New and Changed Information

The following table provides an overview of the significant changes up to this current release. The table does not provide an exhaustive list of all changes or of the new features up to this release.

Release Version	Feature	Description
Nexus Dashboard 4.3.1		There were no major changes from the previous release.

Manage your system software

For the latest upgrade process information, see the online version of the [Cisco Nexus Dashboard Deployment and Upgrade Guide](#).

This section describes how to manage different firmware versions and perform cluster upgrades.

The upgrade process involves uploading a new image and then deploying it. As such, the same workflow can be used for cluster firmware downgrades as well.

The following sections provide reference information for firmware upgrades. For the latest upgrade process information, see the online version of the [Cisco Nexus Dashboard Deployment and Upgrade Guide](#).

These sections provide the necessary information to install or upgrade system software on your Nexus Dashboard:

- [Prerequisites and guidelines](#)
- [Upgrading your Nexus Dashboard using images from the Software Download page](#)
- [Applying SMU packages on your Nexus Dashboard](#)

Prerequisites and guidelines

Before you upgrade your existing Nexus Dashboard cluster:

- Ensure that you have read the target release's [Release Notes](#) for any changes in behavior, guidelines, and issues that may affect your upgrade.

The upgrade process is the same for all Nexus Dashboard form factors. However, if your existing cluster is deployed using physical servers, VMware ESX, Linux KVM, Azure, or AWS, you will use the target release's ISO image (nd-dk9.<version>.iso) to upgrade; if your existing cluster is deployed in Red Hat Enterprise Linux, you will use the RHEL-specific image (nd-rhel-<version>.tar).

- If you are upgrading a physical Nexus Dashboard cluster, ensure that the nodes have a supported CIMC version for the target Nexus Dashboard release.

Supported CIMC versions are listed in the Nexus Dashboard [Release Notes](#) for the target release.

CIMC upgrade is described in detail in [Upgrade UCS server firmware \(including CIMC\)](#).

- Before CIMC upgrade, ensure to perform a graceful shutdown of the node using the **acs shutdown** command. Any abrupt power off of UCS or CIMC can cause file system corruption in some ND services. Such corruption may require manual volume recovery with assistance from Cisco Technical Assistance Center (TAC).
- You must perform configuration backups of your Nexus Dashboard and services before the upgrade to safeguard data and minimize any potential risk before proceeding with the upgrade.
- You must have valid DNS and NTP servers configured and reachable by all cluster nodes.
- Ensure that your current Nexus Dashboard cluster is healthy.

You can check the system status on the **Overview** page of the Nexus Dashboard's **Admin Console** or by logging in to one of the nodes as **rescue-user** and ensuring that the **acs health** command returns **All components are healthy**.

- Ensure that no configuration changes are made to the cluster, such as adding secondary or standby nodes, while the upgrade is in progress.
- Nexus Dashboard does not support platform downgrades.

If you want to downgrade to an earlier release, you will need to deploy a new cluster and reinstall the services.

- You can no longer download and install images in parallel for a secondary cluster in a co-location configuration. Instead, you must download and install the image and upgrade the primary cluster first, and then download and install the image and upgrade the secondary cluster afterward.

Upgrading your Nexus Dashboard using images from the Software Download page

This section describes how to add images from the Software Download page and install those images on your Nexus Dashboard.

- [View currently installed software](#)
- [Add images](#)
- [Upgrade the cluster](#)
- [Retry software installation](#)
- [Delete images](#)
- [View update history](#)

View currently installed software

1. Navigate to the System Software page.

Admin > System Software

2. Review the information provided in the **System Software** page.

Field	Description
Nexus Dashboard releases	Provides information on the Nexus Dashboard release currently installed on your system. • Click What's new? to view the features that are new to this release. • Click Release details to view information on the release.
Cluster software	Provides information on the cluster software. Click View update history to get update history for your cluster software. See View update history for more information.
SMUs	Provides SMU information, if you applied SMU packages in your Nexus Dashboard, such as the SMU ID and Fix details. Note that the GUI shows a list of the SMUs that are currently active but does not update the release versions. See Applying SMU packages on your Nexus Dashboard for more information.

