

# Deploying Cisco Nexus Dashboard Data Broker Software in Clusters

---

Beginning with Release 3.10.1, Cisco Nexus Data Broker (NDB) has been renamed to Cisco Nexus Dashboard Data Broker. However, some instances of NDB are present in this document, to correspond with the GUI, and installation folder structure. References of NDB/ Nexus Data Broker/ Nexus Dashboard Data Broker, can be used interchangeably.

This chapter contains the following details:

- [Installing a Cisco Nexus Dashboard Data Broker Cluster , on page 1](#)
- [Upgrading a Cisco Nexus Dashboard Data Broker Cluster, on page 3](#)
- [Upgrading the Application Software with TLS-enabled for HA-clustered Controller, on page 5](#)

## Installing a Cisco Nexus Dashboard Data Broker Cluster

Use this procedure to install a Cisco Nexus Dashboard Data Broker (NDDDB) cluster.

### Before you begin

Prerequisites:

- Cisco Nexus Dashboard Data Broker (NDDDB) supports 3-node clusters.
- All IP addresses must be reachable and capable of communicating with each other.
- All switches in the cluster must connect to all the controllers.
- All controllers must have the same HA clustering configuration information in the `config.ini` files.
- All the NDDDB instances should be of the same NDDDB version to form the cluster.
- If using cluster passwords, all controllers must have the same password configured in the `ndbjgroups.xml` file. See *Password Protecting for HA Clusters* section in the *Cisco Nexus Dashboard Data Broker Configuration Guide*.

---

**Note** All the NDDDB instances to form the cluster should be of the same NDDDB version.

---

## Procedure

- 
- Step 1** In a web browser, navigate to [www.cisco.com](http://www.cisco.com).
- Step 2** Scroll down and click **Downloads**.
- Step 3** In the **Select a Product** search box, enter *Nexus Dashboard Data Broker* and you are automatically taken to the latest release **Software Download** screen.
- The file information for Release 3.10.5 is displayed: Cisco Nexus Data Broker Software Application:  
`ndb1000-sw-app-k9-3.10.5.zip`
- Step 4** Download the Cisco Nexus Data Broker application bundle. If prompted, enter your Cisco.com username and password to login.
- Step 5** Create a directory in your Linux machine where you plan to install the Data Broker.
- For example, in your Home directory, create `CiscoNDB`.
- Step 6** Copy the Cisco Nexus Dashboard Data Broker zip file to the created NDDB directory.
- Step 7** Unzip the Data Broker zip file.
- The Data Broker software is installed in a directory called `ndb`. The directory contains the following:
- `runndb.sh` file—file to launch NDDB.
  - `version.properties` file—NDDB build version.
  - `configuration` directory—contains the NDDB initialization files. This directory also contains the `startup` subdirectory where configurations are saved.
  - `bin` directory—contains the NDDB file that has the common CLI.
  - `etc` directory—contains profile information.
  - `lib` directory—contains NDDB Java libraries.
  - `logs` directory—contains NDDB logs.
- Note**  
 The logs directory is created after the NDDB application is started.
- `plugins` directory—The directory that contains the NDDB plugins.
  - `work` directory—webserver working directory.
- Step 8** Navigate to the `ndb/configuration` directory that was created when you installed the software.
- Step 9** Use any text editor to open the `config.ini` file and locate the following text:
- ```
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
# supernodes=<ip1>;<ip2>;<ip3>
```
- If a standby node is available:  
`#supernodes=<ip1>;<ip2>;<ip3>;<ip4>-standby`
- Step 10** Uncomment the line which consists of supernodes and replace `<ip*>` with NDDB server IPs.

```
IPv4 example:
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
supernodes=10.1.1.1;10.2.1.1;10.3.1.1

IPv6 example:
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
supernodes=2001:22:11::1;2001:33::44::1;2001:55:66::1
```

- Step 11** Save the file and exit the editor.
- Step 12** Repeat steps 5 to 11 in all the Linux machines where the NDDB is installed.
- Step 13** Start the primary NDDB server using the `./runndb.sh -start` command.
- Step 14** After the GUI of the primary NDDB server is up, start the other NDDB servers using the `./runndb.sh -start` command.
- After the primary is up, await the confirmation message displayed on the GUI before starting the members of the cluster. The displayed message reads, *Primary is ready, bring up the members.*

