# **Command-Line Interface Troubleshooting Commands**

The command-line interface (CLI) allows you to configure and monitor Cisco NX-OS using a local console or remotely using a Telnet or Secure Shell (SSH) session. The CLI provides a command structure similar to Cisco IOS software, with context-sensitive help, **show** commands, multiuser support, and roles-based access control.

Each feature has **show** commands that provide information about the feature configuration, status, and performance. Additionally, you can use the following command for more information:

• **show system**—Provides information about system-level components, including cores, errors, and exceptions. Use the **show system error-id** command to find details on error codes.

### **Consistency Checker Commands**

Cisco NX-OS provides consistency checker commands to validate the software state with the hardware state. The result of the consistency checker is logged as either PASSED or FAILED.

```
2019 May 1 16:31:39 switch vshd: CC_LINK_STATE:
Consistency Check: PASSED
```

Consistency checker is a tool that performs the following functions:

- · Checks for system consistency
- · Helps perform root cause analysis and fault isolation
- · Checks for consistency between software and hardware tables

Note When monitor session is in Down or Error state, Consistency checker is not validated.

Cisco NX-OS supports the following consistency checker commands.

#### **Table 1: Consistency Checker Commands**

Command	Description	Supported Platforms
show consistency-checker copp	Verifies CoPP programming.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker dme interfaces	Verifies the DME interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker egress-xlate private-vlan	Verifies the private VLAN egress-xlate in the hardware.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
<pre>show consistency-checker fex-interfaces {fex fex-id   interface ethernet fex-id/fex-slot/fex-port} [brief   detail]</pre>	Compares the software and hardware state of FEX interfaces.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards <b>Note</b> The <i>fex-slot</i> is always 1.
show consistency-checker fex-interfaces fabric <fabric-po></fabric-po>	Verifies FEX fabric PO membership of the physical member interfaces, and interface level hardware programming of the fabric port-channel members.	Cisco Nexus 9300-EX, 9300-FX, 9300-FX2, 9300-GX series switches.
show consistency-checker fex-interfaces fabric <fabric-po> membership vlan <vlan-id></vlan-id></fabric-po>	Verifies FEX fabric PO members are part of the VLAN floodlist, for VLAN which are enabled on FEX interfaces.	Cisco Nexus 9300-EX, 9300-FX, 9300-FX2, 9300-GX series switches.
<pre>show consistency-checker fex-interfaces fabric <fabric-po> stp-state vlan <vlan-id></vlan-id></fabric-po></pre>	Verifies FEX fabric PO members are in forwarding / disabled state for VLANs that are enabled on FEX interfaces.	Cisco Nexus 9300-EX, 9300-FX, 9300-FX2, 9300-GX series switches.
show consistency-checker fex-interfaces fabric <fabric-po> egress-xlate private-vlan <vlan-id></vlan-id></fabric-po>	Verifies PVLAN hardware programming corresponding to FEX fabric PO interface, in case there are PVLAN enabled FEX interfaces.	Cisco Nexus 9300-EX, 9300-FX, 9300-FX2, 9300-GX series switches.
test consistency-checker forwarding {ipv4   ipv6} [vrf vrf-name   all] [module module-number   all]	Starts the Layer 3 route consistency checker test.	All Cisco Nexus 9000 Series switches
show consistency-checker forwarding {ipv4   ipv6} [vrf vrf-name   all] [module module-number   all]	Displays the Layer 3 route consistency checker test result.	All Cisco Nexus 9000 Series switches

Command	Description	Supported Platforms
<pre>show consistency-checker forwarding single-route {ipv4   ipv6} ip-address vrf vrf-name} [brief   detail]</pre>	Checks for Layer 3 route consistency for a specific route. Warns when a single-route fails due to ECMP group table exhaustion.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
		<b>Note</b> Cisco Nexus 34180YC platform switches support only the <b>ipv4</b> command.
show consistency-checker gwmacdb	Checks for hardware and software consistency in the gateway MAC address database. <b>Note</b> This command might show incorrect results for 4-way HSRP.	All Cisco Nexus 9000 Series switches
<pre>show consistency-checker kim interface {ethernet slot/port   port-channel number   vlan vlan-id} [brief   detail]</pre>	Verifies the internal connectivity between the supervisor and the line card.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker 12 module <i>module-number</i>	Verifies that learned MAC addresses are consistent between the software and the hardware. It also shows extra entries that are present in the hardware but not in the software and missing entries in the hardware.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards

Command	Description	Supported Platforms
show consistency-checker 12 multicast group <i>ip-address</i> source <i>ip-address</i> vlan <i>vlan-id</i> [brief   detail]	Checks for inconsistencies with Layer 2 multicast groups.	Cisco Nexus 9200, 9300-EX, 9300-FX, and 9300-GX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 series switches with N9K-X9432C-S, N9K-X9536PQ line cards.
		Cisco Nexus 9500 series switches with N9K-X9432C-FM-S, N9K-C9508-FMX-S, N9K-C9508-FM-S fabric modules.
		Cisco Nexus N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches.
		Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX and N9K-C9372PX-E switches.
<pre>show consistency-checker l2 switchport interface {ethernet slot/port   port-channel number }[brief   detail   all]</pre>	Checks for inconsistencies with switchport interfaces.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker 13-interface interface ethernet <i>slot/port</i> [brief   detail]	Checks for Layer 3 settings of an interface in the hardware and for the following configuration in the hardware: L3 VLAN, CML Flags, IPv4 Enable, VPN ID. This command works for physical interfaces and interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces. Beginning Cisco NX-OS Release 9.3(5) this command checks for Layer 3 settings of an SI and SVI interfaces; and the support is extend to Cisco Nexus 9300-GX platform switches.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX devices. Beginning with Cisco NX-OS Release 10.3(1)F, L3 Consistency Checker is supported on the Cisco Nexus 9808 platform switches.
show consistency-checker 13-interface module module-number [brief   detail]	Checks for Layer 3 settings of all interfaces in the module and for the following configuration in the hardware: L3 VLAN, CML Flags, IPv4 Enable, VPN ID. This command works for physical interfaces and interfaces that are part of a port channel. It does not validate subinterfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards

Command	Description	Supported Platforms
show consistency-checker 13 multicast group <i>ip-address</i> source <i>ip-address</i> vrf vrf-name [brief   detail]	Checks for inconsistencies with Layer 3 multicast groups.	Cisco Nexus 9200, 9300-EX, 9300-FX, and 9300-GX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FM-S fabric modules.
		Cisco Nexus N3K-C3048TP, N3K-C3064-TC, N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches.
		Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX and N9K-C9372PX-E switches.
show consistency-checker link-state fabric-ieth [module module-number] [brief   detail]	Verifies the programming consistency between software and hardware for the link-state status of internal fabric ports.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker link-state interface ethernet <i>slot/port</i> [brief   detail]	Verifies the programming consistency between software and hardware for the link-state status of the interfaces. This command works for physical Ethernet interfaces and physical Ethernet interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker link-state module module-number [brief   detail]	Verifies the software link state of all the interfaces in the module against its hardware link state. This command works for physical Ethernet interfaces and physical Ethernet interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership port-channels [interface port-channel channel-number] [brief   detail]	Checks for port-channel membership in the hardware in all modules and validates it with the software state. This command runs per port channel.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership port-channels [brief   detail]	Checks for port-channel membership in the hardware in all modules and validates it with the software state. This command runs for all port channels in the system.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership vlan vlan-id {native-vlan   private-vlan interface {ethernet slot/port   port-channel number   native-vlan}} [brief   detail   interface]	Determines that the VLAN membership in the software is the same as programmed in the hardware. It also ignores the interfaces that are in the STP BLK state.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards <b>Note</b> The <b>private-vlan</b> command does not support the <b>brief</b> or <b>detail</b> option.
		Note Cisco Nexus 34180YC platform switches support only the native-vlan command.
<pre>show consistency-checker pacl {module module-number   port-channels interface port-channel channel-number}</pre>	Validates the IPv4, IPv6, and MAC PACL programming consistency between the hardware and software and verifies if <label, entry-location=""> pairs are consistent between the hardware and software.</label,>	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
<pre>show consistency-checker pacl extended ingress {ip   ipv6   mac} interface {ethernet slot/port   port-channel number} [brief   detail]</pre>	Verifies PACL programming for ingress interfaces (including FEX interfaces) and port channels.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker pacl extended ingress {ip   ipv6   mac} module module-number [brief   detail]	Verifies PACL programming across all physical interfaces, subinterfaces, breakout ports, and FEX interfaces for the specified module.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker port-state fabric-ieth [module module-number [ieth-port ieth-port]] [brief   detail]	Verifies the state of internal fabric ports.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker port-state [module module-number] [brief   detail]	Verifies the port state for the specified module.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
<pre>show consistency-checker racl {module module-number   port-channels interface port-channel channel-number   svi interface vlan vlan-id}</pre>	<ul> <li>Validates the IPv4 and IPv6 RACL programming consistency between the hardware and software and verifies if <label, entry-location=""> pairs are consistent between the hardware and software.</label,></li> <li>When invoked per module, this command verifies IPv4 and IPv6 ACL consistency for all of the physical interfaces and subinterfaces for that module.</li> <li>When invoked on a specific port channel, this command verifies for all the member ports.</li> </ul>	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
	<ul> <li>When invoked on all port channels, this command verifies for each port channel that has an ACL applied.</li> <li>Note This command does not verify IPv4 and IPv6 ACLs and does not verify if qualifiers and actions are matching.</li> </ul>	
show consistency-checker racl extended ingress {ip   ipv6} interface {ethernet slot/port   port-channel number   vlan vlan-id} [brief   detail]	Verifies RACL programming for ingress interfaces, subinterfaces, breakout ports, port channels, or SVIs.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker racl extended ingress {ip   ipv6} module module-number [brief   detail]	Verifies RACL programming for ingress interfaces on the specified module. This command runs across all of the physical interfaces, subinterfaces, and breakout ports for that module.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker stp-state vlan <i>vlan-id</i> [brief   detail   interface]	Determines whether the spanning tree state in the software is the same as programmed in the hardware. This command is run only on interfaces that are operational (up).	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards.
show consistency-checker vacl extended ingress {ip ipv6 mac} vlan vlan-id [brief detail]	Verifies VACL programming on all of the member interfaces of the VLAN.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker vpc [source-interface] [brief   detail]	Checks for vPC inconsistencies.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FM-S fabric modules.
		Cisco Nexus N3K-C3048TP, N3K-C3064-TC, N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches. Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C9372TX-E, N9K-C9372PX and N9K-C9372PX-E switches.