Add images

Before you can upgrade your Nexus Dashboard cluster, you need to make the upgrade image available by adding it using the GUI.

1. Download the Nexus Dashboard image.
 - a. Browse to the Software Download page.

- b. Choose the Nexus Dashboard version you want to download.
- c. Download the Cisco Nexus Dashboard image (**nd-dk9.<version>.iso**).

You must download the **.iso** image for all upgrades, even if you used the VMware ESX **.ova**, Linux KVM **.qcow2**, or a cloud provider's marketplace for initial cluster deployment.

- d. (Optional) Host the image on a web server in your environment.

When you upload the image to your Nexus Dashboard cluster, you will have an option to provide a direct URL to the image.

2. Add the image.

- a. From the main navigation menu, select **Admin > System Software**.
- b. In the **System Software** page, review the information provided in the **Nexus Dashboard Releases** area.
 - The leftmost tile shows the software image that is currently installed and running on your Nexus Dashboard.
 - The rightmost tile shows the software image that is currently uploaded onto your Nexus Dashboard.

In either tile, click **What's new** to see the new features available with that particular release, or click **Release notes** to see the Release Notes for that particular release.

- c. In the upper right corner of the **Nexus Dashboard Releases** area, click **Add Image**.

3. In the **Add Software Image** page, choose whether your image is stored on a local system or a remote server.

- If you are adding an image from a local system, click **Local**, then select the image file from your local system by clicking **Choose File** and navigating to the image file on your local system.

If uploading from a local machine, slow upload speeds may cause the session to timeout which can interrupt the transfer. We recommend at least 40Mbps upload speed and increasing the session timeout to 1800 seconds (from the default 1200).

You can change the session timeout in the **Admin > Security** page in your Nexus Dashboard GUI. If you are logged out of your Nexus Dashboard session, it may take a minute before you can re-login to the UI.

- If you are adding an image from a remote location, choose how you will add the image:
 - If you choose **HTTP**, enter the full URL to the image in the **URL** field.
 - If you choose **SFTP/SCP**:
 - a. In the **Remote Storage** field, choose an already-configured remote storage location from the list, if available, or click **Create Remote Storage Location**.

If you click **Create Remote Storage Location**, follow the procedures provided in the

section "Configuring Remote Storage Locations" in *Backing Up and Restoring Your Nexus Dashboard*, then return here.

b. In the **Remote Path Filename** field, enter the remote path for the image.

4. Click **Add** to add the image.

The rightmost tile will show the image upload progress. Wait for it to finish before proceeding to the next section.

Upgrade the cluster

Before you Begin

You must have the upgrade image already added to the Nexus Dashboard cluster as described in [Add images](#).

To upgrade your cluster:

1. From the main navigation menu, click **Admin > System Software**.

These buttons appear in the card in the **Nexus Dashboard Releases** area in the **System Software** page.

- **Factory install:** The **Factory install** option wipes all data, including bootstrap configurations. You will have to re-bootstrap the cluster afterward.
- **Upgrade:** Click the **Upgrade** option if you are upgrading from a previous release. You do not have to perform a **Factory install** before upgrading.

Click **Upgrade** to upgrade the software.

2. Click **Set up Update** or **Modify Details**.

If this is the first time you are upgrading your cluster, simply click the **Setup Update** button in the middle of the page.

If you have previously upgraded the cluster, the last upgrade's details will be displayed in this page instead of the **Setup Update** button. In this case, click the **Modify Details** button at the top right of the screen.

3. In the **Setup/Version Selection** screen, select the target version and click **Next** to proceed.

If you uploaded multiple images to your Nexus Dashboard, they will be listed here.

4. Review the validation report and click **Install** to proceed with the upgrade.

Before the upgrade is triggered, the system will perform a number of validation checks and show the report.

