

Configuring VXLAN with IPv6 in the Underlay (VXLANv6)

This chapter contains the following sections:

- [Information About Configuring VXLAN with IPv6 in the Underlay \(VXLANv6\)](#) , on page 1
- [Information About vPC and VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 2
- [Information About vPC Peer Keepalive and VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 2
- [Guidelines and Limitations for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#) , on page 3
- [Configuring the VTEP IP Address](#), on page 5
- [Configuring vPC for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 6
- [Example Configurations for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 8
- [Verifying VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 9

Information About Configuring VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN BGP EVPN is deployed with IPv4 underlay and IPv4 VTEP. Hosts in the overlay can be IPv4 or IPv6. Support is added for VXLAN with IPv6 in the Underlay (VXLANv6) with an IPv6 VTEP. This requires IPv6 versions of the unicast routing protocols and utilizing ingress replication for multi-destination traffic (BUM) in the underlay.

This solution is targeted for deployments where the VTEP is IPv6 only and the underlay is IPv6. The BGP sessions between the leaf and spine are also IPv6. The overlay hosts can be either IPv4 or IPv6.

VXLANv6 feature supports BGP unnumbered peering in the underlay.

The following protocols are supported in the underlay:

- IS-IS
- OSPFv3
- eBGP

Information About vPC and VXLAN with IPv6 in the Underlay (VXLANv6)

vPC VTEPs use vMAC (virtual MAC) with the VIP/PIP feature. vMAC is used with VIP and the system MAC is used with PIP.

In the IPv4 underlay, vMAC is derived from the IPv4 VIP address:

VMAC = 0x02 + 4 bytes IPv4 VIP address.

In the IPv6 underlay, VIP is IPv6 (128 bits) which cannot be used to generate a conflict free unique vMAC (48 bits). The default method is to autogenerate the vMAC by picking the last 48 bits from the IPv6 VIP:

Autogenerated vMAC = 0x06 + the last 4 bytes of the IPv6 VIP address.

If there are two vPC complexes which have different VIPs but the same last 4 bytes of IPv6 address in the VIP, both autogenerate the same vMAC. For a remote VTEP, it sees vMAC flopping between two different VIPs. This is not an issue for Cisco Nexus 9000 Series switches which support VXLAN IPv6.

For other vendor boxes, if this is an issue for interoperability reasons, the vMAC can be manually configured on Cisco Nexus 9000 Series switches to override the autogenerated vMAC. The default behavior for VXLAN with IPv6 in the Underlay (VXLANv6) is to autogenerate the VMAC. If a VMAC is configured manually, the manually configured VMAC takes precedence.

```
interface nve1
  virtual-rmac <48-bit mac address>
```

The VMAC must be managed by the administrator just like the VIP/PIP and must be unique in the fabric. All the preceding behavior is for VXLAN with IPv6 in the Underlay (VXLANv6) only and nothing changes about VMAC creation and advertisement for VXLAN IPv4 in the underlay.

The default behavior is that vMAC is autogenerated from the configured VIP and advertised. There is no need to use the **virtual-rmac** command as previously described except for interoperability cases. There is no need to use the existing **advertise virtual-rmac** command for VXLAN with IPv6 in the Underlay (VXLANv6).

Information About vPC Peer Keepalive and VXLAN with IPv6 in the Underlay (VXLANv6)

The modification for vPC is to allow IPv6 addresses to be used for the peer-keepalive link. The link can be on the management interface or any other interface. The keepalive link becomes operational only when both peers are configured correctly either with the IPv4 or IPv6 address and those addresses are reachable from each peer. Peer-keepalive can be configured on in-band and out-of-band interfaces.

Note peer-keepalive must be a global unicast address.

The configuration command for **peer-keepalive** accepts an IPv6 address

```
vpc domain 1
peer-keepalive destination 001:002::003:004 source 001:002::003:005 vrf management
```

Guidelines and Limitations for VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN with IPv6 in the Underlay (VXLANv6) has the following guidelines and limitations:

- Dual Stack (IPv4 and IPv6) is not supported for VXLAN underlay. It should either be IPv4 or IPv6, not both.
- NVE Source interface loopback for VTEP can either be IPv4 (VXLANv4) or IPv6 (VXLANv6), and not both.
- Next hop address in overlay (in `bgp l2vpn evpn address family updates`) should be resolved in underlay URIB to the same address family. For example, the use of VTEP (NVE source loopback) IPv4 addresses in fabric should only have BGP l2vpn evpn peering over IPv4 addresses.
- Usage of IPv6 LLA requires the TCAM Region for **ing-sup** to be re-carved from the default value of 512 to 768. This step requires a copy run start and reload

The following Cisco Nexus platforms are supported to provide the VTEP function (leaf and border). The BGP route reflector can be provided by any Cisco Nexus platform that supports the EVPN **address-family** command over an IPv6 MP-BGP peering.

