

# Configuring the Cisco IOS DHCP Server

---

Cisco devices running Cisco software include Dynamic Host Configuration Protocol (DHCP) server and the relay agent software. The Cisco IOS DHCP server is a full DHCP server implementation that assigns and manages IP addresses from specified address pools within the device to DHCP clients. The DHCP server can be configured to assign additional parameters such as the IP address of the Domain Name System (DNS) server and the default device.

This module describes the concepts and the tasks needed to configure the Cisco IOS DHCP server.

- [Finding Feature Information, page 1](#)
- [Prerequisites for Configuring the DHCP Server, page 1](#)
- [Information About the Cisco IOS DHCP Server, page 2](#)
- [How to Configure the Cisco IOS DHCP Server, page 4](#)
- [Configuration Examples for the Cisco IOS DHCP Server, page 37](#)
- [Additional References for Cisco IOS DHCP Server, page 44](#)
- [Feature Information for the Cisco IOS DHCP Server, page 45](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Prerequisites for Configuring the DHCP Server

- Before you configure a Cisco Dynamic Host Control Protocol (DHCP) server, you must understand the concepts documented in the [Overview of the DHCP Server](#) section.

- The Cisco DHCP server and the relay agent services are enabled by default. Use the **no service dhcp** command to disable the Cisco DHCP server and the relay agent and the **service dhcp** command to reenables the functionality.
- Port 67 (the DHCP server port) is closed in the Cisco DHCP/BOOTP default configuration. There are two logical parts to the **service dhcp** command: service enabled and service running. The DHCP service is enabled by default, but port 67 does not open until the DHCP service is running. If the DHCP service is running, the **show ip sockets details** or the **show sockets detail** command displays port 67 as open.
- The Cisco DHCP relay agent is enabled on an interface only when you configure the **ip helper-address** command. This command enables a DHCP broadcast to be forwarded to the configured DHCP server.

## Information About the Cisco IOS DHCP Server

### Overview of the DHCP Server

The Cisco DHCP server accepts address assignment requests and renewals from the client and assigns the addresses from predefined groups of addresses within DHCP address pools. These address pools can also be configured to supply additional information to the requesting client such as the IP address of the Domain Name System (DNS) server, the default device, and other configuration parameters. The Cisco DHCP server can accept broadcasts from locally attached LAN segments or from DHCP requests that have been forwarded by other DHCP relay agents within the network.

### DHCP Attribute Inheritance

The DHCP server database is organized as a tree. The root of the tree is the address pool for natural networks, branches are subnetwork address pools, and leaves are manual bindings to clients. Subnetworks inherit network parameters and clients inherit subnetwork parameters. Therefore, common parameters (for example, the domain name) should be configured at the highest (network or subnetwork) level of the tree.

Inherited parameters can be overridden. For example, if a parameter is defined in both the natural network and a subnetwork, the definition of the subnetwork is used.

Address leases are not inherited. If a lease is not specified for an IP address, by default, the DHCP server assigns a one-day lease for the address.

### DHCP Server Address Allocation Using Option 82

The Cisco IOS DHCP server can allocate dynamic IP addresses based on the relay information option (option 82) sent by the relay agent.

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. Configuration parameters and other control information are carried in tagged data items that are stored in the options field of the DHCP message. The data items are also called options. Option 82 is organized as a single DHCP option that contains information known by the relay agent.

Automatic DHCP address allocation is based on an IP address. This IP address can either be the gateway address (giaddr field of the DHCP packet) or the IP address of an incoming interface. In some networks, it is necessary to use additional information to further determine which IP addresses to allocate. By using option

82, the Cisco IOS DHCP relay agent can include additional information about itself when forwarding client-originated DHCP packets to a DHCP server. The Cisco IOS DHCP server can also use option 82 to provide additional information to properly allocate IP addresses to DHCP clients. The information sent via option 82 is used to identify the port where the DHCP request arrives. Automatic DHCP address allocation does not parse out the individual suboptions contained in option 82. Rather, the address allocation is done by matching a configured pattern byte by byte.

This feature introduces a new DHCP class capability, which is a method to group DHCP clients based on some shared characteristics other than the subnet in which the clients reside.

For example, DHCP clients are connected to two ports of a single switch. Each port can be configured to be a part of two VLANs: VLAN1 and VLAN2. DHCP clients belong to either VLAN1 or VLAN2 and the switch can differentiate the VLAN that a particular DHCP Discover message belongs to (possibly through Layer 2 encapsulation). Each VLAN has its own subnet and all DHCP messages from the same VLAN (same switch) have the giaddr field set to the same value indicating the subnet of the VLAN.

