Controlling Subscriber Bandwidth

Last Updated: December 4, 2011

The Dynamic Subscriber Bandwidth Selection (DBS) feature enables wholesale service providers to sell different classes of service to retail service providers by controlling bandwidth at the ATM virtual circuit (VC) level. ATM quality of service (QoS) parameters from the subscriber domain are applied to the ATM PVC on which a PPP over Ethernet (PPPoE) or PPP over ATM (PPPoA) session is established.

• Finding Feature Information, page 1
• Prerequisites for Controlling Subscriber Bandwidth, page 1
• Restrictions for Controlling Subscriber Bandwidth, page 2
• Information About Controlling Subscriber Bandwidth, page 2
• How to Control Subscriber Bandwidth, page 3
• Configuration Examples for Controlling Subscriber Bandwidth, page 13
• Additional References, page 14
• Feature Information for Controlling Subscriber Bandwidth, page 15

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Subscriber Bandwidth

A Cisco ASR 1000 series router must have the following shared port adapters (SPAs) installed to enable DBS:

• SPA-3XOC3-ATM-V2
• SPA-1XOC3-ATM-V2
• SPA-1XOC12-ATM-V2
Restrictions for Controlling Subscriber Bandwidth

The DBS feature does not support the following:

- Switched virtual circuits (SVC)
- ATM port adapters installed in a Cisco ASR 1000 series router
- When changing QoS values dynamically on a VC, there can be some duration (in milliseconds) during which traffic on the VC is dropped.

Information About Controlling Subscriber Bandwidth

- Traffic-Shaping Parameters, page 2
- Benefits of Controlling Subscriber Bandwidth, page 3

Traffic-Shaping Parameters

Using DBS you can set the ATM permanent virtual circuit (PVC) traffic-shaping parameters to be dynamically changed based on the RADIUS profile of a PPPoE or PPPoA user logging in on the PVC. If the user is the first user on a given PVC, the RADIUS profile values override the default values of the PVC. If users already exist on the PVC, the new value overrides the existing configuration only if it is higher than the existing value. If multiple PPPoE sessions are allowed on a subscriber VC, the highest peak cell rate (PCR) and sustainable cell rate (SCR) of all the sessions are selected as the PCR and SCR, respectively, of the VC.

You can apply DBS QoS parameters per user as well as per domain. If you apply DBS QoS parameters under a domain profile, all users in that profile are assigned the same DBS QoS parameters. These parameters are assigned to the RADIUS profile for that domain. You can also apply distinctive DBS QoS parameters via the RADIUS user profile.

Traffic-shaping parameters can be locally configured by Cisco IOS command-line interface (CLI) in VC-mode, VC-class, range mode, or PVC-in-range mode. These parameters have a lower priority and are overridden by the shaping parameters specified in the domain service profile. Traffic-shaping parameters that are CLI-configured at the VC class interface or subinterface level are treated as the default QoS parameters for the PVCs to which they apply. These parameters are overridden by the domain service profile QoS parameters of the domain the user is logged in to. If no VC class is configured, the default is the unspecified bit rate (UBR).

When a network access server (NAS) sends a domain authorization request and receives an affirmative response from the RADIUS server, this response may include a "QoS-management" string via vendor-specific attribute (VSA) 26 for QoS management in the NAS. The QoS management values are configured as part of the domain service profile attributes on the RADIUS server. These values contain PCR and SCR values for a particular user or domain. If the QoS specified for a domain or user cannot be applied on the PVC to which the session belongs, the session is not established.

Changing PVC traffic parameters because of new simultaneous PPPoE sessions on the PVC does not cause existing PPPoE sessions that are already established to disconnect. Changing domain service profile QoS parameters on the RADIUS server does not cause traffic parameters to automatically change for PVCs that have existing sessions.

When you enter the `dbs enable` or `no dbs enable` command to configure or unconfigure DBS, existing sessions are not disconnected. If you have a session that has been configured for DBS and you configure
the **no dbs enable** command on a VC, additional sessions that are configured will display DBS-configured QoS values until the first new session is up. After the first session is brought up, the VC has default and locally configured values. If you configure the **dbs enable** command after multiple sessions are already up on the VC, all sessions on that VC have DBS QoS parameters.

**Benefits of Controlling Subscriber Bandwidth**

DBS provides the following benefits:

- Wholesale service providers can provide different bandwidth options to their retail service provider customers, such as ISPs and enterprises.
- Subscribers can choose between enhanced and basic service, with a fixed billing plan for each service.

