1-Port G.SHDSL WAN Interface Card for Cisco 2600 Series and Cisco 3600 Series Routers

This document describes the Multirate Symmetrical High-Speed Digital Subscriber Line (G.SHDSL) feature supported on the 1-port G.SHDSL WAN interface card (WIC) (WIC-1SHDSL) on Cisco 2600 series and Cisco 3600 series routers in Cisco IOS Release 12.2(8)T.

G.SHDSL is an ATM-based, multirate, high-speed (up to 2.3 MB), symmetrical digital subscriber line technology for data transfer between a single customer premises equipment (CPE) subscriber and a central office.

G.SHDSL is supported on the G.SHDSL WAN interface card (WIC-1SHDSL), a 1-port WAN interface card (WIC) for Cisco 2600 series and Cisco 3600 series routers.

The G.SHDSL WIC is compatible with the Cisco 6015, Cisco 6130, Cisco 6160, and Cisco 6260 Digital Subscriber Line Access Multiplexers (DSLAMs). The DSLAM must be equipped with G.SHDSL line cards that are compatible with the DSL service to be configured.

The G.SHDSL WIC supports ATM Adaptation Layer 2 (AAL2), ATM Adaptation Layer 5 (AAL5), and various classes of service for ATM

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for 1-Port G.SHDSL WAN Interface Card

A G.SHDSL WIC must be installed in the router to match the DSL service to be configured. A compatible G.SHDSL line card must be installed in the DSLAM.

Restrictions for 1-Port G.SHDSL WAN Interface Card

- The G.SHDSL WIC does not support dual latency. When the DSL link is intended to support both voice and data traffic simultaneously, the total supported data rate must be reduced to adjust for the reduced coding gain, which is usually present with high-latency traffic.
- The G.SHDSL WIC does not support Dying Gasp in ANSI T1.413 Issue 2.
- The G.SHDSL WIC does not support available bit rate (ABR) class of service (CoS).
- The G.SHDSL WIC should be inserted only into onboard WIC slots or 1FE2W, 2W, 1FE1R, 2FE2W network modules. This WIC is not supported in old combination network modules.

Information About 1-Port G.SHDSL WAN Interface Card

Benefits

- Enables business-class broadband service with voice integration, scalable performance, flexibility, and security.
- Symmetrical WAN speeds (up to 2.3Mbps) over a single copper pair.
- Repeatable and has thirty percent longer reach than SDSL.
- Rate adaptive with G.HS "handshake" Protocol.
- Based on ITU Recommendation G.991.2 (Accepted Worldwide).
- Support for G.SHDSL Annex A (U.S. signaling) and Annex B (European signaling).
- Multiple G.SHDSL WAN Interface Cards configurable per Cisco 2600 series and Cisco 3600 series chassis.
How to Configure 1-Port G.SHDSL WAN Interface Card

Configuring G.SHDSL on a Cisco Router

To configure G.SHDSL service on a Cisco router containing a G.SHDSL WIC, complete the following steps, beginning in global configuration mode:

SUMMARY STEPS

1. interface atm 1/0
2. ip address IP-address
3. atm ilmi-keepalive seconds
4. pvc [name] vpi/vci
5. protocol ip IP-address
6. vbr-rt peak-rate average-rate burst
7. encapsulation aal1 | aal2 | aal5ciscopp | aal5mux | aal5nlpid | aal5snap
8. exit
9. dsl operating-mode gshdsl symmetric annex {A| B} }
10. equipment-type co | cpe
11. dsl linerate kbps | auto
12. exit
13. exit
14. show interface atm 1/0
15. clear interface atm 1/0

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 interface atm 1/0</td>
<td>Enters ATM configuration mode for interface ATM 0 in slot 1.</td>
</tr>
</tbody>
</table>

Example:

Router(config)# interface atm 1/0
If a slot has two subslots for WIC modules and no ATM interface is present in subslot 0, the WIC will take ATM x/0 as its interface number even if placed in subslot 1 (ATMx/1). If a two-port ATM module is present in subslot 0, the WIC will use ATM x/2 as its interface number. This subslot number is pertinent to all interface commands such as `show interface atm` and `show dsl interface atm`.

**Note**

Assigns an IP address to the DSL ATM interface.

**Step 2**

`ip address IP-address`

**Example:**

```
Router(config-if)# ip address 10.3.0.1 255.255.255.0
```

Assigns an IP address to the DSL ATM interface.

**Step 3**

`atm ilmi-keepalive seconds`

**Example:**

```
Router(config-if)# atm ilmi-keepalive 10
```

(Optional) Enables Integrated Local Management Interface (ILMI) keepalives.