- Cisco Nexus 9332C
- Cisco Nexus 9364C
- Cisco Nexus 9300-EX
- Cisco Nexus 9300-FX
- Cisco Nexus 9300-FX2
- Cisco Nexus 9300-FX3
- Cisco Nexus 9300-FXP
- Cisco Nexus 9300-GX
- Cisco Nexus 9300-GX2

VXLAN with IPv6 in the Underlay (VXLANv6) supports the following features:

- Address Resolution Protocol (ARP) suppression in the overlay
- Access Control List (ACL) Quality of Service (QoS)
- Border Node with VRF-Lite
- Dynamic Host Configuration Protocol (DHCP)
- Guestshell support
- Internet Group Management Protocol (IGMP) Snooping in the overlay

- Virtual Extensible Local Area Network (VXLAN) Operation, Administration, and Maintenance (OAM)
- Storm Control for host ports (Access Side)
- Virtual Port Channel (vPC) with VIP and PIP support
- VXLAN Policy-Based Routing (PBR)
- vPC Fabric Peering

VXLAN with IPv6 in the Underlay (VXLANv6) does not support the following features:

- Downstream VNI
- Bidirectional Forwarding Detection (BFD)
- Centralized Route Leak
- Cisco Data Center Network Manager (DCNM) integration
- Cross Connect
- EVPN Multi-homing with Ethernet Segment (ES)
- Fabric Extender (FEX) attached to a VXLAN-enabled switch.
- VXLAN Flood and Learn
- MACsec
- Multiprotocol Label Switching (MPLS) and Locator/ID Separation Protocol (LISP) handoff
- Multicast underlay (PIM-BiDir, Protocol Independent Multicast (PIM) Any Source Multicast (ASM), Snooping)
- NetFlow
- Overlay IGMP Snooping
- **peer vtep** command
- Sampled Flow (sFLOW)
- Static ingress replication (IR)
- Tenant Routed Multicast (TRM)
- Virtual Network Functions (VNF) Multipath
- VXLAN Access Features
 - 802.1x
 - Port security
 - Private VLAN (PVLAN)
 - PV translation (Switching/Routing)
 - Q-in-Q with QinVNI
 - QinVNI and SelQinVNI

- VXLAN Multi-Site

Beginning with Cisco NX-OS Release 10.1(1), IPv6 Underlay is supported for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.

Beginning with Cisco NX-OS Release 10.2(3)F, IPv6 Underlay is supported on Cisco Nexus 9700-EX/FX/GX line cards.

Beginning with Cisco NX-OS Release 10.2(3)F, the VTEP function (leaf and border) is supported on Cisco Nexus 9300-GX2 platform switches.

Beginning with Cisco NX-OS Release 10.2(3)F, VXLAN PBR is supported with VXLAN v6 underlay on Cisco Nexus 9300-EX/FX/FX2/FX3/GX/GX2 platforms, N9K-C9364C, and N9K-C9332C ToR switches.

Beginning with Cisco NX-OS Release 10.2(3)F, IPv6 Underlay is supported on Cisco Nexus 9300-GX2 switches.

Other guidelines and limitations:

- VXLAN/Fibre Channel co-existence

Configuring the VTEP IP Address

SUMMARY STEPS

1. **configure terminal**
2. **interface nve1**
3. **source-interface loopback** *src-if*
4. **exit**
5. **interface loopback** *loopback_number*
6. **ipv6 address** *ipv6_format*
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <code>switch# configure terminal</code>	Enter global configuration mode.
Step 2	interface nve1 Example: <code>switch(config)# interface nve1</code>	Configure the NVE interface.
Step 3	source-interface loopback <i>src-if</i> Example: <code>switch(config-if-nve)# source interface loopback 1</code>	The source interface must be a loopback interface that is configured on the switch with a valid /128 IP address. This /128 IP address must be known by the intermediate devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.

	Command or Action	Purpose
		<p>Note The IPv6 address on loopback1 must be a /128 address.</p> <p>The VTEP IP address cannot be a link local IPv6 address.</p>
Step 4	<p>exit</p> <p>Example:</p> <pre>switch(config-if-nve)# exit</pre>	Exit configuration mode.
Step 5	<p>interface loopback <i>loopback_number</i></p> <p>Example:</p> <pre>switch(config)# interface loopback 1</pre>	Configure the loopback interface.
Step 6	<p>ipv6 address <i>ipv6_format</i></p> <p>Example:</p> <pre>switch(config-if)# ipv6 address 2001:db8:0:0:1:0:0:1/128</pre>	Configure IPv6 address on the interface.
Step 7	<p>exit</p> <p>Example:</p> <pre>switch(config-if)# exit</pre>	Exit configuration mode.