Command	Description	Supported Platforms
show consistency-checker vxlan config-check [verbose-mode]	Verifies the VXLAN EVPN configuration on the switch.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.
show consistency-checker vxlan infra [verbose-mode]	Checks for inconsistencies with the VXLAN tunnel infrastructure.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.
show consistency-checker vxlan 12 module <i>module-number</i>	Verifies the consistency with VXLAN Layer 2 routes.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.

Command	Description	Supported Platforms
show consistency-checker vxlan 13 vrf [vrf-name   all] [start-scan	Checks for inconsistencies with VXLAN Layer 3 routes.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
report]		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
show consistency-checker vxlan pv	Verifies if VLAN mappings are programmed consistently between the software and across different tables in the hardware. At least one interface needs to be enabled with port VLAN mappings in order to run this command.	Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2, and 9500 platform switches
show consistency-checker vxlan qinq-qinvni	Checks for a multi-tag VLAN list and associated multi-tag vn-segment being consistent in the software and hardware.	Cisco Nexus 9300-FX/FX2 platform switches
<pre>show consistency-checker vxlan selective-qinvni interface {ethernet slot/port   port-channel channel-number}</pre>	Validates if port-specific selective Q-in-VNI mappings are programmed correctly in the software and hardware in order for the inner tags in the packets to be preserved.	Cisco Nexus 9300-EX and 9300-FX/FX2 platform switches
show consistency-checker vxlan vlan [all   vlan-id] [verbose-mode]	Checks for inconsistencies with VXLAN VLANs.	Cisco Nexus 9300-EX and 9300-FX/FX2 platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.

Command	Description	Supported Platforms
show consistency-checker tap-aggregation qinq	Checks for inconsistencies with port tap-aggregation and qinq.	Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX, N9K-C9504-FM-G, and N9KC9508- FM-G switches and N9K-X9716D-GX line cards
show consistency-checker vxlan xconnect	Checks for inconsistencies with VXLAN Xconnect VLANs. Validates that Xconnect ACLs are installed on all units and slices and MAC learn is disabled on all Xconnect VLANs.	Cisco Nexus 9200, 9332C, 9364C, 9300-EX, and 9300-FX/FX2 platform switches
<pre>show consistency-checker vxlan l3 single-route [ipv4   ipv6] [ vrf ]</pre>	Checks for inconsistencies with VXLAN layer 3 single route traffic.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches.
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches and Cisco Nexus 9200, 9300-EX and 9300-FX platform switches.
<pre>show consistency-checker vxlan l2 [mac-address ] [ mac-address</pre>	Checks for inconsistencies with VXLAN layer 2.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches.
]   <b>module</b> ] [ <i>module</i>		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches and Cisco Nexus 9200, 9300-EX and 9300-FX platform switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.

Command	Description	Supported Platforms
show consistency-checker storm-control [brief   detail]	Checks for inconsistencies with storm control	Beginning with Cisco NX-OS Release 10.5(1), the breif and detail of the storm control consistency.
		Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
		Beginning with Cisco NX-OS Release 9.3(5), it is supported on N3K-C30l6Q40GEN3K-C3048IP-IGE, N3K-C3064PQ-10GE, N3K-C3064PQ-10GX, N3K-C3064T-10GT, N9K-C9504-FM, N9K-C9508-FM, N9K-C9508-FM, N9K-C9508-FM-S, N3K-C31128PQ, N3K-C3164Q-40GE, N3K-C3164Q-40GE, N3K-C31108PC-V, N3K-C31108PC-V, N3K-C31108PC-V, N3K-C3128PZ, N9K-C93128TX, N9K-C93128TX, N9K-C9396PX, N9K-C9372PX and N9K-C9332PQ devices.
		Note When ND ISSU is done to Cisco NX-OS Release 10.3(x), and if pol_rate or pol_burst value in hardware and software do not match, the storm control consistency checker fails. To resolve the issue, reconfigure storm control.
<pre>show consistency-checker segment-routing mpls [ip ] [ ip-address ]   mask ] [ mask   vrf ] [ vrf</pre>	Checks route consistency for Underlay Segment Routing (ISIS, BGP, OSPF) and Overlay routes Layer 3 VPN and Layer 2 EVPN.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, and -FX line cards.
		Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX devices.

Command	Description	Supported Platforms
show consistency-checker segment-routing mpls label	Checks label consistency for Underlay Segment Routing (ISIS, BGP, OSPF) and Overlay routes Layer 3 VPN, Layer 2 EVPN, and ADJ SIDS	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, and -FX line cards.
		Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX devices.
show consistency-checker sflow [brief   detail]	Checks the program and consistency configurations for supervisor and line cards hardware tables.	Cisco Nexus 9300-FX2, 9300-FX3, 9300-GX, and 9300-GX2 platform switches <b>Note</b> Beginning with Cisco NX-OS Release 10.3(3)F, Cisco Nexus 9808 platform switches

The following commands do not support JSON output:

- show consistency-checker forwarding {ipv4 | ipv6 } [vrf vrf-name | all] [module module-number | all]
- show consistency-checker pacl {module module-number | port-channels interface port-channel channel-number}
- show consistency-checker racl module module-number
- show consistency-checker racl port-channels interface port-channel channel-number}
- show consistency-checker racl svi interface vlan vlan-id
- show consistency-checker vxlan
- test consistency-checker forwarding {ipv4 | ipv6} [vrf vrf-name | all] [module module-number | all]

The show consistency-checker vxlan commands are not modeled.

## **Multicast Consistency Checker**

The multicast consistency checker is a single-route consistency checker for Layer 2 and Layer 3 routes for verifying the state of multicast routes. The multicast consistency checker executes the show commands in each component, parses the relevant information, and then compares the processed information against the other components to check for inconsistencies. The multicast consistency checker commands terminate upon encountering a failure. The **show consistency-checker 12 multicast group** and **show consistency-checker 13 multicast group** commands return the differences in the expected value and the actual value.

The commands support the following output formats:

- verbose: Displays the results in text format.
- detail: Displays the results in JSON format.
- brief: Displays the results in JSON format with minimal details.

Beginning with Cisco NX-OS Release 10.2(2)F, L3 Multicast Consistency Checker supports NAT translation and is supported on all platforms. UMNAT is not supported.

**Note** MMNAT stands for Multicast to Multicast NAT, MUNAT stands for Multicast to Unicast NAT, and UMNAT stands for Unicast to Multicast NAT. NAT translation must be of the type MMNAT ingress and egress, and MUNAT.

Beginning with Cisco NX-OS Release 10.2(1)F, Multicast over GRE consistency checker is introduced on N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX family switches. Multicast over GRE (mGRE) Consistency Checker supports the following:

- Single route mGRE Consistency Checker
- mGRE tunnels on L3 Ethernet Interfaces, L3 Port-channels and L3 sub-interfaces
- GRE tunnel where transport protocol VRF can be different from tunnel interface VRF. This is supported only for GREv4 GRE tunnels over IPv4 multicast.

Multicast over GRE (mGRE) Consistency Checker does not support the following:

- FEX
- GRE tunnels over IPv6
- mGRE is not supported on EoRs. Consistency check is supported only on N9K-C9316D-GX, N9KC93600CD-GX, N9K-C9364C-GX ToRs.
- mGRE is not supported on SVIs.

The mGRE consistency checks happen only if there is a IP GRE Tunnel interface in the outgoing interface list or if the RPF interface is an IP GRE tunnel interface.

Beginning from Cisco NX-OS Release 10.1(1), the following consistency checkers are supported:

- IPv6 L2 Multicast Consistency Checker
- IPv6 L3 Multicast Consistency Checker
- Multicast NLB Consistency Checker
  - Multicast MAC Lookup mode Consistency Checker
  - Multicast NLB L3 unicast configuration Consistency Checker
- Multicast GRE Consistency Checker

The following existing CLI command is extended to accept IPv6 source and group addresses for IPv6 L2 Multicast Consistency Checker:

# show consistency-checker l2 multicast group <ipv4/ipv6 group address> source <ipv4/v6 source address> vrf <vrf-id> [brief|detail]

The following is the output example for IPv6 L2 Multicast Consistency Checker:

```
# show consistency-checker 12 multicast group ?
A.B.C.D Group IP address
A:B::C:D Group IPv6 address
```

The following existing CLI command is extended to accept IPv6 source and group addresses for IPv6 L3 Multicast Consistency Checker:

show consistency-checker l3 multicast group <ipv4/ipv6 group address> source <ipv4/v6 source address> vlan <vlan-id> [brief]detail]

The following is the output example for IPv6 L3 Multicast Consistency Checker:

# show consistency-checker 13 multicast group ?
A.B.C.D Group IP address
A:B::C:D Group IPv6 address

The following new CLI command is added to support Multicast MAC Lookup mode Consistency Checker:

show consistency-checker l2 multicast mac <mac> vlan <vlan-id>

The following is the output example for Multicast MAC Lookup mode Consistency Checker:

```
# show consistency-checker 12 multicast mac 0100.1234.1234 vlan 10 ?
> Redirect it to a file
>> Redirect it to a file in append mode
brief Show consistency checker structured output in brief
detail Show consistency checker structured output in detail
| Pipe command output to filter
```

**Note** This CLI is used for MAC lookup mode Consistency Checker or L2 mode consistency checker for NLB. The input MAC can be ip-mac or non-ip-mac.

