

Deploying in VMware ESX

- [Prerequisites and Guidelines](#), on page 1
- [Deploying Nexus Dashboard Using VMware vCenter](#), on page 4
- [Deploying Nexus Dashboard Directly in VMware ESXi](#), on page 19

Prerequisites and Guidelines

Before you proceed with deploying the Nexus Dashboard cluster in VMware ESX, you must:

- Ensure that the ESX form factor supports your scale and services requirements.

Scale and services support and co-hosting vary based on the cluster form factor and the specific services you plan to deploy. You can use the [Nexus Dashboard Capacity Planning](#) tool to verify that the virtual form factor satisfies your deployment requirements.

Note This document describes how to initially deploy the base Cisco Nexus Dashboard cluster. If you want to expand an existing cluster with additional `worker` nodes, see the [Infrastructure Management](#) article instead, which is also available from the Cisco Nexus Dashboard UI.

Some services (such as Nexus Dashboard Fabric Controller) may require only a single ESX virtual node for one or more specific use cases. In that case, the capacity planning tool will indicate the requirement and you can simply skip the additional node deployment step in the following sections.

Standby nodes are not supported with this cluster form factor.

- Review and complete the general prerequisites described in [Deployment Overview and Requirements](#).

Note that this document describes how to initially deploy the base Nexus Dashboard cluster. If you want to expand an existing cluster with additional nodes (such as `worker` or `standby`), see the "Infrastructure Management" chapter of the *Cisco Nexus Dashboard User Guide* instead, which is available from the Nexus Dashboard UI or online at [Cisco Nexus Dashboard User Guide](#)

- Review and complete any additional prerequisites described in the *Release Notes* for the services you plan to deploy.
- When deploying in VMware ESX, you can deploy two types of nodes:

- Data Node—node profile with higher system requirements designed for specific services that require the additional resources.
- App Node—node profile with a smaller resource footprint that can be used for most services.

**Note**

Some larger scale Nexus Dashboard Fabric Controller deployments may require additional worker nodes. If you plan to add worker nodes to your NDFC cluster, you can deploy all nodes (the initial 3-node cluster and the additional worker nodes) using the OVA-App profile. Detailed scale information is available in the [Verified Scalability Guide for Cisco Nexus Dashboard Fabric Controller](#) for your release.

Ensure you have enough system resources:

Table 1: Deployment Requirements

Data Node Requirements	App Node Requirements
- VMware ESXi 7.0, 7.0.1, 7.0.2, 7.0.3 - VMware vCenter 7.0.1, 7.0.2, 7.0.3 if deploying using vCenter - Each VM requires the following: 32 vCPUs with physical reservation of at least 2.2GHz 128GB of RAM with physical reservation 3TB SSD storage for the data volume and an additional 50GB for the system volume Data nodes must be deployed on storage with the following minimum performance requirements: - The SSD must be attached to the data store directly or in JBOD mode if using a RAID Host Bus Adapter (HBA) - The SSDs must be optimized for Mixed Use/Application (not Read-Optimized) 4K Random Read IOPS: 93000 4K Random Write IOPS: 31000 - We recommend that each Nexus Dashboard node is deployed in a different ESXi server.	- VMware ESXi 7.0, 7.0.1, 7.0.2, 7.0.3 - VMware vCenter 7.0.1, 7.0.2, 7.0.3 if deploying using vCenter - Each VM requires the following: 16 vCPUs with physical reservation of at least 2.2GHz 64GB of RAM with physical reservation 500GB HDD or SSD storage for the data volume and an additional 50GB for the system volume Some services require App nodes to be deployed on faster SSD storage while other services support HDD. Check the Nexus Dashboard Capacity Planning tool to ensure that you use the correct type of storage. Note Beginning with Nexus Dashboard release 3.0(1i) and Nexus Dashboard Insights release 6.3(1), you can use the OVA-App node profile for the Insights service. However, you must change from the default 500GB disk requirement to 1536GB when deploying node VMs which will be used for hosting Insights. - We recommend that each Nexus Dashboard node is deployed in a different ESXi server.

- If you plan to configure VLAN ID for the cluster nodes' data interfaces, you must enable VLAN 4095 on the data interface port group in vCenter for Virtual Guest VLAN Tagging (VGT) mode.

If you specify a VLAN ID for Nexus Dashboard data interfaces, the packets must carry a Dot1q tag with that VLAN ID. When you set an explicit VLAN tag in a port group in the vSwitch and attach it to a Nexus Dashboard VM's VNIC, the vSwitch removes the Dot1q tag from the packet coming from the uplink before it sends the packet to that VNIC. Because the vND node expects the Dot1q tag, you must enable VLAN 4095 on the data interface port group to allow all VLANs.

