debug decnet adj through debug dss ipx event

- debug decnet adj through debug dss ipx event, page 1
The `debug decnet adj` command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display debugging information on DECnet adjacencies, use the `debug decnet adj` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug decnet adj
no debug decnet adj
```

**Syntax Description**
This command has no arguments or keywords.

**Command Modes**
Privileged EXEC (#)

**Examples**
The following is sample output from the `debug decnet adj` command:

```
Router# debug decnet adj
DNET-ADJ: Level 1 hello from 1.3
DNET-ADJ: sending hellos
DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498
DNET-ADJ: Level 1 hello from 1.3
DNET-ADJ: 1.5 adjacency initializing
DNET-ADJ: sending triggered hellos
DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498
DNET-ADJ: Level 1 hello from 1.3
DNET-ADJ: 1.5 adjacency up
DNET-ADJ: Level 1 hello from 1.5
DNET-ADJ: 1.5 adjacency down, listener timeout
```

The following line indicates that the router is sending hello messages to all routers on this segment, which in this case is Ethernet 0:

```
DNET-ADJ: Sending hellos to all routers on interface Ethernet0, blksize 1498
```

The following line indicates that the router has heard a hello message from address 1.5 and is creating an adjacency entry in its table. The initial state of this adjacency will be *initializing*.

```
DNET-ADJ: 1.5 adjacency initializing
```

The following line indicates that the router is sending an unscheduled (triggered) hello message as a result of some event, such as new adjacency being heard:

```
DNET-ADJ: sending triggered hellos
```

The following line indicates that the adjacency with 1.5 is now up, or active:

```
DNET-ADJ: 1.5 adjacency up
```

The following line indicates that the adjacency with 1.5 has timed out, because no hello message has been heard from adjacency 1.5 in the time interval originally specified in the hello message from 1.5:

```
DNET-ADJ: 1.5 adjacency down, listener timeout
```
The following line indicates that the router is sending an unscheduled hello message, as a result of some event, such as the adjacency state changing:

DNET-ADJ: hello update triggered by state changed in dn_add_adjacency
**debug decnet connects**

The `debug decnet connects` command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display debugging information of all connect packets that are filtered (permitted or denied) by DECnet access lists, use the `debug decnet connects` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug decnet connects
no debug decnet connects
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC (#)

**Usage Guidelines**

When you use connect packet filtering, it may be helpful to use the `decnetsaccess-group` configuration command to apply the following basic access list:

```
access-list 300 permit 0.0 63.1023 eq any
```

You can then log all connect packets sent on interfaces to which you applied this list, in order to determine those elements on which your connect packets must be filtered.

**Note**

Packet password and account information is not logged in the `debug decnet connects` message, nor is it displayed by the `show access` EXEC command. If you specify `password` or `account` information in your access list, they can be viewed by anyone with access to the configuration of the router.

**Examples**

The following is sample output from the `debug decnet connects` command:

```
Router# debug decnet connects
DNET-CON: list 300 item #2 matched src=19.403 dst=19.309 on Ethernet0: permitted
          srcname="RICK" srcuic=[0,017] dstobj=42 id="USER"
```

The table below describes significant fields shown in the output.

**Table 1: debug decnet connects Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNET-CON:</td>
<td>Indicates that this is a <code>debug decnet connects</code> packet.</td>
</tr>
<tr>
<td>list 300 item #2 matched</td>
<td>Indicates that a packet matched the second item in access list 300.</td>
</tr>
<tr>
<td>src=19.403</td>
<td>Indicates the source DECnet address for the packet.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
dst=19.309 | Indicates the destination DECnet address for the packet.
on Ethernet0: | Indicates the router interface on which the access list filtering the packet was applied.
permitted | Indicates that the access list permitted the packet.
srcname = "RICK" | Indicates the originator user of the packet.
sruci=[0,017] | Indicates the source UIC of the packet.
dstobj=42 | Indicates that DECnet object 42 is the destination.
id="USER" | Indicates the access user.
The `debug decnet events` command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display debugging information on DECnet events, use the `debug decnet events` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug decnet events
no debug decnet events
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC (#)

**Examples**

The following is sample output from the `debug decnet events` command:

```
Router# debug decnet events
DNET: Hello from area 50 rejected - exceeded 'max area' parameter (45)
DNET: Hello from area 50 rejected - exceeded 'max area' parameter (45)
The following line indicates that the router received a hello message from a router whose area was greater than the max-area parameter with which this router was configured:

DNET: Hello from area 50 rejected - exceeded 'max area' parameter (45)
The following line indicates that the router received a hello message from a router whose node ID was greater than the max-node parameter with which this router was configured:

DNET: Hello from node 1002 rejected - exceeded 'max node' parameter (1000)
```
debug decnet packet

Note
The debugdecnetpacket command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display debugging information on DECnet packet events, use the debugdecnetpacket command in privileged EXEC mode. To disable debugging output, use the no form of this command.

d debug decnet packet
no debug decnet packet

Syntax Description
This command has no arguments or keywords.

Command Modes
Privileged EXEC (#)

Examples
The following is sample output from the debugdecnetpacket command:

Router# debug decnet packet
DNET-PKT: src 1.4 dst 1.5 sending to PHASEV
DNET-PKT: Packet fwded from 1.4 to 1.5, via 1.5, snpa 0000.3080.cf90, TokenRing0
The following line indicates that the router is sending a converted packet addressed to node 1.5 to Phase V:

DNET-PKT: src 1.4 dst 1.5 sending to PHASEV
The following line indicates that the router forwarded a packet from node 1.4 to node 1.5. The packet is being sent to the next hop of 1.5 whose subnetwork point of attachment (MAC address) on that interface is 0000.3080.cf90.

DNET-PKT: Packet fwded from 1.4 to 1.5, via 1.5, snpa 0000.3080.cf90, TokenRing0
**debug decnet routing**

The `debug decnet routing` command is not available in Cisco IOS Release 12.2(33)SXH and later Cisco IOS 12.2SX releases.

To display all DECnet routing-related events occurring at the router, use the `debug decnet routing` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```plaintext
debug decnet routing
no debug decnet routing
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC (#)

**Examples**

The following is sample output from the `debug decnet routing` command:

```
Router# debug decnet routing
DNET-RT: Received level 1 routing from 1.3 on Ethernet0 at 1:16:34
DNET-RT: Sending normal routing updates on Ethernet0
DNET-RT: Sending level 1 routing updates on interface Ethernet0
DNET-RT: Level1 routes from 1.5 on Ethernet0: entry for node 5 created
DNET-RT: route update triggered by after split route pointers in dn_rt_input
DNET-RT: Received level 1 routing from 1.5 on Ethernet 0 at 1:18:35
DNET-RT: Sending L1 triggered routes
DNET-RT: Sending L1 triggered routing updates on Ethernet0
DNET-RT: removing route to node 5
```

The following line indicates that the router has received a level 1 update on Ethernet interface 0:

```
DNET-RT: Received level 1 routing from 1.3 on Ethernet0 at 1:16:34
```

The following line indicates that the router is sending its scheduled updates on Ethernet interface 0:

```
DNET-RT: Sending normal routing updates on Ethernet0
```

The following line indicates that the route will send an unscheduled update on this interface as a result of some event. In this case, the unscheduled update is a result of a new entry created in the routing table of the interface.