If you enable ILMI keepalives without specifying the seconds, the default time interval is 3 seconds.

**Step 4**

`pvc [name] vpi/vci`

**Example:**

```
Router(config-if-vc)# pvc 10/100
```

Enters atm-virtual-circuit (interface-atm-vc) configuration mode, and configures a new ATM permanent virtual circuit (PVC) by assigning a name (optional) and VPI/VCI numbers.

The default traffic shaping is an unspecified bit rate (UBR); the default encapsulation is AAL5+LLC/SNAP.

**Step 5**

`protocol ip IP-address`

**Example:**

```
Router(config-if-vc)# protocol ip 10.3.0.2 broadcast
```

(Optional) Enables IP connectivity and create a point-to-point IP address for the virtual circuit (VC).

**Step 6**

`vbr-rt peak-rate average-rate burst`

**Example:**

```
Router(config-if-vc)# vbr-rt 672 672 512
```

(Optional) Configures the PVC for real-time variable bit rate (VBR) traffic shaping.

- **Peak rate** --Peak information rate (PIR)
- **Average rate** --Average information rate (AIR)
- **Burst** --Burst size in cells

**Step 7**

`encapsulation aal1 | aal2 | aal5ciscopp | aal5mux | aal5nlpid | aal5snap`

**Example:**

```
Router(config-if-vc)# encapsulation aal2
```

(Optional) Configures the ATM adaptation layer (AAL) and encapsulation type.

- **aal1** --AAL1
- **aal2** --AAL2
- **aal5ciscopp** --Cisco PPP over AAL5
- **aal5mux** --AAL5+MUX
- **aal5nlpid** --AAL5+NLPI

### Configuring ILMI on the DSLAM Connected to the G.SHDSL WIC

The ILMI protocol allows DSLAMs to be used for ATM address registration across an ATM User-Network Interface (UNI). If ILMI is configured on the G.SHDSL WIC, the ATM PVC must be configured on the DSLAM. All switch terminating connections use interface 0/0 to connect to the switch CPU.

For information about configuring the DSLAM, see the Configuration Guide for Cisco DSLAMs with NI-2.

### Verifying ATM Configuration

Use the following commands to verify your configuration:

- To verify current configuration and to view the status for all controllers, use the `show running-config` command.
- To view ATM controller statistics, use the `show controllers atm slot/port` command.
- To verify the PVC status, use the `show atm vc` command. Make sure that active PVCs are up.
- To help identify ATM related events as they are generated, use the `debug atm events` command.
- To indicate which interfaces are having trouble, use the `debug atm errors` command.
- To identify an entry for the ATM interface you configured and to show an entry for the ATM slot/port you configured, use the `show ip route` command.
- To view the status of ATM interface, use the `show interface atm` command. Make sure that the ATM slot/port and the line protocol are up, as shown in the following example:

```text
Router# show interface atm 1/0
ATM1/0 is up, line protocol is up
```

Glossary

ABR--available bit rate.

ADSL--asymmetric digital subscriber line. Available through several telecommunications carriers to accommodate the need for increased bandwidth for Internet access and telecommuting applications.

ATM --Asynchronous Transfer Mode. International standard for cell relay in which multiple service types (such as voice, video, or data) are conveyed in fixed-length (53-byte) cells. Fixed-length cells allow cell processing to occur in hardware, thereby reducing transit delays. ATM is designed to take advantage of high-speed transmission media such as E3, SONET, and T3.

CLI--command-line interface.

CO--central office. Local exchange (local switch) that terminates individual local telephone subscriber lines for switching, and connects to the public network. A CO is known as a class 5 switch office. For example, 5ESS by Lucent and DMS 100 by Nortel.

CPE--customer premise equipment. Devices such as channel service units (CSUs)/data service units (DSUs), modems, and ISDN terminal adapters, required to provide an electromagnetic termination for wide-area network circuits before connecting to the router or access server. This equipment was historically provided by the telephone company, but is now typically provided by the customer in North American markets.

DSL--digital subscriber line available through several telecommunications carriers to accommodate the need for increased bandwidth for Internet access and telecommuting applications.

FXO--foreign exchange office. An FXO interface connects to a central office.
FXS--foreign exchange station. An FXS interface connects directly to a standard telephone, supplying ring voltage, dial tone, and so on.

G.SHDSL--Multirate Symmetrical High-Speed Digital Subscriber Line

IAD--integrated access device. A CPE device used to combine services from various sources onto a common platform for transmission on a common transport span. Typically, an IAD combines various voice and data services such as circuit-based services like traditional POTS and packet-switched services such as frame relay or ATM.

PVC--permanent virtual circuit.
