Cisco IOS Scripting with Tcl

The Cisco IOS Scripting with Tcl feature provides the ability to run Tool Command Language (Tcl) version 8.3.4 commands from the Cisco IOS command-line interface (CLI).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Cisco IOS Scripting with Tcl

- Familiarity with Tcl programming and Cisco IOS commands is required.
- Tcl commands can be executed from the Tcl configuration mode using the Cisco IOS CLI. Tcl configuration mode is accessed from privileged EXEC mode. Access to privileged EXEC mode should be managed by restricting access using the enable command password.
Restrictions for Cisco IOS Scripting with Tcl

- If Cisco IOS configuration commands are used within the Tcl scripts, submode commands must be entered as quoted arguments on the same line as the configuration command.

- Error messages are provided, but you must check that the Tcl script will run successfully because errors may cause the Tcl shell to run in an infinite loop.

⚠️ Caution

The use of Tcl server sockets to listen to telnet and FTP ports (23 and 21 respectively) will preempt the normal handling of these ports in Cisco IOS software.

- The table below lists Tcl commands and library calls that do not behave within Cisco IOS software as documented in standard Tcl documents.

Table 1: Tcl Command Options That Behave Differently in Cisco IOS Software

<table>
<thead>
<tr>
<th>Command</th>
<th>Keyword</th>
<th>Argument</th>
<th>Supported</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>after</td>
<td>ms</td>
<td>script</td>
<td>Partially</td>
<td>When the CLI <code>tclsh</code> command is used, there is no event loop implemented unless Embedded Syslog Manager (ESM) is active on the same router. Commands entered using the <code>after</code> Tcl command will not run unless forced using the <code>update</code> command. Sleep mode (the <code>after</code> command) works only with the <code>ms</code> keyword.</td>
</tr>
<tr>
<td>file</td>
<td>-time</td>
<td>atime</td>
<td>No</td>
<td>The optional <code>-time</code> keyword to set the file access time is not supported in Cisco IOS software.</td>
</tr>
<tr>

<td></td>
<td></td>
<td>Partially</td>
<td>When the CLI tclsh command is used, there is no event loop implemented unless Embedded Syslog Manager (ESM) is active on the same router. Commands entered using the fileevent Tcl command will not run unless forced using the update command.</td>
</tr>
<tr>
<td>history</td>
<td>! n</td>
<td></td>
<td>Partially</td>
<td>The ! n shortcut does not work in Cisco IOS software. Use the history Tcl command with the redo n keyword.</td>
</tr>
<tr>
<td>load</td>
<td></td>
<td></td>
<td>No</td>
<td>When the CLI load command is used, an error message stating &quot;dynamic loading not available on this system&quot; is displayed.</td>
</tr>
</tbody>
</table>

**Information About Cisco IOS Scripting with Tcl**

**Tcl Shell for Cisco IOS Software**

The Cisco IOS Tcl shell was designed to allow customers to run Tcl commands directly from the Cisco IOS CLI prompt. Cisco IOS software does contain some subsystems such as Embedded Syslog Manager (ESM)
and Interactive Voice Response (IVR) that use Tcl interpreters as part of their implementation. These subsystems have their own proprietary commands and keyword options that are not available in the Tcl shell.

Several methods have been developed for creating and running Tcl scripts within Cisco IOS software. A Tcl shell can be enabled, and Tcl commands can be entered line by line. After Tcl commands are entered, they are sent to a Tcl interpreter. If the commands are recognized as valid Tcl commands, the commands are executed and the results are sent to the TTY device. If a command is not a recognized Tcl command, it is sent to the Cisco IOS CLI parser. If the command is not a Tcl or Cisco IOS command, two error messages are displayed. A predefined Tcl script can be created outside of Cisco IOS software, transferred to flash or disk memory, and run within Cisco IOS software. It is also possible to create a Tcl script and precompile the code before running it under Cisco IOS software.

Multiple users on the same router can be in Tcl configuration mode at the same time without interference because each Tcl shell session launches a separate interpreter and Tcl server process. The TTY interface number served by each Tcl process is represented in the server process name and can be displayed using the `show process` CLI command.

The Tcl shell can be used to run Cisco IOS CLI EXEC commands within a Tcl script. Using the Tcl shell to run CLI commands allows customers to build menus to guide novice users through tasks, to automate repetitive tasks, and to create custom output for `show` commands.

## Tcl Precompiler

The Cisco IOS Tcl implementation offers support for loading scripts that have been precompiled by the TclPro precompiler. Precompiled scripts allow a measure of security and consistency because they are obfuscated.

## SNMP MIB Object Access

Designed to make access to Simple Network Management Protocol (SNMP) MIB objects easier, a set of UNIX-like SNMP commands has been created. The Tcl shell is enabled either manually or by using a Tcl script, and the new commands can be entered to allow you to perform specified get and set actions on MIB objects. To increase usability, the new commands have names similar to those used for UNIX SNMP access. To access the SNMP commands go to, Using the Tcl Shell to Access SNMP MIB Objects, on page 12.

## Custom Extensions in the Tcl Shell

The Cisco IOS implementation of the Tcl shell contains some custom command extensions. These extensions operate only under Tcl configuration mode. The table below displays these command extensions.

### Table 2: Cisco IOS Custom Tcl Command Extensions

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fconfigure -remote [host port] -broadcast boolean vrf[vrf_table_name]</code></td>
<td>Specifies the options in a channel and enables you to associate a virtual routing and forwarding (VRF) table name with it.</td>
</tr>
<tr>
<td><code>ios_config</code></td>
<td>Runs a Cisco IOS CLI configuration command.</td>
</tr>
</tbody>
</table>
SNMP MIB Custom Extensions in the Tcl Shell

The Cisco IOS implementation of the Tcl shell contains some custom command extensions for SNMP MIB object access. These extensions operate only under Tcl configuration mode. The table below displays these command extensions.