- After each node's VM is deployed, ensure that the VMware Tools' periodic time synchronization is disabled as described in the deployment procedure in the next section.
- VMware snapshots are only supported for Nexus Dashboard VMs that are powered off and must be done for all Nexus Dashboard VMs belonging to the same cluster.

Snapshots of powered on VMs are not supported.

- VMware Distributed Resource Scheduler (DRS) is not supported for Nexus Dashboard cluster nodes.

If you have DRS enabled at the ESXi cluster level, you must explicitly disable it for the Nexus Dashboard VMs during deployment as described in the following section.

- This release does not support VMware snapshots of the Nexus Dashboard VMs.
- You can choose to deploy the nodes directly in ESXi or using vCenter.

If you want to deploy using vCenter, following the steps described in [Deploying Nexus Dashboard Using VMware vCenter, on page 4](#).

If you want to deploy directly in ESXi, following the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 19](#).

Note If you plan to deploy Nexus Dashboard Insights using the OVA-App node profile, you must deploy using vCenter.

Nexus Dashboard Insights requires a larger disk size than the default value for OVA-App node profiles. If you plan to deploy NDI using the OVA-App node profile, you must change the default disk size for OVA-App nodes from 500GB to 1.5TB during VM deployment. Disk size customization is supported when deploying through VMware vCenter only. For detailed Insights requirements, see the [Nexus Dashboard Capacity Planning](#) and the [Nexus Dashboard Insights Deployment](#) document.

Deploying Nexus Dashboard Using VMware vCenter

This section describes how to deploy Cisco Nexus Dashboard cluster using VMware vCenter. If you prefer to deploy directly in ESXi, follow the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 19](#) instead.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 1](#).

Procedure

Step 1

Obtain the Cisco Nexus Dashboard OVA image.

- a) Browse to the Software Download page.

<https://software.cisco.com/download/home/286327743/type/286328258/>

- b) Choose the Nexus Dashboard release version you want to download.
- c) Click the **Download** icon next to the Nexus Dashboard OVA image (`nd-dk9.<version>.ova`).

Step 2 Log in to your VMware vCenter.

Depending on the version of your vSphere client, the location and order of configuration screens may differ slightly. The following steps provide deployment details using VMware vSphere Client 7.0.

Step 3 Start the new VM deployment.

a) Right-click the ESX host where you want to deploy the VM.

b) Select **Deploy OVF Template...**

The **Deploy OVF Template** wizard appears.

Step 4 In the **Select an OVF template** screen, provide the OVA image.

a) Provide the location of the image.

If you hosted the image on a web server in your environment, select **URL** and provide the URL to the image as shown in the above screenshot.

If your image is local, select **Local file** and click **Choose Files** to select the OVA file you downloaded.

b) Click **Next** to continue.

Step 5

In the **Select a name and folder** screen, provide a name and location for the VM.

The screenshot shows the 'Deploy OVF Template' wizard with six steps. Step 2, 'Select a name and folder', is active. The main panel has a title bar with a close button. Below the title bar, it says 'Specify a unique name and target location'. There is a text input field for 'Virtual machine name:' with the value 'nd-ova-node1' and a blue callout 'a' pointing to it. Below this is a section 'Select a location for the virtual machine.' with a tree view showing 'Datacenter' selected, indicated by a blue callout 'b'. At the bottom right are 'CANCEL', 'BACK', and 'NEXT' buttons, with a blue callout 'c' pointing to the 'NEXT' button.

a) Provide the name for the virtual machine.

For example, `nd-ova-node1`.

b) Select the location for the virtual machine.

c) Click **Next** to continue

Step 6

In the **Select a compute resource** screen, select the ESX host.

- a) Select the vCenter data center and the ESX host for the virtual machine.
- b) Click **Next** to continue

Step 7 In the **Review details** screen, click **Next** to continue.

Step 8 In the **Configuration** screen, select the node profile you want to deploy.

The screenshot shows the 'Deploy OVF Template' wizard in VMware vCenter. The left sidebar lists the steps: 1. Select an OVF template, 2. Select a name and folder, 3. Select a compute resource, 4. Review details, 5. Configuration (highlighted), 6. Select storage, 7. Select networks, 8. Customize template, and 9. Ready to complete. The main area is titled 'Configuration' and contains a section 'Select a deployment configuration' with two radio buttons: 'App' (selected) and 'Data'. A blue callout 'a' points to the 'App' radio button. To the right, a 'Description' box states: 'Use this deployment profile to configure an App OVA with 16 vCPUs, 64 GB RAM, and 500 GB Disk.' At the bottom right, there are 'CANCEL', 'BACK', and 'NEXT' buttons. A blue callout 'b' points to the 'NEXT' button. A status bar at the bottom right indicates '2 Items'.