## Upgrading a Cisco Nexus Dashboard Data Broker Cluster

### Before you begin

Prerequisites:

- Cisco Nexus Dashboard Data Broker (NDDB) supports 3-node clusters.
- All IP addresses must be reachable and capable of communicating with each other.
- All switches in the cluster must connect to all the controllers.
- All controllers must have the same HA clustering configuration information in the `config.ini` files.
- All the Nexus Dashboard Data Broker instances should be of the same Nexus Dashboard Data Broker version to form the cluster.
- If using cluster passwords, all controllers must have the same password configured in the `ndbjgroups.xml` file. See *Password Protecting for HA Clusters* section in the *Cisco Nexus Data Broker Configuration Guide*.

**Note** All the Nexus Dashboard Data Broker instances to form the cluster should be of the same Cisco Nexus Dashboard Data Broker version.

### Procedure

- Step 1** Login to the Cisco Nexus Dashboard Data Broker primary server.
- Step 2** Navigate to **Administration > Backup/ Restore**.

- Step 3** Click **Backup Locally** to download the configuration file.
- Step 4** Stop all Cisco Nexus Dashboard Data Broker instances using the **runndb.sh -stop** command.
- Step 5** If TLS certification is enabled between NDDB server and NDDB Devices, take backup of the `tlsTrustStore` and `tlsKeyStore` files from `/ndb/configuration`.
- Step 6** Perform the previous step on all the NDDB cluster instances.
- Step 7** In a web browser, navigate to `www.cisco.com`.
- Step 8** Navigate to **Support > Products > Downloads**.
- Step 9** In the Find Products and Downloads search box, enter “Nexus Data Broker” and click on ‘Downloads’ from search response list.
- The file information for Release 3.10.5 is displayed: Cisco Nexus Dashboard Data Broker Software Application: `ndb1000-sw-app-k9-3.10.5.zip`
- Step 10** Download the Cisco Nexus Dashboard Data Broker application bundle. When prompted, enter your Cisco.com username and password to login.
- Step 11** Create a directory in your Linux machine where you plan to install Cisco Nexus Dashboard Data Broker.
- For example, in your Home directory, create Cisco Nexus Dashboard Data Broker.
- Step 12** Copy the Cisco Nexus Dashboard Data Broker zip file to the directory that you have created.
- Step 13** Unzip the Cisco Nexus Dashboard Data Broker zip file.
- The Cisco Nexus Dashboard Data Broker software is installed in a directory called `ndb`. The directory contains the following:
- `runndb.sh` file—file to launch NDDB.
  - `version.properties` file—NDDB build version.
  - `configuration` directory—contains the NDDB initialization files. This directory also contains the `startup` subdirectory where configurations are saved.
  - `bin` directory—contains the NDDB file that has the NDDB common CLI.
  - `etc` directory—contains profile information.
  - `lib` directory—contains NDDB Java libraries.
  - `logs` directory—contains NDDB logs.
- Note**  
The `logs` directory is created after the NDDB application is started.
- `plugins` directory—The directory that contains the NDDB plugins.
  - `work` directory—webserver working directory.
- Step 14** Navigate to the `ndb/configuration` directory that was created when you installed the software.
- Step 15** Use any text editor to open the `config.ini` file and locate the following text:
- Step 16** Locate the following text:
- ```
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
# supernodes=<ip1>;<ip2>;<ip3>
```

```
If a standby node is available:
#supernodes=<ip1>;<ip2>;<ip3>;<ip4>-standby
```

**Step 17** Uncomment the line which consists of supernodes and replace <ip\*> with NDDB Server IPs.

```
IPv4 example:
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
supernodes=10.1.1.1;10.2.1.1;10.3.1.1

IPv6 example:
# HA Clustering configuration (semi-colon-separated IP addresses of all controllers that are part
of the cluster.)
supernodes=2001:22:11::1;2001:33::44::1;2001:55:66::1
```

**Step 18** Save the file and exit the editor.

**Step 19** Repeat the steps 7 to 18 in all the Linux machines where the NDDB is installed.

**Step 20** Start the Primary NDDB server using the `./runndb.sh -start` command.

**Step 21** After the GUI of the Primary NDDB Server is up, start the other NDDB servers using the `./runndb.sh -start` command.

