Document Conventions

Note As part of our constant endeavor to remodel our documents to meet our customers' requirements, we have modified the manner in which we document configuration tasks. As a result of this, you may find a deviation in the style used to describe these tasks, with the newly included sections of the document following the new format.

Command descriptions use the following conventions:

Convention	Description
bold	Bold text indicates the commands and keywords that you enter literally as shown.
Italic	Italic text indicates arguments for which the user supplies the values.
[x]	Square brackets enclose an optional element (keyword or argument).
[x | y]	Square brackets enclosing keywords or arguments separated by a vertical bar indicate an optional choice.
{x | y}	Braces enclosing keywords or arguments separated by a vertical bar indicate a required choice.
[x {y | z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
`variable`	Indicates a variable for which you supply values, in context where italics cannot be used.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.

Examples use the following conventions:

Convention	Description
`screen font`	Terminal sessions and information the switch displays are in screen font.
`boldface screen font`	Information you must enter is in boldface screen font.
italic screen font	Arguments for which you supply values are in italic screen font.
< >	Nonprinting characters, such as passwords, are in angle brackets.
[ ]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

This document uses the following conventions:

Note Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Caution Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Introduction

This document describes the Cisco NX-OS configuration limits for Cisco Nexus 9000 Series switches.

The values provided in this guide should not be interpreted as theoretical system limits for Cisco NX-OS hardware or Cisco NX-OS software. These limits refer to values that have been validated by Cisco. They can increase over time as more testing and validation is done.

Verified Scalability Limits - Unidimensional

The following tables in this section list the verified scalability limits of the Cisco Nexus 9000 Series switches for Cisco NX-OS Release 10.6(2n).

- VXLAN Verified Scalability Limits, on page 75
- Tetration Verified Scalability Limits, on page 91

These limits are validated with a unidimensional configuration. The values provided in these tables focus on the scalability of one particular feature at a time.

Each number is the absolute maximum that is currently supported by this Cisco NX-OS release for the corresponding feature. If the hardware is capable of a higher scale, future software releases could increase this verified maximum limit. Results might differ from the values that are listed in this guide when you try to achieve maximum scalability with multiple features enabled.

Note

1. If only one number is provided, the verified limit applies to all supported platforms and line cards.
2. Verified limits are provided only for supported platforms.
3. If a feature is not supported for a particular platform, the verified limit is not provided.

Note You can deploy up to 500 commands under config-profile.

Cisco Nexus 2000 Series Fabric Extenders (FEX) Straight Through Mode Verified Scalability Limits

Feature	Supported Platforms	Verified Limits
Fabric Extenders[1] and Fabric Extender server interfaces	Nexus 9300-FX/FX2/FX3 [2]/GX switches	16 and 768
VLANs across all Fabric Extenders	Nexus 9300-FX/FX2/FX3[2]/GX switches	562
VLANs per Fabric Extender server interface[3]	Nexus 9300-FX/FX2/FX3[2]/GX switches	75
Port channels	Nexus 9300-FX/FX2/FX3[2]/GX switches + FEX	511

[1] When FEX configured using "AA" mode, then the maximum number of 6 FEX on the NFE base ToR and 16 FEX for the LSE base ToR are supported.

[2] FEX is not supported on Nexus 9348GC-FX3, and 9348GC-FX3PH, 93108TC-FX3, 9332D-H2R, 93400LD-H1, 9364C-H1, and 92348GC-FX3 switches.