5. In the **Setup/Confirmation** screen, review the details of the update and click **Begin Install** to proceed.

The screen will proceed to the **Install** tab and you will be able to see the progress of each node.

The process can take up to 2 hours and you can navigate away from this screen in the meantime.

6. Wait for the image installation to complete.

7. Click **Install**.

It may take up to 20 additional minute for all the cluster services to start and the GUI may become unavailable during this process. The page will automatically reload when the process is completed. You can track the activation process in the **Activate** screen.

If the software installation fails for any reason, see [Retry software installation](#) for additional information on retrying the software installation.

8. After the process is complete, check if services are active and verify health of the cluster.

For more information on troubleshooting nodes, see [Cisco Nexus Dashboard Troubleshooting](#).

After upgrading to Nexus Dashboard 4.1.1 or later, ensure the cluster's management IP addresses are added to the management routes **Admin > System Settings > General > Routes**. Failure to do so may cause significant delays when accessing API endpoints. Verifying and updating the management routes configuration with the cluster's management IP addresses as a post-upgrade step ensures proper API functionality.

Retry software installation

You might encounter a software installation failure at these stages:

- During the system software installation or upgrade, as described in this article.
- During the **Cluster bringup** stage that occurs as part of the **Journey** process, which is available as a drop-down list item under the question mark icon, as described in [Exploring Your Nexus Dashboard](#).

If the software installation fails for any reason, a pop-up might appear that describes the issue with the software installation or upgrade failure, such as this example.

Cluster Install

i While cluster installation is in progress, you may get logged out. Please wait a few minutes from that point before attempting to re-login to allow time for all services to come up.

Software Install/Upgrade encountered an issue at stage 'Deploy ND core infrastructure services'

Error: Failed to activate Infra Services

Recovery Action: Please click Retry to trigger auto-recovery.

If the issue persists after retrying, please contact Cisco TAC for further assistance.

100%

Retry

Click **Retry** to repeat the software installation or upgrade process. If the failure persists, you might be asked to contact Cisco TAC for further assistance, or you might also be asked to use the **acs reboot** command to correct the issue, as described in [Cisco Nexus Dashboard Troubleshooting](#).

Delete images

After an upgrade is completed, Nexus Dashboard will automatically remove the upgrade image that you uploaded for the upgrade. However, if you upload an upgrade image and then choose not to upgrade, you can delete the uploaded images using the following steps:

1. From the main navigation menu, select **Admin > System Software**.
2. In the **Nexus Dashboard Releases** area, click the trash icon next to the specific release image that you want to delete.
3. In the **Confirm Delete** prompt, click **OK** to confirm.

View update history

To view the update history for your cluster software:

1. From the main navigation menu, select **Admin > System Software**.
2. In the **Cluster software** area, locate the **Last update** field and click **View update history**.

The **Update history** page appears.

Field	Description
Timestamp	Provides the timestamp for the update.
From version	Shows the previous version of the software before the update.
To version	Shows the updated version of the software.
User	Shows the user who initiated the update.
SMU	Provides SMU information, if applicable. See Applying SMU packages on your Nexus Dashboard for more information.
Fix details	Provides details on fixes provided in the update.

3. Click **Back** to return to the **System Software** page.

Applying SMU packages on your Nexus Dashboard

Beginning with Nexus Dashboard release 4.2.1, you can now apply SMU (Software Maintenance Upgrade) released images on your Nexus Dashboard. SMUs are packages that provide bug fixes and security patches for Nexus Dashboard without requiring a full software upgrade. SMU releases are essentially patches that you would install on top of images that you already installed from the Software Download page, as described in [Upgrading your Nexus Dashboard using images from the Software Download page](#).

These sections provide more information on applying SMU packages on your Nexus Dashboard.