### Table 3: Cisco IOS Custom Tcl Command Extensions for SNMP MIB Access

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_user</td>
<td>Toggles Tcl command output under Tcl configuration mode.</td>
</tr>
<tr>
<td>socket -myvrf [vrf_table_name]</td>
<td>Opens a TCP network connection and enables you to associate a VRF table name with it.</td>
</tr>
<tr>
<td>typeahead</td>
<td>Writes text to the router standard input (stdin) buffer file.</td>
</tr>
<tr>
<td>tclquit</td>
<td>Leaves Tcl shell--synonym for exit.</td>
</tr>
<tr>
<td>udp_open -ipv6 port</td>
<td>Opens a User Datagram Protocol (UDP) socket.</td>
</tr>
<tr>
<td>udp_peek sock -buffersize buffer-size</td>
<td>Enables peeking into a UDP socket.</td>
</tr>
</tbody>
</table>

### snmp_getbulk

Retrieves a large section of a MIB table. This command is similar to the SNMP getbulk command. The syntax is in the following format:

```
snmp_getbulk community-string non-repeaters max-repetitions oid [oid2 oid3...]
```

- Use the `community-string` argument to specify the SNMP community from which the objects will be retrieved.
- Use the `non-repeaters` argument to specify the number of objects that can be retrieved with a get-next operation.
- Use the `max-repetitions` argument to specify the maximum number of get-next operations to attempt while trying to retrieve the remaining objects.
- Use the `oid` argument to specify the object ID(s) to retrieve.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp_getid</td>
<td>Retrieves the following variables from the SNMP entity on the router:</td>
</tr>
<tr>
<td></td>
<td>• sysDescr.0</td>
</tr>
<tr>
<td></td>
<td>• sysObjectID.0</td>
</tr>
<tr>
<td></td>
<td>• sysUpTime.0</td>
</tr>
<tr>
<td></td>
<td>• sysContact.0</td>
</tr>
<tr>
<td></td>
<td>• sysName.0</td>
</tr>
<tr>
<td></td>
<td>• sysLocation.0</td>
</tr>
<tr>
<td></td>
<td>This command is similar to the SNMP getid command. The syntax is in the following format:</td>
</tr>
<tr>
<td></td>
<td><strong>snmp_getid</strong> community-string</td>
</tr>
<tr>
<td>snmp_getnext</td>
<td>Retrieves a set of individual variables from the SNMP entity on the router. This command is similar to the SNMP getnext command. The syntax is in the following format:</td>
</tr>
<tr>
<td></td>
<td><strong>snmp_getnext</strong> community-string oid [oid2 oid3...]</td>
</tr>
<tr>
<td>snmp_getone</td>
<td>Retrieves a set of individual variables from the SNMP entity on the router. This command is similar to the SNMP getone command. The syntax is in the following format:</td>
</tr>
<tr>
<td></td>
<td><strong>snmp_getone</strong> community-string oid [oid2 oid3...]</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| `snmp_setany` | Retrieves the current values of the specified variables and then performs a set request on the variables. This command is similar to the SNMP `setany` command. The syntax is in the following format:  

```
snmp_setany community-string oid type val [oid2 type2 val2...]
```

  - Use the `type` argument to specify the type of object to retrieve. The `type` can be one of the following:
    - `-i`--Integer. A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a router interface, 1 represents up and 2 represents down.
    - `-u`--Unsigned32. A 32-bit number used to represent decimal values in the range from 0 to 2^32 - 1 inclusive.
    - `-c`--Counter32. A 32-bit number with a minimum value of 0 and a maximum value of 2^32 - 1. When the maximum value is reached, the counter resets to 0 and starts again.
    - `-g`--Gauge. A 32-bit number with a minimum value of 0 and a maximum value of 2^32 - 1. The number can increase or decrease at will. For example, the interface speed on a router is measured using a gauge object type.
    - `-o`--Octet string. An octet string--in hex notation--used to represent physical addresses.
    - `-d`--Display string. An octet string--in text notation--used to represent text strings.
    - `-ipv4`--IP version 4 address.
    - `-oid`--Object ID.
  - Use the `val` argument to specify the value of object ID(s) to retrieve. |
How to Configure Cisco IOS Scripting with Tcl

Enabling the Tcl Shell and Using the CLI to Enter Commands

Perform this task to enable the interactive Tcl shell and to enter Tcl commands line by line through the Cisco IOS CLI prompt. Optional steps include specifying a default location for encoding files and specifying an initialization script.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. scripting tcl encdir location-url
4. scripting tcl init init-url
5. scripting tcl low-memory bytes
6. exit
7. tclsh
8. Enter the required Tcl command language syntax.
9. ios_config " cmd " " cmd-option "
10. socket -myaddr addr -myport port -myvrf vrf-table-name host port
11. socket - server -myaddr addr -myvrf vrf-table-name port
12. fconfigure channelname - remote [host port] - broadcast boolean - vrf[vrf_table_name]
13. udp_open -ipv6 port
14. udp_peek sock -buffersize buffer-size
15. exec " exec-cmd "
16. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Router# configure terminal</td>
<td>• Perform Enabling the Tcl Shell and Using the CLI to Enter Commands through Enabling the Tcl Shell and Using the CLI to Enter Commands if you are using encoding files, an initialization script, or both.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 3** scripting tcl endir  *location-url* | (Optional) Specifies the default location of external encoding files used by the Tcl encoding command. Example: 
Router(config)# scripting tcl endir tftp://10.18.117.23/enctcl/ |
| **Step 4** scripting tcl init  *init-url* | (Optional) Specifies an initialization script to run when the Tcl shell is enabled. Example: 
Router(config)# scripting tcl init ftp://user:password@172.17.40.3/tclscript/initfiles3.tcl |
| **Step 5** scripting tcl low-memory  *bytes* | (Optional) Specifies a low water memory mark for free memory for Tcl-based applications. The memory threshold can be set anywhere between 0-4294967295 bytes. Note: If minimum free RAM drops below this threshold, TCL aborts the current script. This prevents the Tcl interpreter from allocating too much RAM and crashing the router. Example: 
Router(config)# scripting tcl low-memory 33117513 |
| **Step 6** exit | (Optional) Exits global configuration mode and returns to privileged EXEC mode. Example: 
Router(config)# exit |
| **Step 7** tclsh | Enables the interactive Tcl shell and enters Tcl configuration mode. Example: 
Router(config)# tclsh |
| **Step 8** Enter the required Tcl command language syntax. | Commands entered in Tcl configuration mode are sent first to the interactive Tcl interpreter. If the command is not a valid Tcl command, it is then sent to the CLI parser. Example: 
Router(tcl)# proc get_bri {} |
| **Step 9** ios_config "cmd "" cmd-option " | (Optional) Modifies the router configuration using a Tcl script by specifying the Tcl command ios_config with CLI commands and options. All arguments and submode commands must be entered on the same line as the CLI configuration command. Example: 
Router(tcl)# ios_config "interface Ethernet 2/0" "no keepalive" |

