IPCOIR-6LCWAITINFO	6-Information	CLC [dec]/[dec]>[chars]	The NPE OIR handler received a console error message from a distributed line card while in the crashwait state. The handler enters this state when it detects a Keepalive timeout on a distributed line card. During the crash wait period the LC is expected to collect and store crash information. At the end of the wait period the NPE will reload the LC. During this time it's possible that the LC will try to send error messages to it's console. Normally these would be sent to the NPE via the logger. However during the wait period the IPC link between the NPE and the LC is down so the OIR debug code provides a rudimentary method of collecting and displaying these messages	ubr7200-sw	"Report the problem to Cisco. LCINFO-3-NOBUF	3-Error	Could not malloc line card crash structures on PRE size=[dec]	The PRE could not malloc data structures for line card crash data structures at startup time. This is not in and of itself a Serious problem but the underlying memory shortage at startup time will probably prevent the router from running well if at all.	ubr10k-sw	"Add more memory and/or debug the memory shortage problem."

LCINFO-3-NOCLHANGPROC	3-Error	Failed creating line card hang cure process	When creating the LC hang cure process for checking prolonged CLC down states the create_process call failed. This should not happen. It is probably due to a software defect or hardware failure. This failure should only happen during initialization.	ubr10k-sw	"Rebooting the system should fix this. If the condition persists " "on subsequent reloads of the system a bug should be filed and " "the system should be reloaded with a different image."
LCINFO-3-NOPROCESS	3-Error	Failed creating line card complete process	When creating the crash complete process for the crash information subsystem the create_process call failed. This should not happen. It is probably due to a software defect or hardware failure. This failure should only happen during initialization.	ubr10k-sw	"Rebooting the system should fix this. LCINFO-3-TIMEOUT	3-Error	Timeout waiting for crash info from slot [dec]/[dec]	The crash information complete timer expired. When a line card crashes it sends information to the PRE for debugging and analysis. When the START OF CRASH message is recieved a timer is set for approx 10 seconds. The line card has 10 seconds to send all the crash information to the PRE. This is not a crash dump -- this is a small amount of information that usually includes context stack trace etc. It is less than 8K bytes of information. If an END OF CRASH information message is not received before the timer goes off the crash information record is closed contains partial information this message is	ubr10k-sw	"No action is required specifically because this message was " "displayed. Because the line card was crashing there might be " "other defects to report. If this message is seen without a line " "card crashing report this defect with the output of the usual " "commands includeing show tech-support on the PRE *AND* on the line " "card that didn't crash but was mentioned in this error " "message."

LCINFO-4-LCHUNG	4-Warning	Slot [[dec]/[dec]] down on last [dec] checks. HW RESET # [dec] ...	A line card can get hung in some IOS operation and is not able to recover or when rommon can get stuck while initiating tftp bootload. This is the time when an external monitoring process on RP checks for health of each line card. And if the line card is found stuck for more than 150 seconds a hardware reset is issued for that subslot. ANd while issuing a hard reset this error message is displayed onto the console.	ubr10k-sw	"Report this LC defect with as much information about the LC"

LCINFO-4-TRUNC	4-Warning	Crash record [dec]=[chars] truncated expected=[dec] actual=[dec]	A line card crashed an was sending crash information to the PRE. The PRE received a CRASH RECORD START message that indicated the data would be \expected\ bytes long. Before that many bytes were received the PRE received another CRASH RECORD START message indicating the start of another record. The current record is marked as truncated and the next record is received but the anomaly is noted in this error message. This is a problem but because what started this process was a line card crashing this might only be a symptom of another underlying problem.	ubr10k-sw	"Report this defect with as much information about the BPE subsystem " "and the line card crash information subsystem possible."

LCINFO-4-UNXMSG	4-Warning	Unexpected crash info msg type [chars] in state [chars] LC=[dec]/[dec]	The line card crash information subsystem received an unexpected message for the state it is in. The state and message type are given in the error message. This does not have any adverse effect on the PRE since it ignores and/or recovers from this occurrence. Because the sender of these messages is a line card that is crashing it is not completely unbelievable that this might happen. The source of the crash on the line card is more interesting. If this occurs without a line card crashing it is due to a stray/errant BPE message that should be pursued. This could also be due to a dropped BPE message.	ubr10k-sw	"Find the source of the crash on the line card if one was crashing " "when the message occurred. If no line card was crashing report " "this defect with as much information about the BPE subsystem and " "the line card crash information subsystem as possible. If this " "message persists rebooting the router might help remove this " "message."

~~ERR-MNEMONIC~~	4-Warning	The LISP database-mapping platform limit of [dec] has been reached. Current count is [dec].	This message is a warning that the local database size has hit the platform limit. The limit may be reached during normal operation if a xTR discovers a large number of dynamic hosts in the EID-prefix ranges enabled for dynamic learning. If the dynamic local database size limit is reached new hosts will not be discovered. It is worth noting that it is normal for the local database to have a limit for dynamic entries for example to set an upper limit on the amount of memory required. To diagnose this issue it may be helpful to inspect the local database using show ip[v6] lisp [eid-table <vrf>] database. The entries can also be cleared with clear lisp[eid-table <vrf>] dynamic-eid.	-	"If this warning persists and traffic drops are " "experienced please contact TAC."

~~RSVP~~ RSVP_CHALLENGE	3-Error	No response to challenge issued to [inet] for key ID %*s	The router sent an RSVP message to challenge the untrusted source to\n\ compute a secure hash on a random piece of data and return the hash\n\ with the same data but the source did not reply. The source may\n\ have crashed or lost its network connection. However it is also\n\ possible that the source was unsuccessfully attempting to reply to the challenge command. Since key identifiers must\n\n be unique across all the key chains used by RSVP RSVP will not use the\n\n keys with this identifier in all such key chains. This could cause RSVP\n\n authentication to fail in some cases.	rsvp	"Update the listed key chains so they use different key identifiers."

RSVP-INFO-ACL-CHG	5-Notice	Key chain [chars] [chars] for [inet] because ACL \[chars]\ [chars]		rsvp	"If the ACL change unexpectedly caused authentication to be disabled\n or enabled for one or more RSVP neighbors undo the ACL change so that\n RSVP authentication is not impacted."

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Recommended-Action
			The ACL specified in the message text associates the key chain specified in the message text with a set of RSVP neighbors. RSVP uses the specified key chain to authenticate each RSVP message exchanged with that set of RSVP neighbors after the association is configured. Subsequently the specified ACL has been reconfigured such that the key chain association is no longer valid for one or more RSVP neighbors in the set. This causes RSVP to search the configuration for another suitable key chain to use with those neighbors. If no such key chain is found RSVP will no longer be able to provide authentication for messages exchanged with those RSVP neighbors. This causes RSVP to discard RSVP messages from that set of neighbors. Because this may ultimately lead to loss of RSVP functionality with those neighbors RSVP generates this system message.		

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Recommended-Action
			This system\n\ message may also be generated if the ACL is subsequently changed so that\n\ it re-associates RSVP neighbors with the specified key chain. If RSVP is\n\ not using another key chain for the set of RSVP neighbors specified by\n\ the ACL RSVP will begin using the specified key chain to exchange\n\ authenticated RSVP messages with that set of RSVP neighbors potentially\n\ restoring RSVP functionality with those neighbors.