Problems can occur while allocating IP addresses to DHCP clients that are connected to different ports of the same VLAN. These IP addresses must be part of the same subnet but the range of IP addresses must be different. In the preceding example, when a DHCP client that is connected to a port of VLAN1 must be allocated an IP address from a range of IP addresses within the VLAN's subnet, whereas a DHCP client connecting to port 2 of VLAN1 must be allocated an IP address from another range of IP addresses. The two range of IP addresses are part of the same subnet (and have the same subnet mask). Generally, during DHCP address allocation, the DHCP server refers only to the giaddr field and is unable to differentiate between the two ranges.

To solve this problem, a relay agent residing at the switch inserts the relay information option (option 82), which carries information specific to the port, and the DHCP server inspects both the giaddr field and the inserted option 82 during the address selection process.

When you enable option 82 on a device, the following sequence of events occurs:

- 1 The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- 2 When the device receives the DHCP request, it adds the option 82 information in the packet. The option 82 information contains the device MAC address (the remote ID suboption) and the port identifier, vlan-mod-port, from which the packet is received (the circuit ID suboption).
- 3 The device adds the IP address of the relay agent to the DHCP packet.
- 4 The device forwards the DHCP request that includes the option 82 field to the DHCP server.
- 5 The DHCP server receives the packet. If the server is option 82 capable, it uses the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. The DHCP server echoes the option 82 field in the DHCP reply.
- 6 The DHCP server unicasts the reply to the device if the request is relayed to the server by the device. The device verifies that it originally inserted the option 82 data by inspecting remote ID and possibly circuit ID fields. The device removes the option 82 field and forwards the packet to the interface that connects to the DHCP client that sent the DHCP request.

The Cisco software refers to a pool of IP addresses (giaddr or incoming interface IP address) and matches the request to a class or classes configured in the pool in the order the classes are specified in the DHCP pool configuration.

When a DHCP address pool is configured with one or more DHCP classes, the pool becomes a restricted access pool, which means that no addresses are allocated from the pool unless one or more classes in the pool matches. This design allows DHCP classes to be used either for access control (no default class is configured on the pool) or to provide further address range partitions within the subnet of the pool.

Multiple pools can be configured with the same class, eliminating the need to configure the same pattern in multiple pools.

The following capabilities are supported for DHCP class-based address allocation:

- Specifying the full relay agent information option value as a raw hexadecimal string by using the **relay-information hex** command in new relay agent information configuration mode.
- Support for bit-masking the raw relay information hexadecimal value.
- Support for a wildcard at the end of a hexadecimal string specified by the **relay-information hex** command.

If the relay agent inserts option 82 but does not set the giaddr field in the DHCP packet, the DHCP server interface must be configured as a trusted interface by using the **ip dhcp relay information trusted** command. This configuration prevents the server from dropping the DHCP message.

## How to Configure the Cisco IOS DHCP Server

### Configuring a DHCP Database Agent or Disabling Conflict Logging

A DHCP database agent is any host (for example, an FTP, a TFTP, or a remote copy protocol [RCP] server) or storage media on a DHCP server (for example, disk0) that stores the DHCP bindings database. You can configure multiple DHCP database agents, and the interval between database updates and transfers for each agent.

Automatic bindings are IP addresses that are automatically mapped to the MAC addresses of hosts that are found in the DHCP database. Automatic binding information (such as lease expiration date and time, interface index, and VPN routing and forwarding [VRF] name) is stored in a database agent. The bindings are saved as text records for easy maintenance.

An address conflict occurs when two hosts use the same IP address. During address assignment, DHCP checks for conflicts by using ping and gratuitous Address Resolution Protocol (ARP). If a conflict is detected, the address is removed from the pool. The address is not assigned until the administrator resolves the conflict.

**Note**

We strongly recommend using database agents. However, the Cisco DHCP server can run without database agents. If you choose not to configure a DHCP database agent, disable the recording of DHCP address conflicts on the DHCP server by using the **no ip dhcp conflict logging** command in global configuration mode. If there is a conflict logging but no database agent is configured, bindings during a switchover are lost when a device reboots. Possible false conflicts can occur causing the address to be removed from the address pool.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
  - **ip dhcp database url [timeout seconds | write-delay seconds]**
  - **no ip dhcp conflict logging**
4. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	Do one of the following: <ul style="list-style-type: none"> <li>• <b>ip dhcp database url [timeout seconds   write-delay seconds]</b></li> <li>• <b>no ip dhcp conflict logging</b></li> </ul> <b>Example:</b> Device(config)# ip dhcp database ftp://user:password@172.16.1.1/router-dhcp timeout 80  <b>Example:</b> Device(config)# no ip dhcp conflict logging	Configures a DHCP server to save automatic bindings on a remote host called a database agent. or Disables DHCP address conflict logging.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

## Excluding IP Addresses

The IP address configured on a device interface is automatically excluded from the DHCP address pool. The DHCP server assumes that all other IP addresses in a DHCP address pool subnet are available for assigning to DHCP clients.