Configuring vPC for VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN with IPv4 in the underlay leveraged the concept of a secondary IP address (VIP) used in vPC. IPv6 does not have the concept of secondary addresses as does IPv4. However, multiple IPv6 global addresses can be configured on an interface, which are treated equally in priority.

The CLI for the VIP configuration has been extended to specify the loopback interface that carries the VIP if there is a VXLAN with IPv6 in the Underlay (VXLANv6) vPC. The IPv6 primary IP address (PIP) and VIP are in two separate loopback interfaces.

Similar to IPv4, if there are multiple IPv6 addresses specified on either loopback, the lowest IP is selected for each.

The following steps outline the configuration of a VTEP IP (VIP/PIP) required on a vPC setup.

Note The **anycast loopback** command is used only for VXLAN with IPv6 in the Underlay (VXLANv6).

SUMMARY STEPS

1. **configure terminal**
2. **interface nve1**
3. **source-interface loopback** *src-if* **anycast loopback** *any-if*

4. **exit**
5. **interface loopback** *loopback_number*
6. **ipv6 address** *ipv6_format*
7. **exit**
8. **interface loopback** *loopback_number*
9. **ipv6 address** *ipv6_format*

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal</pre>	Enter global configuration mode.
Step 2	interface nve1 Example: <pre>switch(config)# interface nve1</pre>	Configure the NVE interface.
Step 3	source-interface loopback <i>src-if</i> anycast loopback <i>any-if</i> Example: <pre>switch(config-if-nve)# source interface loopback 1 anycast loopback 2</pre>	<p>The source interface must be a loopback interface that is configured on the switch with a valid /128 IP address. This /128 IP address must be known by the transient devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.</p> <p>Note The IPv6 address on loopback1, the primary IP address (PIP), and loopback2, the secondary IP address (JVIP), must be a /128 address.</p> <p>The VTEP IP address cannot be a link local IPv6 address.</p>
Step 4	exit Example: <pre>switch(config-if-nve)# exit</pre>	Exit configuration mode.
Step 5	interface loopback <i>loopback_number</i> Example: <pre>switch(config)# interface loopback 1</pre>	Configure the loopback interface.
Step 6	ipv6 address <i>ipv6_format</i> Example: <pre>switch(config-if)# ipv6 address 2001:db8:0:0:1:0:0:1/128</pre>	Configure IPv6 address on the interface.
Step 7	exit Example:	Exit configuration mode.

	Command or Action	Purpose
	<code>switch(config-if)# exit</code>	
Step 8	interface loopback <i>loopback_number</i> Example: <code>switch(config)# interface loopback 2</code>	Configure the loopback interface.
Step 9	ipv6 address <i>ipv6_format</i> Example: <code>switch(config-if)# ipv6 address 2001:db8:0:0:1:0:0:2/128</code>	Configure IPv6 address on the interface.

Example Configurations for VXLAN with IPv6 in the Underlay (VXLANv6)

The following are configuration examples for VXLAN with IPv6 in the Underlay (VXLANv6):

With IPv6 address set/match in next-hop, BGP must set/match the IPv6 next-hop address in route type-2 (MAC-IP) and route type-5 (IP Prefix).

Under route-map:

```
set ipv6 next-hop <vtep address>
match ipv6 next-hop <vtep address>
```

BGP Underlay

Note BGP IPv6 neighbor must support L2VPN EVPN address-family session.

Note The router ID in VXLAN with IPv6 in the Underlay (VXLANv6) must be an IPv4 address.

The BGP router ID is a 32-bit value that is often represented by an IPv4 address. By default, Cisco NX-OS sets the router ID to the IPv4 address of a loopback interface on the router. For VXLAN with IPv6 in the Underlay (VXLANv6), none of the loopbacks need to have an IPv4 address in which case the default selection of router ID does not happen correctly. You can configure the router ID manually to an IPv4 address.