The following new CLI command is added to support Multicast NLB L3 unicast configuration Consistency Checker:

show consistency-checker multicast nlb cluster-ip <unicast-cluster-ip> vrf <vrf-id>

The following is the output example for Multicast NLB L3 unicast configuration Consistency Checker:

```
# show consistency-checker multicast nlb cluster-ip <unicast-cluster-ip>
> Redirect it to a file
>> Redirect it to a file in append mode
brief Show consistency checker structured output in brief
detail Show consistency checker structured output in detail
| Pipe command output to filter
```

The following existing CLI command is used for Multicast GRE Consistency Checker:

show consistency-checker 13 multicast group <ipv4 group address> source <ipv4 source address> vrf <vrf-id> [brief|detail]

### 

Note

Existing IPv4 L3 multicast consistency checker CLI will be used to start Multicast GRE Consistency Checker.

The multicast consistency checker supports the following devices:

- Cisco Nexus 92304QC, 9272Q, 9236C, 92300YC, 93108TC-EX, 93180LC-EX, 93180YC-EX, and 9300-GX platform switches and N9K-X9736C-EX, N9K-X97160YC-EX, N9K-X9732C-EX, and N9K-X9732C-EXM line cards.
- Cisco Nexus 9500 Series switches with N9K-X96136YC-R, N9K-X9636C-R, and N9K-X9636Q-R line cards.

Beginning with Cisco NX-OS Release 9.3(5), multicast consistency checker supports the following devices:

- Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FM-S fabric modules.
- Cisco Nexus N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches.
- Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX, and N9K-C9372PX-E switches.

Beginning with Cisco NX-OS Release 10.1(1), multicast consistency checker supports the following devices:

- Cisco Nexus N9k-C9504 with N9K-X97160YC-EX, N9k-C9504 with N9K-X9732C-EX, N9k-C9504 with N9K-X9732C-FX, N9k-C9504 with N9K-X9736C-FX, N9k-C9504 with N9K-X9736Q-FX, and N9k-C9504 with N9K-X9788TC-FX.
- Cisco Nexus N9k-C9508 with N9K-X97160YC-EX, N9k-C9508 with N9K-X9732C-EX, N9k-C9508 with N9K-X9732C-FX, N9k-C9508 with N9K-X9736C-FX, N9k-C9508 with N9K-X9736Q-FX, and N9k-C9508 with N9K-X9788TC-FX.
- Beginning with Cisco NX-OS Release 10.3(1)F, Multicast Consistency Checker is supported on the Cisco Nexus 9808 platform switches.

The Multicast Consistency Checker verifies the programming consistency of the following Layer 2 components:

- IGMP snooping
- MFDM
- MFIBPI
- MFIBPD
- Hardware tables

The Multicast Consistency Checker verifies the programming consistency of the following Layer 3 components:

- PIM
- MRIB
- IGMP snooping
- MFDM
- MFIBPI
- MFIBPD
- Hardware tables

### **Output Examples for Multicast Consistency Checker Commands**

The following is an example of IGMP snooping output:

switch# show ip igmp snooping groups 225.12.12.28 225.12.12.28 vlan 222
Type: S - Static, D - Dynamic, R - Router port, F - Fabricpath core port

Vlan	Group Address	Ver	Туре	Port list
222	225.12.12.28	v3	D	Eth1/2 Eth1/3 Po12 Po100 Po18

The following is an example of MFDM output:

```
switch# show forwarding distribution 12 multicast vlan 222 group 225.12.12.28 source
225.12.12.28
Vlan: 222, Group: 225.12.12.28, Source: 225.12.12.28
```

```
Outgoing Interface List Index: 4
Reference Count: 204
Num L3 usages: 4
Platform Index: 0xa00004
Vpc peer link exclude flag set
Number of Outgoing Interfaces: 5
Ethernet1/2
Ethernet1/3
port-channel12
port-channel18
port-channel100
```

The following is an example of comparing IGMP Snooping with MFDM (passed):

The following is an example of comparing IGMP Snooping with MFDM (failed):

### **Congestion Detection and Avoidance**

Beginning Cisco NX-OS Release 9.3(3), Cisco Nexus 9000 series switches supports **show tech-support slowdrain** command to troubleshoot congestion issues. The **show tech-support slowdrain** command contains

some of the congestion detection indications, counters, and log messages as well as other commands that allow an understanding of the switches, Cisco NX-OS versions, and topology.

Since, congestion can propagate from one switch to another, you must gather the **show tech-support slowdrain** command output from all the switches at the same time for a better assessment of the congestion triggers and propogation.

## **ACL Consistency Checker**

Beginning with Cisco NX-OS Release 9.3(3), the ACL consistency checker supports the following devices:

N9K-C9372PX, N9K-C9372PX-E, N9K-C9372TX, N9K-C9372TX-E, N9K-C9332PQ, N9K-C93128TX, N9K-C9396PX, N9K-C9396TX, N9K-C9508-FM-S, N9K-C9508-FM2, N9K-C9504-FM-S, N9K-X9632PC-QSFP100, N9K-X9432C-S

Beginning with Cisco NX-OS Release 9.3(5), the ACL consistency checker is supported on Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX, N9K-C93240YC-FX2, N9K-C93180YC-EX, N3K-C3636C-R, N3K-C36180YC-R; and Cisco Nexus 9500 Series switches with N9K-X9636Q-R, N9K-X9636C-RX and N9K-X96136YC-R line cards.

Beginning with Cisco NX-OS Release 10.3(1)F, ACL Consistency Checker is supported on the Cisco Nexus 9808 platform switches.

The following entities are verified as part of the ACL consistency check:

Action, Protocol, SIP, DIP, source port, destination port, Source MAC, Destination MAC, Ethertype, COS, DSCP, VLAN and UDFs.

Cisco NX-OS supports the following PACL, RACL, and VACL consistency checker commands.

Command	Description
show consistency-checker pacl extended ingress ip module <module-id> [brief   detail]</module-id>	Verifies PACL consistency check for ingress interfaces and port channel for the specified IP module.
show consistency-checker pacl extended ingress ipv6 module <module-id> [brief   detail]</module-id>	Verifies PACL consistency check for ingress interfaces and port channel for the specified IPv6 module.
show consistency-checker pacl extended ingress mac module <module-id> [brief   detail]</module-id>	Verifies MAC PACL consistency check for ingress interfaces and port channel for the specified MAC module.
show consistency-checker pacl extended ingress ip interface { <int-id>   <ch-id> [brief   detail]</ch-id></int-id>	Verifies PACL consistency check for the specified ingress interface.
show consistency-checker pacl extended ingress ipv6 interface { <int-id>   <ch-id> [brief   detail]</ch-id></int-id>	Verifies PACL consistency check for the specified IPv6 ingress interface.
show consistency-checker pacl extended ingress mac interface { <int-id>   <ch-id> [brief   detail]</ch-id></int-id>	Verifies PACL consistency check for the specified ingress MAC interface.

Command	Description
show consistency-checker racl extended ingress ip module <module-id> [brief   detail]</module-id>	Verifies RACL consistency check for ingress interfaces and port channel for the specified IP module.
show consistency-checker racl extended ingress ipv6 module <module-id> [brief   detail]</module-id>	Verifies RACL consistency check for ingress interfaces and port channel for the specified IPv6 module.
show consistency-checker racl extended ingress ip interface { <int-id>   <ch-id>   <vlan-id>} [brief   detail]</vlan-id></ch-id></int-id>	Verifies RACL consistency check for the specified ingress interface.
show consistency-checker racl extended ingress ipv6 interface { <int-id>   <ch-id>   <vlan-id>} [brief   detail]</vlan-id></ch-id></int-id>	Verifies RACL consistency check for the specified ingress IPv6 interface.
show consistency-checker vacl extended ingress ip vlan <vlan-id> [brief   detail]</vlan-id>	Verifies VACL consistency check for the specified IP VLAN.
show consistency-checker vacl extended ingress ipv6 vlan <vlan-id> [brief   detail]</vlan-id>	Verifies VACL consistency check for the specified IPv6 VLAN.
show consistency-checker vacl extended ingress mac vlan <vlan-id> [brief   detail]</vlan-id>	Verifies VACL consistency check for the specified ingress MAC VLAN.

#### **Output Examples for ACL Consistency Checker Commands**

This example shows the RACL consistency check results:

```
switch# show consistency-checker racl extended ingress ip module 1 Consistency checker
passed for Eth1/3 (ingress, ip, ip-list)
switch#
switch#
switch# show consistency-checker racl extended ingress ip module 1 brief
{
   "result": {
   "status": "CC STATUS OK",
   "checkers": [
     {
       "version": 1,
       "type": "CC_TYPE_IF_RACL",
       "status": "CC STATUS OK",
        "platformDetails": {
        "classType": "CC_PLTFM_NXOS_BCM"
      },
      "recoveryActions": [],
      "failedEntities": []
      }
    ]
   }
}
switch#
switch # show consistency-checker racl extended ingress ip interface ethernet 3/5
Consistency checker passed for Ethernet3/5 (ingress, ip, ip-list)
switch#
switch# show consistency-checker racl extended ingress ip interface ethernet 3/5 brief
```

```
{
    "result": {
    "status": "CC_STATUS_OK",
    "checkers": [
        {
            "version": 1,
            "type": "CC_TYPE_IF_RACL",
            "status": "CC_STATUS_OK",
            "platformDetails": {
                "classType": "CC_PLTFM_NXOS_BCM"
            },
            "recoveryActions": [],
            "failedEntities": []
            }
        ]
      }
```

# **Proactive Consistency Checker**

Consistency check between software and hardware tables on Nexus platform is a high priority serviceability challenge with respect to route consistency checker. The existing route consistency checker is not a proactive mechanism and is an on-demand consistency checker when a command is issued.