- a) Select either `App` or `Data` node profile based on your use case requirements.
For more information about the node profiles, see [Prerequisites and Guidelines](#), on page 1.
- b) Click **Next** to continue

Step 9

In the **Select storage** screen, provide the storage information.

Deploy OVF Template

- Select an OVF template
- Select a name and folder
- Select a compute resource
- Review details
- Configuration
- Select storage**
- Select networks
- Customize template
- Ready to complete

Select storage

Select the storage for the configuration and disk files

☐ Encrypt this virtual machine (Requires Key Management Server)

Select virtual disk format: Thick Provision Lazy Zeroed

VM Storage Policy: Datastore Default

☒ Disable Storage DRS for this virtual machine

	Name	Storage Compatibility	Capacity	Provisioned	Free	Type	Cluster
☐	datastore1	--	989.75 GB	613.47 GB	376.28 GB	VMFS 6	
☒	datastore2-s...	--	3.49 TB	1.55 TB	1.94 TB	VMFS 6	
☐	datastore3-s...	--	3.49 TB	1.46 GB	3.49 TB	VMFS 6	
☐	datastore4-s...	--	3.49 TB	1.46 GB	3.49 TB	VMFS 6	

Compatibility

✓ Compatibility checks succeeded.

CANCEL BACK NEXT

- From the **Select virtual disk format** drop-down, choose **Thick Provisioning**.
- Check the **Disable Storage DRS for this virtual machine** checkbox.

Nexus Dashboard does not support VMware DRS. We recommend that you check the **Disable Storage DRS for this virtual machine** option in case DRS is enabled at the ESXi cluster level.

- Select the datastore for the virtual machine.
We recommend a unique datastore for each node.
- Click **Next** to continue

Step 10

In the **Select networks** screen, choose the VM network for the Nexus Dashboard's Management and Data networks and click **Next** to continue.

There are two networks required by the Nexus Dashboard cluster:

- **fabric0** is used for the Nexus Dashboard cluster's Data Network
- **mgmt0** is used for the Nexus Dashboard cluster's Management Network.

For more information about these networks, see [Prerequisites and Guidelines](#) in the "Deployment Overview and Requirements" chapter.

Step 11

In the **Customize template** screen, provide the required information.

Deploy OVF Template

- Select an OVF template
- Select a name and folder
- Select a compute resource
- Review details
- Configuration
- Select storage
- Select networks
- Customize template**
- Ready to complete

Customize template

Customize the deployment properties of this software solution.

✓ All properties have valid values

Resource Configuration 1 settings

1. Data Disk Size (GB) Data disk size (min 500GB, max 1536GB (1.5TB))
500

Node Configuration 3 settings

1. Password Local "rescue-user" password
Password
Confirm Password

2. Management Network Address and subnet Management network address. Enter IP/subnet Ex: 192.168.1.100/24 or 2222::32/120
172.23.141.129/21

3. Management Gateway IP Management network gateway IP address. Enter IP only Ex: 192.168.1.1 or 2222::1
172.23.136.1

CANCEL **Next**

- a) Provide the size for the node's data volume.

The default values will be pre-populated based on the type of node you are deploying, with App node having a single 500GB disk and Data node having a single 3TB disk. In addition to the data volume, a second 50GB system volume will also be configured but cannot be customized.

Note

If you want to specify a custom disk size for your node, you must do so during VM deployment. Resizing the disk after the node is brought up is not supported by Nexus Dashboard.

If you plan to deploy Nexus Dashboard Insights using the OVA-App node profile, you must change the data disk size from the default 500GB value to 1536GB. For additional information about cluster sizing, system resource requirements, and node profile support, see the [Nexus Dashboard Capacity Planning](#) and the [Nexus Dashboard Insights Deployment](#) document.

- b) Provide and confirm the **Password**.

This password is used for the `rescue-user` account on each node.

Note

You must provide the same password for all nodes or the cluster creation will fail.

- c) Provide the **Management Network** IP address and netmask.
d) Provide the **Management Network** IP gateway.
e) Click **Next** to continue.

Step 12

In the **Ready to complete** screen, verify that all information is accurate and click **Finish** to begin deploying the first node.

Step 13 Repeat previous steps to deploy the second and third nodes.

Note

If you are deploying a single-node cluster, you can skip this step.

You do not need to wait for the first node's VM deployment to complete, you can begin deploying the other two nodes simultaneously. The steps to deploy the second and third nodes are identical to the first node's.

Step 14 Wait for the VM(s) to finish deploying.

Step 15 Ensure that the VMware Tools periodic time synchronization is disabled, then start the VMs.

To disable time synchronization:

- Right-click the node's VM and select **Edit Settings**.
- In the **Edit Settings** window, select the **VM Options** tab.
- Expand the **VMware Tools** category and uncheck the **Synchronize guest time with host** option.