[3] For FEX HIF port channels, Cisco recommends that you enable STP port type edge using the **spanning tree port type edge [trunk]** command.

ePBR Verified Scalability Limits

Feature	Supported Platforms	Verified Limits
Maximum services per switch	Nexus 9300 and 9500 switches	150[4]
Endpoints per service	Nexus 9300 and 9500 switches	64

Feature	Supported Platforms	Verified Limits
ePBR policies per switch	Nexus 9300 and 9500 switches	150
Policies per VRF	Nexus 9300 and 9500 switches	16
Services per chain	Nexus 9300 and 9500 switches	6
Match per policy	Nexus 9300 and 9500 switches	16
Aces per match	Nexus 9300 and 9500 switches	256

[4] Only 62 unique ACLs can be configured per slice of ASIC. Each ACL takes one label. If the same ACL is configured on multiple interfaces, the same label is shared. If each ACL has unique entries, the ACL labels are not shared, and the label limit is 62. In order to achieve 150 services per switch with the limitation of 62 ACLs per slice, the ingress interfaces should be spread across multiple slices of ASIC.

Note

1. For a list of platforms on which ePBR is supported, see the Nexus Switch Platform Support Matrix.
2. For the ACL limitations, see the Cisco Nexus 9000 Series NX-OS Security Configuration Guide.

[9] Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS Interfaces Configuration Guide, Release 10.4(x).

[10] For Nexus 9300-SE1 switches, of the total Router MAC scale, the number of unique 32 bit MSBs allowed for user-defined MAC addresses is 11.

[11] The scale of vPC on the N9K-C9332D-H2R switch has been tested in breakout mode (4x25G) across 28 physical ports.

[12] The total number of available links are 256. When scaling, ensure that uplinks and MCT links are planned accordingly to avoid exceeding this limit.

Note

- The scale for vPC convergence is tested with an LACP supported device connected to the vPC pair link.
- For **interface port-channel** configuration, LACP vPC convergence must be enabled. For more details, see the **Configuring vPCs** section of the *Cisco Nexus 9000 Series NX-OS Interfaces Configuration Guide*.
- For **vPC domain** configuration, the tested time for the delay restore is 150 seconds, the delay restore for interface VLAN is 150 seconds, and the delay restore for orphan ports is 140 seconds. For more details, see the **Configuring vPCs** section of the *Cisco Nexus 9000 Series NX-OS Interfaces Configuration Guide*.
- Above NAT scale numbers are supported provided that enough TCAM resources configured and allocated.

[13] Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS Label Switching Configuration Guide Release 10.4(x).
[14] For Cisco Nexus 9300 and 9500 Series switches, LSPs *ECMP* label stack push cannot exceed 1500.
[15] Nexus X9636C-RX, X9636C-R, X9636Q-R, and 96136YC-R
[16] Hierarchical ECMP provides enhanced ECMP scale and convergence, with two level route resolution.

Note For network scalability, Cisco recommends using a hierarchical routing design with multi-hop BGP for advertising the attached prefixes from a top-of-rack (ToR) or border leaf switch.

ECMP group creation will be limited if the next-hop adjacency space is exhausted.

17 Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS Layer 2 Switching Configuration Guide, Release 10.4(x).

18 Layer 2 unidimensional scale only. SVI, Layer 3 interface, and VXLAN VLANs are not supported. 200K MAC is enabled only when " system routing template-l2-heavy" is configured and the system is reloaded.

19 On EOR, support is for 12,000 PV count with 3967 vlans and RPVST with default timers. If 22,000 PV count is needed with 3968 vlans and RPVST, recommended hello timer value is 4 or higher. It is also recommended to tune forward delay and max age accordingly.

20 Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS Layer 2 Switching Configuration Guide, Release 10.4(x).

Note

- For more information on STP scale considerations, see Spanning Tree Protocol scale considerations, on page 91 section.
- The number of supported VLANs per vPC should be within the MST or RPVST virtual port count that is specified in this table, depending on the topology.
- The number of supported STP VLAN port instances, for Fabric Extender host interface ports, should be less than 13000.
- The ports with switch port isolated are only supported on Layer 2 ports. However, on Layer 2 the following port types are not supported:
  - FEX host interfaces
  - FEX host interface port channels
  - PVLAN ports

Note

- The IPv4 multicast routes and the IPv4/IPv6 host routes share the same hardware table. Limits are provided for both the default line card mode and the max host line card mode.
- High availability (graceful restart and stateful switchover) is not supported when unicast or multicast aggressive timers are configured at any scale.
- The hash table is subject to collisions. Depending on the host route pattern, collisions might occur with an expected hashing efficiency of about 80%.