The Proactive Consistency checker has a route/adjacency consistency checker that runs in the background continuously that enables to pro-actively detect any inconsistency for IPv4 or IPv6 routes and ARP or ND adjacencies.

Beginning with Cisco NX-OS Release 10.3(1)F, Proactive Consistency Checker is supported on Cisco Nexus 9504/9508 modular chassis with R/RX line cards.

The Proactive Consistency Checker is supported on all Cloudscale EOR and TOR platforms. It has two types of consistency checking methods.

- The Full Database Consistency Checker: This performs the consistency check on complete route and adjacency database.
- The Incremental Consistency Checker: This consistency check runs on the incremental change set of routes and adjacencies which got updated or added over a period of time.

Beginning with Cisco NX-OS Release 10.3(2)F, Proactive consistency checker will be supporting MPLS route consistency check for IPv4, IPv6, VPNv4, VPNv6, and PE/Deagg FEC types on Cisco Nexus 9504 and 9508 modular chassis with R/R2/RX line cards.

### Show commands

Whenever any inconsistency is found by the proactive consistency checker, the following syslog will be generated:

"%UFDM-3-PROACTIVE CC INCONSISTENCY FOUND: Inconsistencies found in Proactive CC session"

The following two commands must be used to check the inconsistencies during proactive consistency check:

Commands	Description
show forwarding proactive-cc inconsistencies	This show command displays the inconsistencies found in the last failed iteration.
show forwarding proactive-cc inconsistencies all	This show command displays all the inconsistencies found from the time when the proactive consistency check is configured

If the user intends to clear the inconsistencies seen in the above two commands, the following command can be used:

"clear forwarding proactive-cc inconsistencies"

## **Configuration Commands**

The following are the commands to enable/disable the feature and to change the periodicity (timer) for incremental and full consistency check:

- platform proactive-cc forwarding (enables with default timers)
- no platform proactive-cc forwarding (to disable)
- platform proactive-cc forwarding fulldb <time in sec>
- platform proactive-cc forwarding incremental <time in sec>
- platform proactive-cc forwarding incremental <time in sec> fulldb <time in sec>

Command	Purpose
platform proactive-cc forwarding	This command enables the proactive consistency
Example:	checker in the switch and default timers will be set.
switch(config)# platform proactive-cc	FulldB default timer value is 86400.
forwarding	Incremental dB default timer value is 10 seconds.
no platform proactive-cc forwarding	This command disables the proactive consistency
Example:	checker.
<pre>switch(config)# no platform proactive-cc</pre>	
forwarding	
platform proactive-cc forwarding fulldb <time in<="" th=""><th>This command will configure proactive consistency</th></time>	This command will configure proactive consistency
sec>	checker fulldB timer to 600 seconds.
Example:	
<pre>switch(config)# platform proactive-cc</pre>	
forwarding fulldb 600	

Command	Purpose
platform proactive-cc forwarding incremental <time in="" sec=""></time>	This command will configure proactive cc incremental timer value to 20 seconds.
Example:	
switch(config)# platform proactive-cc forwarding incremental 20	
platform proactive-cc forwarding incremental <time in="" sec=""> fulldb <time in="" sec=""></time></time>	This command will configure both incremental timer and fulldB timer together.
Example:	
<pre>switch(config)# platform proactive-cc forwarding incremental 20 fulldb 600</pre>	

# **Interface Consistency Checker**

Beginning with Cisco NX-OS Release 10.3(1)F, Interface Consistency Checker is supported on the Cisco Nexus 9808 platform switches.

# **ITD Consistency Checker**

ITD generates settings on dependent components internally to achieve expected functionality. Any unexpected setting on these components results in an ITD malfunction. The ITD consistency-checker through CLI, displays if any inconsistency is found between the ITD and actual settings on these components.

ITD consistency-check is stop-on-error, which means if a property check fails for service, ITD skips checking the remaining properties and replies with a failure for that service.

For example: When running the **show consistency-checker itd all** [**brief** | **detail**] command, if one property check fails for one service, ITD will move on to check the next service.

Beginning with Cisco NX-OS Release 10.3(2)F, the following ITD consistency checker commands are supported on Cisco Nexus 9300-EX/FX/FX2/FX3/GX/GX2 platform switches:

Command	Description
<pre>show consistency-checker itd <service-name> [brief   detail]</service-name></pre>	Displays the consistency-check on one service <i><service-name></service-name></i> . If the service does not exist, the check will be skipped.
show consistency-checker itd all [brief   detail]	Displays the consistency-check for each existing ITD service in order and responses with the result if check for each service is passed or failed.

Command	Description
<pre>show consistency-checker itd ingress interface &lt; intf-name&gt; source <srcip> destination <destip> [brief   detail]</destip></srcip></pre>	Displays whether the ITD service consistency-checker is passed or failed if the given flow to the ingress interface hits a redirect policy generated by an ITD service. If the flow is not hitting any ITD generated policy, the service consistency-check will treat as passed.

# **Configuration Files**

Configuration files contain the Cisco NX-OS commands used to configure the features on a Cisco NX-OS device. Cisco NX-OS has two types of configuration files: running configuration and startup configuration. The device uses the startup configuration (startup-config) during the device startup to configure the software features. The running configuration (running-config) contains the current changes that you make to the startup-configuration file. You should create a backup version of your configuration files before modifying that configuration. You can back up the configuration files to a remote server. See the configuration file information in the *Cisco Nexus 9000 Series NX-OS Fundamentals Configuration Guide*. You can also create a checkpoint copy of the configuration file that you can roll back to if problems occur. See the rollback feature in the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Cisco NX-OS features can create internal locks on the startup configuration file. In rare cases, these locks might not be removed by the features. Use the **system startup-config unlock** command to remove these locks.

# **CLI** Debug

Cisco NX-OS supports an extensive debugging feature set for actively troubleshooting a network. Using the CLI, you can enable debugging modes for each feature and view a real-time updated activity log of the control protocol exchanges. Each log entry has a time stamp and is listed chronologically. You can limit access to the debug feature through the CLI roles mechanism to partition access on a per-role basis. While the **debug** commands show real-time information, you can use the **show** commands to list historical and real-time information.

Caution

Use the **debug** commands only under the guidance of your Cisco technical support representative because some **debug** commands can impact your network performance.

You can log debug messages to a special log file, which is more secure and easier to process than sending the debug output to the console.

By using the ? option, you can see the options that are available for any feature. A log entry is created for each entered command in addition to the actual debug output. The debug output shows a time-stamped account of the activity that occurred between the local device and other adjacent devices.

You can use the debug facility to track events, internal messages, and protocol errors. However, you should be careful when using the debug utility in a production environment because some options might prevent access to the device by generating too many messages to the console or creating CPU-intensive events that could seriously affect network performance.

Note

We recommend that you open a second Telnet or SSH session before you enter any **debug** commands. If the debug session overwhelms the current output window, you can use the second session to enter the **undebug all** command to stop the debug message output.

### **Debug Filters**

You can filter out unwanted debug information by using the **debug-filter** command. The **debug-filter** command allows you to limit the debug information produced by related **debug** commands.

The following example limits EIGRP hello packet debug information to Ethernet interface 2/1:

```
switch# debug-filter ip eigrp interface ethernet 2/1
switch# debug eigrp packets hello
```

## **Ping and Traceroute**

Note

Use the ping and traceroute features to troubleshoot problems with connectivity and path choices. Do not use these features to identify or resolve network performance issues.

The **ping** and **traceroute** commands are two of the most useful tools for troubleshooting TCP/IP networking problems. The ping utility generates a series of echo packets to a destination across a TCP/IP internetwork. When the echo packets arrive at the destination, they are rerouted and sent back to the source.

The traceroute utility operates in a similar fashion but can also determine the specific path that a frame takes to its destination on a hop-by-hop basis.

### Using Ping

Use the **ping** command to verify connectivity and latency to a particular destination across an IPv4 routed network.

Use the **ping6** command to verify connectivity and latency to a particular destination across an IPv6 routed network.

The ping utility allows you to send a short message to a port or end device. By specifying the IPv4 or IPv6 address, you can send a series of frames to a target destination. Once these frames reach the target, they are looped back to the source and a time stamp is taken.

Note

We do not recommend using the Ping utility to test network performance with the IP address configured on the Nexus switch. ICMP (Ping) traffic directed to the switch IP address is subject to CoPP (Control Plane Policing) and may be dropped.

```
switch# ping 172.28.230.1 vrf management
PING 172.28.230.1 (172.28.230.1): 56 data bytes
64 bytes from 172.28.230.1: icmp_seq=0 ttl=254 time=1.095 ms
64 bytes from 172.28.230.1: icmp_seq=1 ttl=254 time=1.003 ms
64 bytes from 172.28.230.1: icmp_seq=2 ttl=254 time=1.101 ms
64 bytes from 172.28.230.1: icmp_seq=3 ttl=254 time=1.093 ms

```

### **Using Traceroute**

Use traceroute to do the following:

- Trace the route followed by the data traffic.
- Compute the interswitch (hop-to-hop) latency.

