

802.1ah Support for Ethernet Infrastructure

Last Updated: May 22, 2012

The Excalibur MAC Tunneling Protocol (MTP) feature is based on IEEE 802.1ah standard and provides Virtual Bridged Local Area Network (VLAN) and MAC scalability. This feature extends the Cisco QinQ (IEEE 802.1ad) capability to support highly scalable Provider Backbone Bridge Architecture (PBB). MTP allows a service provider to interconnect multiple Provider Bridged Networks (PBNs) with maximum 10,48,576 (2 to the power 20) Service VLANS support and extend the MAC address scalability.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About 802.1ah Support for Ethernet Infrastructure

With this feature, you can scale a Provider Bridged P802.1ad network using the existing Bridged and VLAN deployment. Although the current Cisco QinQ capability provides for VLAN scaling, this feature extends the scaling and interoperability between multiple vendors.

To make forwarding decisions, Bridges in a Provider Backbone Bridged Network (PBBN) need to know the MAC address of each host. MTP resolves the issue of MAC address learning by encapsulating the data packet and MAC addresses (source and destination) into a new Ethernet frame. The header of the new Ethernet frame contains:

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

- Backbone VLAN TAG (B-TAG) with 12 bit Backbone VLAN ID (B-VID)
- Destination Backbone MAC (B-MAC)
- Source Backbone MAC (B-MAC)
- Service Instance TAG (I-TAG) with 24 bit Service Instance ID (I-SID)

MAC scalability is implemented using the B-MACs. Since the new Ethernet frames are encapsulated with MAC address while traversing the PBBN, a bridge needs to learn only the B-MACs. The MAC addresses of hosts are hidden from the Provider Backbone Bridges (PBB), resulting in the PB Bridges to learn only the provider MAC address, independent of the number of hosts or the number of host MAC addresses supported. Since the data packets are sent to specific MAC addresses, the 802.1ah cloud is not flooded with unnecessary traffic. A MAC address may be a static entry in the MAC address table on the Backbone Core Bridge.

The VLAN scalability is implemented using the I-SID. The MTP achieves VLAN scalability by using a backbone VLAN TAG with 12 bit B-VID and the Service Instance TAG with 24 bit Service Instance ID to provide the VLAN scalability necessary to map large number of customers.

- [IB Backbone Edge Bridge, page 3](#)
- [Data Plane Processing, page 3](#)
- [MTP Configuration, page 3](#)
- [Scalability Information, page 4](#)

MTP Software Architecture

The encapsulation and decapsulation of MAC addresses is performed on a Backbone Edge Bridge (BEB) at the edge of the PBBN. A BEB can be an I-Bridge (I-BEB), a B-bridge (B-BEB), or an IB-bridge (IB-BEB). MTP with IB-BEB functionality is also supported. The figure below shows the MTP software architecture:

Figure 1 MTP Software Architecture

IB Backbone Edge Bridge

IB-BEB consists of one B-Component and one or more I-Components. An IB-BEB provides the functionality to select the B-MAC and insert I-SIDs based on the supported tags. It also validates the I-SIDs and transmits or receives the frames on the B-VLAN.

The 802.1ah draft describes two types of customer facing interfaces supported by IB-BEB:

- S-Tagged Service Interface
 - Translating S-tagged Interface
 - Bundling S-tagged interface
- Port Based (transparent) Service Interface

MTP supports these interfaces.

Data Plane Processing

The packets on the ingress EFP are tunneled to the appropriate MAC tunnel using the C-MAC bridge domain. For multiple EFPs using the same I-SID, the switching among EFPs is done using the C-MAC bridge domain. The local switching is performed across all ports in the bridge domain even if they span multiple tunnel engines.