**Configuring DBS Under a VC Class**

Perform the following task to configure DBS under a VC class.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. vc-class atm vc-class-name
4. dbs enable

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1 enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

Example:

```
Router> enable
```
### Configuring DBS on a PVC

Perform the following task to configure DBS for a PVC.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface atm number [point-to-point | multipoint]
4. pvc [name] vpi/vci
5. dbs enable
6. protocol pppoe

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
</tr>
</tbody>
</table>

---

### Command or Action | Purpose
--- | ---
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: | Router# configure terminal |

### Command or Action | Purpose
--- | ---
| **Step 3** vc-class atm vc-class-name | Creates an ATM VC class and enters ATM VC class configuration mode. |
| Example: | Router(config)# vc-class atm class1 |
| • A VC class can be applied to an ATM interface, subinterface, or VC. |

### Command or Action | Purpose
--- | ---
<p>| <strong>Step 4</strong> dbs enable | Applies DBS QoS parameters. |
| Example: | Router(config-vc-class)# dbs enable |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>

| **Step 5** in-range [pvc-name] [[vpi]vci] | Defines an individual PVC within a PVC range and enables PVC-in-range configuration mode. |
| **Example:** Router(config-if-atm-range)# pvc-in-range pvc1 3/104 |
| **Step 6** dbs enable | Applies DBS QoS parameters. |
| **Example:** Router(config-if-atm-range-pvc)# dbs enable |

### Configuring the RADIUS Attributes for DBS

You can apply DBS QoS parameters per user as well as per domain. If you apply DBS QoS parameters under a domain profile, all users in that profile are assigned the same DBS QoS parameters. These parameters are assigned to the RADIUS profile for that domain. You can also apply distinctive DBS QoS parameters via the RADIUS user profile.
Configure the RADIUS attributes listed in this section in the user or domain profiles on the authentication, authorization, and accounting (AAA) server. The user or domain profile is downloaded from the AAA server as part of user authentication.

The QoS management string for DBS has the following syntax:

\[
\text{Cisco-Avpair} = \text{atm:peak-cell-rate}=155000 \\
\text{Cisco-Avpair} = \text{atm:sustainable-cell-rate}=155000
\]

You must configure the PCR. Configuring the SCR is optional. If you configure only the PCR, the ATM service type is an unspecified bit rate (UBR). If you specify both the SCR and the PCR, the ATM service type is a variable bit rate nonreal-time (VBR-nrt) connection.

If the peak rate is greater than the maximum rate permitted on the ATM physical interface, the PCR applied on the ATM PVC is set to the maximum rate. If the specified PCR is less than the minimum rate, then the PCR applied on the ATM PVC is the minimum rate.

If the sustainable-cell-rate (in Kbps) applied exceeds the maximum for the interface, the session is rejected.

\[\text{Note}\]
DBS cannot change service categories such as from UBR to VBR-nrt. For details, see the table in Configuring Dynamic Suscriber Services.

---

**Verifying DBS**

\[\text{Note}\]
The configuration examples in this section explain the PPPOE termination using a VPDN group.

**SUMMARY STEPS**

1. Enter the `show atm pvc vpi / vci` command to view details about ATM PVCs or VCs:
2. Enter the `show atm pvc dbs` command to display information about ATM PVCs that have DBS QoS parameters applied:
3. Enter the `show running-config` command to verify that DBS QoS parameters have been applied. If you enter the `dbs enable` or the `no dbs enable` command, it appears in the output of the `show running-config` command. If you enter the `default dbs enable` command, it does not appear.

**DETAILED STEPS**

**Step 1**

Enter the `show atm pvc vpi / vci` command to view details about ATM PVCs or VCs:

**Example:**

```
Router# show atm pvc 0/75
ATM/0.4:VCD:1, VPI:0, VCI:75
UBB, PeakRate:149760
AAL5-LLC/SNAP; etype:0x0, Flags:0xC20, Vmode:0x0
OAM frequency:0 second(s), OAM retry frequency:1 second(s)
OAM up retry count:3, OAM down retry count:5
OAM Loopback status:OAM Disabled
OAM VC state:Not Managed
ILMI VC state:Not Managed
```
PA TxRingLimit: 40 particles
PA Rx Limit: 1600 particles
InARP frequency: 15 minutes(s)
Transmit priority 4
InPktDrops: 0, OutPktDrops: 0 (holdq/outputq/total)
CrcErrors: 0, SarTimeOuts: 0, OverSizedSDUs: 0, LengthViolation: 0,
CPIErrors: 0
Out CLP=1 Pkts: 0
OAM cells received: 0
F5 InEndloop: 0, F5 InSegloop: 0, F5 InAIS: 0, F5 InRDI: 0
F4 InEndloop: 0, F4 InSegloop: 0, F4 InAIS: 0, F4 InRDI: 0
OAM cells sent: 0
F5 OutEndloop: 0, F5 OutSegloop: 0, F5 OutRDI: 0
F4 OutEndloop: 0, F4 OutSegloop: 0, F4 OutRDI: 0
OAM cell drops: 0
Status: UP
PPPOE enabled.
DBS enabled.

