in the **Images** tab.

Step 7 Wait for the image status to change to `Downloaded`.

You can check the status of the image download progress in the **Images**.

Step 8 Set up the update.

- Navigate to **Operations** > **Firmware Management**.
- Select the **Updates** tab.
- Click **Set Up Update**.

Note If you had upgraded your cluster before, the page shows the previous upgrade's details instead. In that case, click the **Modify Details** button in the top right of the page to provide new upgrade information.

The **Firmware Update** screen opens.

Step 9 Start the upgrade.

- In the **Firmware Update** > **Version selection** screen, select the firmware version you uploaded and click **Next**.
- In the **Firmware Update** > **Confirmation** screen, verify the details and click **Validate**.

The setup goes through a number of preparation and validation stages to ensure successful upgrade. This may take several minutes to complete.

- After the validation is complete, click **Install**.

The installation progress window is displayed. You can navigate away from this screen while the update is in progress. To check on the update status at a later time, navigate to the **Firmware Management** screen and click **View Details** in the **Last Update Status** tile.

This will set up the required Kubernetes images and services but will not switch the cluster to the new version. The cluster will continue to run the existing version until you activate the new image in the next step. This step may take up to 20 minutes.

Step 10 Activate the new image.

If you never navigated away from the upgrade screen, simply click **Activate** to activate the new image.

Otherwise:

- a) Navigate back to the **Operations > Firmware Management** screen
- b) In the **Last Update Status** tile, click **Continue**.

In some of the earlier Nexus Dashboard versions, this link may be called **View Details** instead.

- c) In the **Firmware Update > Install** screen, click **Activate**.

It may take up to 20 additional minutes for all the cluster services to start and the GUI to become available. The page will automatically reload when the process is completed.

Step 11 Upgrade the individual services deployed in the cluster.

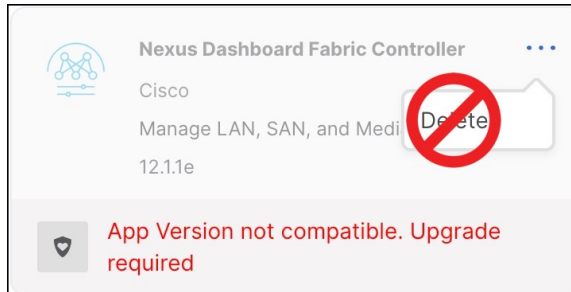

Ensure that you have read the upgrade guide specific to the service that you are upgrading:

- [Nexus Dashboard Fabric Controller Upgrade Guide](#)
- [Nexus Dashboard Insights Upgrade Guide](#)
- [Nexus Dashboard Orchestrator Upgrade Guide](#)

Note When upgrading the services:

- For Nexus Dashboard Fabric Controller, you must keep the service disabled after the cluster is upgraded until you upgrade the service as well.

After the Nexus Dashboard cluster is upgraded, you may see that the existing version of the service is listed with the `App Version not compatible. Upgrade required.` warning. You **must not delete or re-enable** this version before uploading the Fabric Controller upgrade image.

- For Nexus Dashboard Insights, you must keep the service disabled after the cluster is upgraded until you upgrade the service as well.

After the Nexus Dashboard cluster is upgraded, you may see that the existing version of the service is listed with the `App Version not compatible. Upgrade required.` warning. You **must not delete or re-enable** this version before uploading the Insights upgrade image.

- For Nexus Dashboard Orchestrator, you must re-enable the existing version of the service before uploading and activating the new version.

Step 12 (Optional) Migrate to the new UCS-C225-M6 hardware.

Note If you do not plan to replace your Nexus Dashboard nodes with the new UCS-C225-M6 servers, you can skip this step.

If you do plan to migrate to the new hardware, you must first upgrade your existing cluster to release 2.3(1) or later as described in the previous steps.

To migrate your existing Nexus Dashboard cluster deployed using UCS-C220-M5 hardware, you can simply add a new UCS-C225-M6 node as a `standby` node to the existing cluster and fail over one of the older nodes.

Then repeat the process one node at a time for the remaining nodes of the older cluster. Adding and using `standby` nodes is described in detail in the "Infrastructure Management" chapter of the *Nexus Dashboard User Guide*.
