Configuring Monitoring and Accounting for the IPSec VPN SPA

This chapter provides information about configuring monitoring and accounting using the IPSec VPN SPA on the Cisco 7600 series router. It includes the following sections:

- **Overview of Monitoring and Accounting for the IPSec VPN SPA**, page 34-2
- **Monitoring and Managing IPSec VPN Sessions**, page 34-2
- **Configuring IPSec VPN Accounting**, page 34-5
- **Configuring IPSec and IKE MIB Support for Cisco VRF-Aware IPSec**, page 34-9
- **Configuration Examples**, page 34-10

**Note**
For detailed information on Cisco IOS IPSec cryptographic operations and policies, refer to the *Cisco IOS Security Configuration Guide* and *Cisco IOS Security Command Reference* publications.

For information about managing your system images and configuration files, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide* and *Cisco IOS Configuration Fundamentals Command Reference* publications.

For more information about the commands used in this chapter, refer to the *Cisco IOS Software Releases 15.0SR Command References* and to the *Cisco IOS Software Releases 12.2SX Command References*. Also refer to the related Cisco IOS Release 12.2 software command reference and master index publications. For more information, see the “Related Documentation” section on page 20.

**Tip**
To ensure a successful configuration of your VPN using the IPSec VPN SPA, read all of the configuration summaries and guidelines before you perform any configuration tasks.
Overview of Monitoring and Accounting for the IPSec VPN SPA

This chapter describes some IPSec features that can be used to monitor and manage the IPSec VPN. These features include:

- The IPSec VPN monitoring feature, which provides VPN session monitoring enhancements that will allow you to troubleshoot the VPN and monitor the end-user interface.
- The IPSec VPN accounting feature, which enables session accounting records to be generated by indicating when the session starts and when it stops.
- The IPSec and IKE MIB support for Cisco VRF-aware IPSec feature, which provides manageability of VPN routing and forwarding- (VRF-) aware IPSec using MIBs.

Monitoring and Managing IPSec VPN Sessions

The IPSec VPN monitoring feature provides VPN session monitoring enhancements that will allow you to troubleshoot the Virtual Private Network (VPN) and monitor the end-user interface. A crypto session is a set of IPSec connections (flows) between two crypto endpoints. If the two crypto endpoints use IKE as the keying protocol, they are IKE peers to each other. Typically, a crypto session consists of one IKE security association (for control traffic) and at least two IPSec security associations (for data traffic, one per each direction). There may be duplicated IKE security associations (SAs) and IPSec SAs or duplicated IKE SAs or IPSec SAs for the same session in the duration of rekeying or because of simultaneous setup requests from both sides.

Session monitoring enhancements include the following:

- Ability to specify an Internet Key Exchange (IKE) peer description in the configuration file
- Summary listing of crypto session status
- Syslog notification for crypto session up or down status
- Ability to clear both IKE and IP Security (IPSec) security associations (SAs) using one command-line interface (CLI)

Adding the Description of an IKE Peer

To add the description of an IKE peer to an IPSec VPN session, perform this task beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
  Router(config)# crypto isakmp peer (ip-address ip-address) | Enables an IPSec peer for IKE querying of authentication, authorization, and accounting (AAA) for tunnel attributes in aggressive mode and enters ISAKMP peer configuration mode.  
  - ip-address—IP address of the peer. |
| **Step 2**  
  Router(config-isakmp-peer)# description description | Adds a description for an IKE peer.  
  - description—Description identifying the peer. |
Verifying Peer Descriptions

To verify peer descriptions, enter the `show crypto isakmp peer` command:

```
Router# show crypto isakmp peer
```

```
Peer: 10.2.2.9 Port: 500
Description: connection from site A
flags: PEER_POLICY
```

When the peer at address 10.2.2.9 connects and the session comes up, the syslog status will be shown as follows:

```
%CRYPTO-5-SESSION_STATUS: Crypto tunnel is UP. Peer 10.2.2.9:500 Description: connection from site A Id: ezvpn
```

Getting a Summary Listing of Crypto Session Status

You can get a list of all the active VPN sessions by entering the `show crypto session` command. The listing will include the following:

- Interface
- IKE peer description, if available
- IKE SAs that are associated with the peer by which the IPSec SAs are created
- IPSec SAs serving the flows of a session

Multiple IKE or IPSec SAs may be established for the same peer, in which case IKE peer descriptions will be repeated with different values for the IKE SAs that are associated with the peer and for the IPSec SAs that are serving the flows of the session.

You can also use the `show crypto session detail` variant of this command to obtain more detailed information about the sessions.

