

Third-Party Applications

This chapter contains the following sections:

- About Third-Party Applications, on page 1
- Installing Signed Third-Party RPMs by Importing Keys Automatically, on page 1
- Installing Signed RPM, on page 3
- Persistent Third-Party RPMs, on page 8
- Installing RPM from VSH, on page 9
- Third-Party Applications, on page 13

About Third-Party Applications

The RPMs for the Third-Party Applications are available in the repository at . These applications are installed in the native host by using the **dnf** command in the Bash shell or through the NX-OS CLI.

When you enter the **dnf install** *rpm* command, a Cisco **DNF** plug-in gets executed. This plug-in copies the RPM to a hidden location. On switch reload, the system reinstalls the RPM.

For configurations in /etc, a Linux process, **incrond**, monitors artifacts that are created in the directory and copies them to a hidden location, which gets copied back to /etc.

Installing Signed Third-Party RPMs by Importing Keys Automatically

Setup the yum repo to point to the keys and RPM.

```
root@switch# cat /etc/yum/repos.d/puppet.repo
[puppet]
name=Puppet RPM
baseurl=file:///bootflash/puppet
enabled=1
gpgcheck=1
gpgkey=http://yum.puppetlabs.com/RPM-GPG-KEY-puppetlabs
```

```
metadata_expire=0
cost=500
bash-4.2# yum install puppet-enterprise

Installed:
puppet-enterprise.x86 64 0:3.7.1.rc2.6.g6cdc186-1.pe.nxos
Complete!
```

Installing Signed RPM

Checking a Signed RPM

Run the following command to check if a given RPM is signed or not.

```
Run, rpm -K rpm_file_name
```

Not a signed RPM

```
bash-4.2# rpm -K bgp-1.0.0-r0.lib32_n3600.rpm
bgp-1.0.0-r0.lib32_n3600.rpm: (sha1) dsa sha1 md5 OK
```

Signed RPM

```
bash-4.2#
rpm -K puppet-enterprise-3.7.1.rc2.6.g6cdc186-1.pe.nxos.x86_64.rpm
puppet-enterprise-3.7.1.rc2.6.g6cdc186-1.pe.nxos.x86_64.rpm: RSA sha1 MD5 NOT_OK
bash-4.2#
```

Signed third-party rpm requires public GPG key to be imported first before the package can be installed otherwise **yum** will throw the following error:

```
bash-4.2#
yum install puppet-enterprise-3.7.1.rc2.6.g6cdc186-1.pe.nxos.x86_64.rpm -q
Setting up Install Process
warning: rpmts_HdrFromFdno: Header V4 RSA/SHA1 signature: NOKEY, key ID 4bd6ec30
Cannot open: puppet-enterprise-3.7.1.rc2.6.g6cdc186-1.pe.nxos.x86_64.rpm. Skipping.
Error: Nothing to do
```

Installing Signed RPMs by Manually Importing Key

• Copy the GPG keys to /etc rootfs so that they are persisted across reboots.

```
bash-4.2# mkdir -p /etc/pki/rpm-gpg
bash-4.2# cp -f RPM-GPG-KEY-puppetlabs /etc/pki/rpm-gpg/
```

• Import the keys using the below command

```
bash-4.2# rpm --import /etc/pki/rpm-gpg/RPM-GPG-KEY-puppetlabs
bash-4.2#
bash-4.2# rpm -q gpg-pubkey
gpg-pubkey-4bd6ec30-4c37bb40
bash-4.2# rpm --import /etc/pki/rpm-gpg/RPM-GPG-KEY-puppetlabs
bash-4.2#
bash-4.2# rpm -q gpg-pubkey
gpg-pubkey-4bd6ec30-4c37bb40
```

• Install the signed RPM with yum command

```

```

Step 3 Create repo config file under /etc/yum/repos.d pointing to this repo

Persistent Third-Party RPMs

The following is the logic behind persistent third-party RPMs:

- A local **dnf** repository is dedicated to persistent third-party RPMs. The /etc/yum/repos.d/thirdparty.repo points to /bootflash/.rpmstore/thirdparty.
- Whenever you enter the **dnf install third-party.rpm** command, a copy of the RPM is saved in //bootflash/.rpmstore/thirdparty.
- During a reboot, all the RPMs in the third-party repository are reinstalled on the switch.
- Any change in the /etc configuration files persists under /bootflash/.rpmstore/config/etc and they are replayed during boot on /etc.
- Any script that is created in the /etc directory persists across reloads. For example, a third-party service script that is created under /etc/init.d/ brings up the apps during a reload.