[25] Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS Security Configuration Guide, Release 10.4(x).

[26] Each IPv6 ACL is limited to 1000 ACEs. This applies to all IPv6 ACLs (RACL, QoS or SPAN filter). No such limitation applies for IPv4 ACL.

[27] ACL SPAN is not supported on Nexus 9364E-SG2-Q and 9364E-SG2-O switches.

Note

- The TCAM entries scalability limits also apply to policy-based TCAM entries (PBACLs).
- Only 62 unique ACLs can be configured. Each ACL takes one label. If the same ACL is configured on multiple interfaces, the same label is shared. If each ACL has unique entries, the ACL labels are not shared, and the label limit is 62.

[28] Nexus 9348GC-FX3PH switch has feature limitations due to Half Duplex only ports, see Cisco Nexus 9000 Series NX-OS System Management Configuration Guide, Release 10.4(x).

[29] A single forwarding engine instance supports four SPAN or ERSPAN sessions. For Cisco Nexus 9300 Series switches, if the first three sessions have bidirectional sources, the fourth session has hardware resources only for Rx sources. This limitation might also apply to Cisco Nexus 9500 Series switches, depending on the SPAN or ERSPAN source's forwarding engine instance mappings.

[30] The number of SPAN or ERSPAN sessions per line card reduces to two if the same interface is configured as the bidirectional source in more than one session.

[31] When configuring a NetFlow flow monitor on a range of VLAN interfaces, the process can be time-consuming (approximately 30 minutes) depending on the range of VLANs specified in the command. To reduce wait time, limit the number of VLANs or specify the VLANs in chunks. Note: On a 9500 modular chassis with 9700-FX or 9700-GX modules, the configuration takes significantly longer time compared to other switches.

NetFlow Scalability Support (Flows) for Cisco Nexus 9500 Family Switches

Feature	Platform	Scale Limit per Slice (Flows)
IP flow monitor	Nexus 9500-EX Line cards	2
IPv6 flow monitor		2
Layer 2 Flow monitor		1
Maximum number of exporters per each flow monitor		2
Flow Scale		24,000 per ASIC slice

Feature	Platform	Scale Limit per Slice (Flows)
IP flow monitor	Nexus 9500-FX Line cards	30
IPv6 flow monitor		28
Layer 2 Flow monitor		1
Maximum number of exporters per each flow monitor		2
Flow Scale		24,000 per ASIC slice

Note NetFlow scale limits are determined based on the interfaces of the line cards where the NetFlow configurations are attached in the modular switches.

NetFlow SVI Verified Scalability Limits

Platform (VLAN Ports)	SVI			VLAN			SVI + VLAN		
	IPv4	IPv6	IPv4 + IPv6	IPv4	IPv6	IPv4 + IPv6	IPv4	IPv6	IPv4 + IPv6
Member ports from Cisco Nexus 9300-FX switches	Total interfaces supported in the system								
Member ports from Nexus 9300-FX switches (EOR chassis)	474	118	94	474	118	94	237	61	38

Note The scale numbers are based on the TCAM space available on the Cisco Nexus 9300-FX switches. A IPv4 flow monitor uses 4 TCAM space for the Cisco Nexus 9300-FX switches. Similarly, a IPv6 flow monitor uses 2 TCAM space for the Cisco Nexus 9300-FX switches.

For port channels, SVIs, and VLANs that have port from both 9300-FX switches, the lower common denominator limit of the 9300-FX switches is applied.

[37] If you have more than 490 groups, then only one group per SVI. SVIs cannot have a user defined MAC or any VRRP group with it.