- [Guidelines and limitations: Applying SMU packages](#)
- [Install a new SMU package](#)
- [View available packages](#)
- [Activate an SMU package](#)
- [Remove an inactive SMU package](#)
- [Remove all active SMU packages](#)
- [Understand SMU package states](#)
- [Available commands](#)

Guidelines and limitations: Applying SMU packages

- SMU packages are not available through the Software Download page the same way that Nexus Dashboard images are. Instead, for critical bugs, Cisco TAC requests an SMU through the Nexus Dashboard SMU management portal, then TAC shares the location of the released SMU directly to the customer.
- Even though you can view details about active SMUs through the Nexus Dashboard GUI, downloading or applying an SMU package through the GUI is not supported. You can only download and apply SMU packages through the CLI, as described in [Install a new SMU package](#).

If you incorrectly attempt to download an SMU package through the Nexus Dashboard GUI, once the SMU package download is complete, you will not see any information on that SMU package in the **Software management** page in the Nexus Dashboard GUI. Instead, you will have to use the appropriate CLI (**acs**) command to display all of the inactive SMU packages and the progress for downloading and applying the SMU packages. See [View available packages](#) for more information.

- You can install multiple SMU packages over time, though you can only install one SMU package at a time. SMU packages are cumulative, so a newer SMU package will automatically supersede any already-installed older SMU packages.
- You can only download one SMU package at a time. If you have already downloaded an SMU package and you want to download another SMU package, you must first install or delete that already-downloaded SMU package before you can download and install another SMU package. See:
 - [Install a new SMU package](#) for instructions on installing a new SMU package, or

- [Remove an inactive SMU package](#) or [Remove all active SMU packages](#) for instructions on removing an already-downloaded SMU package.
- You can uninstall an SMU package in case of a failure or for any other reason. SMU packages are cumulative, so there is no selected removal; instead, all SMU packages are deleted when you uninstall an SMU package, and the Nexus Dashboard software will be reverted back to released software. See [Remove an inactive SMU package](#) or [Remove all active SMU packages](#) for more information.
- You can only apply SMU patch releases on top of associated releases from the Software Download page. For example, if your Nexus Dashboard is running on release 4.2.1, you can only apply 4.2.1-based SMU patches on top of the 4.2.1 release running on your Nexus Dashboard.
- You cannot use an SMU release for a fresh installation of your new Nexus Dashboard; you must use releases from the Software Download page for a fresh installation for a new Nexus Dashboard.
- Similarly, you cannot upgrade directly to an SMU release. For example, if your Nexus Dashboard is running on release 4.1.1, you cannot upgrade directly to a 4.2.1-based SMU patch. You must first upgrade to the Nexus Dashboard release 4.2.1 from the Software Download page in this case, as described in [Upgrading your Nexus Dashboard using images from the Software Download page](#), then you can apply the 4.2.1-based SMU package afterward.
- You can migrate from one SMU release to another SMU release, but only on the same release branch. Similarly, you can migrate directly to a later SMU release, if necessary, as long as it is on the same release branch.

For example, assume that your Nexus Dashboard is running on release 4.2.1, and:

- The first 4.2.1-based SMU release (4.2.1.0119007001) becomes available. You could apply that 4.2.1.0119007001 SMU release to your 4.2.1 system.
 - A second 4.2.1-based SMU release (4.2.1.0119007002) then becomes available.
 - If you already applied the first 4.2.1-based SMU release (4.2.1.0119007001), you could then migrate from 4.2.1.0119007001 to 4.2.1.0119007002.
 - Alternatively, you could directly apply the SMU release 4.2.1.0119007002 to your 4.2.1 system without first applying the SMU release 4.2.1.0119007001, if necessary.
- You can also upgrade to the next released version of the Nexus Dashboard software after you have applied SMUs for the previously-released version of the Nexus Dashboard software. For example, building on the example scenario above, after you have applied two 4.2.1-based SMU packages (4.2.1.0119007001 and 4.2.1.0119007002) on your 4.2.1 Nexus Dashboard, when the next full release of Nexus Dashboard becomes available (for example, 4.3.1), you can then upgrade to that next full release of Nexus Dashboard software.