You must exclude addresses from the pool if the DHCP server does not allocate those IP addresses to DHCP clients. Consider a scenario where two DHCP servers are set up for the same network segment (subnet) for redundancy. If DHCP servers do not coordinate their services with each other using a protocol such as DHCP failover, each DHCP server must be configured to allocate addresses from a nonoverlapping set of addresses in the shared subnet. See the [Configuring Manual Bindings](#) section for a configuration example.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp excluded-address** *low-address* [*high-address*]
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp excluded-address</b> <i>low-address</i> [ <i>high-address</i> ]  <b>Example:</b> Device(config)# ip dhcp excluded-address 172.16.1.100 172.16.1.103	Specifies IP addresses that the DHCP server should not assign to DHCP clients.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

# Configuring DHCP Address Pools

## Configuring a DHCP Address Pool

On a per-address pool basis, specify DHCP options for the client as necessary.

You can configure a DHCP address pool with a name that is a string (such as “engineering”) or an integer (such as 0). Configuring a DHCP address pool also puts the device into DHCP pool configuration mode—identified by the (dhcp-config)# prompt—from which you can configure pool parameters (for example, the IP subnet number and default device list).

DHCP defines a process by which the DHCP server knows the IP subnet in which the DHCP client resides, and it can assign an IP address from a pool of valid IP addresses in that subnet. The process by which the DHCP server identifies the DHCP address pool to use for a client request is described in the [Configuring Manual Bindings](#) section.

The DHCP server identifies and uses DHCP address pools for a client request, in the following manner:

- If the client is not directly connected to the DHCP server (the giaddr field of the DHCPDISCOVER broadcast message is nonzero), the server matches the DHCPDISCOVER with the DHCP pool that has the subnet that contains the IP address in the giaddr field.
- If the client is directly connected to the DHCP server (the giaddr field is zero), the DHCP server matches the DHCPDISCOVER with DHCP pools that contain the subnets configured on the receiving interface. If the interface has secondary IP addresses, subnets associated with the secondary IP addresses are examined for possible allocation only after the subnet associated with the primary IP address (on the interface) is exhausted.

Cisco DHCP server software supports advanced capabilities for IP address allocation. See the [Configuring DHCP Address Allocation Using Option 82](#) section for more information.

### Before You Begin

Before you configure the DHCP address pool, you must:

- Identify DHCP options for devices where necessary, including the following:
  - Default boot image name
  - Default devices
  - Domain Name System (DNS) servers
  - Network Basic Input/Output System (NetBIOS) name server
  - Primary subnet
  - Secondary subnets and subnet-specific default device lists (see [Configuring a DHCP Address Pool with Secondary Subnets](#) for information on secondary subnets).
- Decide on a NetBIOS node type (b, p, m, or h).
- Decide on a DNS domain name.

**Note**

You cannot configure manual bindings within the same pool that is configured with the **network** DHCP pool configuration command. To configure manual bindings, see the [Configuring Manual Bindings](#) section.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *name*
4. **utilization mark high** *percentage-number* [**log**]
5. **utilization mark low** *percentage-number* [**log**]
6. **network** *network-number* [*mask* | *prefix-length*] [**secondary**]
7. **domain-name** *domain*
8. **dns-server** *address* [*address2* ... *address8*]
9. **bootfile** *filename*
10. **next-server** *address* [*address2* ... *address8*]
11. **netbios-name-server** *address* [*address2* ... *address8*]
12. **netbios-node-type** *type*
13. **default-router** *address* [*address2* ... *address8*]
14. **option** *code* [*instance number*] {**ascii** *string* | **hex** *string* | *ip-address*}
15. **lease** {*days* [*hours* [*minutes*]] | **infinite**}
16. **end**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp pool</b> <i>name</i>  <b>Example:</b> Device(config)# ip dhcp pool 1	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.