• In this example, the first argument in quotes configures an Ethernet interface and enters interface configuration mode. The second argument in quotes sets the keepalive option. If these two CLI statements were entered on separate
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 10** socket -myaddr addr -myport port -myvrf vrf-table-name host port | Specifies the client socket and allows a TCL interpreter to connect via TCP over IPv4/IPv6 and opens a TCP network connection. You can specify a port and host to connect to; there must be a server to accept connections on this port.  
  - **-myaddr** addr -- domain name or numerical IP address of the client-side network interface required for the connection. Use this option especially if the client machine has multiple network interfaces.  
  - **-myport** port -- port number that is required for the client's connection.  
  - **-myvrf** [vrf_table_name] -- specifies the vrf table name. If the vrf table is not configured, then the command will return a TCL_ERROR. |
| **Example:** | |
| Router(tcl)# socket -myaddr 10.4.9.34 -myport 12345 -myvrf testvrf 12346 | |
| **Step 11** socket -server -myaddr addr -myvrf vrf-table-name port | Specifies the server socket and allows a TCL interpreter to connect via TCP over IPv4/IPv6 and opens a TCP network connection. If the port is zero, Cisco IOS will allocate a free port to the server socket by using fconfigure command to read the -sock0 argument.  
  - **-myaddr** addr -- domain name or numerical IP address of the client-side network interface required for the connection. Use this option especially if the client machine has multiple network interfaces.  
  - **-myvrf** vrf -- specifies the vrf table name. If the vrf table is not configured, then the command will return a TCL_ERROR and append "Cannot obtain VRF Table ID for VRF_table_name" to the interpreter result. |
| **Example:** | |
| Router(tcl)# socket -server test -myvrf testvrf 12348 | |
| **Step 12** fconfigure channelname - remote [host port] - broadcast boolean - vrf[vrf_table_name] | Specifies the options in a channel.  
  - In case of UDP sockets that are created using the udp_open, the UDP socket can be mapped to a VRF using the fconfigure command.  
  - This command can also be used to display the properties of the channel.  
  - **-broadcast** -- enables or disables the broadcasting. |
<p>| <strong>Example:</strong> | |
| Router(tcl)# fconfigure sock1 -vrf vrf1 -remote [list 10.4.9.37 56009] -broadcast 1 | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 13** udp_open -ipv6 port | Opens a UDP socket.  
- If a port is specified the UDP socket will be opened on that port. Otherwise the system will choose a port and you can use the `fconfigure` command to obtain the port number, if required. If `-ipv6` argument is specified, the socket will be opened specifying the AF_INET6 protocol family. |
| **Example:** | 
| Router(tcl)# udp_open -ipv6 56005 | |
| **Step 14** udp_peek sock -buffersize buffer-size | Enables peeking into a UDP socket.  
- `-buffersize` buffer-size --specifies the buffersize. |
| **Example:** | 
| Router(tcl)# udp_peek sock0 -buffersize 100 | |
| **Step 15** exec "exec-cmd " | (Optional) Executes Cisco IOS CLI EXEC mode commands from a Tcl script by specifying the Tcl command `exec` with the CLI commands.  
- In this example, interface information for the router is displayed. |
| **Example:** | 
| Router(tcl)# exec "show interfaces" | |
| **Step 16** exit | Exits Tcl configuration mode and returns to privileged EXEC mode. |
| **Example:** | 
| Router(tcl)# exit | |

**Examples**

The following sample (partial) output shows information about Ethernet interface 0 on the router. The `show interfaces` command has been executed from Tcl configuration mode.

```text
Router# tclsh
Router(tcl)# exec "show interfaces"
Ethernet 0 is up, line protocol is up  
Hardware is MCI Ethernet, address is 0000.0c00.750c (bia 0000.0c00.750c)  
Internet address is 10.108.28.8, subnet mask is 255.255.255.0  
MTU 1500 bytes, BW 10000 Kbit, DLY 100000 usec, rely 255/255, load 1/255  
Encapsulation ARPA, loopback not set, keepalive set (10 sec)  
ARP type: ARPA, ARP Timeout 4:00:00  
Last input 0:00:00, output 0:00:00, output hang never  
Last clearing of "show interface" counters 0:00:00  
Output queue 0/40, 0 drops; input queue 0/75, 0 drops  
Five minute input rate 0 bits/sec, 0 packets/sec  
Five minute output rate 2000 bits/sec, 4 packets/sec  
1127576 packets input, 447251251 bytes, 0 no buffer  
Received 354125 broadcasts, 0 runts, 0 giants, 57186* throttles  
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort  
5332142 packets output, 496316039 bytes, 0 underruns  
0 output errors, 432 collisions, 0 interface resets, 0 restarts
```
Troubleshooting Tips

Use the Tcl `puts` command in a Tcl script to trace command execution.