Step 16 Open your browser and navigate to `https://<node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Login**

Step 17 Provide the **Cluster Details**.

In the **Cluster Details** screen of the **Cluster Bringup** wizard, provide the following information:

Cluster Bringup

1 Cluster Details
2 Node Details
3 Confirmation

Cluster Details

Provide the necessary cluster details to set up Nexus Dashboard and bring up the user interface.

Next

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.

The cluster name must follow the [RFC-1123](#) requirements.

- b) (Optional) If you want to enable IPv6 functionality for the cluster, check the **Enable IPv6** checkbox.
- c) (Optional) If you want to enable NTP server authentication, click **Add NTP Key**.

In the additional fields, provide the following information:

- **NTP Key** – a cryptographic key that is used to authenticate the NTP traffic between the Nexus Dashboard and the NTP server(s). You will define the NTP servers in the following step, and multiple NTP servers can use the same NTP key.

- **Key ID** – each NTP key must be assigned a unique key ID, which is used to identify the appropriate key to use when verifying the NTP packet.
- **Auth Type** – this release supports MD5, SHA, and AES128CMAC authentication types.
- Choose whether this key is **Trusted**. Untrusted keys cannot be used for NTP authentication.

Note

For the complete list of NTP authentication requirements and guidelines, see [Prerequisites and Guidelines](#).

After you've entered the information, click the checkmark icon to save it.

- d) Click **+Add NTP Host** to add one or more NTP servers.

In the additional fields, provide the following information:

- **NTP Host** – you must provide an IP address; fully qualified domain name (FQDN) are not supported.
- **Key ID** – if you want to enable NTP authentication for this server, provide the key ID of the NTP key you defined in the previous step.
- Choose whether this NTP server is **Preferred**.

After you've entered the information, click the checkmark icon to save it.

Note

If the node into which you are logged in is configured with only an IPv4 address, but you have checked **Enable IPv6** in a previous step and provided an IPv6 address for an NTP server, you will get the following validation error:

NTP Host*	Key ID	Preferred	
2001:420:28e:202a:5054:ff:fe6f:b3f6	22	true	 
 Add NTP Server  Could not validate one or more hosts If deploying a dual-stack cluster, IPv6 IPs can only be validated after cluster bringup. Adding at least one valid IPv4 server is recommended			

This is because the node does not have an IPv6 address yet (you will provide it in the next step) and is unable to connect to an IPv6 address of the NTP server.

In this case, simply finish providing the other required information as described in the following steps and click **Next** to proceed to the next screen where you will provide IPv6 addresses for the nodes.

If you want to provide additional NTP servers, click **+Add NTP Host** again and repeat this substep.

- e) Click **+Add DNS Provider** to add one or more DNS servers.

After you've entered the information, click the checkmark icon to save it.

- f) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity. This allows you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

The proxy server must have the following URLs enabled:

```
dcappcenter.cisco.com
svc.intersight.com
svc.ucs-connect.com
```

```
svc-static1.intersight.com
svc-static1.ucs-connect.com
```

If you want to skip proxy configuration, mouse over the information (i) icon next to the field, then click **Skip**.

- g) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- h) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you've entered the information, click the checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

If you have checked the **Enable IPv6** option earlier, you can also define the IPv6 subnets for the App and Service networks.

Application and Services networks are described in the [Prerequisites and Guidelines](#) section earlier in this document.

- i) Click **Next** to continue.

Note

If your node has only an IPv4 management address but you have checked **Enabled IPv6** and provided an IPv6 NTP server address, ensure that the NTP address is correct and click **Confirm** to proceed to the next screen where you will provide the nodes' IPv6 addresses.

Step 18 In the **Node Details** screen, update the current node's information.

You have defined the Management network and IP address for the node into which you are currently logged in during the initial node configuration in earlier steps, but you must also provide the Data network information for the node before you can proceed with adding the other `primary` nodes and creating the cluster.

Cluster Bringup

Cluster Details

2 Node Details

3 Confirmation

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the user interface.

Serial Number	Name	Management Network	Data Network
D52C57566031		IPv4/mask: 172.23.141.129/21 IPv4 Gateway: 172.23.136.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: IPv4 Gateway: IPv6/mask: - IPv6 Gateway: - VLAN: -

[Add Node](#)

- Click the **Edit** button next to the first node.
- Provide the **Name** for the node.

The node's **Serial Number** and the **Management Network** information are automatically populated.

The node's **Name** will be set as its hostname, so it must follow the [RFC-1123](#) requirements.

- In the **Data Network** area, provide the node's **Data Network** information.

You must provide the data network IP address, netmask, and gateway. Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

If you had enabled IPv6 functionality in a previous screen, provide the IPv6 address, netmask, and gateway.

Note

If you want to provide IPv6 information, you must do it during cluster bootstrap process. To change IP configuration later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4, only IPv6, or dual IPv4/IPv6 stack.