	Command or Action	Purpose
Step 4	<p><b>utilization mark high</b> <i>percentage-number</i> [log]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# utilization mark high 80 log</pre>	<p>(Optional) Configures the high utilization mark of the current address pool size.</p> <ul style="list-style-type: none"> <li>The <b>log</b> keyword enables the logging of a system message. A system message will be generated for a DHCP pool when the pool utilization exceeds the configured high utilization threshold.</li> </ul>
Step 5	<p><b>utilization mark low</b> <i>percentage-number</i> [log]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# utilization mark low 70 log</pre>	<p>(Optional) Configures the low utilization mark of the current address pool size.</p> <ul style="list-style-type: none"> <li>The <b>log</b> keyword enables the logging of a system message. A system message will be generated for a DHCP pool when the pool utilization falls below the configured low utilization threshold.</li> </ul>
Step 6	<p><b>network</b> <i>network-number</i> [mask   /<i>prefix-length</i>] [secondary]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# network 172.16.0.0 /16</pre>	Specifies the subnet network number and mask of the DHCP address pool.
Step 7	<p><b>domain-name</b> <i>domain</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# domain-name cisco.com</pre>	Specifies the domain name for the client.
Step 8	<p><b>dns-server</b> <i>address</i> [<i>address2</i> ... <i>address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# dns server 172.16.1.103 172.16.2.103</pre>	<p>Specifies the IP address of a DNS server that is available to a DHCP client.</p> <ul style="list-style-type: none"> <li>One IP address is required; however, you can specify up to eight IP addresses in one command.</li> <li>Servers should be listed in order of preference.</li> </ul>
Step 9	<p><b>bootfile</b> <i>filename</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# bootfile xllboot</pre>	<p>(Optional) Specifies the name of the default boot image for a DHCP client.</p> <ul style="list-style-type: none"> <li>The boot file is used to store the boot image for the client. The boot image is generally the operating system that the client uses to load.</li> </ul>
Step 10	<p><b>next-server</b> <i>address</i> [<i>address2</i> ... <i>address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# next-server 172.17.1.103 172.17.2.103</pre>	<p>(Optional) Configures the next server in the boot process of a DHCP client.</p> <ul style="list-style-type: none"> <li>One address is required; however, you can specify up to eight addresses in one command line.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>If multiple servers are specified, DHCP assigns them to clients in a round-robin order. The first client gets address 1, the next client gets address 2, and so on.</li> <li>If this command is not configured, DHCP uses the server specified by the <b>ip helper address</b> command as the boot server.</li> </ul>
<b>Step 11</b>	<b>netbios-name-server</b> <i>address</i> [ <i>address2</i> ... <i>address8</i> ]  <b>Example:</b>  <pre>Device(dhcp-config)# netbios-name-server 172.16.1.103 172.16.2.103</pre>	(Optional) Specifies the NetBIOS WINS server that is available to a Microsoft DHCP client. <ul style="list-style-type: none"> <li>One address is required; however, you can specify up to eight addresses in one command line.</li> <li>Servers should be listed in order of preference.</li> </ul>
<b>Step 12</b>	<b>netbios-node-type</b> <i>type</i>  <b>Example:</b>  <pre>Device(dhcp-config)# netbios-node-type h-node</pre>	(Optional) Specifies the NetBIOS node type for a Microsoft DHCP client.
<b>Step 13</b>	<b>default-router</b> <i>address</i> [ <i>address2</i> ... <i>address8</i> ]  <b>Example:</b>  <pre>Device(dhcp-config)# default-router 172.16.1.100 172.16.1.101</pre>	(Optional) Specifies the IP address of the default device for a DHCP client. <ul style="list-style-type: none"> <li>The IP address should be on the same subnet as the client.</li> <li>One IP address is required; however, you can specify up to eight IP addresses in one command line. These default devices are listed in order of preference; that is, <i>address</i> is the most preferred device, <i>address2</i> is the next most preferred device, and so on.</li> <li>When a DHCP client requests an IP address, the device—acting as a DHCP server—accesses the default device list to select another device that the DHCP client will use as the first hop for forwarding messages. After a DHCP client has booted, the client begins sending packets to its default device.</li> </ul>
<b>Step 14</b>	<b>option</b> <i>code</i> [ <i>instance number</i> ] { <i>ascii string</i>   <i>hex string</i>   <i>ip-address</i> }  <b>Example:</b>  <pre>Device(dhcp-config)# option 19 hex 01</pre>	(Optional) Configures DHCP server options.
<b>Step 15</b>	<b>lease</b> { <i>days</i> [ <i>hours</i> [ <i>minutes</i> ]]   <b>infinite</b> }  <b>Example:</b>  <pre>Device(dhcp-config)# lease 30</pre>	(Optional) Specifies the duration of the lease. <ul style="list-style-type: none"> <li>The default is a one-day lease.</li> <li>The <b>infinite</b> keyword specifies that the duration of the lease is unlimited.</li> </ul>

	Command or Action	Purpose
<b>Step 16</b>	<b>end</b>  <b>Example:</b> Device (dhcp-config) # end	Returns to privileged EXEC mode.