Using the Tcl Shell to Access SNMP MIB Objects

Perform this task to enable the interactive Tcl shell and enter Tcl commands to perform actions on MIB objects.

Before You Begin

The SNMP community configuration must exist in the running configuration of the router.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `scripting tcl encdir location-url`
4. `scripting tcl init init-url`
5. `exit`
6. `tclsh`
7. Enter the required Tcl command language syntax.
8. `snmp_getbulk community-string non-repeaters max-repetitions oid [oid2 oid3...]
9. `snmp_getid community-string`
10. `snmp_getnext community-string oid [oid2 oid3...]
11. `snmp_getone community-string oid [oid2 oid3...]`
12. `snmp_setany community-string oid type val [oid2 type2 val2...]
13. `exit`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

|                      | - Use the *community-string* argument to specify the SNMP community from which the values of objects will be retrieved and then set. |
|                      | - Use the *oid* argument to specify the object ID(s) to retrieve and set. |
|                      | - Use the *type* argument to specify the type of object to retrieve and set. |
|                      | - Use the *val* argument to specify the value of the object to be retrieved and then set. |
| **Step 13**          | **exit**                                                                |
| Example:             | Exits Tcl configuration mode and returns to privileged EXEC mode.        |
Troubleshooting Tips

Use the Tcl `puts` command in a Tcl script to trace command execution.

Running Predefined Tcl Scripts

Perform this optional task to run a predefined Tcl script in Cisco IOS software.

**Before You Begin**

Before performing this task, you must create a Tcl script that can run on Cisco IOS software. The Tcl script may be transferred to internal flash memory using any file system that the Cisco IOS file system (IFS) supports, including TFTP, FTP, and rcp. The Tcl script may also be sourced from a remote location.

**SUMMARY STEPS**

1. `enable`
2. `tclsh`
3. Enter the Tcl source command with the filename and path.
4. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>tclsh</code></td>
<td>Enables the interactive Tcl shell and enters Tcl configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router# tclsh</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the Tcl source command with the filename and path.</td>
<td>Commands entered in Tcl configuration mode are sent first to the interactive Tcl interpreter. If the command is not a valid Tcl command, it is then sent to the CLI parser.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Router(tcl)# source slot0:test.tcl</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuration Examples for Cisco IOS Scripting with Tcl

#### Example Tcl Script Using the `show interfaces` Command

Using the Tcl regular expression engine, scripts can filter specific information from `show` commands and present it in a custom format. The following is an example of filtering the `show interfaces` command output and creating a comma-separated list of BRI interfaces on the router:

```tcl
proc get_bri {} {
    set check ""
    set int_out [exec "show interfaces"]
    foreach int [regexp -all -line -inline "(^BRI\[0-9-][0-9])" $int_out] {
        if {![string equal $check $int]} {
            if {[info exists bri_out]} {
                append bri_out "," $int
            } else {
                set bri_out $int
            }
            set check $int
        }
    }
    return $bri_out
}
```

#### Example Tcl Script for SMTP Support

The following Tcl script is useful for sending e-mail messages from a router.

```tcl
namespace eval ::sendmail {
    namespace export initialize configure sendmessage sendfile
    array set ::sendmail {
        smthost mailhub
        from ""
        friendly ""
    }
    proc configure {} {}
    proc initialize {smtphost from friendly} {
        variable sendmail
        if {[string length $smtphost]} then {
```
Example Tcl Script for SMTP Support

```tcl
proc sendmessage {toList subject body {tcl_trace 0}} {
    variable sendmail
    set smtphost [lindex $sendmail 0]
    set from [lindex $sendmail 1]
    set friendly [lindex $sendmail 2]
    if {$trace} then {
        puts stdout "Connecting to $smtphost:25"
    }
    set sockid [socket $smtphost 25]
    if {[string length $from]} then {
        puts $sockid "MAIL From:<$from>
        flush $sockid
        set result [gets $sockid]
        if {$trace} then {
            puts stdout "MAIL From:<$from>
            $result"
        }
    } foreach to $toList {
        puts $sockid "RCPT To:<$to>
        flush $sockid
        set result [gets $sockid]
        if {$trace} then {
            puts stdout "RCPT To:<$to>
            $result"
        }
    }
    puts $sockid "DATA "
    flush $sockid
    set result [gets $sockid]
    if {$trace} then {
        puts stdout "DATA 
        $result"
    }
    puts $sockid "From: $friendly <$from>"
    foreach to $toList {
        puts $sockid "To:<$to>"
        flush $sockid
    }
    puts $sockid "Subject: $subject"
    flush $sockid
    set result [gets $sockid]
    if {$trace} then {
        puts stdout "QUIT
        $result"
    }
    catch {close $sockid }
    if {$status} then {
        return -code error $result
    }
    return
}
proc sendfile {toList filename subject {tcl_trace 0}} {
    set fd [open $filename r]
    sendmessage $toList $subject [read $fd] $trace
    return
}
```
Example Tcl Script for SNMP MIB Access

Using the Tcl shell, Tcl commands can perform actions on MIBs. The following example shows how to set up the community access strings to permit access to SNMP. Public access is read-only, but private access is read-write. The following example shows how to retrieve a large section of a table at once using the `snmp_getbulk` Tcl command extension.

Two arguments, `non-repeaters` and `max-repetitions`, must be set when an `snmp_getbulk` command is issued. The `non-repeaters` argument specifies that the first N objects are to be retrieved with a simple `snmp_getnext` operation. The `max-repetitions` argument specifies that up to M `snmp_getnext` operations are to be attempted to retrieve the remaining objects.