Note that in the case of a backup/restore operation, if you take a backup at the time that SMUs are applied, then you can only perform the restore operation on a Nexus Dashboard with the same base software and applied SMU. For example, if you performed a backup with this configuration:

- Nexus Dashboard release 4.2.1, and
 - A 4.2.1-based SMU release (such as 4.2.1.0119007001) applied on top of the base software
- then you can only perform a restore on a system running on Nexus Dashboard 4.2.1, with the 4.2.1.0119007001 also applied.

Install a new SMU package

You will use CLI commands to install an SMU package in your Nexus Dashboard.

We highly recommend that you wait for a maintenance window before you install an SMU package in your Nexus Dashboard.

1. Verify that the cluster is healthy before downloading and applying an SMU package to your Nexus Dashboard.

See [Exploring Your Nexus Dashboard](#) for more information.

2. SSH into the primary Nexus Dashboard node as **rescue-user** and enter these commands through the command line.

On multi-node clusters, when you apply an SMU package on the primary node in the cluster, it then applies the SMU package on the remaining nodes in the cluster as well.

3. Download and add the SMU iso package on the Nexus Dashboard cluster.

```
acs install add <url>
```

Where:

- o The path to the SMU iso package could be through http or https, such as these examples:

```
acs install add http://server.example.com/smu-package.iso
```

```
acs install add https://server.example.com/updates/smu-package.iso
```

- o Or the path to the SME iso package could be through scp, such as this example:

```
acs install add scp://10.10.10.10:/folder/smu-package.iso
```

If you are using scp to download the SMU iso package, you will have to set up a remote storage scp server in the **Systems Settings** area prior to the download. See [Working with System Settings](#) for more information.

For example:

```
$ acs install add http://updates.example.com/acs-smu-2024-12.iso
SMU package add operation started. Package ID: abc-123-def
```

4. Display SMU package details to verify that the package is ready to install.

```
acs show install package <name>
```

or

```
acs show install inactive
```

For example:

`acs show install package nd-dk9.4.2.0.0110007001.iso`

5. Activate the SMU package.

`acs install activate <name>`

For example:

`acs install activate nd-dk9.4.2.0.0110007001.iso`

Output similar to this appears:

`SMU package activate operation started for: nd-dk9.4.2.0.0110007001.iso`

6. Confirm that the package is active to verify that the installation was successful.
 - Use this command to view only active packages that are currently installed.

`acs show install active`

Output similar to the following appears.

PACKAGE NAME	STATE	PROGRESS	DESCRIPTION
nd-dk9.4.2.0.0110007001.iso	installed	100%	SMU package contains CSCws45780, CSCwp92789

- Use this command to view specific package details.

`acs show install package <name>`

For example: `acs show install package nd-dk9.4.2.0.0110007001.iso`

Output similar to the following appears.

PACKAGE NAME	STATE	PROGRESS
nd-dk9.4.2.0.0110007001.iso	Processed	100%

Service Status:

SERVICE	VERSION	STATUS	PROGRESS	ERROR
uiassets	4.1.2030-v1.0.10-0084cdf	Processed	100%	-

View available packages

Use the `acs show install` commands to view packages on your system.

- To view only inactive packages (ready to activate):

`$ acs show install inactive`

PACKAGE NAME	STATE	PROGRESS
--------------	-------	----------

```
nd-dk9      processed  100%
```

- To view only active packages (currently installed):

```
$ acs show install active
```

PACKAGE NAME	STATE	PROGRESS	DESCRIPTION
nd-dk9.4.2.0.0110007001.iso	installed	100%	SMU package contains CSCws45780, CSCwp92789

- To view specific package details:

```
$ acs show install package nd-dk9.4.2.0.0110007001.iso
```

PACKAGE NAME	STATE	PROGRESS
nd-dk9.4.2.0.0110007001.iso	Processed	100%

Service Status:

SERVICE	VERSION	STATUS	PROGRESS	ERROR
uiassets	4.1.2030-v1.0.10-0084cdf	Processed	100%	-

Activate an SMU package

You can only activate an SMU package when the SMU package is in the **processed** state. See [Understand SMU package states](#) for more information.