[41] For vPC configuration, HSRP maximum scale is 16 groups, 15 groups with vPC peer-gateway configured.
[42] If the user has Multi-protocol configuration, user should configure appropriate CoPP policies to avoid any control plane traffic drops.
[43] When using PBR with the "set vrf" option, if the user attempts to shut down the recircular port, it will trigger a modify PPF session from RPM. If the maximum labels (510) have already been consumed and atomic update is enabled, a "label allocation failure" will occur. To avoid this, the user needs to disable atomic update.
[44] 128-way ECMP paths are not supported for MPLS, VXLAN, and L3 tunnels. Resilient hashing is not supported on Cisco Nexus 9808 switch for routing, PBR and Port-channel.
[45] 128-way ECMP paths are not supported for MPLS, VXLAN, and L3 tunnels. Resilient hashing is not supported on Cisco Nexus 9808 switch for routing, PBR and Port-channel.
[46] VM Routes are service routes which are recursively resolved over its Gateway IP/VNF.

Note

- With IPv6 scale, traffic loss could be there for a few seconds during switchover.
- The maximum number of PBR next-hops based on 4 FM-E supported is 192 per slice of the forwarding engine
  - The IPv4/IPv6 host routes and the IPv4 multicast routes share the same hardware table. Limits are provided for both the default line card mode and the max host line card mode.
  - The IPv4 and IPv6 unicast routes share the same hardware table. Limits are provided for both the default line card mode and the max host line card mode.
  - High availability (graceful restart and stateful switchover) is not supported when unicast or multicast aggressive timers are configured at any scale.

Guidelines and Limitations for OSPF Verified Scalability Limits

- To achieve the highest scale, we recommend that you use a single OSPF instance instead of multiple instances.
- Each OSPFv2 and OSPFv3 scale value might vary when combined with other parameters.
- The graceful restart timeout value might be increased in multidimensional scenarios.

[47] ECMP objects are not shared across multiple VRFs.
[48] In case of IR, each VNI can have a max of 64 peers.
[49] Beginning with Cisco NX-OS Release10.4(3)F, 1000 VTEP Scale is supported. However, a minimum of 32 GB of memory is required on the device to support this scale.
[50] All /64 routes + 4000 for non /64 routes.
[51] All the other BGW numbers (number of supported L2VNIs, L3VNIs, MAC addresses, IP addresses, and so on) match the values supported on a generic VXLAN EVPN VTEP node.
[52] Total number of Cloudsec Security Associations in hardware = 128 (M *N*L) where (M = no. of Cloudsec peers, N = no. of uplinks on each Cloudsec endpoint, L is number of border gateway nodes)
[53] Multi-Site enabled with TRM supported number of L2VNIs –1000 and L3VNIs –100. Maximum supported multicast underlay and overlay route is 8000. From Cisco NX-OS Release 10.2(3), Multi-Site enabled with TRM supported number of L3VNIs –250. Maximum supported multicast underlay and overlay route is 32000 for Nexus 9300-FX/FX3/GX/GX2 and 8000 for Nexus 9300-FX2 and Nexus 9508.
[54] Number of vrfs * number of sites = 1000
[55] IPv6 unicast traffic is supported only with 9500-FM-G Fabric Modules.
[56] This feature is not supported on Nexus 9348GC-FX3, 9348GC-FX3PH, 9332D-H2R and 93108TC-FX3 switches.
[57] Total number of Cloudsec Security Associations in hardware = 128 (M *N*L) where (M = no. of Cloudsec peers, N = no. of uplinks on each Cloudsec endpoint, L is number of border gateway nodes)
[58] VXLAN underlay and overlay multicast routes shares the same hardware table. Maximum Multicast routes is 8000 in the default mode. If you want more overlay route scale, reduce the underlay multicast control group.
[59] In case of IR, each VNI can have a maximum number of 64 peers; 512 peers supported on 100 VNIs only.
[60] Only one provider VLAN is supported.
[61] The maximum number of Layer-2 subinterfaces is based on the available entries allocated for ing-pacl-sb tcam region.
[62] Since Nexus 9300-FX have only one slice, the maximum number of Layer-2 subinterfaces that can be created is lower than the limit for Nexus 9300-FX2.