- (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature used by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in more detail in [Prerequisites and Guidelines](#) and the "Persistent IP Addresses" sections of the [Cisco Nexus Dashboard User Guide](#).

Note

You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- For pure IPv6, the **Router ID** of this node.
The router ID must be an IPv4 address, for example 1.1.1.1
- BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

e) Click **Update** to save the changes.

Step 19

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

If you are deploying a single-node cluster, skip this step.

The screenshot shows the 'Add Node' dialog box with the following fields and values:

- Deployment Details:**
 - Management IP Address: 172.23.141.130
 - Username: rescue-user
 - Password: [masked]
 - Validate button
- General:**
 - Name: nd-node2
 - Serial Number: 0274EC65BC40
- Management Network:**
 - IPv4 Address/Mask: 172.23.141.130/21
 - IPv4 Gateway: 172.23.136.1
 - IPv6 Address/Mask: [empty]
 - IPv6 Gateway: [empty]
- Data Network:**
 - IPv4 Address/Mask: 172.31.140.70/21
 - IPv4 Gateway: 172.31.136.1
 - IPv6 Address/Mask: [empty]
 - IPv6 Gateway: [empty]
 - VLAN: [empty]
 - Enable BGP: [toggle switch]

- In the **Deployment Details** area, provide the **Management IP Address** and **Password** for the second node
You defined the management network information and the password during the initial node configuration steps.
- Click **Validate** to verify connectivity to the node.
After network connectivity is validated, you can provide the other required information for the node.
- Provide the **Name** for the node.
The node's **Serial Number** and the **Management Network** information are automatically populated during the management network information validation in the previous step.

- d) In the **Data Network** area, provide the node's **Data Network** information.

You must provide the data network IP address, netmask, and gateway. Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

If you had enabled IPv6 functionality in a previous screen, provide the IPv6 address, netmask, and gateway.

Note

If you want to provide IPv6 information, you must do it during cluster bootstrap process. To change IP configuration later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4, only IPv6, or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature used by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in more detail in [Prerequisites and Guidelines](#) and the "Persistent IP Addresses" sections of the [Cisco Nexus Dashboard User Guide](#).

Note

You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- For pure IPv6, the **Router ID** of this node.
The router ID must be an IPv4 address, for example 2.2.2.2
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- f) Click **Add** to save the changes.

Step 20

Repeat the previous step to add the 3rd node.

If you are deploying a single-node cluster, skip this step.

Step 21

In the **Node Details** page, click **Next** to continue.

After you have provided the management and data network information for all nodes, you can proceed to the final **Confirmation** screen.

Cluster Bringup

Cluster Details

Back

Next

Step 22 In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 23 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH as the `rescue-user` using the password you provided during node deployment and run the following command to verify cluster health:

a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress
```

```
$ acs health
k8s services not in desired state - [...]
```

```
$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

- b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Step 24 Configure the **Network Scale** parameters for your cluster.

This is described in the **Infrastructure Management > Cluster Configuration** section of the [Cisco Nexus Dashboard User Guide](#), which is also available directly from your Nexus Dashboard's Help Center.

Deploying Nexus Dashboard Directly in VMware ESXi

This section describes how to deploy Cisco Nexus Dashboard cluster directly in VMware ESXi. If you prefer to deploy using vCenter, follow the steps described in [Deploying Nexus Dashboard Directly in VMware ESXi, on page 19](#) instead.

Before you begin

- Ensure that you meet the requirements and guidelines described in [Prerequisites and Guidelines, on page 1](#).

Procedure

Step 1 Obtain the Cisco Nexus Dashboard OVA image.

- Browse to the Software Download page.
<https://software.cisco.com/download/home/286327743/type/286328258/>
- Choose the Nexus Dashboard release version you want to download.
- Click the **Download** icon next to the Nexus Dashboard OVA image (`nd-dk9.<version>.ova`).

Step 2 Log in to your VMware ESXi.

Depending on the version of your ESXi server, the location and order of configuration screens may differ slightly. The following steps provide deployment details using VMware ESXi 7.0.

Step 3 Right-click the host and select **Create/Register VM**.

Step 4 In the **Select creation type** screen, choose **Deploy a virtual machine from an OVF or OVA file**, then click **Next**.

Step 5 In the **Select OVF and VMDK files** screen, provide the virtual machine name (for example, `nd-ova-node1`) and the OVA image you downloaded in the first step, then click **Next**.

Step 6 In the **Select storage** screen, choose the datastore for the VM, then click **Next**.

Step 7 In the **Select OVF and VMDK files** screen, provide the virtual machine name (for example, `nd-node1`) and the OVA image you downloaded in the first step, then click **Next**.

Step 8 Specify the **Deployment options**.