The following is sample output for the `show crypto session` command without the `detail` keyword:

```
Router# show crypto session
```

```
Crypto session current status
Interface: FastEthernet0/1
Session status: UP-ACTIVE
Peer: 172.0.0.2/500
IKE SA: local 172.0.0.1/500 remote 172.0.0.2/500 Active
IPSEC FLOW: permit ip 10.10.10.0/255.255.255.0 10.30.30.0/255.255.255.0
Active SAs: 2, origin: crypto map
```

The following is sample output using the `show crypto session` command with the `detail` keyword:

```
Router# show crypto session detail
```

```
Interface: Tunnel0
Session status: UP-ACTIVE
Peer: 10.1.1.3 port 500 fvrf: (none) ivrf: (none)
Desc: this is my peer at 10.1.1.3:500 Green
Phase1_id: 10.1.1.3
IKE SA: local 10.1.1.4/500 remote 10.1.1.3/500 Active
Capabilities: (none) connid:3 lifetime:22:03:24
IPSEC FLOW: permit 47 host 10.1.1.4 host 10.1.1.3
Active SAs: 0, origin: crypto map
```
Syslog Notification for Crypto Session Up or Down Status

The syslog notification for crypto session up or down status function provides syslog notification every time the crypto session comes up or goes down. To enable syslog logging of the session status, enter the `crypto logging session` and `crypto logging ezvpn` commands in configuration mode.

The following is a sample syslog notification showing that a crypto session is up:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is UP. Peer 10.6.6.1:500 fvrf=name10 ivrf=name20
Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

The following is a sample syslog notification showing that a crypto session is down:

```
%CRYPTO-5-SESSION_STATUS: Crypto session is DOWN. Peer 10.6.6.1:500 fvrf=name10
ivrf=name20 Description: SJC24-2-VPN-Gateway Id: 10.5.5.2
```

Clearing a Crypto Session

In previous Cisco IOS software releases, there was no single command to clear both IKE and IPSec security associations (SAs). Instead, you entered the `clear crypto isakmp` command to clear IKE and the `clear crypto ipsec` command to clear IPSec. The `clear crypto session` command allows you to clear both IKE and IPSec with a single command. To clear a specific crypto session or a subset of all the sessions (for example, a single tunnel to one remote site), you must provide session-specific parameters, such as a local or remote IP address, a local or remote port, a front-door VPN routing and forwarding (FVRF) name, or an inside VRF (IVRF) name. Typically, the remote IP address will be used to specify a single tunnel to be deleted.

If a local IP address is provided as a parameter when you enter the `clear crypto session` command, all the sessions (and their IKE SAs and IPSec SAs) that share the IP address as a local crypto endpoint (IKE local address) will be cleared. If you do not provide a parameter when you enter the `clear crypto session` command, all IPSec SAs and IKE SAs in the router will be deleted.

To clear a crypto session, enter the `clear crypto session` command in privileged EXEC mode from the router command line. No configuration statements are required in the configuration file to use this command:

```
Router# clear crypto session
```

For complete configuration information for IPSec VPN Monitoring, refer to this URL:

For IPSec VPN monitoring configuration examples, see the “IPSec VPN Monitoring Configuration Example” section on page 34-11.
**Configuring IPSec VPN Accounting**

The IPSec VPN accounting feature enables session accounting records to be generated by indicating when the session starts and when it stops.

A VPN session is defined as an Internet Key Exchange (IKE) security association (SA) and the one or more SA pairs that are created by the IKE SA. The session starts when the first IP Security (IPSec) pair is created and stops when all IPSec SAs are deleted. If IPSec accounting is configured, after IKE phases are complete, an accounting start record is generated for the session. New accounting records are not generated during a rekeying.

Session-identifying information and session-usage information is passed to the Remote Authentication Dial-In User Service (RADIUS) server by standard RADIUS attributes and vendor-specific attributes (VSAs).

To enable IPSec VPN accounting, perform this task beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# aaa new-model</td>
<td>Enables periodic interim accounting records to be sent to the accounting server.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# aaa authentication login list-name group radius</td>
<td>Sets authentication, authorization, and accounting (AAA) authentication at login using RADIUS servers.</td>
</tr>
<tr>
<td></td>
<td>• list-name—Character string used to name the list of authentication methods activated when a user logs in.</td>
</tr>
<tr>
<td></td>
<td>• group radius—Uses the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# aaa authorization network list-name group radius</td>
<td>Runs authorization for all network-related service requests, including Serial Line Internet Protocol (SLIP), PPP, PPP Network Control Programs (NCPs), and AppleTalk Remote Access (ARA).</td>
</tr>
<tr>
<td></td>
<td>• list-name—Character string used to name the list of authorization methods activated when a user logs in.</td>
</tr>
<tr>
<td></td>
<td>• group radius—Uses the list of all RADIUS servers for authentication.</td>
</tr>
</tbody>
</table>
### Configuring Monitoring and Accounting for the IPSec VPN SPA