The traceroute utility identifies the path taken on a hop-by-hop basis and includes a time stamp at each hop in both directions. You can use traceroute to test the connectivity of ports along the path between the generating device and the device closest to the destination.

Use the **traceroute** {*dest-ipv4-addr* | *hostname*} [**vrf** *vrf-name*] command for IPv4 networks and the **traceroute6** {*dest-ipv6-addr* | *hostname*} [**vrf** *vrf-name*] command for IPv6 networks. If the destination cannot be reached, the path discovery traces the path up to the point of failure.

```
switch# traceroute 172.28.254.254 vrf management
traceroute to 172.28.254.254 (172.28.254.254), 30 hops max, 40 byte packets
1 172.28.230.1 (172.28.230.1) 0.941 ms 0.676 ms 0.585 ms
2 172.24.114.213 (172.24.114.213) 0.733 ms 0.7 ms 0.69 ms
3 172.20.147.46 (172.20.147.46) 0.671 ms 0.619 ms 0.615 ms
4 172.28.254.254 (172.28.254.254) 0.613 ms 0.628 ms 0.61 ms
```

Press Ctrl-C to terminate a running traceroute.

You can use the following commands to specify a source interface for the traceroute:

Command	Purpose
traceroute {dest-ipv4-addr   hostname} [source {dest-ipv4-addr   hostname   interface}] [vrf vrf-name] Example:	Specifies the source IPv4 address of the traceroute packets from the specified IP address, hostname, or interface.
switch# traceroute 112.112.112.1 source vlan 10	

Command	Purpose
traceroute6 {dest-ipv6-addr   hostname} [source{dest-ipv6-addr   hostname   interface}] [vrf vrf-name]Example:	Specifies the source IPv6 address of the traceroute6 packets from the specified IP address, hostname, or interface.
<pre>switch# traceroute6 2010:11:22:0:1000::1 source ethernet 2/2</pre>	
[no] ip traceroute source-interface interface [vrf vrf-name]	Generates traceroute or traceroute6 packets with the source IP address from the configured interface.
Example:	
switch(config)# ip traceroute source-interface loopback 1	
<pre>show ip traceroute source-interface [vrf vrf-name]</pre>	Displays the configured source interface for the
Example:	traceroute.
<pre>switch# show ip traceroute source-interface vrf all</pre>	
VRF Name Interface	
default loopback1	
ip icmp-errors source-interface interface	Generates ICMP error packets with the source IPv4
Example 1:	or IPv6 address from the configured interface.
switch(config)# ip icmp-errors source-interface loopback 1	You can also optionally configure this command within a virtual routing and forwarding instance (VRF)
Example 2:	
switch(config)# vrf context vrf-blue	
<pre>switch(config-vrf)# ip icmp-errors source-interface loopback 2</pre>	

# **Monitoring Processes and CPUs**

Use the **show processes** command to identify the processes that are running and the status of each process. The command output includes the following:

- PID = process ID.
- State = process state.
- PC = current program counter in hexadecimal format.
- Start\_cnt = how many times a process has been started (or restarted).
- TTY = terminal that controls the process. A (hyphen) usually means a daemon not running on any particular TTY.

• Process = name of the process.

Process states are as follows:

- D = uninterruptible sleep (usually I/O).
- R = runnable (on run queue).
- S = sleeping.
- T = traced or stopped.
- Z = defunct (zombie) process.
- NR = not-running.
- ER = should be running but currently not-running.

Note

Typically, the ER state designates a process that has been restarted too many times, causing the system to classify it as faulty and disable it.

### Using the show processes cpu Command

Use the show processes cpu command to display CPU utilization. The command output includes the following:

• Runtime(ms) = CPU time that the process has used, expressed in milliseconds.

- Invoked = Number of times that the process has been invoked.
- uSecs = Average CPU time, in microseconds, for each process invocation.
- 1Sec = Percentage of CPU utilization for the last 1 second.

```
switch# show processes cpu
PID Runtime(ms) Invoked uSecs 1Sec Process

### Using the show system resources Command

Use the **show system resources** command to display system-related CPU and memory statistics. The output includes the following:

- Load average is defined as the number of running processes. The average reflects the system load over the past 1, 5, and 15 minutes.
- Processes displays the number of processes in the system and how many are actually running when the command is issued.
- CPU states show the CPU usage percentage in user mode, kernel mode, and idle time in the last 1 second.
- Memory usage provides the total memory, used memory, free memory, memory used for buffers, and memory used for cache in kilobytes. Buffers and cache are also included in the used memory statistics.

# **Using Onboard Failure Logging**

Cisco NX-OS provides the facility to log failure data to the persistent storage, which can be retrieved and displayed for analysis. This onboard failure logging (OBFL) feature stores failure and environmental information in nonvolatile memory on the module. This information will help you analyze failed modules.

The data stored by the OBFL facility includes the following:

- · Time of initial power on
- · Slot number of the module in the chassis
- Initial temperature of the module
- · Firmware, BIOS, FPGA, and ASIC versions
- Serial number of the module
- Stack trace for crashes
- CPU hog information
- Memory leak information
- Software error messages
- Hardware exception logs
- Environmental history
- OBFL specific history information
- · ASIC interrupt and error statistics history
- ASIC register dumps

For more information about configuring OBFL, see the *Cisco Nexus* 9000 Series NX-OS System Management Configuration Guide.

## **Using OBFL Error Status Command**

Beginning Cisco NX-OS Release 9.3(3), Cisco Nexus 9000 series switches supports several counters to monitor and log fibre channel interfaces. The counters help identify and troubleshoot issues at FCMAC level.

Use the **show logging onboard error-stats** command to display onboard error statistics. The output includes the following counters:

- FCP\_CNTR\_MAC\_RX\_BAD\_WORDS\_FROM\_DECODER
- FCP\_CNTR\_MAC\_RX\_EOFA
- FCP\_CNTR\_MAC\_RX\_CRC
- FCP\_CNTR\_MAC\_RX\_MAX\_FRAME\_TRUNCATE
- FCP\_CNTR\_MAC\_RX\_MIN\_FRAME\_PAD
- FCP\_CNTR\_CREDIT\_LOSS

#### • FCP\_CNTR\_TX\_WT\_AVG\_B2B\_ZERO

#### The following is an example outout of the **show logging onboard error-stats** command:

switch# show logging onboard error-stats

Module: 1

ERROR STATISTICS INFORMATION FOR DEVICE: FCMAC				
Interface Range	   Error Stat Counter Name 	   Count 	Time Stamp  MM/DD/YY HH:MM:SS

fc1/36	LECP ONTE MAC BY BAD WORDS FROM DECODER	118788	111/14/19 06.16.44	

# **Using Diagnostics**

Generic online diagnostics (GOLD) define a common framework for diagnostic operations across Cisco platforms. The GOLD implementation checks the health of hardware components and verifies proper operation of the system data and control planes. Some tests take effect when the system is booting up; other tests take effect when the system is operational. A booting module goes through a series of checks before coming online to allow the system to detect faults in the hardware components at bootup and to ensure that a failing module is not introduced in a live network.

Defects are also diagnosed during system operation or runtime. You can configure a series of diagnostic checks to determine the condition of an online system. You must distinguish between disruptive and nondisruptive diagnostic tests. Although nondisruptive tests occur in the background and do not affect the system data or control planes, disruptive tests do affect live packet flows. You should schedule disruptive tests during special maintenance windows. The **show diagnostic content module** command output displays test attributes such as disruptive or nondisruptive tests.

You can configure runtime diagnostic checks to run at a specific time or to run continually in the background.

Health-monitoring diagnostic tests are nondisruptive, and they run in the background while the system is in operation. The role of online diagnostic health monitoring is to proactively detect hardware failures in the live network environment and inform you of a failure.

GOLD collects diagnostic results and detailed statistics for all tests including the last execution time, the first and last test pass time, the first and last test failure time, the total run count, the total failure count, the

consecutive failure count, and the error code. These test results help administrators determine the condition of a system and understand the reason for a system failure. Use the **show diagnostic result** command to view diagnostic results.

For more information about configuring GOLD, see the Cisco Nexus 9000 Series NX-OS System Management Configuration Guide.

# **Using Embedded Event Manager**

Embedded Event Manager (EEM) is a policy-based framework that allows you to monitor key system events and then act on those events through a set policy. The policy is a preprogrammed script that you can load that defines actions that the device should invoke based on set events occurring. The script can generate actions, including, but not limited to, generating custom syslog or SNMP traps, invoking CLI commands, forcing a failover, and much more.

For more information about configuring EEM, see the Cisco Nexus 9000 Series NX-OS System Management Configuration Guide.

## Using Ethanalyzer

Ethanalyzer is a Cisco NX-OS protocol analyzer tool implementation of the open source software TShark which is a terminal version of Wireshark (formerly Ethereal). You can use Ethanalyzer to troubleshoot your network by capturing and analyzing control-plane traffic on inband and management interfaces across all Nexus platforms.

Note

 Performing ethanalyzer using the front-panel option for an interface bundled into a port-channel is not supported. Instead, use the port-channel option.

Beginning with Cisco NX-OS Release 10.3(1)F, Ethanalyzer is supported on Cisco Nexus 9808 platform switches.

To configure Ethanalyzer, use the following commands:

Command	Purpose
ethanalyzer local interface inband	Captures packets sent or received by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface inband-in	Captures packets received by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface inband-out	Captures packets sent by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface mgmt	Captures packets sent or received by the management interface and displays summarized protocol information for captured packets.

Command	Purpose
ethanalyzer local interface front-panel	Captures packets sent or received by the supervisor through a Layer 3 (routed) front-panel port and displays summarized protocol information for captured packets.
	Note This command does not support capturing packets sent or received by the supervisor through Layer 2 (switchport) front-panel ports.
ethanalyzer local interface port-channel	Captures packets sent or received by the supervisor through a Layer 3 (routed) port-channel interface and displays summarized protocol information for captured packets.
	<b>Note</b> This command does not support capturing packets sent or received by the supervisor through Layer 2 (switchport) port-channel interfaces.
ethanalyzer local interface vlan	Captures packets sent or received by the supervisor through a Layer 3 Switch Virtual Interface (SVI) and displays summarized protocol information.
ethanalyzer local interface netstack	Captures packets sent or received by the supervisor through the Netstack software component and displays summarized protocol information.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} limit-captured-frames	Limits the number of frames to capture within the Ethanalyzer session. The number of frames can be an integer value from 0 to 500,000. If 0 is provided, then a maximum of 500,000 frames will be captured before the Ethanalyzer session automatically stops.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} limit-frame-size	Limits the length of the frame to capture. The length of frame can be an integer value from 192 to 65,536.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} capture-filter	Filters the types of packets to capture using Berkeley Packet Filter (BPF) syntax.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} display-filter	Filtersthe types of captured packets to display using Wireshark or TShark Display Filters.
$ethanalyzer\ local\ interface\ \{front-panel\  \ inband\  \ inband\  \ inband-out\  \ mgmt\  \ port-channel\  \ vlan\}$ write	Saves the captured data to a file. Valid storage options include the switch's bootflash, logflash, a USB storage device, or volatile storage.
ethanalyzer local read	Opens a captured data file and analyzes the file. Valid storage options include the switch's bootflash, logflash, a USB storage device, or volatile storage.

Command	Purpose
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} autostop	Specifies a condition that will automatically stop the Ethanalyzer session. You can specify the duration of the session in seconds, number of files to capture when writing captured packets to a file using the <b>write</b> keyword, and file size when writing captured packets to a file using the <b>write</b> keyword.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} capture-ring-buffer	Specifies the capture ring buffer options for Ethanalyzer. This option will continuously write to one or more files in a ring buffer when combined with the write keyword. You can specify the duration in seconds that Ethanalyzer will wait before writing to a new file, the number of files to keep as part of the ring buffer, and the file size of each individual file in the ring buffer.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} detail	Displays detailed protocol information for captured packets.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} raw	Displays captured packets inhex format.
ethanalyzer local interface {front-panel   inband   inband-in   inband-out   mgmt   port-channel   vlan} vrf	Specifies the VRF that the Layer 3 interface is a member if the Layer 3 interface is in a non-default VRF.

#### **Guidelines and Limitations**

- If a Layer 3 interface is a member of a non-default VRF and is specified in an Ethanalyzer session (for example, through the **ethanalyzer local interface front-panel ethernet1/1** or **ethanalyzer local interface port-channel1** commands), you must specify the VRF that the Layer 3 interface is a member of within the Ethanalyzer session using the **vrf** keyword. For example, to capture packets received or sent by the supervisor through Layer 3 front-panel port Ethernet1/1 in VRF "red", use the **ethanalyzer local interface front-panel ethernet1/1 vrf red** command.
- When writing to a file, Ethanalyzer will automatically stop if the Ethanalyzer session captures 500,000 packets, or if the size of the file reaches ~11 megabytes, whichever comes first.

#### Examples