**Step 22** Login to the Primary Server NDDB GUI.

**Step 23** (applicable for the 3.9.x release train) If the TLS configuration is available, move the TrustStore and KeyStore files to the configuration folder.

#### Important

If you are upgrading from 3.9.2, your backup file contains the TLS files. The `tlsconf`, `tlsKeyStore`, `tlsTrustStore` files are part of your backup.

If you are upgrading from release 3.10.x or 3.9.0, your backup file will not contain the `tlsTrustStore`, `tlsKeyStore` files. You will need to manually upload the `tls` files to the `/ndb/configuration` folder in the server before restoring the backup. Ensure the files moved are named as "tlsKeyStore" and "tlsTrustStore" before proceeding.

**Step 24** Navigate to **Administration > Backup/Restore > Actions > Restore Locally** and upload the configuration you had earlier downloaded.

**Step 25** Stop all instances of NDDB in the cluster using the `./runndb.sh -stop` command.

**Step 26** Start the primary NDDB server using the `./runndb.sh -start` command.

After the primary is up, await the confirmation message displayed on the GUI before starting the members of the cluster. The displayed message reads, *Primary is ready, bring up the members.*

After the primary is *up*, the TLS files for the member servers(s) are synced by the NDDB controller.

**Step 27** Start the member NDDB server(s) using the `./runndb.sh -start` command.

## Upgrading the Application Software with TLS-enabled for HA-clustered Controller

Use this procedure for upgrading the Nexus Dashboard Data Broker (NDDB) application software in centralized mode, using the GUI, when the TLS certification is enabled in a HA-clustered controller.

## Procedure

- 
- Step 1** Log in to the existing NDDB GUI instance using `https://server IP:8443`.
- Step 2** Navigate to the **Administration > Backup/ Restore** tab.
- Step 3** Click **Backup now Locally** to download the configuration as a zip file.
- Step 4** Stop the current NDDB instance(s) using the `./runndb.sh -stop` command.
- Step 5** After the NDDB instances are stopped, navigate to the `/ndb/configuration` folder, and copy the `tlsTrustStore` and `tlsKeyStore` files to `local/common` folder.
- Step 6** Download the NDDB 3.10.5 software from the standard *Cisco.com Downloads* page and configure the cluster mode using the "supernodes" configuration in the `config.ini` file and start the new NDDB 3.10.5 cluster using the `./runndb.sh -start` command on all the controllers.
- Step 7** (applicable for the 3.9.x release train) If the TLS configuration is available, move the TrustStore and KeyStore files to the configuration folder.
- Important**  
 If you are upgrading from 3.9.2, your backup file contains the TLS files. The `tlsconf`, `tlsKeyStore`, `tlsTrustStore` files are part of your backup.  
 If you are upgrading from release 3.10.x or 3.9.0, your backup file will not contain the `tlsTrustStore`, `tlsKeyStore` files. You will need to manually upload the `tls` files to the `/ndb/configuration` folder in the server before restoring the backup. Ensure the files moved are named as "tlsKeyStore" and "tlsTrustStore" before proceeding.
- Step 8** On the primary controller, navigate to the **Administration > Backup/ Restore** tab.
- Step 9** Click **Restore Locally** to upload the configuration file which you had earlier downloaded (Step 3, above).  
 After the configuration is uploaded successfully, you will see a success message on the GUI.
- Step 10** Stop the NDDB 3.10.5 instances on all the controllers using the `./runndb.sh -stop` command.
- Step 11** Start the primary NDDB server using the `./runndb.sh -start` command.  
 Wait for a few minutes; a `ready` message is displayed.  
 After the primary is `up`, the TLS files for the member servers(s) are synced by the NDDB controller.
- Step 12** Start the NDDB instance on the other controllers of the cluster using the `./runndb.sh start` command.
-