#### Step 4
```
Router(config)# aaa accounting network list-name
start-stop [broadcast] group radius
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables AAA accounting of network-related requested services for billing or security purposes when you use RADIUS.</td>
<td></td>
</tr>
<tr>
<td>- <code>list-name</code>: Character string used to name the list of the accounting methods.</td>
<td></td>
</tr>
<tr>
<td>- <code>start-stop</code>: Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested user process begins regardless of whether the start accounting notice was received by the accounting server.</td>
<td></td>
</tr>
<tr>
<td>- <code>broadcast</code>: (Optional) Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, failover occurs using the backup servers defined within that group.</td>
<td></td>
</tr>
<tr>
<td>- <code>group radius</code>: Uses the list of all RADIUS servers for authentication as defined by the <code>aaa group server radius</code> command.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 5
```
Router(config)# aaa accounting update periodic minutes
```

(Optional) Sends accounting updates to the accounting server while a session is up.

- `minutes`: Specifies the interval (in number of minutes) at which accounting records are to be sent to the accounting server.

#### Step 6
```
Router(config)# aaa session-id common
```

Specifies whether the same session ID will be used for each AAA accounting service type within a call or whether a different session ID will be assigned to each accounting service type.

- `common`: Ensures that all session identification (ID) information that is sent out for a given call will be made identical. The default behavior is common.

#### Step 7
```
Router(config)# crypto isakmp profile profile-name
```

Audits IP security (IPSec) user sessions and enters isakmp-profile configuration mode.

- `profile-name`: Name of the user profile. To associate a user profile with the RADIUS server, the user profile name must be identified.

#### Step 8
```
Router(conf-isa-prof)# vrf ivrf
```

Associates the on-demand address pool with a Virtual Private Network (VPN) routing and forwarding (VRF) instance name.

- `ivrf`: VRF to which the IPSec tunnel will be mapped.
## Command Purpose

| Step 9 | Router(conf-isa-prof)# match identity group group-name | Matches an identity from a peer in an ISAKMP profile.  
| group-name—A unity group that matches identification (ID) type ID_KEY_ID. If unity and main mode Rivest, Shamir, and Adelman (RSA) signatures are used, the group-name argument matches the Organizational Unit (OU) field of the Distinguished Name (DN). |
| Step 10 | Router(conf-isa-prof)# client authentication list list-name | Configures Internet Key Exchange (IKE) extended authentication (XAUTH) in an Internet Security Association and Key Management Protocol (ISAKMP) profile.  
| list-name—Character string used to name the list of authentication methods activated when a user logs in. The list name must match the list name that was defined during the authentication, authorization, and accounting (AAA) configuration. |
| Step 11 | Router(conf-isa-prof)# isakmp authorization list list-name | Configures an IKE shared secret and other parameters using the AAA server in an ISAKMP profile. The shared secret and other parameters are generally pushed to the remote peer via mode configuration (MODECFG).  
| list-name—AAA authorization list used for configuration mode attributes or preshared keys for aggressive mode. |
| Step 12 | Router(conf-isa-prof)# client configuration address [initiate | respond] | Configures IKE mode configuration (MODECFG) in the ISAKMP profile.  
| initiate—(Optional) Router will attempt to set IP addresses for each peer.  
| respond—(Optional) Router will accept requests for IP addresses from any requesting peer. |
| Step 13 | Router(conf-isa-prof)# accounting list-name | Enables AAA accounting services for all peers that connect via this ISAKMP profile.  
| list-name—Name of a client accounting list. |
| Step 14 | Router(conf-isa-prof)# exit | Exits isakmp profile configuration mode and returns to global configuration mode. |
| Step 15 | Router(config)# crypto dynamic-map dynamic-map-name dynamic-seq-num | Creates a dynamic crypto map template and enters the crypto map configuration command mode.  
| dynamic-map-name—Name of the dynamic crypto map set that should be used as the policy template.  
| dynamic-seq-num—Sequence number you assign to the dynamic crypto map entry. |
### Command Purpose

| Step 16 | Router(config-crypto-map)# set transform-set transform-set-name | Specifies which transform sets can be used with the crypto map template. A transform set defines IPSec security protocols and algorithms. Transform sets and their accepted values are described in the *Cisco IOS Security Command Reference*.  