In this example, three bindings--sysUpTime (1.3.6.1.2.1.1.2.0), ifDescr (1.3.6.1.2.1.2.2.1.2), and ifType (1.3.6.1.2.1.2.2.1.3)--are used. The total number of variable bindings requested is given by the formula N + (M * R), where N is the number of non-repeaters (in this example 1), M is the max-repetitions (in this example 5), and R is the number of request objects (in this case 2, ifDescr and ifType). Using the formula, 1 + (5 * 2) equals 11; and this is the total number of variable bindings that can be retrieved by this `snmp_getbulk` request command.

Sample results for the individual variables include a retrieved value of sysUpTime.0 being 1336090, where the unit is in milliseconds. The retrieved value of ifDescr.1 (the first interface description) is FastEthernet0/0, and the retrieved value of ifType.1 (the first interface type) is 6, which corresponds to the ethernetCsmacd type.

```
snmp-server community public RO
snmp-server community private RW
```
```
tclsh
        snmp_getbulk public 1 5 1.3.6.1.2.1.1.2.0 1.3.6.1.2.1.2.2.1.2 1.3.6.1.2.1.2.2.1.3
        {<obj oid='sysUpTime.0' val='1336090'/>}
        {<obj oid='ifDescr.1' val='FastEthernet0/0'/>}
        {<obj oid='ifType.1' val='6'/>}
        {<obj oid='ifDescr.2' val='FastEthernet1/0'/>}
        {<obj oid='ifType.2' val='6'/>}
        {<obj oid='ifDescr.3' val='Ethernet2/0'/>}
        {<obj oid='ifType.3' val='6'/>}
        {<obj oid='ifDescr.4' val='Ethernet2/1'/>}
        {<obj oid='ifType.4' val='6'/>}
        {<obj oid='ifDescr.5' val='Ethernet2/2'/>}
        {<obj oid='ifType.5' val='6'/>}
```

The following example shows how to retrieve the sysDescr.0, sysObjectID.0, sysUpTime.0, sysContact.0, sysName.0, and sysLocation.0 variables--in this example shown as system.1.0, system.2.0, system.3.0, system.4.0, system.5.0, and system.6.0--from the SNMP entity on the router using the `snmp_getid` Tcl command extension.

```
tclsh
        snmp_getid public
        {<obj oid='system.1.0' val='Cisco Internetwork Operating System Software
Cisco IOS(tm) 7200 Software (C7200-IK9S-M), Experimental Version 12.3(20030507:225511)
[geotpi2itd1 124]
Copyright (c) 1986-2003 by Cisco Systems, Inc.
Compiled Wed 21-May-03 16:16 by engineer'/>}
        {<obj oid='system.2.0' val='products.223'/>}
        {<obj oid='sysUpTime.0' val='6664317'/>}
        {<obj oid='system.4.0' val='1-800-553-2447 - phone the TAC'/>}
        {<obj oid='system.5.0' val='c7200.myCompany.com'/>}
        {<obj oid='system.6.0' val='Bldg 24, San Jose, CA'/>}
```
The following example shows how to retrieve a set of individual variables from the SNMP entity on the router using the `snmp_getnext` Tcl command extension:

```
snmp_getnext public 1.3.6.1.2.1.1.1.0 1.3.6.1.2.1.1.2.0
{
  <obj oid='system.2.0' val='products.223'/>
  <obj oid='sysUpTime.0' val='6683320'/>
}
```

The following example shows how to retrieve a set of individual variables from the SNMP entity on the router using the `snmp_getone` Tcl command extension:

```
snmp_getone public 1.3.6.1.2.1.1.1.0 1.3.6.1.2.1.1.2.0
{
  <obj oid='system.1.0' val='Cisco Internetwork Operating System Software
       Cisco IOS(tm) 7200 Software (C7200-IK9S-M), Experimental Version 12.3(20030507:225511)
       [geotpi2itd1 124]
       Copyright (c) 1986-2003 by Cisco Systems, Inc.
       Compiled Wed 21-May-03 16:16 by engineer'/>
  <obj oid='system.2.0' val='products.223'/>
}
```

The following example shows how to change something in the configuration of the router using the `snmp_setany` Tcl command extension. In this example, the hostname of the router is changed to TCLSNMP-HOST.

```
tclsh
snmp_setany private 1.3.6.1.2.1.1.5.0 -d TCLSNMP-HOST
{
  <obj oid='system.5.0' val='TCLSNMP-HOST'/>
}
```

### Feature Information for Cisco IOS Scripting with Tcl

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

- **MIB** -- Management Information Base.
- **SNMP** -- Simple Network Management Protocol.
- **Tcl** -- Tool Command Language.

See Internetworking Terms and Acronyms for terms not included in this glossary.
 CHAPTER  2  

Signed Tcl Scripts

The Signed Tcl Scripts feature allows you to create a certificate to generate a digital signature and sign a Tool Command Language (Tcl) script with that digital signature. This feature also allows you to work with existing scripts and certificates. The digital signature is verified for authentication and then run with trusted access to the Tcl interpreter. If the script does not contain the digital signature, the script may run in a limited mode for untrusted scripts, or may not run at all.

• Finding Feature Information, page 23
• Prerequisites for Signed Tcl Scripts, page 24
• Restrictions for Signed Tcl Scripts, page 24
• Information About Signed Tcl Scripts, page 24
• How to Configure Signed Tcl Scripts, page 25
• Configuration Examples for Signed Tcl Script, page 38
• Additional References, page 42

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Signed Tcl Scripts

For this feature to work, the Cisco public key infrastructure (PKI) configuration trustpoint commands must be enabled.

For further details, see the Prerequisites for Signed Tcl Scripts, on page 24.