Installing RPM from VSH

Package Addition

NX-OS feature RPMs can also be installed by using the VSH CLIs.

Procedure

	Command or Action	Purpose
Step 1	show install packages	Displays the packages and versions that already exist.
Step 2	install add?	Determine supported URIs.
Step 3	install add rpm-packagename	The install add command copies the package file to a local storage device or network server.

Example

The following example shows how to activate the Chef RPM:

switch# show install packages

```
switch# install add ?
        Package name
bootflash: Enter package uri
ftp: Enter package uri
http: Enter package uri
modflash: Enter package uri
scp: Enter package uri
sftp:
            Enter package uri
           Enter package uri
tftp:
usb1:
          Enter package uri
usb2:
           Enter package uri
volatile: Enter package uri
switch# install add
bootflash:chef-12.0.0alpha.2+20150319234423.git.1608.b6eb10f-1.el5.x86 64.rpm
[######### 100%
```

Install operation 314 completed successfully at Thu Aug 6 12:58:22 2015

What to do next

When you are ready to activate the package, go to Package Activation.

Note

Adding and activating an RPM package can be accomplished in a single command:

switch#
install add bootflash:chef-12.0.0alpha.2+20150319234423.git.1608.b6eb10f-1.el5.x86_64.rpm
activate

Package Activation

Before you begin

The RPM has to have been previously added.

Procedure

	Command or Action	Purpose
Step 1	show install inactive	Displays the list of packages that were added and not activated.
Step 2	install activate rpm-packagename	Activates the package.

Example

The following example shows how to activate a package:

```
switch# show install inactive
Boot image:
       NXOS Image: bootflash:///yumcli6.bin
Inactive Packages:
       sysinfo-1.0.0-7.0.3.x86 64
Loaded plugins: downloadonly, importpubkey, localrpmDB, patchaction, patching,
             : protect-packages
Available Packages
chef.x86 64
               12.0.0alpha.2+20150319234423.git.1608.b6eb10f-1.el5 thirdparty
eigrp.lib32 n3600 1.0.0-r0
                                                                    groups-rep
sysinfo.x86 64
                1.0.0-7.0.3
                                                                    patching
switch# install activate chef-12.0-1.el5.x86_64.rpm
[######### 100%
Install operation completed successfully at Thu Aug 6 12:46:53 2015
```

Deactivating Packages

Procedure

	Command or Action	Purpose
Step 1	install deactivate package-name	Deactivates the RPM package.

Example

The following example shows how to deactivate the Chef RPM package:

switch# install deactivate chef

Removing Packages

Before you begin

Deactivate the package before removing it. Only deactivated RPM packages can be removed.

Procedure

	Command or Action	Purpose
Step 1	install remove package-name	Removes the RPM package.

Example

The following example shows how to remove the Chef RPM package:

switch# install remove chef-12.0-1.el5.x86_64.rpm

Displaying Installed Packages

Procedure

	Command or Action	Purpose
Step 1	show install packages	Displays a list of the installed packages.

Example

The following example shows how to display a list of the installed packages:

switch# show install packages

Displaying Detail Logs

Procedure

	Command or Action	Purpose
Step 1	show tech-support install	Displays the detail logs.

Example

The following example shows how to display the detail logs:

switch# show tech-support install

Upgrading a Package

Procedure

	Command or Action	Purpose
Step 1	install add package-name activate upgrade	Upgrade a package.

Example

The following example show how to upgrade a package:

Downgrading a Package

Procedure

	Command or Action	Purpose
Step 1	install add package-name activate downgrade	Downgrade a package.

Example

The following example shows how to downgrade a package:

```
switch# install add bootflash:bgp-1.0.1-r0.lib32_n3600.rpm activate ?
downgrade Downgrade package
```

```
forced Non-interactive upgrade Upgrade package switch# install add bootflash:bgp-1.0.1-r0.lib32_n3600.rpm activate downgrade [############### 100% Install operation completed successfully at Thu Aug 6 12:46:53 2015
```

Third-Party Applications

NX-OS

For more information about NX-API REST API object model specifications, see https://developer.cisco.com/media/dme/index.html

collectd

collectd is a daemon that periodically collects system performance statistics and provides multiple means to store the values, such as RRD files. Those statistics can then be used to find current performance bottlenecks (i.e. performance analysis) and predict future system load (that is, capacity planning).