Step 2  Enter the show atm pvc dbs command to display information about ATM PVCs that have DBS QoS parameters applied:

Example:

Router# show atm pvc dbs

<table>
<thead>
<tr>
<th>Interface</th>
<th>VCD / Name</th>
<th>VPI</th>
<th>VCI</th>
<th>Type</th>
<th>Encaps</th>
<th>SC</th>
<th>Peak</th>
<th>Avg/Min</th>
<th>Burst</th>
<th>Cells</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1/0.7</td>
<td>3</td>
<td>0</td>
<td>75</td>
<td>PVC</td>
<td>MIX</td>
<td>VBR</td>
<td>2000</td>
<td>700</td>
<td>94</td>
</tr>
</tbody>
</table>

Step 3  Enter the show running-config command to verify that DBS QoS parameters have been applied. If you enter the dbs enable or the no dbs enable command, it appears in the output of the show running-config command. If you enter the default dbs enable command, it does not appear.

Example:

Router# show running-config

Monitoring DBS

Use the commands listed below to monitor DBS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug atm events</td>
<td>Displays the normal set of ATM events when a session comes up or goes down.</td>
</tr>
<tr>
<td>debug atm errors</td>
<td>Displays protocol errors and error statistics associated with VCs.</td>
</tr>
<tr>
<td>debug atm status</td>
<td>Displays changes in the status of a VC when a session comes up or goes down or when the VC configuration is changed.</td>
</tr>
<tr>
<td>debug ppp authentication</td>
<td>Displays authentication protocol messages, including Challenge Authentication Protocol (CHAP) packet exchanges and Password Authentication Protocol (PAP) exchanges.</td>
</tr>
<tr>
<td>debug ppp error</td>
<td>Displays protocol errors and error statistics associated with PPP connection negotiation and operation.</td>
</tr>
<tr>
<td>debug ppp negotiation</td>
<td>Enables debugging of PPP negotiation process.</td>

### Configuration Examples for Controlling Subscriber Bandwidth

- Configuring DBS for a VC Class Example, page 13
- Configuring DBS for a PVC Example, page 13
- Configuring DBS for a Range of PVCs Example, page 13
- Configuring DBS for a PVC Within a PVC Range Example, page 13
- Configuring RADIUS Attributes Examples, page 14

#### Configuring DBS for a VC Class Example

In the following example, DBS QoS parameters have been applied to a VC called "cisco":

```plaintext
vc-class atm cisco
dbs enable
```

#### Configuring DBS for a PVC Example

In the following example, DBS QoS parameters have been applied on a PVC called "cisco":

```plaintext
interface atm0/0/0.5 point-to-point
ip address 10.0.0.0 255.255.255.0
pvc cisco 0/100
dbs enable
protocol pppoe
```

#### Configuring DBS for a Range of PVCs Example

In the following example, DBS QoS parameters have been applied on a range of PVCs. The range is named "cisco range" and has a start-vpi of 0, a start-vci of 50, an end-vpiof 0, and an end-vci of 70:

```plaintext
interface atm0/0/0.1 multipoint
ip address 10.0.0.0 255.255.255.0
range cisco pvc 0/50 0/70
dbs enable
```

#### Configuring DBS for a PVC Within a PVC Range Example

In the following example, DBS parameters have been applied on PVC 60, which is part of the PVC range called "cisco":

```plaintext
interface atm0/0/0.1 multipoint
```
range cisco pvc 0/50 0/70
pvc-in-range 0/60
dbs enable

**Configuring RADIUS Attributes Examples**

The following example shows how to configure RADIUS attributes for a domain profile for DBS:

```plaintext
cisco.com  Password = "cisco", Service-Type = Outbound
           Service-Type = Outbound,
Cisco-Avpair = "vpdn:tunnel-id=tunnel33",
Cisco-Avpair = "vpdn:tunnel-type=l2tp",
Cisco-Avpair = "vpdn:ip-addresses=172.16.0.0",
Cisco-Avpair = "vpdn:l2tp-tunnel-password=password2",
Cisco-Avpair = "atm:peak-cell-rate=155000",
Cisco-Avpair = "atm:sustainable-cell-rate=155000"
```

The following example shows how to configure RADIUS attributes for a user profile for DBS:

```plaintext
user1@cisco.com Password = "userpassword1", Service-Type = Outbound
            Service-Type = Outbound,
Cisco-Avpair = "atm:peak-cell-rate=155000",
Cisco-Avpair = "atm:sustainable-cell-rate=155000"
```

Feature Information for Controlling Subscriber Bandwidth

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

<td>Cisco IOS XE Release 2.5</td>
<td>This feature enables wholesale service providers to sell different classes of service to retail service providers by controlling bandwidth at the ATM virtual circuit (VC) level. ATM quality of service (QoS) parameters from the subscriber domain are applied to the ATM PVC on which a PPPoE or PPPoA session is established.</td>
</tr>