```
DNET-RT: route update triggered by after split route pointers in dn_rt_input
```

The following line indicates that the router sent the unscheduled update on Ethernet 0:

```
DNET-RT: Sending L1 triggered routes
```

The following line indicates that the router removed the entry for node 5 because the adjacency with node 5 timed out, or the route to node 5 through a next-hop router was disconnected:

```
DNET-RT: removing route to node 5
```
**debug device-sensor**

To enable debugging for device sensor, use the `debug device-sensor` command in privileged EXEC mode.

```
debug device-sensor {errors | events}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>Displays device sensor error messages.</td>
</tr>
<tr>
<td>events</td>
<td>Displays messages for events such as protocol packet arrivals, identity updates, and release events sent to the session manager.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(SE1)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>15.1(SG)</td>
<td>This command was integrated into Cisco IOS Release 15.1(SG).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `debug device-sensor` command in conjunction with the `debug authentication all` command to troubleshoot scenarios where device sensor cache entries are not being created for the connected devices.

**Examples**

The following is sample output from the `debug device-sensor events` command. The debug output shows how Cisco Discovery Protocol packets and Type-Length-Values (TLVs) are received from the device connected to the Gigabit Ethernet interface 2/1.

```
Device# debug device-sensor events
Device#
*Nov 30 23:58:45.811: DSensor: Received cdp packet from GigabitEthernet2/1:00d0.2bdf.08a5
*Nov 30 23:58:45.811: DSensor: SM returned no or invalid session label for
 GigabitEthernet2/1:00d0.2bdf.08a5
*Nov 30 23:58:45.811: DSensor: SM returned no or invalid session label for
 GigabitEthernet2/1:00d0.2bdf.08a5
```

debug dhcp

To display debugging information about the Dynamic Host Configuration Protocol (DHCP) client activities and to monitor the status of DHCP packets, use the `debug dhcp` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

`debug dhcp [detail]`
`no debug dhcp [detail]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>(Optional) Displays additional debugging information.</td>

<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the `debug dhcp` command to monitor the subnet allocation and releasing for on-demand address pools.

For debugging purposes, the `debug dhcp detail` command provides the most useful information such as the lease entry structure of the client and the state transitions of the lease entry. The debug output shows the scanned option values from received DHCP messages that are replies to a router request. The values of the op, htype, hlen, hops, server identifier option, xid, secs, flags, ciaddr, yiaddr, siaddr, and giaddr fields of the DHCP packet are shown in addition to the length of the options field.

**Examples**

The following examples show and explain some of the typical debugging messages you may see when using the `debug dhcp detail` command.

The following sample output shows when a DHCP client sends a DHCPDISCOVER broadcast message to find its local DHCP server:

```
Router# debug dhcp detail
00:07:16:DHCP:DHCP client process started:10
00:07:16:RAC:Starting DHCP discover on Ethernet2
00:07:16:DHCP:Try 1 to acquire address for Ethernet2
00:07:16:%SYS-5-CONFIG_I:Configured from console by console
00:07:19:DHCP:Shutting down from get_netinfo()
00:07:19:DHCP:Attempting to shutdown DHCP Client
00:07:21:DHCP:allocate request
```
The first seven lines of the following output show the current values stored in the lease entry structure for the client:

00:07:21:Temp IP addr:0.0.0.0 for peer on Interface:Ethernet2
00:07:21:Temp sub net mask:0.0.0.0
00:07:21: DHCP Lease server:0.0.0.0, state:1 Selecting
00:07:21: DHCP transaction id:582
00:07:21: Lease:0 secs, Renewal:0 secs, Rebind:0 secs
00:07:21: Next timer fires after:00:00:03
00:07:21: Retry count:1 Client-ID:cisco-0010.7b6e.afd8-Et2
00:07:21: DHCP:SDiscover: sending 308 byte length DHCP packet
00:07:21: DHCP:SDiscover 308 bytes
00:07:21: B'cast on Ethernet2 interface from 0.0.0.0

The following output shows the offered addresses and parameters sent to the DHCP client by the DHCP server via a DHCPOFFER message. The messages containing the Scan field indicate the options that were scanned from the received BOOTP packet and the corresponding values:

00:07:23:DHCP:Received a BOOTREP pkt
00:07:23:DHCP:Scan:Message type:DHCP Offer
00:07:23:DHCP:Scan:Server ID Option:10.1.1.1 = A010101
00:07:23:DHCP:Scan:Lease Time:180
00:07:23:DHCP:Scan:Renewal time:90
00:07:23:DHCP:Scan:Rebind time:157
00:07:23:DHCP:Scan:Subnet Address Option:255.255.255.0

The following output shows selected fields in the received BOOTP packet:

00:07:23:DHCP:rcvd pkt source:10.1.1.1, destination: 255.255.255.255
00:07:23: UDP sport:43, dport:44, length:308
00:07:23: DHCP op:2, htype:1, hlen:6, hops:0
00:07:23: DHCP server identifier:10.1.1.1
00:07:23: xid:582, secs:0, flags:8000
00:07:23: client:0.0.0.0, your:10.1.1.2
00:07:23: srvr: 0.0.0.0, gw:0.0.0.0
00:07:23: options block length:60
00:07:23:DHCP Offer Message Offered Address:10.1.1.2
00:07:23:DHCP:Lease Seconds:180 Renewal secs: 90 Rebind secs:157
00:07:23:DHCP:Server ID Option:10.1.1.1
00:07:23:DHCP:offer received from 10.1.1.1

The following output shows when the DHCP client sends a DHCPREQUEST broadcast message to the DHCP server to accept the offered parameters:

00:07:23:DHCP:SRequest attempt # 1 for entry:
00:07:23:Temp IP addr:10.1.1.2 for peer on Interface:Ethernet2
00:07:23:Temp sub net mask:255.255.255.0
00:07:23: DHCP Lease server:10.1.1.1, state:2 Requesting
00:07:23: DHCP transaction id:582
00:07:23: Lease:180 secs, Renewal:0 secs, Rebind:0 secs
00:07:23: Next timer fires after:00:00:02
00:07:23: Retry count:1 Client-ID:cisco-0010.7b6e.afd8-Et2
00:07:23:DHCP:SRequest- Server ID option:10.1.1.1
00:07:23:DHCP:SRequest- Requested IP addr option:10.1.1.2
00:07:23:DHCP:SRequest placed lease len option:180
00:07:23:DHCP:SRequest:326 bytes
00:07:23:DHCP:SRequest:326 bytes
00:07:23: B'cast on Ethernet2 interface from 0.0.0.0