## Configuring a DHCP Address Pool with Secondary Subnets

For any DHCP pool, you can configure a primary subnet and any number of secondary subnets. Each subnet is a range of IP addresses that the device uses to allocate an IP address to a DHCP client. The DHCP server multiple subnet functionality enables a Cisco DHCP server address pool to manage additional IP addresses by adding the addresses to a secondary subnet of an existing DHCP address pool (instead of using a separate address pool).

Configuring a secondary DHCP subnetwork places the device in DHCP pool secondary subnet configuration mode—identified by the (config-dhcp-subnet-secondary)# prompt—where you can configure a default address list that is specific to the secondary subnet. You can also specify the utilization rate of the secondary subnet, which allows pools of IP addresses to dynamically increase or reduce in size depending on the address utilization level. This setting overrides the global utilization rate.

If the DHCP server selects an address pool that contains multiple subnets, the DHCP server allocates an IP address from the subnets as follows:

- When the DHCP server receives an address assignment request, it looks for an available IP address in the primary subnet.
- When the primary subnet is exhausted, the DHCP server automatically looks for an available IP address in any of the secondary subnets maintained by the DHCP server (even though the giaddr does not necessarily match the secondary subnet). The server inspects the subnets for address availability in the order of subnets that were added to the pool.
- If the giaddr matches a secondary subnet in the pool, the DHCP server allocates an IP address from that particular secondary subnet (even if IP addresses are available in the primary subnet and irrespective of the order of secondary subnets that were added).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *name*
4. **utilization mark high** *percentage-number* [**log**]
5. **utilization mark low** *percentage-number* [**log**]
6. **network** *network-number* [*mask* | *prefix-length*]
7. **domain-name** *domain*
8. **dns-server** *address* [*address2* ... *address8*]
9. **bootfile** *filename*
10. **next-server** *address* [*address2* ... *address8*]
11. **netbios-name-server** *address* [*address2* ... *address8*]
12. **netbios-node-type** *type*
13. **default-router** *address* [*address2* ... *address8*]
14. **option** *code* [*instance number*] {*ascii string* | *hex string* | *ip-address*}
15. **lease** {*days* [*hours*] [*minutes*] | **infinite**}
16. **network** *network-number* [*mask* | *prefix-length*] [**secondary**]
17. **override default-router** *address* [*address2* ... *address8*]
18. **override utilization high** *percentage-number*
19. **override utilization low** *percentage-number*
20. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>ip dhcp pool</b> <i>name</i>  <b>Example:</b> Device(config)# ip dhcp pool 1	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<p><b>utilization mark high</b> <i>percentage-number</i> [log]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# utilization mark high 80 log</pre>	<p>(Optional) Configures the high utilization mark of the current address pool size.</p> <ul style="list-style-type: none"> <li>The <b>log</b> keyword enables logging of a system message. A system message is generated for a DHCP pool when the pool utilization exceeds the configured high utilization threshold.</li> </ul>
<b>Step 5</b>	<p><b>utilization mark low</b> <i>percentage-number</i> [log]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# utilization mark low 70 log</pre>	<p>(Optional) Configures the low utilization mark of the current address pool size.</p> <ul style="list-style-type: none"> <li>The <b>log</b> keyword enables logging of a system message. A system message is generated for a DHCP pool when the pool utilization falls below the configured low utilization threshold.</li> </ul>
<b>Step 6</b>	<p><b>network</b> <i>network-number</i> [<i>mask</i>   <i>/prefix-length</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# network 172.16.0.0 /16</pre>	<p>Specifies the subnet network number and mask of the primary DHCP address pool.</p>
<b>Step 7</b>	<p><b>domain-name</b> <i>domain</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# domain-name cisco.com</pre>	<p>Specifies the domain name for the client.</p>
<b>Step 8</b>	<p><b>dns-server</b> <i>address</i> [<i>address2 ... address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# dns server 172.16.1.103 172.16.2.103</pre>	<p>Specifies the IP address of a DNS server that is available to a DHCP client.</p> <ul style="list-style-type: none"> <li>One IP address is required; however, you can specify up to eight IP addresses in one command.</li> <li>Servers should be listed in the order of preference.</li> </ul>
<b>Step 9</b>	<p><b>bootfile</b> <i>filename</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# bootfile xllboot</pre>	<p>(Optional) Specifies the name of the default boot image for a DHCP client.</p> <ul style="list-style-type: none"> <li>The boot file is used to store the boot image for the client. The boot image is generally the operating system image that the client loads.</li> </ul>
<b>Step 10</b>	<p><b>next-server</b> <i>address</i> [<i>address2 ... address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# next-server 172.17.1.103 172.17.2.103</pre>	<p>(Optional) Configures the next server in the boot process of a DHCP client.</p> <ul style="list-style-type: none"> <li>One IP address is required; however, you can specify up to eight IP addresses in one command line.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>If multiple servers are specified, DHCP assigns the servers to clients in a round-robin order. The first client gets address 1, the next client gets address 2, and so on.</li> <li>If this command is not configured, DHCP uses the server specified by the <b>ip helper address</b> command as the boot server.</li> </ul>
<b>Step 11</b>	<p><b>netbios-name-server</b> <i>address</i> [<i>address2</i> ... <i>address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# netbios-name-server 172.16.1.103 172.16.2.103</pre>	<p>(Optional) Specifies the NetBIOS Windows Internet Naming Service (WINS) server that is available to a Microsoft DHCP client.</p> <ul style="list-style-type: none"> <li>One address is required; however, you can specify up to eight addresses in one command line.</li> <li>Servers should be listed in order of preference.</li> </ul>
<b>Step 12</b>	<p><b>netbios-node-type</b> <i>type</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# netbios-node-type h-node</pre>	<p>(Optional) Specifies the NetBIOS node type for a Microsoft DHCP client.</p>
<b>Step 13</b>	<p><b>default-router</b> <i>address</i> [<i>address2</i> ... <i>address8</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# default-router 172.16.1.100 172.16.1.101</pre>	<p>(Optional) Specifies the IP address of the default device for a DHCP client.</p> <ul style="list-style-type: none"> <li>The IP address should be on the same subnet as the client.</li> <li>One IP address is required; however, you can specify a up to eight IP addresses in one command line. These default devices are listed in order of preference; that is, <i>address</i> is the most preferred device, <i>address2</i> is the next most preferred device, and so on.</li> <li>When a DHCP client requests for an IP address, the device—acting as a DHCP server—accesses the default device list to select another device that the DHCP client uses as the first hop for forwarding messages. After a DHCP client has booted, the client begins sending packets to its default device.</li> </ul>
<b>Step 14</b>	<p><b>option</b> <i>code</i> [<b>instance</b> <i>number</i>] {<b>ascii</b> <i>string</i>   <b>hex</b> <i>string</i>   <i>ip-address</i>}</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# option 19 hex 01</pre>	<p>(Optional) Configures DHCP server options.</p>
<b>Step 15</b>	<p><b>lease</b> {<i>days</i> [<i>hours</i>] [<i>minutes</i>]   <b>infinite</b>}</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# lease 30</pre>	<p>(Optional) Specifies the duration of the lease.</p> <ul style="list-style-type: none"> <li>The default is a one-day lease.</li> <li>The <b>infinite</b> keyword specifies that the duration of the lease is unlimited.</li> </ul>