MTP Configuration

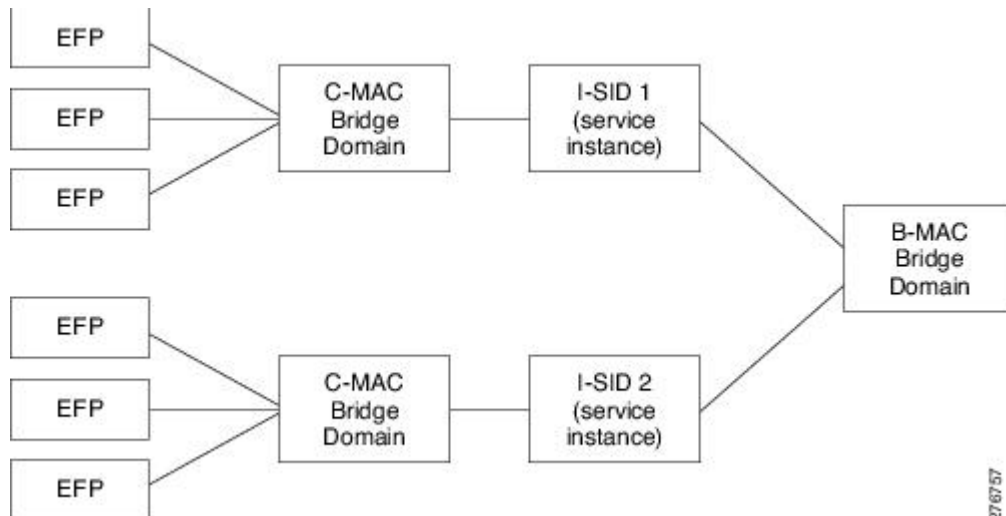

The table below lists the relationship between various entities in a Cisco 7600 Series router for MTP implementation:

Table 1 Relationship between various entities in a Cisco 7600 Series Router

| Entity to Entity | Relationship |
|------------------------------|--------------|
| EFP to C-MAC bridge domain | many to one |
| C-MAC bridge domain to I-SID | one to one |
| I-SID to B-MAC bridge domain | many to one |

The figure below shows N to N relationship within a Cisco 7600 Series Router:

Figure 2 N to N relationship within a Cisco 7600 Series Router

27 67 57

Scalability Information

The table below lists the scalability information for MTP:

Table 2 Scalability Information for MTP

| Scalability Factor | Scalability Number |
|---|------------------------|
| Total number of EVCs in the system | 32000 |
| Total number of EVCs per line card | 16000 |
| Total number of ISIDs in the system | |
| Total C-MAC addresses per LC | 128000 (32000 per NPU) |
| Total number of EVCs per ISID per NPU | 110 |
| Total number of EVCs per ISID for a two port Excalibur | 220 |
| Total number of EVCs per ISID for a four port Excalibur | 440 |
| Total B-bridge-domains per chassis | 4094 |
| Total I-SIDs or MAC-Tunnels | 16000 |
| Total entries in a C-MAC table | 32000 |

How to Configure 802.1ah Support for Ethernet Infrastructure

The configuration of 802.1ah support for ethernet infrastructure of Excalibur MTP for Cisco 7600 Router is described in details below.

Note

Follow these restrictions and usage guidelines when configuring the MAC Tunneling Protocol on an ES40 line card:

- By default, all BPDUs are dropped.
- The Port channels with 802.1ah EVCs are supported. However, there can only be one member link per port channel.
- The IGMP Snooping or any multicast protocol support on the C bridge-domain.
- The MAC address synchronization and MAC address move notification in the C bridge-domain is not supported.
- The DHCP Snooping with 802.1ah EVCs is not supported.
- The B-Bridge and I-Bridge models are not supported.
- An ISID configured under a MAC-Tunnel cannot be configured on another MAC-Tunnel.
- The tunnel-engine configuration is not supported.
- Source MAC address configuration for a Tunnel-Engine is not supported.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface gigabitEthernet** *slot/port* or **interface tengigabitEthernet** *slot/port*
4. **service instance id** {Ethernet [*service-name*]}
5. **encapsulation untagged dot1q** {*any* | *vlan-id*[*vlan-id*[*vlan-id*]]} **second-dot1q** {*any* | *vlan-id*[*vlan-id*[*vlan-id*]]}
6. **rewrite ingress tag** {push {dot1q *vlan-id* | dot1q *vlan-id* second-dot1q *vlan-id* | dot1ad *vlan-id* dot1q *vlan-id*} | pop {1 | 2} | translate {1-to-1 {dot1q *vlan-id* | dot1ad *vlan-id*} | 2-to-1 dot1q *vlan-id* | dot1ad *vlan-id*} | 1-to-2 {dot1q *vlan-id* second-dot1q *vlan-id* | dot1ad *vlan-id* dot1q *vlan-id*} | 2-to-2 {dot1q *vlan-id* second-dot1q *vlan-id* | dot1ad *vlan-id* dot1q *vlan-id*}} [symmetric]
7. **bridge-domain bridge-id c-mac**
8. **exit**
9. **exit**
10. **ethernet mac-tunnel virtual** *mac-in-mac-tunnel-identifier*
11. **bridge-domain bridge-id**
12. **service instance id** {Ethernet [*service-name*]}
13. **encapsulation dot1ah i-sid i-sid_number**
14. **bridge-domain bridge-id c-mac**
15. **exit**
16. **exit**
17. **exit**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |

| | Command or Action | Purpose |
|--------|--|---|
| Step 3 | <p>interface gigabitEthernet <i>slot/port</i> or interface tengigabitEthernet <i>slot/port</i></p> <p>Example:</p> <pre>Device(config)#interface GigabitEthernet 3/1</pre> | <p>Specifies the Gigabit Ethernet interface to be configured, where:</p> <ul style="list-style-type: none"> <i>slot/port</i> --Specifies the location of the interface |
| Step 4 | <p>service instance id {Ethernet [<i>service-name</i>]}</p> <p>Example:</p> <pre>Device(config-if)#service instance 20 ethernet</pre> | <p>Creates a service instance (an instance of an EVC) on an interface and sets the device into the config-if-srv mode.</p> |
| Step 5 | <p>encapsulation untagged dot1q {<i>any</i> <i>vlan-id</i>[<i>vlan-id</i>[<i>vlan-id</i>]]} second-dot1q {<i>any</i> <i>vlan-id</i>[<i>vlan-id</i>[<i>vlan-id</i>]]}</p> <p>Example:</p> <pre>Device(config-if-srv)#encapsulation dot1q 40 second-dot1q 42</pre> | <p>Configures the encapsulation. Defines the matching criteria to be used in order to map ingress dot1q frames on an interface to the appropriate service instance.</p> |
| Step 6 | <p>rewrite ingress tag {push {dot1q <i>vlan-id</i> dot1q <i>vlan-id</i> second-dot1q <i>vlan-id</i> dot1ad <i>vlan-id</i> dot1q <i>vlan-id</i>} pop {1 2} translate {1-to-1 {dot1q <i>vlan-id</i> dot1ad <i>vlan-id</i>} 2-to-1 dot1q <i>vlan-id</i> dot1ad <i>vlan-id</i>} 1-to-2 {dot1q <i>vlan-id</i> second-dot1q <i>vlan-id</i> dot1ad <i>vlan-id</i> dot1q <i>vlan-id</i>} 2-to-2 {dot1q <i>vlan-id</i> second-dot1q <i>vlan-id</i> dot1ad <i>vlan-id</i> dot1q <i>vlan-id</i>}} [symmetric]</p> <p>Example:</p> <pre>[no] bridge-domain bridge-id c-mac</pre> <p>Example:</p> <pre>Device(config-if-srv)#rewrite ingress tag pop 1 symmetric</pre> | <p>Specifies the tag manipulation that is to be performed on the frame ingress to the service instance.</p> |
| Step 7 | <p>bridge-domain bridge-id c-mac</p> <p>Example:</p> <pre>Device(config-if-srv)#bridge-domain 21 c-mac</pre> | <p>Configuring the bridge domain. Binds the service instance to a bridge domain instance where bridge-id is the identifier for the bridge domain instance.</p> |