```
switch(config)# ethanalyzer local interface inband
<CR>
> Redirect it to a file
>> Redirect it to a file in append mode
autostop Capture autostop condition
capture-filter Filter on ethanalyzer capture capture-ring-buffer Capture ring buffer option
decode-internal Include internal system header decoding detail Display detailed protocol
information
display-filter Display filter on frames captured
limit-captured-frames Maximum number of frames to be captured (default is 10) limit-frame-size
Capture only a subset of a frame
```

```
mirror Filter mirrored packets
raw Hex/Ascii dump the packet with possibly one line summary
write Filename to save capture to
| Pipe command output to filter
switch(config)# ethanalyzer local interface inband Capturing on 'ps-inb'

```

Use the capture-filter option to select which packets to display or save to disk during capture. A capture filter maintains a high rate of capture while it filters. Because full dissection has not been done on the packets, the filter fields are predefined and limited.

Use the display-filter option to change the view of a capture file. A display filteruses fully dissected packets, so you can do very complex and advanced filtering when you analyze a network tracefile. Ethanalyzer writes captured data to a temporary file if it is not instructed to write captured data to a file elsewhere. This temporary file can fill quickly when a display filter is used without the user's knowledge, since all packets matching the capture-filter option are written to the temporary file, but only packets matching the display-filter option are displayed.

In this example, limit-captured-frames is set to 5. With the capture-filter option, Ethanalyzer shows you five packets which match the filter host 10.10.10.2. With the display-filter option, Ethanalyzer first captures five packets then displays only the packets that match the filter ip.addr==10.10.10.2.

```
switch(config)# ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frames 5

3200
2 packets captured
```

The write option lets you write the capture data to a file in one of the storage devices (such as boothflash or logflash) on the Cisco Nexus 9000 Series Switch for later analysis. The capture file size is limited to 10 MB.

An example Ethanalyzer command with a write option is **ethanalyzer local interface inband** writebootflash:capture\_file\_name. The following is an example of a write option with capture\_filter and an output file name of first-capture:

```
switch(config)# ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frame 5 write ?
bootflash: Filename logflash: Filename slot0: Filename
usb1: Filename
usb2: Filename volatile: Filename
switch(config)# ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frame 5 write bootflash:first-capture
```

When the capture data is saved to a file, the captured packets are, by default, not displayed in the terminal window. The display option forces Cisco NX-OS to display the packets while it saves the capture data to a file.

The capture-ring-buffer option creates multiple files after a specified number of seconds, a specified number of files, or a specified file size. The following are the definitions of those options:

switch(config)# ethanalyzer local interface inband capture-ring-buffer ?
duration Stop writing to the file or switch to the next file after value seconds have elapsed
files Stop writing to capture files after value number of files were written or begin again
with the first file after value number of files were
written (form a ring buffer)
filesize Stop writing to a capture file or switch to the next file after it reaches a size
of value kilobytes

#### The read option lets you read the saved file on the device itself.

```
switch(config)# ethanalyzer local read bootflash:first-capture
2013-02-10 12:51:52.150404 10.10.10.1 -> 10.10.10.2 UDP Source port: 3200 Destination port:

- · List of UDP and TCP port numbers

Ethanalyzer does not capture data traffic that Cisco NX-OS forwards in the hardware.

Ethanalyzer uses the same capture filter syntax as **tcpdump** and uses the Wireshark display filter syntax.

This example shows captured data (limited to four packets) on the management interface:

```
switch(config)# ethanalyzer local interface mgmt limit-captured-frames 4
Capturing on eth1
```

```

```

#### Ethanalyzer Background Capture Process and Autocollection of Inband Packets

Ethanalyzer can be enabled to run as a background task to capture inband packets. The inband packet data is kept in RAM memory in PCAP files. A configurable limited amount of PCAP data (configurable number of files with a configurable file size) is available at any time. When the limit is reached, the oldest file gets overwritten with the current capture in a cyclic way.

The data captured by the Ethanalyzer background task is in RAM, and cyclically overwritten, not taking up bootflash space. For the user to be able to look at the data, a snapshot needs to be taken, which will copy the packet capture info taken by the background process in PCAP format from RAM to non-volatile storage (bootflash) for viewing. Users need to consider available bootflash space when taking a snapshot.

The snapshot can be triggered manually by the user via CLI. EEM policies, can be as well used to trigger the snapshot upon certain events. Use case examples of triggers are inband rate exceeding a defined threshold, CoPP drops exceeding a threshold - the snapshot gives insight what packets were hitting the inband upto the moment of the event.

When monitoring rates, a threshold that exceeds the normally expected or accepted rates by the user, needs to be set to avoid an excess of alerts for non-issues. Attention need to be paid when increasing the max-triggers in the autocollection EEM policy below. Not following these practices can result an excessive amount of irrelevant PCAP data to be snapshotted with a potential of filling up the bootflash.

Ethanalyzer has added CLIs to enable and configure the background session, start and stop the session, snapshot the Ethanalyzer information as well as show commands to look at the background session status. All CLIs are to be run from enable mode.

CLI	Description
ethanalyzer background-session config <filename filesize numfiles session></filename filesize numfiles session>	Configure parameters of ethanalyzer background process/session for capturinig packet in circular buffer.
	• Filename - Background packet capture file name saved by Ethanalyzer background capture process.
	• Filesize - Size of individual capture file that are in temporary buffer. Value ranges from 1-65536 KB.
	• Numfiles - Number of maximum pcap files to be stored in temporary buffer. Value ranges from 2-16.
	<ul> <li>Session – Enable/Disable Ethanalyzer background capture session.</li> </ul>

#### Table 2: Ethanalyzer CLIs

CLI	Description
ethanalyzer background-session restart	Start/Restart Ethanalyzer background capture session.
ethanalyzer background-session stop	Stops the Ethanalyzer background capture session.
show ethanalyzer background-session processes	Show Ethanalyzer background capture session details.
show ethanalyzer background-session config	Print Ethanalyzer background capture session configuration file.
ethanalyzer copy-background-snapshot	Copy the files captured in temporary buffer to bootflash. Files are in pcap format.
ethanalyzer copy-compressed-background-snapshot	Tar the files captured in temporary buffer and copy the tar file to bootflash.
	<b>Note</b> Issuing this CLI multiple times will delete the old tar file. User discretion is adviced to copy the old tar file if it exists in bootflash.