Restrictions for Signed Tcl Scripts

For this feature to work, you must be running the following:

- Cisco IOS Crypto image
- OpenSSL Version 0.9.7a or above
- Expect

Information About Signed Tcl Scripts

The Signed Tcl Scripts feature introduces security for the Tcl scripts. This feature allows you to create a certificate to generate a digital signature and sign a Tcl script with that digital signature. This certificate examines the Tcl scripts prior to running them. The script is checked for a digital signature from Cisco. In addition, third parties may also sign a script with a digital signature. You may wish to sign your own internally developed Tcl scripts or you could use a script developed by a third party. If the script contains the correct digital signature, it is believed to be authentic and runs with full access to the Tcl interpreter. If the script does not contain the digital signature, the script may be run in a limited mode, known as Safe Tcl mode, or may not run at all.

To create and use signed Tcl scripts, you should understand the following concepts:

Cisco PKI

Cisco PKI provides certificate management to support security protocols such as IP security (IPsec), secure shell (SSH), and secure socket layer (SSL). A PKI is composed of the following entities:

- Peers communicating on a secure network
- At least one certification authority (CA) that grants and maintains certificates
- Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communication, and the signature of the issuing CA
- An optional registration authority (RA) to offload the CA by processing enrollment requests
- A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides you with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every routing device participating in the secured communication...
is enrolled in the PKI in a process where the routing device generates a Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted routing device (also known as a CA or trustpoint).

After each routing device enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

RSA Key Pair

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data that is sent to the device. The private key is kept on the device and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.

RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

Certificate and Trustpoint

A certification authority (CA), also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an internal CA, which is the Cisco Certificate Server.

How to Configure Signed Tcl Scripts

Generating a Key Pair

The key pair consists of a private key and a public key. The private key is intended to be kept private, accessible only to the creator. The public key is generated from the private key and is intended to be known to the public.

To generate a key pair, use the `openssl genrsa` command and then the `openssl rsa` command.

SUMMARY STEPS

1. `openssl genrsa -out private-key-file bit-length`
2. `ls -l`
3. `openssl rsa -in private-key-file -pubout -out public-key-file`
4. `ls -l`
DETAILED STEPS

Step 1  **openssl genrsa -out private-key-file bit-length**  
This command generates a private key that is *bit-length* bits long and writes the key to the *private-key-file* file.

Host% openssl genrsa -out privkey.pem 2048

**Example:**

Generating RSA private key, 2048 bit long modulus
.................+++
.................................................................+++  
e is 65537 (0x10001)

Step 2  **ls -l**  
This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

Host% ls -l  
total 8  
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem

The privkey.pem file contains the private key generated using the **openssl genrsa** command.

Step 3  **openssl rsa -in private-key-file -pubout -out public-key-file**  
This command generates a public key based on the specified private key in the *private-key-file* file and writes the public key to the *public-key-file* file.

**Example:**

Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem

writing RSA key

Step 4  **ls -l**  
This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

Host% ls -l  
total 16  
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem  
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

The pubkey.pem file contains the public key generated from the private key using the **openssl rsa** command.
Generating a Certificate

Perform this task to generate a certificate. To generate an X.509 certificate, use the `openssl req` command.

**SUMMARY STEPS**

1. `openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`
2. `ls -l`

**DETAILED STEPS**

**Step 1**

`openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`

This command creates an X.509 certificate, with full access to a private key that is stored in the `private-key-file` file, and stores the certificate in the `certificate-file` file. The certificate is configured to expire in `expiration-days` days.

To complete the command, enter the following Distinguished Name (DN) information when prompted:

- Country name
- State or province name
- Organization name
- Organizational unit name
- Common name
- Email address

At each prompt, text enclosed in square brackets indicates the default value that will be used if you do not enter a value before you press Enter.

This example shows how to create an X.509 certificate that has full access to the private key in the `privkey.pem` file. The certificate is written to the `cert.pem` file and will expire 1095 days after the creation date.

**Example:**

Host% `openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095`

You are about to be asked to enter information that will be incorporated into your certificate request.

What you are about to enter is what is called a Distinguished Name or a DN. There are quite a few fields but you can leave some blank.

For some fields there will be a default value, if you enter '.', the field will be left blank.

-----

Country Name (2 letter code) [GB]: US

State or Province Name (full name) [Berkshire]: California

Locality Name (eg, city) [Newbury]: San Jose

Organization Name (eg, company) [My Company Ltd]: Cisco Systems, Inc.

Organizational Unit Name (eg, section) []: DEPT_ACCT

Common Name (eg, your name or your server's hostname) []: Jane
Email Address (): janedoe@company.com

Step 2  
ls -l
This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

```
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The cert.pem file contains the X.509 certificate created using the `openssl req` command.

---

**Signing the Tcl Scripts**

Perform this task to sign the Tcl scripts. You will need to sign the Tcl file and output in OpenSSL document in pkcs7 (PKCS#7) format.

To sign the Tcl file, use the `openssl smime` command with the `-sign` keyword.

**SUMMARY STEPS**

1. `openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary`

2. `ls -l`

**DETAILED STEPS**

**Step 1**

```
openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary
```

This command signs the Tcl filename `tcl-file` using the certificate stored in `certificate-file` and the private key stored in `private-key-file` file and then writes the signed Tcl file in DER PKCS#7 format to the `signed-tcl-file` file.

**Example:**

Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary

**Step 2**

```
ls -l
```

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.
Example:

Host% ls -l

```
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The hello.pk7 file contains the signed Tcl file created by the `openssl smime` command from the unsigned Tcl file named hello and using the X.509 certificate in the cert.pem file.

---

**Verifying the Signature**

Perform this task to verify that the signature matches the data, use the `openssl smime` command with the `-verify` keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.

**SUMMARY STEPS**

1. `openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file`

2. `ls -l`

**DETAILED STEPS**

**Step 1**

```
openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file
```

This command verifies the signed Tcl file stored in DER PKCS#7 format in `signed-tcl-file` using the trusted Certificate Authority (CA) certificates in `certificate-file` and then writes the detached content to the file `tcl-file`.