| | Command or Action | Purpose |
|---------|---|---|
| Step 8 | <p>exit</p> <p>Example:</p> <pre>Device(config-if-srv)#exit</pre> | Exits the service instance mode. |
| Step 9 | <p>exit</p> <p>Example:</p> <pre>Device(config-if)#exit</pre> | Exits interface mode. |
| Step 10 | <p>ethernet mac-tunnel virtual <i>mac-in-mac-tunnel-identifier</i></p> <p>Example:</p> <pre>Device(config)#ethernet mac-tunnel virtual 22</pre> | Configures mac-in-mac tunnel and creates a tunnel identifier for the 802.1ah cloud. Sets the configuration to config-tunnel-minm mode. |
| Step 11 | <p>bridge-domain bridge-id</p> <p>Example:</p> <pre>Device(config-tunnel-minm)#bridge-domain 200</pre> | Binds the mac tunnel to the B-MAC bridge domain instance. |
| Step 12 | <p>service instance id {Ethernet [<i>service-name</i>]}</p> <p>Example:</p> <pre>Device(config-tunnel-minm)#service in 23 ethernet</pre> | Defines the service instance to be used with B-VLAN. Set the configuration mode to config-tunnel-srv mode. |
| Step 13 | <p>encapsulation dot1ah i-sid i-sid_number</p> <p>Example:</p> <pre>Device(config-tunnel-srv)#encapsulation dot1ah isid 24</pre> <p>Example:</p> | Defines the matching criteria to be used to map 802.1ah frames with I-SID id to the appropriate EVC. |
| Step 14 | <p>bridge-domain bridge-id c-mac</p> <p>Example:</p> <pre>Device(config-tunnel-srv)#bridge-domain 21 c-mac</pre> | Maps the I-SID used for forwarding the customer packets to a specific EVC on the interface. The bridge-id mentioned step 7 must match with bridge-id in this step to ensure proper configuration. |

| Command or Action | Purpose |
|---|---|
| Step 15 <code>exit</code> Example: <code>Device(config-tunnel-srv)#exit</code> | Exits the mac-tunnel service instance mode. |
| Step 16 <code>exit</code> Example: <code>Device(config-tunnel-minm)#exit</code> | Exits the mac-tunnel mode. |
| Step 17 <code>exit</code> Example: <code>Device(config)#exit</code> | Exits the global config mode. |

Configuration Examples for 802.1ah Support for Ethernet Infrastructure

This example shows how to configure Excalibur MTP for Cisco 7600 Routers:

```
Device>enable
Device#configure terminal
Device(config)#interface GigabitEthernet 3/1
Device(config-if)#service instance 20 ethernet
Device(config-if-srv)#encapsulation dot1q 40 second-dot1q 42
Device(config-if-srv)#rewrite ingress tag pop 1 symmetric
Device(config-if-srv)#bridge-domain 21 c-mac
Device(config-if-srv)#exit
Device(config-if)#exit
Device(config)#ethernet mac-tunnel virtual 22
Device(config-tunnel-minm)#bridge-domain 200
Device(config-tunnel-minm)#service in 23 ethernet
Device(config-tunnel-srv)#encapsulation dot1ah isid 24
Device(config-tunnel-srv)#bridge-domain 21 c-mac
Device(config-tunnel-srv)#exit
Device(config-tunnel-minm)#exit
Device(config)#exit
```

Use the following commands to verify the MTP configuration:

- You can use the **show platform mtp slot slot_num** command to verify the MTP configuration. This command shows the information about MTP for each slot:

```
Device#sh platform mtp slot 3
SLOT      TUNNELENGINE      VLAN_LIST
3         MacTunnelEngine3/0  200
3         MacTunnelEngine3/1
3         MacTunnelEngine3/2
3         MacTunnelEngine3/3
```

- You can use **show platform mtp c_bd** *c-vlan-id* to view information about a specific C-VLAN:

```
Device#sh platform mtp c_bd 21
C_BD      B_BD      SLOT      PPE      C_BD_COUNT
21        200       3         0        1
Router#
```

- You can use **show platform mtp b_bd** *b-vlan-id* to view information about a specific B-VLAN:

```
Device#sh platform mtp b_bd 200
B_BD      SLOT      PPE      B_BD_COUNT
200       3         0        1
Router#
```

- You can use **show platform mtp befp** *b-efp-id* to view information about a specific B-EFP:

```
Device#sh platform mtp befp 23
BEFP      C_BD      B_BD      SLOT      PPE      C_BD_COUNT
23        21        200       3         0        1
Router#
```

- You can use **show ethernet service mac-tunnel summary** to view a summary of information about a specific mac tunnel.
- You can use **show ethernet service mac-tunnel id [detail]** to view information about a specific mac tunnel, and the ID can range from 1 to 4094.

```
Device#show ethernet service mac-tunnel 1 detail
Tunnel Id: 1
EFP Microblocks:
*****
Microblock type: Bridge-domain
Bridge-domain: 20
No. of Service Instances: 1
Service Instance ID: 16000