	Command or Action	Purpose
<b>Step 16</b>	<p><b>network</b> <i>network-number</i> [<i>mask</i>   <i>/prefix-length</i>] [<b>secondary</b>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# network 10.10.0.0 255.255.0.0 secondary</pre>	<p>(Optional) Specifies the network number and mask of a secondary DHCP server address pool.</p> <ul style="list-style-type: none"> <li>Any number of secondary subnets can be added to a DHCP server address pool.</li> <li>During execution of this command, the configuration mode changes to DHCP pool secondary subnet configuration mode, which is identified by (config-dhcp-subnet-secondary)# prompt. In this mode, the administrator can configure a default device list that is specific to the subnet.</li> <li>See <a href="#">Troubleshooting Tips</a> section if you are using secondary IP addresses under a loopback interface with DHCP secondary subnets.</li> </ul>
<b>Step 17</b>	<p><b>override default-router</b> <i>address</i> [<i>address2</i> ... <i>address8</i>]</p> <p><b>Example:</b></p> <pre>Device(config-dhcp-subnet-secondary)# override default-router 10.10.0.100 10.10.0.101</pre>	<p>(Optional) Specifies the default device list that is used when an IP address is assigned to a DHCP client from a particular secondary subnet.</p> <ul style="list-style-type: none"> <li>If the subnet-specific override value is configured, this override value is used when assigning an IP address from the subnet; the network-wide default device list is used only to set the gateway device for the primary subnet.</li> <li>If this subnet-specific override value is not configured, the network-wide default device list is used when assigning an IP address from the subnet.</li> <li>See <a href="#">Example: Configuring a DHCP Address Pool with Multiple Disjoint Subnets</a> section for a sample configuration.</li> </ul>
<b>Step 18</b>	<p><b>override utilization high</b> <i>percentage-number</i></p> <p><b>Example:</b></p> <pre>Device(config-dhcp-subnet-secondary)# override utilization high 60</pre>	<p>(Optional) Sets the high utilization mark of the subnet size.</p> <ul style="list-style-type: none"> <li>This command overrides the global default setting specified by the <b>utilization mark high</b> command.</li> </ul>
<b>Step 19</b>	<p><b>override utilization low</b> <i>percentage-number</i></p> <p><b>Example:</b></p> <pre>Device(config-dhcp-subnet-secondary)# override utilization low 40</pre>	<p>(Optional) Sets the low utilization mark of the subnet size.</p> <ul style="list-style-type: none"> <li>This command overrides the global default setting specified by the <b>utilization mark low</b> command.</li> </ul>
<b>Step 20</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-dhcp-subnet-secondary)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Troubleshooting Tips