The following output shows when the DHCP server sends a DHCPACK message to the client with the full set of configuration parameters:

00:07:23:DHCP:Received a BOOTREP pkt
00:07:23:DHCP:Scan:Message type:DHCP Ack
00:07:23:DHCP:Scan:Server ID Option:10.1.1.1 = A010101
00:07:23:DHCP:Scan:Lease Time:180
00:07:23:DHCP:Scan:Renewal time:90
00:07:23:DHCP:Scan:Rebind time:157
The following output shows when a default gateway (option 3) is assigned a static IP address that is the default route and that static routes were added from the DHCP server:

*Oct 2 06:22:24: Setting default gateway to 68.8.8.1! This is the option 3 default gateway.
*Oct 2 06:22:24: Adding default route 68.8.8.1
*Oct 2 06:22:24: DHCP: Adding static route to 4.3.2.1 255.255.255.255 via 68.8.8.1
*Oct 2 06:22:24: DHCP: Adding static route to 1.1.1.1 255.255.255.255 via 68.8.8.1
*Oct 2 06:22:24: DHCP: Adding static route to 67.2.2.2 255.255.255.255 via 68.8.8.1

Most fields are self-explanatory; however, fields that may need further explanation are described in the table below.

debug dhcp redundancy

To display debugging information about DHCP proxy client redundancy events, use the debug dhcp redundancy command in privileged EXEC mode. To disable the display of debugging output, use the no form of this command.

d debug dhcp redundancy
no debug dhcp redundancy

Syntax Description
This command has no arguments or keywords.

Command Default
Debugging output is disabled for DHCP redundancy events.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SB2</td>

</tr>
</tbody>
</table>

Examples
The following example displays debug messages regarding DHCP redundancy events. The last line is output when the debug dhcp redundancy command is enabled. The line indicates that the active Route Processor has sent a dynamic lease synchronization message for IP address 10.1.1.1:

```
Router# debug dhcp redundancy
*Mar 15 10:32:21: DHCPD: assigned IP address 10.1.1.1 to client
*Mar 15 10:32:21: DHCPD: dynamic sync sent for 10.1.1.1
```

debug dialer events

To display debugging information about the packets received on a dialer interface, use the `debug dialer events` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug dialer events
no debug dialer events
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Usage Guidelines**

When dial-on-demand routing (DDR) is enabled on the interface, information concerning the cause of any call (called the *Dialing cause*) is displayed.

**Examples**

In the following example, the line of output for an IP packet lists the name of the DDR interface and the source and destination addresses of the packet:

```
Router# debug dialer events
Dialing cause: Serial0: ip (s=172.16.1.111 d=172.16.2.22)
```

The following line of output for a bridged packet lists the DDR interface and the type of packet (in hexadecimal). For information on these packet types, see the "Ethernet Type Codes" appendix of the Cisco IOS Bridging and IBM Networking Command Reference publication.

```
Dialing cause: Serial1: Bridge (0x6005)
```

Most messages are self-explanatory; however, messages that may need some explanation are described in the table below.

**Table 3: debug dialer events Message Descriptions**

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dialer0: Already <code>xxx</code> call(s) in progress on Dialer0, dialing not allowed</td>
<td>Number of calls in progress (<code>xxx</code>) exceeds the maximum number of calls set on the interface.</td>
</tr>
<tr>
<td>Dialer0: No free dialer - starting fast idle timer</td>
<td>All the lines in the interface or rotary group are busy, and a packet is waiting to be sent to the destination.</td>
</tr>
<tr>
<td>BRI0: rotary group to <code>xxx</code> overloaded (<code>yyy</code>)</td>
<td>Number dialer (<code>xxx</code>) exceeds the load set on the interface (<code>yyy</code>).</td>
</tr>
<tr>
<td>BRI0: authenticated host <code>xxx</code> with no matching dialer profile</td>
<td>No dialer profile matches <code>xxx</code>, the Challenge Handshake Authentication Protocol (CHAP) name or remote name of the remote host.</td>
</tr>
</tbody>
</table>
The table below describes the messages that the `debug dialer events` command can generate for a serial interface used as a V.25bis dialer for DDR.

**Table 4: debug dialer events Command Message Descriptions for DDR**

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial 0: Dialer result = xxxxxxxxxx</td>
<td>Result returned from the V.25bis dialer. It is useful in debugging if calls are failing. On some hardware platforms, this message cannot be displayed due to hardware limitations. Possible values for the xxxxxxxxxx variable depend on the V.25bis device with which the router is communicating.</td>
</tr>
<tr>
<td>Serial 0: No dialer string defined. Dialing cannot occur.</td>
<td>Packet is received that should cause a call to be placed. However, no dialer string is configured, so dialing cannot occur. This message usually indicates a configuration problem.</td>
</tr>
<tr>
<td>Serial 0: Attempting to dial xxxxxxxxxx</td>
<td>Packet has been received that passes the dial-on-demand access lists. That packet causes phone number xxxxxxxxxx to be dialed.</td>

debug dialer forwarding

To display debugging information about the control plane at the home gateway (HGW) for Layer 2 Tunneling Protocol (L2TP) dialout, use the `debug dialer forwarding` command in privileged EXEC mode. The `no` form of this command disables debugging output.

```plaintext
debug dialer forwarding
no debug dialer forwarding
```

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
This command is disabled by default.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `debug dialer forwarding` command to configure a virtual private dialout network (VPDN) on the HGW and a network access server (NAS) to dial from the HGW to the client.

An L2TP tunnel is created between the HGW and the NAS and the packets are forwarded transparently at the NAS.

**Examples**
The following is sample output from the `debug dialer forwarding` command for dialing from the HGW to the client.

```
Router# debug dialer forwarding
Dialer forwarding events debugging is on
Router# ping
Protocol [ip]:
Target IP address:1.1.1.3
Repeat count [5]:1
Datagram size [100]:
Timeout in seconds [2]:
Extended commands [n]:
Sweep range of sizes [n]:
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 1.1.1.3, timeout is 2 seconds:
```

**Note**

**debug dialer map**

To display debugging information about the creation and deletion of dynamic dialer maps, use the `debug dialer map` command in privileged EXEC mode. The `no` form of this command disables debugging output.

```
debug dialer map
no debug dialer map
```

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

This command is disabled by default.

**Command Modes**

Privileged EXEC

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>

</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

Use the `debug dialer map` command to track large-scale dialout (LSDO) and incoming calls that use dynamic dialer maps. This command shows the whole trace including when the map is created and removed.

If an interface is configured for dial-on-demand routing (DDR), and a map to a specified address does not exist, then a dynamic dialer map is created and when the call disconnects, the dialer map is removed.

**Note**

Do not configure a dialer string or a dialer map on the incoming interface.