BGP RD (Route distinguisher) which is 64 bits in length can be configured using the autonomous system number of the 4-byte IP address. For VXLAN with IPv6 in the Underlay (VXLANv6), when using an IP address for configuring RD, you must use IPv4 as in the case of VXLAN IPv4.

```
feature bgp
nv overlay evpn

router bgp 64496
! IPv4 router id
router-id 35.35.35.35
! Redistribute the igp/bgp routes
```

```

address-family ipv6 unicast
  redistribute direct route-map allow

! For IPv6 session, directly connected peer interface
neighbor 2001:DB8:0:1::55
  remote-as 64496
  address-family ipv6 unicast

```

OSPFv3 Underlay

```

feature ospfv3

router ospfv3 201
router-id 290.0.2.1

```

Verifying VXLAN with IPv6 in the Underlay (VXLANv6)

To display the status for the VXLAN with IPv6 in the Underlay (VXLANv6) configuration, enter one of the following commands:

Table 1: VXLAN with IPv6 in the Underlay (VXLANv6) Verification Commands

Command	Purpose
show running-config interface nve 1	Displays interface NVE 1 running configuration information.
show nve interface 1 detail	Displays NVE interface detail.
show nve peers	Displays the peering time and VNI information for VTEP peers.
show nve vni ingress-replication	Displays NVE VNI ingress replication information.
show nve peers 2018:1015::abcd:1234:3 int nv1 counters	Displays NVE peers counter information.

Command	Purpose
show bgp l2vpn evpn 1012.0383.9600	Displays BGP L2VPN information for route type 2.
show bgp l2vpn evpn 303:304::1	Displays BGP L2VPN EVPN for route type 3.
show bgp l2vpn evpn 5.116.204.0	Displays BGP L2VPN EVPN for route type 5.
show l2route peerid	Displays L2route peerid.
show l2route topology detail	Displays L2route topology detail.
show l2route evpn imet all detail	Displays L2route EVPN imet detail.
show l2route fl all	Display L2route flood list detail.
show l2route mac all detail	Displays L2route MAC detail.
show l2route mac-ip all detail	Displays MAC address and host IP address.
show ip route 1.191.1.0 vrf vxlan-10101	Displays route table for VRF.
show forwarding ipv4 route 1.191.1.0 detail vrf vxlan-10101	Displays forwarding information.
show ipv6 route vrf vxlan-10101	Displays IPv6 routing table.
show bgp l2vpn evpn	Displays BGP's updated routes.
show bgp evi <i>evi-id</i>	Displays BGP EVI information.
show forwarding distribution peer-id	Displays forwarding information.
show forwarding nve l2 ingress-replication-peers	Displays forwarding information for ingress replication.
show forwarding nve l3 peers	Displays nv3 Layer 3 peers information.
show forwarding ecmp platform	Displays forwarding ECMP platform information.
show forwarding ecmp platform	Displays forwarding ECMP platform information.
show forwarding nve l3 ecmp	Displays forwarding NVE Layer 3 ECMP information.

Example of the **show running-config interface nve 1**

Command

```
switch# show running-config interface nve 1
interface nve1
  no shutdown
  source-interface loopback1 anycast loopback2
  host-reachability protocol bgp
  member vni 10011
    ingress-replication protocol bgp
  member vni 20011 associate-vrf
```

Example of the **show nve interface 1 detail**

Command

```
switch# show nve interface nve 1 detail
Interface: nve1, State: Up, encapsulation: VXLAN
VPC Capability: VPC-VIP-Only [notified]
Local Router MAC: a093.51cf.78f7
Host Learning Mode: Control-Plane
Source-Interface: loopback1 (primary: 30:3:1::2)
Anycast-Interface: loopback2 (secondary: 303:304::1)
Source Interface State: Up
Anycast Interface State: Up
Virtual RMAC Advertisement: Yes
NVE Flags:
Interface Handle: 0x49000001
Source Interface hold-down-time: 745
Source Interface hold-up-time: 30
Remaining hold-down time: 0 seconds
Virtual Router MAC: 0600.0000.0001
Interface state: nve-intf-add-complete
```

Example of the **show nve peers** Command

```
switch# show nve peers
Interface Peer-IP          State LearnType Uptime  Router-Mac
-----
nve1      1:1::1:1              Up    CP        00:44:09  5087.89d4.6bb7
```

Up

Example of the **show nve vni ingress-replication**

Command

```
switch# show nve vni ingress-replication
Interface VNI      Replication List Source Up Time
-----
nve1      10011      1:1::1:1          BGP-IMET  00:46:55
```

Example of the **show nve peers ipv6-address int nv1 counters** Command .

```
switch# show nve peers 2018:2015::abcd:1234:3 int nve 1 counters
Peer IP: 2018:1015::abcd:1234:3
TX
    0 unicast packets 0 unicast bytes
    0 multicast packets 0 multicast bytes
RX
    0 unicast packets 0 unicast bytes
    0 multicast packets 0 multicast bytes
```

Example of the **show bgp l2vpn evpn** Command for Route-Type 2.

```
switch# show bgp l2vpn evpn 1012.0383.9600
BGP routing table information for VRF default, address family L2VPN EVPN