If you are using secondary IP addresses under a single loopback interface and using secondary subnets under a DHCP pool, use one DHCP pool to configure networks for all the secondary subnets instead of using one pool per secondary subnet. The **network** *network-number* [*mask* | *prefix-length*] [**secondary**] command must be configured under a single DHCP address pool rather than multiple DHCP address pools.

The following is the correct configuration:

```
!
ip dhcp pool dhcp_1
 network 172.16.1.0 255.255.255.0
 network 172.16.2.0 255.255.255.0 secondary
 network 172.16.3.0 255.255.255.0 secondary
 network 172.16.4.0 255.255.255.0 secondary
!
interface Loopback111
 ip address 172.16.1.1 255.255.255.255 secondary
 ip address 172.16.2.1 255.255.255.255 secondary
 ip address 172.16.3.1 255.255.255.255 secondary
 ip address 172.16.4.1 255.255.255.255 secondary
```

The following is the incorrect configuration:

```
!
ip dhcp pool dhcp_1
 network 172.16.1.0 255.255.255.0
 lease 1 20 30
 accounting default
!
ip dhcp pool dhcp_2
 network 172.16.2.0 255.255.255.0
 lease 1 20 30
 accounting default
!
ip dhcp pool dhcp_3
 network 172.16.3.0 255.255.255.0
 lease 1 20 30
 accounting default
!
ip dhcp pool dhcp_4
 network 172.16.4.0 255.255.255.0
 lease 1 20 30
 accounting default
!
interface Loopback111
 ip address 172.16.1.1 255.255.255.255 secondary
 ip address 172.16.2.1 255.255.255.255 secondary
 ip address 172.16.3.1 255.255.255.255 secondary
 ip address 172.16.4.1 255.255.255.255 secondary
```

## Verifying the DHCP Address Pool Configuration

The following configuration commands are optional. You can enter the **show** commands in any order.

## SUMMARY STEPS

1. **enable**
2. **show ip dhcp pool** [*name*]
3. **show ip dhcp binding** [*address*]
4. **show ip dhcp conflict** [*address*]
5. **show ip dhcp database** [*url*]
6. **show ip dhcp server statistics** [*type-number*]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>show ip dhcp pool</b> [ <i>name</i> ]  <b>Example:</b> Device# show ip dhcp pool	(Optional) Displays information about DHCP address pools.
<b>Step 3</b>	<b>show ip dhcp binding</b> [ <i>address</i> ]  <b>Example:</b> Device# show ip dhcp binding	(Optional) Displays a list of all bindings created on a specific DHCP server. <ul style="list-style-type: none"> <li>• Use the <b>show ip dhcp binding</b> command to display the IP addresses that have already been assigned. Verify that the address pool is not exhausted. If necessary, recreate the pool to create a larger pool of addresses.</li> <li>• Use the <b>show ip dhcp binding</b> command to display the lease expiration date and time of the IP address of the host.</li> </ul>
<b>Step 4</b>	<b>show ip dhcp conflict</b> [ <i>address</i> ]  <b>Example:</b> Device# show ip dhcp conflict	(Optional) Displays a list of all IP address conflicts.
<b>Step 5</b>	<b>show ip dhcp database</b> [ <i>url</i> ]  <b>Example:</b> Device# show ip dhcp database	(Optional) Displays recent activity on the DHCP database.

	Command or Action	Purpose
<b>Step 6</b>	<b>show ip dhcp server statistics</b> [ <i>type-number</i> ]  <b>Example:</b>  Device# show ip dhcp server statistics	(Optional) Displays count information about server statistics and messages sent and received.

## Configuring Manual Bindings

An address binding is a mapping between the IP address and MAC address of a client. The IP address of a client can be assigned manually by an administrator or assigned automatically from a pool by a DHCP server.

Manual bindings are IP addresses that are manually mapped to MAC addresses of hosts that are found in the DHCP database. Manual bindings are stored in the NVRAM of the DHCP server. Manual bindings are just special address pools. There is no limit to the number of manual bindings, but you can configure only one manual binding per host pool.