The following example shows how to verify the signature with the input file hello.pk7:

**Example:**

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello

puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
```

**Note**

The SSL command page describes `-in filename` as the input message to be encrypted or signed or the MIME message to be decrypted or verified. For more information, go to [http://www.openssl.org/](http://www.openssl.org/).

**Step 2**

```
ls -l
```

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.
Converting the Signature into Nonbinary Data

Perform this task to convert the signature from binary to nonbinary data.

**SUMMARY STEPS**

1. `xxd -ps signed-tcl-file > nonbinary-signature-file`
2. Create a script that displays `#Cisco Tcl Signature V1.0` in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string "_sig" to the name of the input file.
3. Run the script, supplying the name of the file containing the nonbinary signature file `(nonbinary-signature-file)` as the input argument.
4. `ls -l`
5. `cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script`
6. `cat signed-tcl-script`

**DETAILED STEPS**

**Step 1**

`xxd -ps signed-tcl-file > nonbinary-signature-file`

This command converts the signature in `signed-tcl-file` from binary to nonbinary data and stores it as a hexadecimal dump in the file `nonbinary-signature-file`.

**Example:**

```
Host% xxd -ps hello.pk7 > hello.hex
```

**Step 2**

Create a script that displays `#Cisco Tcl Signature V1.0` in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string "_sig" to the name of the input file.

In this example the `cat` command is used to display the contents of the script file named `my_append`. 

The `hello` file contains the content detached from the signed Tcl file `hello.pk7` by running the `openssl smime` command with the `-verify` keyword. If the verification was successful, the signer’s certificates are written to the X.509 certificate in the `cert.pem` file.
Example:

Host% cat my_append

#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0} 
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
    set new_line {#}
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle

Step 3
Run the script, supplying the name of the file containing the nonbinary signature file (nonbinary-signature-file) as the input argument.
In this example, the my_append script is run with the nonbinary signature file hello.hex specified as input. The output file will be named hello.hex_sig.

Example:

Host% my_append hello.hex

Step 4
ls -l
This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

The hello.hex file contains nonbinary data (stored as a hexadecimal dump) converted from the binary signature in the signed Tcl file hello.pk7. The my_append file contains the script that inserts a comment character at the beginning of each line of the input file. The hello.hex_sig file is the file created by running the my_append script on the nonbinary signature file.

Step 5
cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script
This command appends the contents of the nonbinary signature file (commented-nonbinary-signature-file) to the signed Tcl file stored in DER PKCS#7 format (in the signed-tcl-file file). The concatenated output is written to the file signed-tcl-script.
Example:

Host% `cat hello hello.hex_sig > hello.tcl`

Step 6

This command displays the contents of the file `signed-tcl-script`, which is the concatenation of content detached from the signed Tcl file and the nonbinary signature file.

Example:

Host% `cat hello.tcl`

```
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
```

Cisco IOS Scripting with TCL Configuration Guide, Cisco IOS Release 15M&T
Configuring the Device with a Certificate

Perform this task to configure the device with a certificate.

**Before You Begin**

You must already have a Cisco IOS Crypto image; otherwise you cannot configure a certificate.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto pki trustpoint name`
4. `enrollment terminal`
5. `exit`
6. `crypto pki authenticate name`
7. `At the prompt, enter the base-encoded CA certificate.`
8. `scripting tcl secure-mode`
9. `scripting tcl trustpoint name name`
10. `scripting tcl trustpoint untrusted {execute | safe-execute | terminate}`
11. `exit`
12. `tclsafe`

**DETAILED STEPS**

**Step 1**

`enable`

Enables privileged EXEC mode. Enter your password if prompted.
Configuring the Device with a Certificate

Example:

Device> enable

**Step 2**

**configure terminal**

Enters global configuration mode.

**Example:**

Device# configure terminal

**Step 3**

**crypto pki trustpoint name**

Declares the device is to use the Certificate Authority (CA) *mytrust* and enters ca-trustpoint configuration mode.

**Example:**

Device(config)# crypto pki trustpoint mytrust

**Step 4**

**enrollment terminal**

Specifies manual cut-and-paste certificate enrollment. When this command is enabled, the device displays the certificate request on the console terminal, allowing you to enter the issued certificate on the terminal.

**Example:**

Device(ca-trustpoint)# enrollment terminal

**Step 5**

**exit**

Exits ca-trustpoint configuration mode and returns to global configuration mode.

**Example:**

Device(config)# exit

**Step 6**

**crypto pki authenticate name**

Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted.

**Note** Because the CA signs its own certificate, you should manually authenticate the public key of the CA by contacting the CA administrator when you perform this command.

**Example:**

Device(config)# crypto pki authenticate mytrust

**Step 7**

At the prompt, enter the base-encoded CA certificate.

**Example:**

Enter the base 64 encoded CA certificate.
End with a blank line or the word "quit" on a line by itself

Signed Tcl Scripts

Configuring the Device with a Certificate

Cisco IOS Scripting with TCL Configuration Guide, Cisco IOS Release 15M&T
Step 8 **scripting tcl secure-mode**

Enables signature verification of the interactive Tcl scripts.

```
Device(config)# scripting tcl secure-mode
```

Step 9 **scripting tcl trustpoint name** *name*

Associates an existing configured trustpoint name with a certificate to verify Tcl scripts.