In the **Deployment options** screen, provide the following:

- From the **Network mappings** dropdowns, choose the networks for the Nexus Dashboard management (`mgmt0`) and data (`fabric0`) interfaces.
Nexus Dashboard networks are described in [Deployment Overview and Requirements](#).
- From the **Deployment type** dropdown, choose the node profile (`App` or `Data`).
Node profiles are described in [Prerequisites and Guidelines, on page 1](#).
- For **Disk provisioning** type, choose `Thick`.
- Disable the **Power on automatically** option.

Step 9 In the **Ready to complete** screen, verify that all information is accurate and click **Finish** to begin deploying the first node.

Step 10 Repeat previous steps to deploy the second and third nodes.

Note

If you are deploying a single-node cluster, you can skip this step.

You do not need to wait for the first node deployment to complete, you can begin deploying the other two nodes simultaneously.

Step 11 Wait for the VM(s) to finish deploying.

Step 12 Ensure that the VMware Tools periodic time synchronization is disabled, then start the VMs.

To disable time synchronization:

- Right-click the node's VM and select **Edit Settings**.
- In the **Edit Settings** window, select the **VM Options** tab.
- Expand the **VMware Tools** category and uncheck the **Synchronize guest time with host** option.

Step 13 Open one of the node's console and configure the node's basic information.

- Begin initial setup.

You will be prompted to run the first-time setup utility:

```
[ OK ] Started atomix-boot-setup.
      Starting Initial cloud-init job (pre-networking)...
      Starting logrotate...
      Starting logwatch...
      Starting keyhole...
[ OK ] Started keyhole.
[ OK ] Started logrotate.
[ OK ] Started logwatch.
```

Press any key to run first-boot setup on this console...

- Enter and confirm the `admin` password

This password will be used for the `rescue-user` SSH login as well as the initial GUI password.

Note

You must provide the same password for all nodes or the cluster creation will fail.

Admin Password:

Reenter Admin Password:

- Enter the management network information.

Management Network:

IP Address/Mask: **192.168.9.172/24**

Gateway: **192.168.9.1**

- For the first node only, designate it as the "Cluster Leader".

You will log into the cluster leader node to finish configuration and complete cluster creation.

Is this the cluster leader?: **y**

- Review and confirm the entered information.

You will be asked if you want to change the entered information. If all the fields are correct, choose `n` to proceed. If you want to change any of the entered information, enter `y` to re-start the basic configuration script.

```
Please review the config
Management network:
  Gateway: 192.168.9.1
  IP Address/Mask: 192.168.9.172/24
Cluster leader: no

Re-enter config? (y/N): n
```

Step 14 Repeat previous step to configure the initial information for the second and third nodes.

You do not need to wait for the first node configuration to complete, you can begin configuring the other two nodes simultaneously.

Note

You must provide the same password for all nodes or the cluster creation will fail.

The steps to deploy the second and third nodes are identical with the only exception being that you must indicate that they are not the **Cluster Leader**.

Step 15 Open your browser and navigate to `https://<node-mgmt-ip>` to open the GUI.

The rest of the configuration workflow takes place from one of the node's GUI. You can choose any one of the nodes you deployed to begin the bootstrap process and you do not need to log in to or configure the other two nodes directly.

Enter the password you provided in a previous step and click **Login**

Step 16 Provide the **Cluster Details**.

In the **Cluster Details** screen of the **Cluster Bringup** wizard, provide the following information:

Cluster Bringup

1 Cluster Details
2 Node Details
3 Confirmation

Cluster Details

Provide the necessary cluster details to set up Nexus Dashboard and bring up the user interface.

Name *

nd-cluster

Enable IPv6

NTP Key	Key ID	Auth Type	Trusted

171.70.168.183

Add DNS Provider

Proxy Server

Authentication required for proxy

Yes No

Ignore proxy for host addresses beginning with *

Add Ignore Host

DNS Search Domain *

Add DNS Search Domain

App Network *

172.17.0.1/16

Service Network *

100.80.0.0/16

App Network IPv6

2000::/108

Service Network IPv6

3000::/108

Hide Advanced Settings

- a) Provide the **Cluster Name** for this Nexus Dashboard cluster.

The cluster name must follow the [RFC-1123](#) requirements.

- b) (Optional) If you want to enable IPv6 functionality for the cluster, check the **Enable IPv6** checkbox.
- c) (Optional) If you want to enable NTP server authentication, click **Add NTP Key**.

In the additional fields, provide the following information:

- **NTP Key** – a cryptographic key that is used to authenticate the NTP traffic between the Nexus Dashboard and the NTP server(s). You will define the NTP servers in the following step, and multiple NTP servers can use the same NTP key.