**Examples**

In the following sample output from the `debug dialer map` command, a dialer map is created when an incoming call is connected and removed when that call is disconnected:

```
Router# debug dialer map
Dial on demand dynamic dialer maps debugging is on
Incoming call connected:

Router#
*Mar 22 12:19:15.597:%LINK-3-UPDOWN:Interface BRI0/0:1, changed state to up
*Mar 22 12:19:17.748:BR0/0:1 DDR: dialer_create_dynamic_map map created for 11.0.0.1
*Mar 22 12:19:18.734:%LINEPROTO-5-UPDOWN:Line protocol on Interface BRI0/0:1, changed state to up
*Mar 22 12:19:21.598:%ISDN-6-CONNECT:Interface BRI0/0:1 is now connected to unknown R2604
```
Incoming call disconnected:

Router#
*Mar 22 12:21:15.597:%ISDN-6-DISCONNECT:Interface BRI0/0:1 disconnected from R2604, call lasted 120 seconds
*Mar 22 12:21:15.645:%LINK-3-UPDOWN:Interface BRI0/0:1, changed state to down
*Mar 22 12:21:15.649:BR0/0:1 DDR:dialer_remove_dynamic_map map 11.0.0.1 removed
*Mar 22 12:21:16.647:%LINEPROTO-5-UPDOWN:Line protocol on Interface BRI0/0:1, changed state to down

<table>

</table>
**debug dialpeer**

**Note**
Effective with release 12.3(8)T, the `debug dialpeer` command is replaced by the `debug voip dialpeer` command. See the `debug voip dialpeer` command for more information.

To view dial peer information, use the `debug dialpeer` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
  debug dialpeer
  no debug dialpeer
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(11)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.3(8)T</td>
<td>This command was replaced by the <code>debug voip dialpeer</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Disable console logging and use buffered logging before using the `debug dialpeer` command. Using the `debug dialpeer` command generates a large volume of debugging messages, which can affect router performance.

**Examples**
The following is sample output for the `debug dialpeer` command. The output shows the destination pattern configured on the matched dial-peer. Expanded string is the string after applying number translation to the original number. It shows that dial-peer 1311 was an incoming dial-peer match. It also shows that routing label was att1. It shows that dial-peer 5108888 and 111399 are an outgoing dial-peer match.

```
Router# debug dialpeer
Router# 00:22:28: Inside dpMatchCore:
Router# 00:22:28: destination pattn:5108880101 expanded string:5108880101
Router# 00:22:28: MatchNextPeer:Peer 1311 matched
Router# 00:22:28: Inside dpMatchCore:
Router# 00:22:28: destination pattn:5108880101 expanded string:5108880101
Router# 00:22:28: Inside dpMatchCore:

**Usage Guidelines**

When you specify no optional keywords, the `debug dlsw` command enables all available DLSW debugging output.

Normally you need to use only the `error` or `verbose` option of the `debug dlsw reachability` command to help identify problems. The `error` option is recommended for use by customers and provides a subset of the messages from the normal event-level debugging. The `verbose` option provides a very detailed view of events, and is typically used only by service personnel.

To reduce the amount of debug information displayed, use the `sna` or `netbios` option with the `debug dlsw reachability` command if you know that you have an SNA or NetBIOS problem.

The DLSw core is the engine that is responsible for the establishment and maintenance of remote circuits. If possible, specifying the index of the specific circuit you want to debug reduces the amount of output displayed. However, if you want to watch a circuit initially come up, do not use the `circuit-number` option with the `core` keyword.

The `coreflow-control` option provides information about congestion in the WAN or at the remote end station. In these cases, DLSw sends Receiver Not Ready (RNR) frames on its local circuits, slowing data traffic on established sessions and giving the congestion an opportunity to clear.

The `corestate` option allows you to see when the circuit changes state. This capability is especially useful for determining why a session cannot be established or why a session is being disconnected.

The `coreXID` option allows you to track the exchange identification (XID)-state machine. The router tracks XID commands and responses used in negotiations between end stations before establishing a session.
The following examples show and explain some of the typical DLsw debugging messages you might see when using the `debug dlsw` command.

The following example enables UDP packet debugging for a specific remote peer:

```
Router# debug dlsw peers ip-address 1.1.1.6 udp
```

The following message is sample output from the `debug dlsw border-peers` command:

```
*Mar 10 17:39:56: CSM: delete group mac cache for group 0
*Mar 10 17:39:56: CSM: delete group name cache for group 0
*Mar 10 17:40:19: CSM: update group cache for mac 0000.3072.1070, group 10
*Mar 10 17:40:22: DLSw: send_to_group_members(): copy to peer 10.19.32.5
```

The following message is from a router that initiated a TCP connection:

```
DLSw: START-TPFSM (peer 10.3.8.7(2065)):: event:ADMIN-OPEN CONNECTION state:DISCONN

```
The following messages occur when a CUR_ex (CANUREACH explorer) frame is received from other peers, and the peer statements or the **promiscuous** keyword have not been enabled so that the router is not configured correctly:

```plaintext
22:42:44: DLSw: Not promiscuous - Rej conn from 172.20.96.1(2065)
```

In the following messages, the router sends a keepalive message every 30 seconds to keep the peer connected. If three keepalive messages are missed, the peer is torn down. These messages are displayed only if keepalives are enabled (by default, keepalives are disabled):

```plaintext
22:44:03: DLSw: Keepalive Request sent to peer 172.20.98.1(2065) (168243148)
22:44:04: DLSw: Keepalive Response from peer 172.20.98.1(2065) (168243176)
22:44:34: DLSw: Keepalive Request sent to peer 172.20.98.1(2065) (168274148)
22:44:34: DLSw: Keepalive Response from peer 172.20.98.1(2065) (168274172)
```

The following peer debugging messages indicate that the local peer is disconnecting from the specified remote peer because of missed peer keepalives:

```plaintext
0:03:24: DLSw: keepalive failure for peer on interface Serial0
0:03:24: DLSw: action_d(): for peer on interface Serial0
0:03:24: DLSW: DIRECT aborting connection for peer on interface Serial0, old state CONNECT, new state DISCONN
```

The following peer debugging messages result from an attempt to connect to an IP address that does not have DLSw enabled. The local router attempts to connect in 30-second intervals:

```plaintext
23:14:52: DLSw: action_a(): attempting to connect peer 172.20.100.1(2065)
23:14:52: DLSw: action_a(): Write pipe opened for peer 172.20.100.1(2065)
23:14:52: DLSw: peer 172.20.100.1(2065), old state DISCONN, new state WAIT_RD
23:14:52: DLSw: dlsw_tcpd_fini() closing connection for peer 172.20.100.1(2065)
23:14:52: DLSw: aborting tcp connection for peer 172.20.100.1(2065)
23:14:52: DLSw: peer 172.20.100.1(2065), old state WAIT_RD, new state DISCONN
```

The following peer debugging messages that indicates a remote peer statement is missing on the router (address 172.20.100.1) to which the connection attempt is sent:

```plaintext
23:14:52: DLSw: peer 172.20.100.1(2065), old state CAP_EXG
23:14:52: DLSw: dlsw_tcpd_fini() closing write pipe for peer 172.20.100.1(2065)
23:14:52: DLSw: closing write pipe tcp connection for peer 172.20.100.1(2065)
23:16:37: DLSw: peer_act_on_capabilities() for peer 172.20.100.1(2065)
```

The following messages show a peer connection opening with no errors or abnormal events:

```plaintext
23:16:37: DLSw: Pos CapExResp sent to peer 172.20.100.1(2065)
23:16:37: DLSw: action_e(): for peer 172.20.100.1(2065)
23:16:37: DLSw: Recv CapExId Msg from peer 172.20.100.1(2065)
23:16:37: DLSw: dlsw_tcpd_fini() closing write pipe for peer 172.20.100.1(2065)
23:16:37: DLSw: action_g(): for peer 172.20.100.1(2065)
23:16:37: DLSw: closing write pipe tcp connection for peer 172.20.100.1(2065)
```

Cisco IOS Debug Command Reference - Commands A through D
The following two messages show that an information frame is passing through the router:

DLSw: dlsw_tr2fct() lmac:c000.a400.0000 rmac:0800.5a29.75fe ls:5 rs:4 i:34
DLSw: dlsw_tr2fct() lmac:c000.a400.0000 rmac:0800.5a29.75fe ls:4 rs:4 i:34

Examples

The messages in this section are based on the following criteria:

- Reachability is stored in cache. DLSw+ maintains two reachability caches: one for MAC addresses and one for NetBIOS names. Depending on how long entries have been in the cache, they are either fresh or stale.

- If a router has a fresh entry in the cache for a certain resource, it answers a locate request for that resource without verifying that it is still available. A locate request is typically a TEST frame for MAC addresses or a FIND_NAME_QUERY for NetBIOS.

- If a router has a stale entry in the cache for a certain resource, it verifies that the entry is still valid before answering a locate request for the resource by sending a frame to the last known location of the resource and waits for a resource. If the entry is a REMOTE entry, the router sends a CUR_ex frame to the remote peer to verify. If the entry is a LOCAL entry, it sends either a TEST frame or a NetBIOS FIND_NAME_QUERY on the appropriate local port.

- By default, all reachability cache entries remain fresh for 4 minutes after they are learned. For MAC addresses, you can change this time with the `dlswtimersna-verify-interval` command. For NetBIOS names, you can change this time with the `dlswtimernetbios-verify-interval` command.

- By default, all reachability cache entries age out of the cache 16 minutes after they are learned. For MAC addresses, you can change this time with the `dlswtimersna-cache-timeout` command. For NetBIOS names, you can change this time with the `dlswtimernetbios-cache-timeout` command.

The table below describes the debug output indicating that the DLSW router received an SSP message that is flow controlled and should be counted against the window of the sender.

Dec 6 11:26:49: CSM: Received SSP CUR csex flags = 80, mac 4000.90b1.26cf,
The csex flags = 80 means that this is an CUR_ex (explorer).
Dec 5 10:48:33: DLSw: 1620175180 decr r - s:27 so:0 r:27 ro:0

Cisco IOS Debug Command Reference - Commands A through D
debug dmsp doc-to-fax

Note: In release 12.3(8)T, the `debug dmsp doc-to-fax` command is replaced by the `debug fax dmsp` command. See the `debug fax dmsp` command for more information.

To display debugging messages for the doc Media Service Provider (docMSP) TIFF or text2Fax engine, use the `debug dmsp doc-to-fax` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
dep dmsp doc-to-fax [text-to-fax] tiff-reader
no debug dmsp doc-to-fax [text-to-fax] tiff-reader
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text-to-fax</td>
<td>(Optional) Displays debugging messages that occur while the DocMSP Component is receiving text packets and producing T4 fax data.</td>
</tr>
<tr>
<td>tiff-reader</td>
<td>(Optional) Displays debugging messages that occur while the DocMSP Component is receiving TIFF packets and producing T4 fax data.</td>
</tr>
</tbody>
</table>

### Command Default

No default behavior or values.

### Command Modes

Privileged EXEC

### Command History

**debug dmsp fax-to-doc**

In release 12.3(8)T, the `debugdmspfax-to-doc` command is replaced by the `debugfaxdmsp` command. See the `debugfaxdmsp` command for more information.

To display debugging messages for doc MSP (docMSP) fax-to-doc, use the `debugdmspfax-to-doccommandinprivileged EXEC mode. To disable debugging output, use the `no` form of this command.

**Syntax Description**

| tiff-writer | (Optional) Displays debug messages that occur while the DocMSP Component is receiving T4 fax data and producing TIFF packets. |

**Command Default**
No default behavior or values.

**Command Modes**
Privileged EXEC

**Command History**

debug dmvpn

To display debug Dynamic Multipoint VPN (DMVPN) session information, use the **debug dmvpn** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug dmvpn {all| error| detail| packet} {all| debug-type}
no debug dmvpn {all| error| detail| packet} {all| debug-type}
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables all levels of debugging.</td>
</tr>
<tr>
<td>error</td>
<td>Enables error-level debugging.</td>

<td>Enables detail-level debugging.</td>
</tr>
<tr>
<td>packet</td>
<td>Enables packet-level debugging.</td>
</tr>
<tr>
<td>all</td>
<td>Enables NHRP, sockets, tunnel protection, and crypto debugging.</td>
</tr>
<tr>
<td>debug-type</td>
<td>The type of debugging that you want to enable. The following keywords can be specified for the debug-type argument:</td>
</tr>
<tr>
<td>nhrp</td>
<td>Enables Next Hop Resolution Protocol (NHRP) debugging only.</td>
</tr>
<tr>
<td>crypto</td>
<td>Enables crypto Internet Key Exchange (IKE) and IPsec debugging.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Enables tunnel protection debugging.</td>
</tr>
<tr>
<td>socket</td>
<td>Enables crypto secure socket debugging.</td>
</tr>
</tbody>
</table>

The keywords can be used alone, or in any combination with each other, but each keyword can be used only once.

## Command Default

DMVPN debugging is disabled.

## Command Modes

Privileged EXEC (#)

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.4(9)T</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

You must specify both the level and the type of debugging that you want to enable. The debugging levels are all, error, detail, or packet. You can enable NHRP, crypto Internet Key Exchange (IKE) and IPsec, tunnel protection, and crypto secure socket debugging at any of the four debugging levels.

To enable conditional DMVPN debugging, you must first specify the level and type of debugging that you want to enable, and then use the `debug dmvpn condition` command to specify the conditions that you want to enable.

#### Error-Level Debugging

When error-level debugging is enabled with the `debug dmvpn error` command, the following debugging commands are enabled by default:

- `debug crypto ipsec error`
- `debug crypto isakmp error`
- `debug nhrp error`

#### Detail-Level Debugging

When detail-level debugging is enabled with the `debug dmvpn detail` command, the following debugging commands are enabled by default:

- `debug crypto ipsec`
- `debug crypto isakmp`
- `debug crypto sockets`
- `debug nhrp`
- `debug nhrp cache`
- `debug nhrp rate`
- `debug tunnel protection`

#### Packet-Level Debugging

When packet-level debugging is enabled with the `debug dmvpn packet` command, the following debugging commands are enabled by default:

- `debug nhrp extension`
- `debug nhrp packet`
Executing the **debug dmvpn all** command with a high number of active sessions may result in high CPU utilization and large data output.

**NHRP Shortcut Route Debugging**

When shortcut switching is enabled on the router, the system looks up the NHRP shortcut route in the Routing Information Base (RIB) in order to forward the packet to the next-hop in the DMVPN cloud.

The table below describes the debug messages displayed by the router when shortcut switching and NHRP debugging are both enabled.

**Table 7: Sample Messages for Shortcut Switching and NHRP**

<table>
<thead>
<tr>
<th>Event</th>
<th>Sample Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>NHRP successfully adds a route to the RIB</td>
<td>*Feb 21 13:11:24.043: NHRP: Adding route entry for 172.16.99.0 to RIB</td>
</tr>
<tr>
<td></td>
<td>*Feb 21 13:11:24.043: NHRP: Route addition to RIB successful</td>
</tr>
<tr>
<td>NHRP is unable to add a route to the RIB</td>
<td>*Feb 21 13:11:24.043: NHRP: Adding route entry for 172.16.99.0 to RIB</td>
</tr>
<tr>
<td></td>
<td>*Feb 21 13:11:24.043: NHRP: Route addition to RIB failed</td>
</tr>
<tr>
<td>NHRP removes a route from the RIB</td>
<td>*Feb 21 13:11:24.043: NHRP: Deleting route entry for 172.16.99.0 from RIB</td>
</tr>
<tr>
<td>NHRP evicts a route from the RIB</td>
<td>*Mar 1 18:24:29.371: NHRP: Route entry 172.16.22.0/24 clobbered by distance</td>
</tr>
<tr>
<td>NHRP changes the administrative distance</td>
<td>*Mar 1 00:14:16.799: NHRP: Administrative distance changed to 240</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable all debugging levels for DMVPN tunnel debugging:

```
Router# debug dmvpn all tunnel
```

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
<tr>
<td>12.4(20)T</td>
<td>The <em>ipv6-address</em> argument was added.</td>
</tr>
<tr>
<td>Cisco IOS XE Release 2.5</td>
<td>This command was modified. It was integrated into Cisco IOS XE Release 2.5.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Conditional debugging is enabled only after the DMVPN debugging type and level have been specified using the `debug dmvpn` command.

**Console Output**

The following `debug dmvpn` commands do not have any console output on the Cisco 3845 and Cisco 7200 series routers:

- `debug dmvpn condition interface`
- `debug dmvpn condition peer`
- `debug dmvpn condition unmatched`
- `debug dmvpn condition vrf`

**Note**

When the `debug dmvpn condition unmatched` command is enabled on the Cisco 3845 and Cisco 7200 series routers, issuing the `show debugging` command does not produce any console output.

**Examples**

The following example shows how to enable conditional DMVPN debugging for a specific peer NBMA address:

```
Router# debug dmvpn condition peer nbma 192.0.2.1
```

The following example shows how to enable conditional DMVPN debugging when context is not available to check against debugging conditions:

```
Router# debug dmvpn condition unmatched
```

The following example shows how to disable conditional debugging for a specific tunnel interface:

```
Router# no debug dmvpn condition interface tunnel 1
```
The following example shows how to disable all conditional debugging:

Router# no debug dmvpn condition

<table>
<thead>
<tr>

debug dot11

To enable debugging of radio functions, use the debug dot11 command in privileged EXEC mode. To stop or disable the debug operation, use the no form of this command.

d-debug dot11 {events| forwarding| mgmt| packets| syslog| virtual-interface}
no debug dot11 {events| forwarding| mgmt| packets| syslog| virtual-interface}

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>Displays information about all radio-related events.</td>
</tr>
<tr>
<td>forwarding</td>
<td>Displays information about radio-forwarded packets.</td>
</tr>
<tr>
<td>mgmt</td>
<td>Displays information about radio access point management activity.</td>
</tr>
<tr>
<td>packets</td>
<td>Displays information about received or transmitted radio packets.</td>
</tr>
<tr>
<td>syslog</td>
<td>Displays information about the radio system log.</td>
</tr>
<tr>
<td>virtual-interface</td>
<td>Displays information about radio virtual interfaces.</td>
</tr>
</tbody>
</table>

Command Default
Debugging is disabled.

Command Modes
Privileged EXEC (#)

Command History

<table>
<thead>
<tr>

<td>This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use this command to display debugging information about radio functions.
Examples

The following example shows how to enable debugging of all radio-related events:

Router# debug dot11 events

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug dot11 aaa</td>
<td>Enables debugging of dot11 AAA operations.</td>
</tr>
<tr>
<td>debug dot11 dot11radio</td>
<td>Enables radio debug options.</td>
</tr>
</tbody>
</table>
debug dot11 aaa

To enable debugging of dot11 authentication, authorization, and accounting (AAA) operations, use the debug dot11 aaa command in privileged EXEC mode. To disable or stop the debug operation, use the no form of this command.

debug dot11 aaa {accounting authenticator {all dispatcher| mac-authen| process| rxdata| state-machine| txdata} | dispatcher| manager {all| dispatcher| keys| rxdata| state-machine| supplicant| txdata}}

no debug dot11 aaa {accounting authenticator {all dispatcher| mac-authen| process| rxdata| state-machine| txdata} | dispatcher| manager {all| dispatcher| keys| rxdata| state-machine| supplicant| txdata}}

Syntax Description

| accounting | Provides information about 802.11 AAA accounting packets. |
| authenticator | Provides information about MAC and Extensible Authentication Protocol (EAP) authentication packets. Use the following options to activate authenticator debugging: |
| | • all--Activates debugging for all authenticator packets |
| | • dispatcher--Activates debugging for authentication request handler packets |
| | • mac-authen--Activates debugging for MAC authentication packets |
| | • process--Activates debugging for authenticator process packets |
| | • rxdata--Activates debugging for EAP over LAN (EAPOL) packets from client devices |
| | • state-machine--Activates debugging for authenticator state-machine packets |
| | • txdata--Activates debugging for EAPOL packets sent to client devices |
| dispatcher | Provides information about 802.11 AAA dispatcher (interface between association and manager) packets. |
**manager**

Provides information about the AAA manager. Use these options to activate AAA manager debugging:

- **all** -- Activates all AAA manager debugging
- **dispatcher** -- Activates debug information for AAA manager-authenticator dispatch traffic
- **keys** -- Activates debug information for AAA manager key processing
- **rxdata** -- Activates debugging for AAA manager packets received from client devices
- **state-machine** -- Activates debugging for AAA manager state-machine packets
- **supplicant** -- Activates debugging for Light Extensible Authentication Protocol (LEAP) supplicant packets
- **txdata** -- Activates debugging for AAA manager packets sent to client devices.

**Command Default**

Debugging is disabled.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>

**debug drip event**

To display debugging messages for Duplicate Ring Protocol (DRiP) events, use the `debug drip event` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```code
debug drip event
no debug drip event
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Debugging is disabled for DRiP events.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3(4)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a TrBRF interface is configured on the Remote Switch Module (RSM), the DRiP protocol is activated. The DRiP protocol adds the VLAN ID specified in the router command to its database and recognizes the VLAN as a locally configured, active VLAN.

**Examples**

The following is sample output from the `debug drip event` command:

```
Router# debug drip event
DRiP gets a packet from the network:

612B92C0: 01000000 00000000 0C501900 0000AAAA ........P...**
612B92D0: 0300000C 00020000 00000100 0CCCCCCC ............LLL
612B92E0: 00000C50 19000020 AAAA0300 000C0102 ...P... ********
612B92F0: 01010114 00000002 00000002 0000C500 ............P
612B9300: 19000001 04C00064 04 ..........d.
DRiP gets a packet from the network:

Recvd. pak
DRiP recognizes that the VLAN ID it is getting is a new one from the network:

6116C840: 0100 0CCCCCCC ...LLL
6116C850: 00102F72 CBFB0024 AAAA0300 000C0102 ..../K,.**......
6116C860: 01FF0214 0002E254 00015003 00102F72 .....bT..P.../r
6116C870: C8000010 04C00014 044003EB 14 H....@...@.k.
DRiP : remote update - Never heard of this vlan
```
DRiP attempts to resolve any conflicts when it discovers a new VLAN. The value action = 1 means to notify the local platform of change in state.

DRIP : resolve remote for vlan 20 in VLAN0
DRIP : resolve remote - action = 1
The local platform is notified of change in state:

DRIP Change notification active vlan 20
Another new VLAN ID was received in the packet:

DRIP : resolve remote for vlan 1003 in Vlan0
No action is required:

DRIP : resolve remote - action = 0
Thirty seconds have expired, and DRiP sends its local database entries to all its trunk ports:

DRIP : local timer expired
DRIP : transmit on 0000.0C50.1900, length = 24
612B92C0: 01000C00 00000000 0C501900 0000AAAA ...........P.....**
612B92D0: 0300000C 00020000 00000100 0CCCCCCC ............LLL

612B92F0: 01FF0114 00000003 00000002 0000C50 ..............P
612B9300: 19000001 04C00064 04 612B9310: 00000001 04C00064 04
**debug drip packet**

To display debugging messages for Duplicate Ring Protocol (DRiP) packets, use the `debugdrippacket` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
dumpdrip packet
no dumpdrip packet
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Debugging is not enabled for DRiP packets.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3(4)T</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you use this command, you can optionally use the `cleardrip` command first. As a result the DRiP counters are reset to 0. If the DRiP counters begin to increment, the router is receiving packets.

**Examples**

The following is sample output from the `debugdrippacket` command:

```
Router# debug drip packet
```

The following type of output is displayed when a packet is entering the router and you use the `showdebug` command:

```
039E5FC0: 0100 00CC00CC 00E0A39B 3FFB0028 ...LLL.`.#.?.(.
039E5FD0: AAAA0300 000C0102 01FF0314 0000A5F6 **............%v
039E5FE0: 00008805 0000A39B 3C000000 04000028 ..... #.<....@.(.
039E5FF0: 04C00032 044003EB 0F .@.2.@.k.
039FBD20: 01000C00 00000010 ........
```

The following type of output is displayed when a packet is sent by the router:

```
039FBD30: A6AB450 0000AAAA 0300000C 00020000 6.4P..**.*...
039FBD40: 00000100 000000CC 0010A6AE B4500020 .......LLL..&.4P.
039FBD50: AAAA0300 000C0102 01FF0114 00000003 **............

debug dsc clock

To display debugging output for the time-division multiplexing (TDM) clock-switching events on the dial shelf controller (DSC), use the debug dsc clock command in privileged EXEC mode. To disable debugging output, use the no form of this command.

[execute-on] debug dsc clock
[execute-on] no debug dsc clock

Syntax Description
This command has no arguments or keywords; however, it can be used with the execute-on command.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3(2)AA</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

Usage Guidelines
To perform this command from the router shelf on the Cisco AS5800 series platform, use the execute-on slot-number debug dsc clock form of this command.

The debug dsc clock command displays TDM clock-switching events on the dial shelf controller. The information displayed includes the following:

- Clock configuration messages received from trunks via NBUS
- Dial shelf controller clock configuration messages from the router shelf over the dial shelf interface link
- Clock switchover algorithm events

Examples
The following example shows that the debug dsc clock command has been enabled, and that trunk messages and configuration message has been received:

AS5800# debug dsc clock
Dial Shelf Controller Clock debugging is on
AS5800#
00:02:55: Clock Addition msg of len 12 priority 8 from slot 1 port 1 on line 0
00:02:55: Trunk 1 has reloaded

</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.3(2)AA</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(33)SRA</td>
<td>This command was integrated into Cisco IOS Release 12.2(33)SRA.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `debug dsip` command is used to enable the display of debugging messages for DSIP between the router shelf and the dial shelf. Using this command, you can display booting messages generated when the download of an image occurs, view console operation, and trace logging of MAC header information and DSIP transport layer information as modules interact with the underlying physical media driver. This command can be applied to a single modem or a group of modems.
Once the `debug dsiptrace` command has been enabled, you can read the information captured in the trace buffer using the `show dsiptracing` command.

**Examples**

The following example indicates the `debug dsiptrace` command logs MAC headers of the various classes of DSIP packets. To view the logged information, use the `show dsiptracing` command:

```
AS5800# debug dsip trace
NIP tracing debugging is on
AS5800# show dsip tracing
NIP Control Packet Trace
------------------------------------------------------------
Dest:00e0.b093.2238 Src:0007.4c72.0058 Type:200B SrcShelf:1 SrcSlot:11

</tbody>
</table>
**debug dspapi**

**Note**

Effective with release 12.3(8)T, the `debug dspapi` command is replaced by the `debug voip dspapi` command. See the `debug voip dspapi` command for more information.

To enable debugging for Digital Signal Processor (DSP) application programming interface (API) message events, use the `debug dspapi` command in privileged EXEC mode. To reset the default value for this feature, use the `no` form of this command.

```
debug dspapi {all | command | detail | error | notification | response}
no debug dspapi {all | command | detail | error | notification | response}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables all <code>debug dspapi</code> options (command, detail, error, notification and response).</td>
</tr>
<tr>
<td>command</td>
<td>Displays commands sent to the DSPs.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays additional detail for the DSP API debugs enabled.</td>
</tr>
<tr>
<td>error</td>
<td>Displays any DSP API errors.</td>
</tr>
<tr>
<td>notification</td>
<td>Displays notification messages sent from the DSP (for example, tone detection notification).</td>
</tr>
<tr>
<td>response</td>
<td>Displays responses sent by the DSP (for example, responses to statistic requests).</td>
</tr>
</tbody>
</table>

**Command Default**

This command is not enabled.