For additional information, see https://collectd.org.

Ganglia

Ganglia is a scalable distributed monitoring system for high-performance computing systems such as clusters and grids. It is based on a hierarchical design targeted at federations of clusters. It leverages widely used technologies such as XML for data representation, XDR for compact, portable data transport, and RRDtool for data storage and visualization. It uses engineered data structures and algorithms to achieve very low per-node overheads and high concurrency. The implementation is robust, has been ported to an extensive set of operating systems and processor architectures, and is currently in use on thousands of clusters around the world. It has been used to link clusters across university campuses and around the world and can scale to handle clusters with 2000 nodes.

For additional information, see http://ganglia.info.

Iperf

Iperf was developed by NLANR/DAST to measure maximum TCP and UDP bandwidth performance. Iperf allows the tuning of various parameters and UDP characteristics. Iperf reports bandwidth, delay jitter, datagram loss.

For additional information, see http://sourceforge.net/projects/iperf/ or http://iperf.sourceforge.net.

LLDP

The link layer discover prototocol (LLDP) is an industry standard protocol designed to supplant proprietary link layer protocols such as EDP or CDP. The goal of LLDP is to provide an inter-vendor compatible mechanism to deliver link layer notifications to adjacent network devices.

For more information, see https://vincentbernat.github.io/lldpd/index.html.

Nagios

Nagios is open source software that monitors network services (through ICMP, SNMP, SSH, FTP, HTTP etc), host resources (CPU load, disk usage, system logs, etc.), and alert services for servers, switches, applications, and services through the Nagios remote plugin executor (NRPE) and through SSH or SSL tunnels.

For more information, see https://www.nagios.org/.

OpenSSH

OpenSSH is an open-source version of the SSH connectivity tools that encrypts all traffic (including passwords) to effectively eliminate eavesdropping, connection hijacking, and other attacks. OpenSSH provides secure tunneling capabilities and several authentication methods, and supports all SSH protocol versions.

For more information, see http://www.openssh.com.

Quagga

Quagga is a network routing software suite that implements various routing protocols. Quagga daemons are configured through a network accessible CLI called a "vty".

Note

Only Quagga BGP has been validated.

For more information, see http://www.nongnu.org/quagga/.

Splunk

Splunk is a web based data collection, analysis, and monitoring tool that has a search, visualization and pre-packaged content for use-cases. The raw data is sent to the Splunk server using the Splunk Universal Forwarder. Universal Forwarders provide reliable, secure data collection from remote sources and forward that data into the Splunk Enterprise for indexing and consolidation. They can scale to tens of thousands of remote systems, collecting terabytes of data with minimal impact on performance.

For additional information, see http://www.splunk.com/en_us/download/universal-forwarder.html.

tcollector

tcollector is a client-side process that gathers data from local collectors and pushes the data to Open Time Series Database (OpenTSDB).

tcollector has the following features:

- Runs data collectors and collates the data,
- Manages connections to the time series database (TSD),
- Eliminates the need to embed TSD code in collectors,

- · De-duplicates repeated values, and
- Handles wire protocol work.

For additional information, see http://opentsdb.net/docs/build/html/user_guide/utilities/tcollector.html.

tcpdump

Tcpdump is a CLI application that prints out a description of the contents of packets on a network interface that match the boolean expression; the description is preceded by a time stamp, printed, by default, as hours, minutes, seconds, and fractions of a second since midnight. It can also be run with the -w flag, which causes it to save the packet data to a file for later analysis, and/or with the -r flag, which causes it to read from a saved packet file rather than to read packets from a network interface. It can also be run with the -V flag, which causes it to read a list of saved packet files. In all cases, only packets that match expression will be processed by tcpdump.

For more information, see http://www.tcpdump.org/manpages/tcpdump.1.html.

Tshark

TShark is a network protocol analyzer on the CLI. It lets you capture packet data from a live network, or read packets from a previously saved capture file, You can either print a decoded form of those packets to the standard output or write the packets to a file. TShark's native capture file format is the pcap format, which is also the format used by **tcpdump** and various other tools. Tshark can be used within the Guest Shell 2.1 after removing the cap_net_admin file capability.

```
setcap
cap net raw=ep /sbin/dumpcap
```

Note

This command must be run within the Guest Shell.

For more information, see https://www.wireshark.org/docs/man-pages/tshark.html.

Tshark