- **Key ID** – each NTP key must be assigned a unique key ID, which is used to identify the appropriate key to use when verifying the NTP packet.
- **Auth Type** – this release supports MD5, SHA, and AES128CMAC authentication types.
- Choose whether this key is **Trusted**. Untrusted keys cannot be used for NTP authentication.

Note

For the complete list of NTP authentication requirements and guidelines, see [Prerequisites and Guidelines](#).

After you've entered the information, click the checkmark icon to save it.

- d) Click **+Add NTP Host** to add one or more NTP servers.

In the additional fields, provide the following information:

- **NTP Host** – you must provide an IP address; fully qualified domain name (FQDN) are not supported.
- **Key ID** – if you want to enable NTP authentication for this server, provide the key ID of the NTP key you defined in the previous step.
- Choose whether this NTP server is **Preferred**.

After you've entered the information, click the checkmark icon to save it.

Note

If the node into which you are logged in is configured with only an IPv4 address, but you have checked **Enable IPv6** in a previous step and provided an IPv6 address for an NTP server, you will get the following validation error:

NTP Host*	Key ID	Preferred	
2001:420:28e:202a:5054:ff:fe6f:b3f6	22	true	 
+ Add NTP Server ⚠ Could not validate one or more hosts If deploying a dual-stack cluster, IPv6 IPs can only be validated after cluster bringup. Adding at least one valid IPv4 server is recommended			

This is because the node does not have an IPv6 address yet (you will provide it in the next step) and is unable to connect to an IPv6 address of the NTP server.

In this case, simply finish providing the other required information as described in the following steps and click **Next** to proceed to the next screen where you will provide IPv6 addresses for the nodes.

If you want to provide additional NTP servers, click **+Add NTP Host** again and repeat this substep.

- e) Click **+Add DNS Provider** to add one or more DNS servers.

After you've entered the information, click the checkmark icon to save it.

- f) Provide a **Proxy Server**.

For clusters that do not have direct connectivity to Cisco cloud, we recommend configuring a proxy server to establish the connectivity. This allows you to mitigate risk from exposure to non-conformant hardware and software in your fabrics.

The proxy server must have the following URLs enabled:

```
dcappcenter.cisco.com
svc.intersight.com
svc.ucs-connect.com
```

```
svc-static1.intersight.com
svc-static1.ucs-connect.com
```

If you want to skip proxy configuration, mouse over the information (i) icon next to the field, then click **Skip**.

- g) (Optional) If your proxy server required authentication, change **Authentication required for Proxy** to **Yes** and provide the login credentials.
- h) (Optional) Expand the **Advanced Settings** category and change the settings if required.

Under advanced settings, you can configure the following:

- Provide one or more search domains by clicking **+Add DNS Search Domain**.

After you've entered the information, click the checkmark icon to save it.

- Provide custom **App Network** and **Service Network**.

The application overlay network defines the address space used by the application's services running in the Nexus Dashboard. The field is pre-populated with the default `172.17.0.1/16` value.

The services network is an internal network used by the Nexus Dashboard and its processes. The field is pre-populated with the default `100.80.0.0/16` value.

If you have checked the **Enable IPv6** option earlier, you can also define the IPv6 subnets for the App and Service networks.

Application and Services networks are described in the [Prerequisites and Guidelines](#) section earlier in this document.

- i) Click **Next** to continue.

Note

If your node has only an IPv4 management address but you have checked **Enabled IPv6** and provided an IPv6 NTP server address, ensure that the NTP address is correct and click **Confirm** to proceed to the next screen where you will provide the nodes' IPv6 addresses.

Step 17 In the **Node Details** screen, update the current node's information.

You have defined the Management network and IP address for the node into which you are currently logged in during the initial node configuration in earlier steps, but you must also provide the Data network information for the node before you can proceed with adding the other `primary` nodes and creating the cluster.

Cluster Bringup

Cluster Details

2 Node Details

3 Confirmation

Node Details

Provide the necessary node details to set up Nexus Dashboard and bring up the user interface.

Serial Number	Name	Management Network	Data Network
D52C57566031		IPv4/mask: 172.23.141.129/21 IPv4 Gateway: 172.23.136.1 IPv6/mask: - IPv6 Gateway: -	IPv4/mask: IPv4 Gateway: IPv6/mask: - IPv6 Gateway: - VLAN: -

[Add Node](#)

- Click the **Edit** button next to the first node.
- Provide the **Name** for the node.

The node's **Serial Number** and the **Management Network** information are automatically populated.

The node's **Name** will be set as its hostname, so it must follow the [RFC-1123](#) requirements.

- In the **Data Network** area, provide the node's **Data Network** information.

You must provide the data network IP address, netmask, and gateway. Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

If you had enabled IPv6 functionality in a previous screen, provide the IPv6 address, netmask, and gateway.