**Command Modes**

Privileged EXEC

**Command History**

</tr>
</tbody>
</table>
Modification

- **Release**: 12.2(8)T
  - **Modification**: This command was integrated into Cisco IOS Release 12.2(8)T.

- **Release**: 12.3(8)T
  - **Modification**: This command was replaced by the `debugvoipdspapi` command.

- **Release**: 12.2(33)SRA
  - **Modification**: This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Usage Guidelines**: DSP API message events used to communicate with DSPs are intended for use with Connexant (Nextport) and Texas Instrument (54x) DSPs. This command severely impacts performance and should be used only for single-call debug capture.

**Examples**: The following example shows how to enable debugging for all DSP API message events:

```plaintext
Router# debug dspapi all
```

### Usage Guidelines
The router on which this command is used must be equipped with one or more digital T1/E1 packet voice trunk network modules (NM-HDVs) or high-density voice (HDV) transcoding/conferencing DSP farms (NM-HDV-FARMS) to provide DSP resources.

Debugging is turned on for all DSP-farm-service sessions. You can debug multiple sessions simultaneously, with different levels of debugging for each.

### Examples
The following is sample output from the `debug dspfarm events` command:

```
Router# debug dspfarm events
DSP Farm service events debugging is on
*Mar 1 00:45:51: Sent 180 bytes to DSP 4 channel 2

debug dspu activation

To display information on downstream physical unit (DSPU) activation, use the `debug dspu activation` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```plaintext
debug dspu activation [ name ]
no debug dspu activation [ name ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Optional) The host or physical unit (PU) name designation.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Usage Guidelines**

The `debug dspu activation` command displays all DSPU activation traffic. To restrict the output to a specific host or PU, include the host or PU `name` argument. You cannot turn off debugging output for an individual PU if that PU has not been named in the `debug dspu activation` command.

**Examples**

The following is sample output from the `debug dspu activation` command. Not all intermediate numbers are shown for the "activated" and "deactivated" logical unit (LU) address ranges.

```plaintext
Router# debug dspu activation
DSPU: LS HOST3745 connected
DSPU: PU HOST3745 activated
DSPU: LU HOST3745-2 activated
DSPU: LU HOST3745-3 activated
.
.
DSPU: LU HOST3745-253 activated
DSPU: LU HOST3745-254 activated
DSPU: LU HOST3745-2 deactivated
DSPU: LU HOST3745-3 deactivated
.
.
DSPU: LU HOST3745-253 deactivated
DSPU: LU HOST3745-254 deactivated
DSPU: LS HOST3745 disconnected
DSPU: PU HOST3745 deactivated
```

The table below describes the significant fields shown in the display.

**debug dspu packet**

To display information on a downstream physical unit (DSPU) packet, use the `debug dspu packet` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
default dspu packet [name]
no debug dspu packet [name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Optional) The host or PU name designation.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Usage Guidelines**

The `debug dspu packet` command displays all DSPU packet data flowing through the router. To restrict the output to a specific host or physical unit (PU), include the host or PU `name` argument. You cannot turn off debugging output for an individual PU if that PU has not been named in the `debug dspu packet` command.

**Examples**

The following is sample output from the `debug dspu packet` command:

```
Router# debug dspu packet
DSPU: Rx: PU HOST3745 data length 12 data: 2D000002BE1EB80 000D0201
DSPU: Tx: PU HOST3745 data length 25 data: 2D000002BE1EB80 000D020100850000 000C060000100000 00
DSPU: Rx: PU HOST3745 data length 12 data: 2D000002BE1EB80 000D0201
DSPU: Tx: PU HOST3745 data length 25 data: 2D000002BE1EB80 000D020100850000 000C060000100000 00
```

The table below describes the significant fields shown in the display.

debug dspu state

To display information on downstream physical unit (DSPU) finite state machine (FSM) state changes, use the `debug dspu state` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug dspu state [ name ]
no debug dspu state [ name ]
```

**Syntax Description**

| name         | (Optional) The host or physical unit (PU) name designation. |

**Command Modes**

Privileged EXEC

**Usage Guidelines**

Use the `debug dspu state` command to display only the FSM state changes. To see all FSM activity, use the `debug dssputrace` command. You cannot turn off debugging output for an individual PU if that PU has not been named in the `debug dspu state` command.

**Examples**

The following is sample output from the `debug dspu state` command. Not all intermediate numbers are shown for the "activated" and "deactivated" logical unit (LU) address ranges.

```
Router# debug dspu state
DSPU: LS HOST3745: input=StartLs, Reset -> PendConOut
DSPU: LS HOST3745: input=ReqOpn.Cnf, PendConOut -> Xid
DSPU: LSU HOST3745: input=Connect.Ind, Xid -> ConnIn
DSPU: LSU HOST3745: input=Connected.Ind, ConnIn -> Connected
DSPU: PU HOST3745: input=Actpu, Reset -> Active
DSPU: LU HOST3745-2: input=uActlu, Reset -> upLuActive

debug dspu trace

To display information on downstream physical unit (DSPU) trace activity, which includes all finite state machine (FSM) activity, use the `debug dspu trace` command in privileged EXEC mode. To disable debugging output, use the `no` form of this command.

```
debug dspu trace [ name ]
no debug dspu trace [ name ]
```

**Syntax Description**

| name | (Optional) The host or physical unit (PU) name designation. |

**Command Modes**

Privileged EXEC

**Usage Guidelines**

Use the `debug dspu trace` command to display all FSM state changes. To see FSM state changes only, use the `debug dspu state` command. You cannot turn off debugging output for an individual PU if that PU has not been named in the `debug dspu trace` command.

**Examples**

The following is sample output from the `debug dspu trace` command:

```
Router# debug dspu trace
DSPU: LS HOST3745 input = 0 ->(1,a1)
DSPU: LS HOST3745 input = 5 ->(5,a6)
DSPU: LS HOST3745 input = 7 ->(5,a9)
DSPU: LS HOST3745 input = 9 ->(5,a28)
DSPU: LU HOST3745-2 in:0 s:0->(2,a1)
DSPU: LS HOST3745 input = 19 ->(8,a20)
DSPU: LS HOST3745 input = 18 ->(8,a17)
DSPU: LU HOST3745-3 in:0 s:0->(2,a1)
DSPU: LS HOST3745 input = 19 ->(8,a20)
DSPU: LS HOST3745 input = 18 ->(8,a17)
DSPU: LU HOST3745-252 in:0 s:0->(2,a1)
DSPU: LS HOST3745 input = 19 ->(8,a20)
DSPU: LS HOST3745 input = 18 ->(8,a17)
DSPU: LU HOST3745-254 in:0 s:0->(2,a1)
DSPU: LS HOST3745 input = 19 ->(8,a20)
```

The table below describes significant fields shown in the output.