  - transform-set-name—Name of the transform set. |
|---|---|---|
| Step 17 | Router(config-crypto-map)# set isakmp-profile profile-name | Sets the ISAKMP profile name.  
  - profile-name—Name of the ISAKMP profile. |
| Step 18 | Router(config-crypto-map)# reverse-route [remote-peer] | Allows routes (IP addresses) to be injected for destinations behind the VPN remote tunnel endpoint and may include a route to the tunnel endpoint itself (using the `remote-peer` keyword for the crypto map).  
  - remote-peer—(Optional) Routes of public IP addresses and IP security (IPSec) tunnel destination addresses are inserted into the routing table. |
| Step 19 | Router(config-crypto-map)# exit | Exits crypto map configuration mode and returns to global configuration mode. |
| Step 20 | Router(config)# crypto map map-name ipsec-isakmp dynamic dynamic-map-name | Creates a crypto profile that provides a template for configuration of dynamically created crypto maps.  
  - map-name—Name that identifies the crypto map set.  
  - dynamic-map-name—Name of the dynamic crypto map set that should be used as the policy template. |
| Step 21 | Router(config)# radius-server host ip-address [auth-port auth-port-number] [acct-port acct-port-number] | Specifies a RADIUS server host.  
  - ip-address—IP address of the RADIUS server host.  
  - auth-port-number—(Optional) UDP destination port number for authentication requests; the host is not used for authentication if set to 0. If unspecified, the port number defaults to 1645.  
  - acct-port-number—(Optional) UDP destination port number for accounting requests; the host is not used for accounting if set to 0. If unspecified, the port number defaults to 1646. |
| Step 22 | Router(config)# radius-server key string | Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.  
  - string—The unencrypted (cleartext) shared key. |
Chapter 34  Configuring Monitoring and Accounting for the IPSec VPN SPA

Configuring IPSec and IKE MIB Support for Cisco VRF-Aware IPSec

For complete configuration information for IPSec VPN Accounting, refer to this URL:

For IPSec VPN accounting configuration examples, see the “IPSec VPN Accounting Configuration Example” section on page 34-10.

Configuring IPSec and IKE MIB Support for Cisco VRF-Aware IPSec

The IPSec and IKE MIB Support for Cisco VRF-Aware IPSec feature provides manageability of Virtual Private Network routing and forwarding (VRF)-aware IP security (IPSec) using MIBs. The benefit of this feature is that VRF-aware IPSec MIBs provide the granular details of IPSec statistics and performance metrics on a VRF basis.

Note
The IPSec and IKE MIB Support for the Cisco VRF-Aware IPSec feature is only supported as of Cisco IOS Release 12.2(33)SRA and later releases.

MIBs Supported by the IPSec and IKE MIB Support for Cisco VRF-Aware IPSec Feature

The following MIBs are supported by the IPSec and IKE MIB Support for the Cisco VRF-Aware IPSec feature:

- CISCO-IPSEC-FLOW-MONITOR-MIB
- ISCO-IPSEC-MIB
- The CISCO-IPSEC-POLICY-MAP-MIB continues to be supported. However, because this MIB applies to the entire router rather than to a specific VPN VRF instance, it is not VRF-aware; therefore, polling of the object identifiers (OIDs) that belong to this MIB is accomplished with respect to the global VRF context.

Configuring IPSec and IKE MIB Support for Cisco VRF-Aware IPSec

No special configuration is needed for this feature. The SNMP framework can be used to manage VRF-aware IPSec using MIBs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 23  Router(config)# interface type slot/[subslot]/port | Configures an interface type and enters interface configuration mode.  
  - slot/[subslot]/port—Number of the slot, subslot (optional), and port to be configured. |
| Step 24  Router(config-if)# crypto map map-name | Applies a previously defined crypto map set to an interface.  
  - map-name—Name that identifies the crypto map set. |
For complete information for IPSec and IKE MIB Support for Cisco VRF-Aware IPSec, refer to this URL:

Configuration Examples

This section provide examples of the following configurations:

- IPSec VPN Accounting Configuration Example, page 34-10
- IPSec VPN Monitoring Configuration Example, page 34-11

Note
The following examples use commands at the level of Cisco IOS Release 12.2(33)SRA.

As of Cisco IOS Release 12.2(33)SRA, the `crypto engine subslot` command used in previous releases has been replaced with the `crypto engine slot` command (of the form `crypto engine slot slot { inside | outside}`). The `crypto engine subslot` command is no longer supported. When upgrading, ensure that this command has been modified in your start-up configuration to avoid extended maintenance time.

IPSec VPN Accounting Configuration Example
