

DHCP Relay in VXLAN BGP EVPN

This chapter contains the following sections:

- [DHCP Relay in VXLAN BGP EVPN Overview, on page 1](#)
- [DHCP Relay in VXLAN BGP EVPN Example, on page 2](#)
- [DHCP Relay on VTEPs, on page 3](#)
- [Client on Tenant VRF and Server on Layer 3 Default VRF, on page 3](#)
- [Client on Tenant VRF \(SVI X\) and Server on the Same Tenant VRF \(SVI Y\), on page 6](#)
- [Client on Tenant VRF \(VRF X\) and Server on Different Tenant VRF \(VRF Y\), on page 10](#)
- [Client on Tenant VRF and Server on Non-Default Non-VXLAN VRF, on page 13](#)
- [Configuring vPC Peers Example, on page 15](#)
- [vPC VTEP DHCP Relay Configuration Example, on page 17](#)

DHCP Relay in VXLAN BGP EVPN Overview

DHCP relay is utilized to forward DHCP packets between the hosts and DHCP server. The VXLAN VTEP can act as a relay agent, providing DHCP relay services in a multi-tenant VXLAN environment.

With DHCP Relay, DHCP messages require to be sent through the same Switch in both directions. GiAddr (Gateway IP Address) for DHCP Relay is commonly used for Scope Selection and DHCP response messages. In any VXLAN fabric with Distributed IP Anycast Gateway, DHCP messages can be returned to ANY Switch hosting the respective Gateway IP Address (GiAddr).

Solution requires a different way of Scope Selection and Unique IP Address for each Switch. Unique Loopback Interface per Switch will become GiAddr for responding to correct Switch. Option 82 (dhcp option vpn) will be used for Scope Selection based on L2VNI.

In a multi-tenant EVPN environment, DHCP relay uses the following sub-options of Option 82:

- Sub-option 151(0x97) - Virtual Subnet Selection (Defined in RFC#6607)

Used to convey VRF related information to the DHCP server in an MPLS-VPN and VXLAN EVPN multi-tenant environment.

- Sub-option 11(0xb) - Server ID Override (Defined in RFC#5107)

The server identifier (server ID) override sub-option allows the DHCP relay agent to specify a new value for the server ID option, which is inserted by the DHCP server in the reply packet. This sub-option allows the DHCP relay agent to act as the actual DHCP server such that the renew requests will come to the relay agent rather than the DHCP server directly. The server ID override sub-option contains the incoming

interface IP address, which is the IP address on the relay agent that is accessible from the client. Using this information, the DHCP client sends all renew and release request packets to the relay agent. The relay agent adds all of the appropriate sub-options and then forwards the renew and release request packets to the original DHCP server. For this function, Cisco's proprietary implementation is sub-option 152(0x98). You can use the **ip dhcp relay sub-option type cisco** command to manage the function.

- Sub-option 5(0x5) - Link Selection (Defined in RFC#3527)

The link selection sub-option provides a mechanism to separate the subnet/link on which the DHCP client resides from the gateway address (giaddr), which can be used to communicate with the relay agent by the DHCP server. The relay agent will set the sub-option to the correct subscriber subnet and the DHCP server will use that value to assign an IP address rather than the giaddr value. The relay agent will set the giaddr to its own IP address so that DHCP messages are able to be forwarded over the network. For this function, Cisco's proprietary implementation is sub-option 150(0x96). You can use the **ip dhcp relay sub-option type cisco** command to manage the function.