Note

If you want to provide IPv6 information, you must do it during cluster bootstrap process. To change IP configuration later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4, only IPv6, or dual IPv4/IPv6 stack.

- (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature used by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in more detail in [Prerequisites and Guidelines](#) and the "Persistent IP Addresses" sections of the [Cisco Nexus Dashboard User Guide](#).

Note

You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- For pure IPv6, the **Router ID** of this node.
The router ID must be an IPv4 address, for example 1.1.1.1
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

e) Click **Update** to save the changes.

Step 18

In the **Node Details** screen, click **Add Node** to add the second node to the cluster.

If you are deploying a single-node cluster, skip this step.

Enable BGP ☐

Add

- In the **Deployment Details** area, provide the **Management IP Address** and **Password** for the second node
You defined the management network information and the password during the initial node configuration steps.
- Click **Validate** to verify connectivity to the node.
After network connectivity is validated, you can provide the other required information for the node.
- Provide the **Name** for the node.
The node's **Serial Number** and the **Management Network** information are automatically populated during the management network information validation in the previous step.

- d) In the **Data Network** area, provide the node's **Data Network** information.

You must provide the data network IP address, netmask, and gateway. Optionally, you can also provide the VLAN ID for the network. For most deployments, you can leave the VLAN ID field blank.

If you had enabled IPv6 functionality in a previous screen, provide the IPv6 address, netmask, and gateway.

Note

If you want to provide IPv6 information, you must do it during cluster bootstrap process. To change IP configuration later, you would need to redeploy the cluster.

All nodes in the cluster must be configured with either only IPv4, only IPv6, or dual IPv4/IPv6 stack.

- e) (Optional) If required, **Enable BGP** for the data network.

BGP configuration is required for the Persistent IPs feature used by some services, such as Nexus Dashboard Insights with NDFC fabrics. This feature is described in more detail in [Prerequisites and Guidelines](#) and the "Persistent IP Addresses" sections of the [Cisco Nexus Dashboard User Guide](#).

Note

You can enable BGP at this time or in the Nexus Dashboard GUI after the cluster is deployed.

When you enable BGP, you must also provide the following information:

- **ASN** (BGP Autonomous System Number) of this node.
You can configure the same ASN for all nodes or a different ASN per node.
- For pure IPv6, the **Router ID** of this node.
The router ID must be an IPv4 address, for example 2.2.2.2
- **BGP Peer Details**, which includes the peer's IPv4 or IPv6 address and peer's ASN.

- f) Click **Add** to save the changes.

Step 19

Repeat the previous step to add the 3rd node.

If you are deploying a single-node cluster, skip this step.

Step 20

In the **Node Details** page, click **Next** to continue.

After you have provided the management and data network information for all nodes, you can proceed to the final **Confirmation** screen.

Cancel

Back Next

Step 21 In the **Confirmation** screen, review and verify the configuration information and click **Configure** to create the cluster.

During the node bootstrap and cluster bring-up, the overall progress as well as each node's individual progress will be displayed in the UI. If you do not see the bootstrap progress advance, manually refresh the page in your browser to update the status.

It may take up to 30 minutes for the cluster to form and all the services to start. When cluster configuration is complete, the page will reload to the Nexus Dashboard GUI.

Step 22 **Note**

Step 23 Verify that the cluster is healthy.

It may take up to 30 minutes for the cluster to form and all the services to start.

After all three nodes are ready, you can log in to any one node via SSH as the `rescue-user` using the password you provided during node deployment and run the following command to verify cluster health:

a) Verify that the cluster is up and running.

You can check the current status of cluster deployment by logging in to any of the nodes and running the `acs health` command.

While the cluster is converging, you may see the following outputs:

```
$ acs health
k8s install is in-progress

$ acs health
k8s services not in desired state - [...]

$ acs health
k8s: Etcd cluster is not ready
```

When the cluster is up and running, the following output will be displayed:

```
$ acs health
All components are healthy
```

b) Log in to the Nexus Dashboard GUI.

After the cluster becomes available, you can access it by browsing to any one of your nodes' management IP addresses. The default password for the `admin` user is the same as the `rescue-user` password you chose for the first node of the Nexus Dashboard cluster.

Note

There may be an issue during the bootstrap process on 3-node vND (ESX) clusters which can cause the 'acs health' command to show the following error: 'k8s: services not in desired state - aaamgr,cisco-intersightdc,eventmonitoring,infra-kafka,kafka,mongodb,sm,statscollect'

Contact Cisco TAC and open a case referring to open Bug ID [CSCwf65557](#) requesting `root` access to run the workaround command on each node.

Step 24 Configure the **Network Scale** parameters for your cluster.

This is described in the **Infrastructure Management > Cluster Configuration** section of the [Cisco Nexus Dashboard User Guide](#), which is also available directly from your Nexus Dashboard's Help Center.