Use the **acs install activate** command to apply an inactive package to your system.

```
acs install activate <package-name>
```

For example:

```
$ acs install activate nd-dk9.4.2.0.0110007001.iso
```

```
SMU package activate operation started for: nd-dk9.4.2.0.0110007001.iso
```

The package will transition from the processed (inactive) to the installed (active) state.

To verify the activation:

```
$ acs show install active
```

PACKAGE NAME	STATE	PROGRESS	DESCRIPTION
nd-dk9.4.2.0.0110007001.iso	installed	100%	SMU package contains CSCws45780, CSCwp92789

Remove an inactive SMU package

If you added a package but you do not want to activate it, you can remove it.

1. View inactive packages.

```
$ acs show install inactive
```

PACKAGE NAME	STATE	PROGRESS	DESCRIPTION
nd-dk9.4.2.0.0110007001.iso	processed	100%	SMU package contains CSCws45780, CSCwp92789

2. Remove the inactive package.

Only inactive packages can be removed with this command.

```
$ acs install remove inactive
```

This operation will remove the inactive SMU package. Continue? (y/n): y
SMU package remove operation started

3. Verify that the inactive package was removed.

```
$ acs show install inactive
```

(no inactive packages)

Remove all active SMU packages

These procedures will deactivate **all** active SMU packages, so verify that you want to deactivate all active SMU packages before proceeding with these procedures. The system will ask for confirmation before proceeding.

To deactivate and remove all active SMU packages from your system:

1. View currently active packages.

```
$ acs show install active
```

PACKAGE NAME	STATE	PROGRESS	DESCRIPTION
nd-dk9.4.2.0.0110007001.iso	installed	100%	SMU package contains CSCws45780, CSCwp92789

2. Remove all active packages.

```
$ acs install remove active
```

This operation will deactivate and remove all active SMU packages. Continue? (y/n): y

Deactivating SMU package: nd-dk9.4.2.0.0110007001.iso
Deactivation started for 1 out of 1 active SMU packages

3. Verify that all active packages were removed.

```
$ acs show install active  
(no active packages)
```

Understand SMU package states

Understanding SMU package states helps you to track the lifecycle of SMU packages.

State	Description
downloading	Package is being downloaded from the specified URL.
deleting	Package is inactive and is being removed.
installing	Package is being activated.
installed	Package is active and running on the system.
processed	Package is downloaded and ready to activate (inactive).
superseded	Package is being superseded by another active package. There can only be one active SMU on a system, but an inactive SMU could also be present at the same time. If you are installing multiple SMUs, such as this example: 1. You have SMU1 currently installed on your system. 2. You then install SMU2 on top of SMU1. then SMU1 will go to a superseded state. If you remove the active SMU (SMU2 in this case), SMU1 will go to the processed state.
uninstalling	Package is being deactivated.

Available commands

These sections provide additional information on available commands when working with SMU packages.

- [Installation and removal commands](#)
- [Show commands](#)
- [Help commands](#)

Installation and removal commands

Command	Description
<code>acs install add <url></code>	Download and add an SMU package.
<code>acs install activate <name></code>	Activate an added package.
<code>acs install remove active</code>	Remove all active packages.
<code>acs install remove inactive</code>	Remove the inactive package.

Show commands

Command	Description
<code>acs show install active</code>	Display only active packages.
<code>acs show install inactive</code>	Display only inactive packages.
<code>acs show install package <name></code>	Display specific package details.

Help commands

Command	Description
<code>acs --help</code>	Display general help.
<code>acs install --help</code>	Display help for install commands.
<code>acs install add --help</code>	Display help for a specific command.