[63] ACL TCAM region for ing-sup should be carved to a minimum of 768 using 'hardware access-list tcam region ing-sup <size>' on Cisco Nexus 9300-FX switches.
[64] Cisco Nexus 9700-FX line cards support only core links on the ESI fabric.

Spanning Tree Protocol scale considerations

Spanning Tree Protocol (STP) scalability is assessed using two main metrics, each representing a different dimension of scale:

1. **STP Virtual Port Scale**

   Definition: Represents the total number of STP entities managed, considering both internal STP data structures and port-level MAC programming/VLAN allow lists.

   Calculation: Virtual Port Scale = (Number of physical STP-managed ports) × (Number of VLANs carried by those ports)

   Example (RPVST):

   - 100 VLANs
   - 4 individual L2 interfaces
   - 2 L2 port-channels (each with 8 member interfaces)
   - Calculation:

     (4 individual interfaces + 2 port-channels × 8 members each) × 100 VLANs

     = (4 + 16) × 100 = 2000 Virtual Ports

   Note All port-channel members are included in this calculation.

   MST Scenario:

   For Multiple Spanning Tree (MST), multiply the number of physical interfaces by the number of VLANs in the carried MST instances. If all 100 VLANs are in the same instance, the result is the same (2000 Virtual Ports).

2. **STP Logical Port Scale**

Definition: Measures the maximum STP BPDU load per hello interval, especially relevant for RPVST, which generates a BPDU per VLAN. This metric helps evaluate control plane scalability. Hence, MST is recommended for large-scale environments, as it reduces Logical Port Scale concerns.

Calculation: Logical Port Scale = (Number of individual L2 interfaces + Number of port-channels) × (Number of VLANs carried)

Example:

- 100 VLANs
- 4 individual L2 interfaces
- 2 L2 port-channels
- Calculation:

  (4 interfaces + 2 port-channels) × 100 VLANs

  = 6 × 100 = 600 Logical Ports

Note Port-channel members are not included in this calculation.

Note

- All computation will vary if interfaces have unique VLAN pruning lists or have different MST instances with unique VLAN counts. Always review STP scalability against actual hardware/software limits.
- For large deployments, prefer MST to minimize BPDU processing overhead.

These limits are validated with a multidimensional configuration. The values provided in these tables focus on the scalability of all listed features at the same time.

Deployment Case Studies

This section provides sample topologies for some common deployments. For each topology, the scalability numbers are the limits with all of the listed features enabled at the same time.

Attention These numbers are not the maximum verified values if each feature is viewed in isolation. For these numbers, see the "Verified Scalability Limits" section.

VXLAN BGP/eVPN iBGP Centric Topology

This VXLAN BGP/eVPN iBGP centric topology consists of Cisco Nexus 9300 and 9500 Platform switches acting as VXLAN vPC tunnel endpoints (VTEPs) and VXLAN non-vPC VTEPs. VXLAN VTEPs establish iBGP sessions to a Cisco Nexus 9508 switch (route reflector) acting as a spine node. VXLAN-distributed anycast gateway SVIs are configured for dual stack, and the traffic is dual stack.

The focus of this topology is to test VXLAN overlay network scale and underlay Layer 2 switching and other routing, multicast, and Layer 4 through Layer 7 features for management and operations. Underlay PIM neighbors and IS-IS adjacency were tested with the default timer and Bidirectional Forwarding Detection (BFD) enabled on all links.

In the following table, the Verified Limit column lists the verified scaling capabilities with all listed features enabled at the same time. These numbers are not the maximum verified values if each feature is viewed in isolation.

- Multiple FEXs of type Nexus 2248TP-E, C2348TQ, C2332TQ are used.
- The switches are used at the Layer 2 and Layer 3 boundary and are also configured as VXLAN VTEPs. The FEX host ports are operating as Layer 2 ports. The switches are configured as gateways with the use of SVI interfaces.