DHCP Relay in VXLAN BGP EVPN Example

Figure 1: Example Topology

Topology characteristics:

- Switches 9372-1 and 9372-2 are VTEPs connected to the VXLAN fabric.
- Client1 and client2 are DHCP clients in vlan1001. They belong to tenant VRF vxlan-900001.
- The DHCP server is ASR1K, a router that sits in vlan10.
- DHCP server configuration

```

ip vrf vxlan900001
ip dhcp excluded-address vrf vxlan900001 172.16.16.1 172.16.16.9
ip dhcp pool one
 vrf vxlan900001
 network 172.16.16.0 255.240.0.0
 defaultrouter 172.16.16.1

```

DHCP Relay on VTEPs

The following are common deployment scenarios:

- Client on tenant VRF and server on Layer 3 default VRF.
- Client on tenant VRF (SVI X) and server on the same tenant VRF (SVI Y).
- Client on tenant VRF (VRF X) and server on different tenant VRF (VRF Y).
- Client on tenant VRF and server on non-default non-VXLAN VRF.

The following sections below move vlan10 to different VRFs to depict different scenarios.

Client on Tenant VRF and Server on Layer 3 Default VRF

Put DHCP server (192.0.2.42) into the default VRF and make sure it is reachable from both 9372-1 and 9372-2 through the default VRF.

```

9372-1# sh run int vl 10

!Command: show running-config interface Vlan10
!Time: Mon Aug 24 07:51:16 2018

version 7.0(3)I1(3)

interface Vlan10
 no shutdown
 ip address 192.0.2.25/24
 ip router ospf 1 area 0.0.0.0

9372-1# ping 192.0.2.42 cou 1

PING 192.0.2.42 (192.0.2.42): 56 data bytes

interfaoe Vlan1001
 ip dhcp relay address 192.0.2.42 use-vrf default
```

Debug Output

- The following is a packet dump for DHCP interact sequences.

```
9372-1# ethanalyzer local interface inband display-filter
"udp.srcport==67 or udp.dstport==67" limit-captured frames 0

Capturing on inband
20180824 08:35:25.066530 0.0.0.0 -> 255.255.255.0 DHCP DHCP Discover - Transaction ID
0x636a38fd
20180824 08:35:25.068141 192.0.2.25 -> 192.0.2.42 DHCP DHCP Discover - Transaction ID
0x636a38fd
20180824 08:35:27.069494 192.0.2.42 -> 192.0.2.25 DHCP DHCP Offer Transaction - ID
0x636a38fd
20180824 08:35:27.071029 172.16.16.1 -> 172.16.16.11 DHCP DHCP Offer Transaction - ID
0x636a38fd
20180824 08:35:27.071488 0.0.0.0 -> 255.255.255.0 DHCP DHCP Request Transaction - ID
```

```

0x636a38fd
20180824 08:35:27.072447 192.0.2.25 -> 192.0.2.42 DHCP DHCP Request Transaction - ID
0x636a38fd
20180824 08:35:27.073008 192.0.2.42 -> 192.0.2.25 DHCP DHCP ACK Transaction - ID
0x636a38fd
20180824 08:35:27.073692 172.16.16.1 -> 172.16.16.11 DHCP DHCP ACK Transaction - ID
0x636a38fd

```

Note Ethalyzer might not capture all DHCP packets because of inband interpretation issues when you use the filter. You can avoid this by using SPAN.

- DHCP Discover packet 9372-1 sent to DHCP server.

giaddr is set to 192.0.2.25 (ip address of vlan10) and suboptions 5/11/151 are set accordingly.

round-trip min/avg/max = 0.874/0.873/0.874 ms

```

Client on Tenant VRF (SVI X) and Server on the Same Tenant VRF (SVI Y)

Put DHCP server (192.0.2.42) into VRF of vxlan-900001 and make sure it is reachable from both 9372-1 and 9372-2 through VRF of vxlan-900001.

```

9372-1# sh run int vl 10

!Command: show running-config interface Vlan10
!Time: Mon Aug 24 09:10:26 2018

version 7.0(3)I1(3)

interface Vlan10
  no shutdown
  vrf member vxlan-900001
  ip address 192.0.2.25/24

```

Because 172.16.16.1 is an anycast address for vlan1001 configured on all the VTEPs, we need to pick up a unique address as the DHCP relay packet's source address to make sure the DHCP server can deliver a response to the original DHCP Relay agent. In this scenario, we use loopback1 and we need to make sure loopback1 is reachable from everywhere of VRF vxlan-900001.