Beginning with Cisco NX-OS, release 10.1(2) Ethanalyzer Autocollection CLI is supported on all Cisco Nexus 9000 Series platforms.

#### Ethanalyzer Autocollection CLI Warnings

The following are the Ethnalyzer Autocollection CLI warnings:

• Whenever any change is made to the background process, user is required ot restart/start the Ethanalyzer background process. The following warning message shall be displayed to user when any config change is made:

"Please restart the Ethanalyzer background process for any config change to take effect."

• In the platforms where supervisor redundancy is supported, switchover of the active supervisor can lead to the Ethanalyzer background capture process to fail to start automatically. User must manually restart the Ethanalyzer background process. If the user wants the Ethanalyzer background process to start automatically after switchover, the user must configure the session enable on the active supervisor, and then reload the switch to take effect. After this, even if the switchover occurs, the Ethanalyzer background capture process will start automatically in the newly active supervisor.

#### **CLI Examples**

Example CLI Output - All commands are run from enable mode

Step 1: Enable Ethanalyzer session running in the background:

switch# ethanalyzer background-session config session enable

```
<!-- path:
                  background packet capture directory where ring buffer files w
ill be saved -->
<!-- filename:
                 background packet capture file name saved by dumpcap. Files w
ill be generated as filename number date format -->
<!-- filesize: Size of individual ring buffer file in kB. Note that the file
size is limited to a maximum value of 65536 kB-->
<!-- num of files: value begin again with the first file after value number of f
iles were written (form a ring buffer). The maximum value should be equal to 16
-->
<!-- session:
                 Enable/disable background packet capture session process. App
licable for both boot-up as well as session restart -->
<ethanalyzer config>
    <filepath>/tmp/dumpcap bg session files/</filepath>
    <filename>capture</filename>
   <filesize>2048</filesize>
    <numfiles>2</numfiles>
    <session>enable</session>
</ethanalyzer config>
```

The following is the CLI output:

```
switch# ethanalyzer background-session restart
root 30038 1 0 13:58 ttyS0 00:00:00 /usr/bin/dumpcap -n -b filesize:
2048 -b files:2 -i ps-inb -Z none -w /tmp/dumpcap_bg_session_files/capture.pcap
```

Step 2: Verifying the background session configuration parameters

switch# show ethanalyzer background-session process

Step 3: Start the background Ethanalyzer process

#### switch# ethanalyzer background-session restart

Step 4: Verifying the running of Ethanalyzer background capture session

#### switch# ethanalyzer background-session processes

```
Background session of packet analyzer:
root 17216 1 4 12:43 ttyS0 00:00:00 /usr/bin/dumpcap -n -b filesize:2048 -b files:2 -i
ps-inb -Z none -w /tmp/dumpcap_bg_session_files/capture.pcap
switch#
```

#### Usecase example: Execute CLI to capture a snapshot for viewing

switch# ethanalyzer copy-background-snapshot

Copy packet analyzer captured frames to bootflash... Copied snapshot files : 72 -rw-rw-rw- 1 root root 65844 Jan 21 00:21 CAPTURE\_00001\_20210121001903.pcap switch# ethanalyzer copy-compressed-background-snapshot Copy packet analyzer captured compressed frames to bootflash... Copied snapshot files : 28 -rw-r--r-- 1 root root 27181 Jan 21 00:22 CAPTURE.tar.gz

Usecase example: Using inband rate monitoring as a trigger for autocollection of Ethanalyzer snapshot.

Table 3: Int	band Rate	Monitoring	CLI	Options
--------------	-----------	------------	-----	---------

CLI	Description
Config mode	system inband cpu-mac log threshold rx rx_pps tx tx_pps throttle secondsrx_pps, tx_pps: 0-1500000 Inband rx/tx pps rate that needs to be logged when exceededseconds: log throttle interval (maximum 1 exceed log per defined interval)
Enable mode	show system inband cpu-mac log threshold" to display settings
Default	off (PPS values 0), throttle interval 120 seconds.

The assumption is that the Ethanalyzer background process feature is configured and running as explained in the previous section. This usecase has example rates for demo or example purpose, but the user needs to use a realistic rate that is considered as worthwhile logging. A threshold that exceeds the user requirements needs to be notified to avoid an excess of alerts for non-issues.

#### Note

Attention needs to be paid when increasing the max-triggers in the autocollection EEM policy below. Not following these practices can result an excessive amount of PCAP data to be snapshotted with a potential of filling up the bootflash.

The max-triggers parameter gets checked against the amount of snapshot files persistently stored in the eem\_snapshots directory on bootflash (bootflash:eem\_snapshots) of the active supervisor. In case of a supervisor switchover, the number of collections on the newly active supervisor can be different from what is on the previously active supervisor, resulting in autocollection to resume or not. The resuming of autocollection depends on the snapshot bundles present on the newly active supervisor's bootflash.

Once the amount of files in the directory mentioned matches max-triggers, autocollection will stop. To start it again, user must remove the snapshot files from the directory to bring the file count to a "value" lower than max-triggers, allowing for another amount (max-triggers minus "value") of autcollections. The details explained in the Trigger-Based Event Log Auto-Collection section of the Configuring the Embedded Event Manager chapter.

#### Step 1: Enable inband rate monitoring

```
switch(config)# system inband cpu-mac log threshold rx 400 tx 4000 throttle 60
switch# show system inband cpu-mac log threshold
Thresholds Rx: 400 PPS, Tx; 4000 PPS
Log throttle interval: 60 seconds
```

Leveraging the trigger based log file auto-collection, as explained in the Trigger-Based Event Log Auto-Collection section of the Configuring the Embedded Event Manager chapter, creating the directory (in the example below the name of the directory is "auto\_collect") and creating or enabling the EEM policy, will enable the built-in snapshot collection of event logs and ethanalyzer pcap.

Step 2: Create the directory

```
create auto_collect directory
switch# pwd
bootflash:
switch# cd scripts
switch# mkdir auto collect
```

Step 3: Enable the event manager policy

switch(config)# event manager applet syslog\_trigger override \_\_syslog\_trigger\_default switch(config-applet)# action 1.0 collect auto\_collect rate-limit 60 max-triggers 3

\$\_syslog\_msg
This will enable autocollection for a max of 1x per 60 seconds, with a total max of 3 times for the same trigger,

meaning we will store up to max-triggers x num\_files pcap files for the same syslog trigger (in the example:  $3 \ge 2 = 6$  files).

The above use case in action: identifying a misbehaving host 20.1.1.100 launching high volume of ICMP request.

```
switch#

                                                                          PROCESSING
switch# dir bootflash: | include capture
   2048040 Jan 29 15:15:29 2021 capture_00004_20210129150732.pcap
             Jan 29 15:15:29 2021 capture 00005 20210129151528.pcap
    169288
```

To decode the file captured via background process, please contact cisco tac team.

Use case Example: Use a custom (non built in auto collection yaml) trigger (CoPP drop threshold exceed)

The following are the assumptions:

1. Ethanalyzer background process feature is configured and running as explained before.

2. Step 2 and Step 3 of the previous use case example are in place.

Enable CoPP threshold logging for the class interested in learning why drops happen. The details are in the CoPP configuration guide (reference).

In the example, for class copp-class-normal, which includes ARP, a threshold is set to 1000000 and the logging level is set to 1 (high enough to be picked up for autocollect):

```
class copp-class-normal logging drop threshold 1000000 level 1
```

In the same directory used in the previous use case example (bootflash:scripts/auto\_collect), add file copp.yaml with the following (copp = the component name):

```
# $Id: comp specific yaml $
# $Source: $
# $Author: $
#
#****
version: 1
components:
   copp:
           default:
           copp drops1:
             serviceCOPP:
               match: CoPP drops exceed threshold
               commands: ethanalyzer copy-background-snapshot
The above use case in action: identifying high volume of ARP request causing CoPP drops in the class.
switch#

```

#### SSO Behavior

If standby supervisor comes up with background process config session=disable, then the user is expected to restart the process when this supervisor becomes active.

## SNMP and RMON Support

Cisco NX-OS provides extensive SNMPv1, v2, and v3 support, including Management Information Bases (MIBs) and notifications (traps and informs).

The SNMP standard allows any third-party applications that support the different MIBs to manage and monitor Cisco NX-OS.

SNMPv3 provides extended security. Each device can be selectively enabled or disabled for SNMP service. In addition, each device can be configured with a method of handling SNMPv1 and v2 requests.

Cisco NX-OS also supports Remote Monitoring (RMON) alarms and events. RMON alarms and events provide a mechanism for setting thresholds and sending notifications based on changes in network behavior.

The *Alarm Group* allows you to set alarms. Alarms can be set on one or multiple parameters within a device. For example, you can set an RMON alarm for a specific level of CPU utilization on a device. The *EventGroup* allows you to configure events that are actions to be taken based on an alarm condition. The types of events that are supported include logging, SNMP traps, and log-and-trap.

For more information about configuring SNMP and RMON, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

# **Using the PCAP SNMP Parser**

The PCAP SNMP parser is a tool to analyze SNMP packets captured in .pcap format. It runs on the switch and generates a statistics report for all of the SNMP get, getnext, getbulk, set, trap, and response requests sent to the switch.

To use the PCAP SNMP parser, use one of the following commands:

• debug packet-analysis snmp [mgmt0 | inband] duration *seconds* [*output-file*] [keep-pcap]—Captures packets for a specified number of seconds using Tshark, saves them in a temporary .pcap file, and then analyzes them based on this .pcap file.

The results are saved in the output file or printed to the console, if the output file is not specified. The temporary .pcap file will be deleted by default, unless you use the **keep-pcap** option. Packet capture can be performed on the management interface (mgmt0), which is the default, or the inband interface.