```
Device(config)# scripting tcl trustpoint name mytrust
```

Step 10 **scripting tcl trustpoint untrusted** *execute* | *safe-execute* | *terminate*

(Optional) Allows the interactive Tcl scripts to run regardless of the scripts failing in the signature check or in untrusted mode using one of the three keywords: *execute*, *safe-execute*, or *terminate*.

- **execute** --Executes Tcl scripts even if the signature verification fails. If the *execute* keyword is configured, signature verification is not at all performed.

  Use of this keyword is usually not recommended because the signature verification is not at all performed.

  Note

  Use of this keyword is usually not recommended because the signature verification is not at all performed. The use of this keyword is preferred for internal testing purposes and to provide flexibility. For example, in a situation where a certificate has expired but the other configurations are valid and you want to work with the existing configuration, then you can use the execute keyword to work around the expired certificate.

- **safe-execute** --Allows the script to run in safe mode. You can use the tclsafe command and also enter the interactive Tcl shell safe mode to explore the safe mode Tcl commands that are available. In order to get a better understanding of what is available in this limited safe mode, use the tclsafe Exec command to explore the options.

- **terminate** --Stops any script from running and reverts to default behavior. The default policy is to terminate. When the last trustpoint name is removed, the untrusted action is also removed. The untrusted action cannot be entered until at least one trustpoint name is configured for Tcl.
The following example shows how to execute the Tcl script in safe mode using the `safe-execute` keyword when the signature verification fails.

Device(config)# scripting tcl trustpoint untrusted safe-execute

**Step 11**  
Exit  
Exits global configuration mode and returns to privileged EXEC mode.

Device(config)# exit

**Step 12**  
tclsafe  
(Optional) Enables the interactive Tcl shell untrusted safe mode. This allows you to manually run Tcl commands from the Cisco command line interface in untrusted safe mode.

Device# tclsafe

**Example:**

```
```

**Verifying the Trustpoint**

To display the trustpoints that are configured in the device, use the `show crypto pki trustpoints` command.

**SUMMARY STEPS**

1. enable  
2. show crypto pki trustpoints

**DETAILED STEPS**

**Step 1**  
enable  
This command enables privileged EXEC mode.

**Example:**

Device> enable

**Step 2**  
show crypto pki trustpoints  
This command displays the trustpoints that are configured in the device.

**Example:**

Device# show crypto pki trustpoints
Verifying the Signed Tcl Script

To verify that the Signed Tcl Script is properly running, use the `debug crypto pki transactions` command and the `tclsh` command.

**SUMMARY STEPS**

1. enable
2. debug crypto pki transactions
3. tclsh `flash:signed-tcl-file`

**DETAILED STEPS**

### Step 1  enable
This command enables privileged EXEC mode.

**Example:**

```
Device> enable
```

### Step 2  debug crypto pki transactions
This command displays debugging messages for the trace of interaction (message type) between the CA and the device.

**Example:**

```
Device# debug crypto pki transactions
Crypto PKI Trans debugging is on
```

### Step 3  tclsh `flash:signed-tcl-file`
This command executes the Tcl script in Tcl shell.

**Note** The file should be a signed Tcl file.

**Example:**

```
Device# tclsh flash:hello.tcl
```
What to Do Next

- To get an overview of Crypto, refer to the "Part 5: Implementing and Managing a PKI" section of the Security Configuration Guide.

Configuration Examples for Signed Tcl Script

Generating a Key Pair Example

The following example shows how to generate the key pair—a private key and a public key:

**Generate a Private Key: Example**

Host% openssl genrsa -out privkey.pem 2048
Generating RSA private key, 2048 bit long modulus
            ........+++          ................................................+++ e is 65537 (0x10001)
Host% ls -l
total 8
-rw-r--r--  1 janedoe  eng12  1679 Jun 12 14:55 privkey.pem
Host%

**Generate a Public Key from the Private Key**

Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
Host% ls -l
total 16
-rw-r--r--  1 janedoe  eng12  1679 Jun 12 14:55 privkey.pem
-rw-r--r--  1 janedoe  eng12  451 Jun 12 14:57 pubkey.pem

Generating a Certificate Example

The following example shows how to generate a certificate:

Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
You are about to be asked to enter information that will be incorporated into your certificate request. What you are about to enter is what is called a Distinguished Name or a DN. There are quite a few fields but you can leave some blank. For some fields there will be a default value, If you enter '.', the field will be left blank.

-----
Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:California
Locality Name (eg, city) [Newbury]:San Jose
Organization Name (eg, company) [My Company Ltd]:Cisco Systems, Inc.
Organizational Unit Name (eg, section) []:DEPT_ACCT
Common Name (eg, your name or your server's hostname) []:Jane
Email Address []:janedoe@company.com

Host% ls -l
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

Signing the Tcl Scripts Example

The following example shows how to sign the Tcl scripts:

Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary
Host% ls -l
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

Verifying the Signature Example

The following example shows how to verify the signature:

Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful

Converting the Signature with Nonbinary Data Example

The following example shows how to convert the Tcl signature with nonbinary data:

#!/usr/bin/env expect
set my_first "#Cisco Tcl Signature V1.0"
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
  set new_line {#}
  append new_line $line
  puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle
Host% my_append hello.hex
Host% ls -l
  total 80
  -rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
  -rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
  -rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
  -rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
  -rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
  -rw-r--r-- 1 janedoe eng12 2044 Jun 12 10:50 hello.tcl
  -rw-r--r-- 1 janedoe eng12 48380 Jun 12 14:56 hello.wsc
  -rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.wsc
Host% cat hello hello.hex_sig > hello.tcl
Host% cat hello.tcl
  puts hello
  puts "argc = $argc"
  puts "argv = $argv"
  puts "argv0 = $argv0"
  #Cisco Tcl Signature V1.0
  #Cisco IOS Scripting with TCL Configuration Guide, Cisco IOS Release 15M&T
  #Signed Tcl Scripts
  #Converting the Signature with Nonbinary Data Example

Configuring the Device with a Certificate Example

The following example shows how to configure the device with a certificate:

```
crypto pki trustpoint mytrust
enrollment terminal
!

crypto pki authentication mytrust
crypto pki certificate chain mytrust
certificate ca 00
```

Feature Information for Signed Tcl Scripts

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Glossary

CA--certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

certificates--Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

CRL--certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

IPsec--IP security

peer certificate--Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.

PKI--public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA--registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys--Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your device.

SHA1--Secure Hash Algorithm 1

SSH--secure shell

SSL--secure socket layer