```

9372-1# sh run int lo1

!Command: show running-config interface loopback1
!Time: Mon Aug 24 09:18:53 2018

version 7.0(3)I1(3)

interface loopback1
  vrf member vxlan-900001
  ip address 10.11.11.11/8

9372-1# ping 192.0.2.42 vrf vxlan900001 source 10.11.11.11 cou 1
PING 192.0.2.42 (192.0.2.42) from 10.11.11.11: 56 data bytes

```

Client on Tenant VRF (VRF X) and Server on Different Tenant VRF (VRF Y)

The DHCP server is placed into another tenant VRF vxlan-900002 so that DHCP response packets can access the original relay agent. We use loopback2 to avoid any anycast ip address that is used as the source address for the DHCP relay packets.

```

9372-1# sh run int vl 10
!Command: show runningconfig interface Vlan10
!Time: Tue Aug 25 08:48:22 2018

```

```

Configuring vPC Peers Example

The following is an example of how to configure routing between vPC peers in the overlay VLAN for a DHCP relay configuration.

- Enable DHCP service.

```
service dhcp
```

- Configure DHCP relay.

```
ip dhcp relay
ip dhcp relay information option
ip dhcp relay sub-option type cisco
ip dhcp relay information option vpn
```

- Create loopback under VRF where you need DHCP relay service.

```
interface loopback601
 vrf member evpn-tenant-kk1
 ip address 192.0.2.36/24
 ip router ospf 1 area 0 /* Only required for vPC VTEP. */
```

- Advertise LoX into the Layer 3 VRF BGP.

```
Router bgp 2
 vrf X
 network 10.1.1.42/8
```

- Configure DHCP relay on the SVI under the VRF.

```
interface Vlan1601
  vrf member evpn-tenant-kk1
  ip address 10.160.1.254/8
  fabric forwarding mode anycast-gateway
  ip dhcp relay address 10.160.2.201
  ip dhcp relay source-interface loopback601
```

- Configure Layer 3 VNI SVI with **ip forward**.

```
interface Vlan1600
  vrf member evpn-tenant-kk1
  ip forward
```

- Create the routing VLAN/SVI for the vPC VRF.

Note Only required for vPC VTEP

```
Vlan 1605
interface Vlan1605
  vrf member evpn-tenant-kk1
  ip address 10.160.5.43/8
  ip router ospf 1 area 10.10.10.41
```

- Create the VRF routing.

Note Only required for vPC VTEP.

```
router ospf 1
  vrf evpn-tenant-kk1
  router-id 10.160.5.43
```

vPC VTEP DHCP Relay Configuration Example

To address a need to configure a VLAN that is allowed across the MCT/peer-link, such as a vPC VLAN, an SVI can be associated to the VLAN and is created within the tenant VRF. This becomes an underlay peering, with the underlay protocol, such as OSPF, that needs the tenant VRF instantiated under the routing process.

Alternatively, instead of placing the SVI within the routing protocol and instantiate the Tenant-VRF under the routing process, you can use the static routes between the vPC peers across the MCT. This approach ensures that the reply from the server returns to the correct place and each VTEP uses a different loopback interface for the GiAddr.

The following are examples of these configurations:

- Configuration of SVI within underlay routing:

```

/* vPC Peer-1 */

router ospf UNDERLAY
vrf tenant-vrf

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.1/16
  ip router ospf UNDERLAY area 0.0.0.0

/* vPC Peer-2 */

router ospf UNDERLAY
vrf tenant-vrf

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.2/16
  ip router ospf UNDERLAY area 0.0.0.0

```

- Configuration of SVI using static routes between vPC peers across the MCT:

```

/* vPC Peer-1 */

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.1/16

vrf context tenant-vrf
ip route 192.168.1.2/16 192.168.1.1

/* vPC Peer-2 */

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.2/16

vrf context tenant-vrf
ip route 192.168.1.1/16 192.168.1.2

```