#### **Examples:**

```
switch# debug packet-analysis snmp duration 100
switch# debug packet-analysis snmp duration 100 bootflash:snmp_stats.log
switch# debug packet-analysis snmp duration 100 bootflash:snmp stats.log keep-pcap
```

switch# debug packet-analysis snmp inband duration 100

switch# debug packet-analysis snmp inband duration 100 bootflash:snmp\_stats.log

switch# debug packet-analysis snmp inband duration 100 bootflash:snmp stats.log keep-pcap

• **debug packet-analysis snmp** *input-pcap-file* [*output-file*]—Analyzes the captured packets on an existing .pcap file.

#### **Examples:**

switch# debug packet-analysis snmp bootflash:snmp.pcap

switch# debug packet-analysis snmp bootflash:snmp.pcap bootflash:snmp\_stats.log

# The following example shows a sample statistics report for the **debug packet-analysis snmp** [**mgmt0** | **inband**] **duration** command:

```
switch# debug packet-analysis snmp duration 10

# **Using RADIUS**

The RADIUS protocol is used to exchange attributes or credentials between a head-end RADIUS server and a client device. These attributes relate to three classes of services:

- Authentication
- Authorization
- Accounting

Authentication refers to the authentication of users for access to a specific device. You can use RADIUS to manage user accounts for access to a Cisco NX-OS device. When you try to log into a device, Cisco NX-OS validates you with information from a central RADIUS server.

Authorization refers to the scope of access that you have once you have been authenticated. Assigned roles for users can be stored in a RADIUS server with a list of actual devices that the user should have access to. Once the user has been authenticated, the device can then refer to the RADIUS server to determine the access that the user will have.

Accounting refers to the log information that is kept for each management session in a device. You can use this information to generate reports for troubleshooting purposes and user accountability. You can implement accounting locally or remotely (using RADIUS).

This example shows how to display accounting log entries:

```
switch# show accounting log
Sun May 12 04:02:27 2007:start:/dev/pts/0_1039924947:admin
Sun May 12 04:02:28 2007:stop:/dev/pts/0_1039924947:admin:vsh exited normally
Sun May 12 04:02:33 2007:start:/dev/pts/0_1039924953:admin
Sun May 12 04:02:34 2007:stop:/dev/pts/0_1039924953:admin:vsh exited normally
Sun May 12 05:02:08 2007:start:snmp_1039928528_172.22.95.167:public
Sun May 12 05:02:08 2007:update:snmp_1039928528_172.22.95.167:public:Switchname
```

Note

The accounting log shows only the beginning and end (start and stop) for each session.

# Using syslog

The system message logging software saves messages in a log file or directs the messages to other devices. This feature provides the following capabilities:

- Logging information for monitoring and troubleshooting
- · Selection of the types of logging information to be captured
- Selection of the destination of the captured logging information

You can use syslog to store a chronological log of system messages locally or to send this information to a central syslog server. The syslog messages can also be sent to the console for immediate use. These messages can vary in detail depending on the configuration that you choose.

The syslog messages are categorized into seven severity levels from debug to critical events. You can limit the severity levels that are reported for specific services within the device. For example, you might want to report debug events only for the OSPF service but record all severity level events for the BGP service.

Log messages are not saved across system reboots. However, a maximum of 100 log messages with a severity level of critical and below (levels 0, 1, and 2) are saved in NVRAM. You can view this log at any time with the **show logging nvram** command.

### **Logging Levels**

Cisco NX-OS supports the following logging levels:

- 0-emergency
- 1-alert
- 2-critical
- 3-error
- 4-warning
- 5-notification
- 6-informational
- 7-debugging

By default, the device logs normal but significant system messages to a log file and sends these messages to the system console. Users can specify which system messages should be saved based on the type of facility and the severity level. Messages have a time stamp to enhance real-time debugging and management.

### **Enabling Logging for Telnet or SSH**

System logging messages are sent to the console based on the default or configured logging facility and severity values.

- To disable console logging, use the no logging console command in configuration mode.
- To enable logging for Telnet or SSH, use the **terminal monitor** command in EXEC mode.
- When logging to a console session is disabled or enabled, that state is applied to all future console sessions. If a user exits and logs in again to a new session, the state is preserved. However, when logging to a Telnet or SSH session is enabled or disabled, that state is applied only to that session. The state is not preserved after the user exits the session.

The no logging console command disables console logging and is enabled by default.

switch(config) # no logging console

The terminal monitor command enables logging for Telnet or SSH and is disabled by default.

switch# terminal monitor

For more information about configuring syslog, see the *Cisco Nexus* 9000 Series NX-OS System Management Configuration Guide.

# **Using SPAN**

You can use the Switched Port Analyzer (SPAN) utility to perform detailed troubleshooting or to take a sample of traffic from a particular application host for proactive monitoring and analysis.

When you have a problem in your network that you cannot solve by fixing the device configuration, you typically need to take a look at the protocol level. You can use **debug** commands to look at the control traffic between an end node and a device. However, when you need to focus on all the traffic that originates from or is destined to a particular end node, you can use a protocol analyzer to capture protocol traces.

To use a protocol analyzer, you must insert the analyzer inline with the device under analysis, which disrupts input and output (I/O) to and from the device.

In Ethernet networks, you can solve this problem by using the SPAN utility. SPAN allows you to take a copy of all traffic and direct it to another port within the device. The process is nondisruptive to any connected devices and is facilitated in the hardware, which prevents any unnecessary CPU load.

SPAN allows you to create independent SPAN sessions within the device. You can apply a filter to capture only the traffic received or the traffic transmitted.

For more information about configuring SPAN, see the *Cisco Nexus* 9000 Series NX-OS System Management Configuration Guide.

## **SPAN Consistency Checker**

SPAN Consistency Checker performs a check on the program and consistency configurations for Supervisor, Line cards, and Hardware tables. While configuring a SPAN on a switch, its state gets programed in software, storage, line card, and hardware tables. If these states are not in sync with each other, the SPAN session fails. The SPAN Consistency Checker helps in identifying the inconsistencies in a SPAN session that can be fixed instantly.

The **cc\_monitor\_session.py** is the python script for the SPAN Consistency Checker. This python script fetches the states on the Supervisor, Line cards, and Hardware tables and checks if all the states are in sync with each other.

The following is the CLI for SPAN Consistency Checker:

show consistency-checker monitor session {<session-id> | all}

This CLI executes the python script in the backend and displays the output of the SPAN Consistency Checker. The following is the output:

```
switch# show consistency-checker monitor session 1
Monitor Consistency Check : PASSED
```

## **Using sFlow**

Sampled flow (sFlow) allows you to monitor real-time traffic in data networks that contain switches and routers. It uses the sampling mechanism in the sFlow agent software on switches and routers to monitor traffic and to forward the sample data to the central data collector. For more information about sFlow, see RFC 3176.

The sFlow agent, which is embedded in the Cisco NX-OS software, periodically samples or polls the interface counters that are associated with a data source of the sampled packets.

For more information about configuring sFlow, see Cisco Nexus 9000 Series NX-OS System Management Configuration Guide.

## sFlow Consistency Checker

sFlow Consistency Checker performs a check on the program and consistency configurations for supervisor and line card hardware tables. While configuring sFlow on a switch, its state gets programmed in software, storage, and line card hardware tables. However, on Cisco Nexus 9808 switches, Consistency Checker performs a check on the program and consistency configurations for supervisor and line card hardware abstractions layer. While configuring sFlow on a switch, if the states are not in sync with each other, the SPAN session fails. The sFlow Consistency Checker helps in identifying the inconsistencies in an sFlow session that can be fixed instantly.

You can use the sFlow Consistency Checker to validate the consistency of configurations on the sFlow supervisor process.

Note The sFlow Consistency Checker validates the sFlow configuration information related to data source in sFlow process only.

The following is the command for sFlow Consistency Checker:

switch(config) # show consistency-checker sflow

The following is a sample output:

```
switch(config)# show consistency-checker sflow
SFLOW CC validation start:
passed for interface ethernet 1/15
Consistency checker passed for SFLOW
```

## Using the Blue Beacon Feature

On some platforms, you can cause the platform LEDs to blink. This feature is a useful way to mark a piece of hardware so that a local administrator can quickly identify the hardware for troubleshooting or replacement.

To flash the LEDs on a hardware entity, use the following commands:

Command	Purpose
blink chassis	Flashes the chassis LED.
blink fan number	Flashes one of the fan LEDs.
blink module <i>slot</i>	Flashes the selected module LED.
blink powersupply number	Flashes one of the power supply LEDs.

Mon Aug 31 15:52:53 2015

## **Using the watch Command**

The **watch** command allows you to refresh and monitor Cisco NX-OS CLI command output or Unix command output (through the **run bash** *command* command).

Use the command as follows:

watch [differences] [interval seconds] commandwatch

- differences—Highlights the differences in the command output.
- **interval** *seconds*—Specifies how often the command output is refreshed. The range is from 0 to 2147483647 seconds.
- command—Specifies the command that you want to watch.

Every 1.0s: vsh -c "show interface eth1/15 counters"

The following example shows how the **watch** command can be used to refresh the output of the **show interface eth1/15 counters** command every second and to highlight any differences:

```
switch# watch differences interval 1 show interface eth1/15 counters
```

Port	InOctets	InUcastPkts
Eth1/15	583736	0
Port	InMcastPkts	InBcastPkts
Eth1/15	2433	0
Port	OutOctets	OutUcastPkts
Eth1/15	5247672	0
Port	OutMcastPkts	OutBcastPkts
Eth1/15	75307	0