Automatic bindings are IP addresses that have been automatically mapped to MAC addresses of hosts that are found in the DHCP database. Because the bindings are stored in the volatile memory of the DHCP server, binding information is lost in the event of power failures or on device reloads. To prevent the loss of automatic binding information, a copy of the automatic binding information is stored on a remote host called the DHCP database agent. The bindings are periodically written to the database agent. When the device reloads, the bindings are read from the database agent to the DHCP database in the DHCP server.

### Note

We strongly recommend that you use database agents. However, Cisco DHCP server can function even without database agents.

Some DHCP clients send a client identifier (DHCP option 61) in the DHCP packet. To configure manual bindings for such clients, you must enter the **client-identifier** command with the hexadecimal values that identify the DHCP client. To configure manual bindings for clients that do not send a client identifier option, you must enter the **hardware-address** DHCP pool configuration command with the hexadecimal hardware address of the client.

Depending on your release, the DHCP server sends infinite lease time to the clients for which manual bindings are configured.

Depending on your release, the DHCP server sends lease time that is configured using the **lease** command to clients for which manual bindings are configured.

### Note

You cannot configure manual bindings within the same pool that is configured with the **network** command in DHCP pool configuration mode. See the [Configuring DHCP Address Pools](#) section for information about DHCP address pools and the **network** command.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *pool-name*
4. **host** *address* [*mask* | */prefix-length*]
5. **client-identifier** *unique-identifier*
6. **hardware-address** *hardware-address* [*protocol-type* | *hardware-number*]
7. **client-name** *name*
8. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>ip dhcp pool</b> <i>pool-name</i>  <b>Example:</b> Device(config)# ip dhcp pool pool1	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.
Step 4	<b>host</b> <i>address</i> [ <i>mask</i>   <i>/prefix-length</i> ]  <b>Example:</b> Device(dhcp-config)# host 172.16.0.1	Specifies the IP address and subnet mask of the client. <ul style="list-style-type: none"> <li>• There is no limit to the number of manual bindings you can configure. However, you can configure only one manual binding per host pool.</li> </ul>
Step 5	<b>client-identifier</b> <i>unique-identifier</i>  <b>Example:</b> Device(dhcp-config)# client-identifier 01b7.0813.8811.66	Specifies the unique identifier for DHCP clients. <ul style="list-style-type: none"> <li>• This command is used for DHCP requests.</li> <li>• DHCP clients require client identifiers. You can specify the unique identifier for the client in either of the following ways:               <ul style="list-style-type: none"> <li>• A 7-byte dotted hexadecimal notation. For example, 01b7.0813.8811.66, where 01 represents the Ethernet media type and the remaining bytes represent the MAC address of the DHCP client.</li> </ul> </li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>A 27-byte dotted hexadecimal notation. For example, 7665.6e64.6f72.2d30.3032.342e.3937.6230.2e33.3734.312d.4661.302f.31. The equivalent ASCII string for this hexadecimal value is vendor-0024.97b0.3741-fa0/1, where vendor represents the vendor, 0024.97b0.3741 represents the MAC address of the source interface, and fa0/1 represents the source interface of the DHCP client.</li> <li>See the Troubleshooting section for information about how to determine the client identifier of the DHCP client.</li> </ul> <p><b>Note</b> The identifier specified here is considered for a DHCP client that sends a client identifier in the packet.</p>
<b>Step 6</b>	<p><b>hardware-address</b> <i>hardware-address</i> [<i>protocol-type</i>   <i>hardware-number</i>]</p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# hardware-address b708.1388.f166 ethernet</pre>	<p>Specifies a hardware address for the client.</p> <ul style="list-style-type: none"> <li>This command is used for BOOTP requests.</li> </ul> <p><b>Note</b> The hardware address specified here is considered for a DHCP client that does not send a client identifier in the packet.</p>
<b>Step 7</b>	<p><b>client-name</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# client-name client1</pre>	<p>(Optional) Specifies the name of the client using any standard ASCII character.</p> <ul style="list-style-type: none"> <li>The client name should not include the domain name. For example, the name client1 should not be specified as client1.cisco.com.</li> </ul>
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(dhcp-config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Troubleshooting Tips

You can determine the client identifier by using the **debug ip dhcp server packet** command. In the following sample output, the client is identified by the value 0b07.1134.a029:

```
Device# debug ip dhcp server packet

DHCPD:DHCPDISCOVER received from client 0b07.1134.a029 through relay 10.1.0.253.
DHCPD:assigned IP address 10.1.0.3 to client 0b07.1134.a029.
.
.
.
```

## Configuring DHCP Static Mapping

The DHCP Static Mapping feature enables the assignment of static IP addresses (without creating numerous host pools with manual bindings) by using a customer-created text file that the DHCP server reads. The benefit of this feature is that it eliminates the need for a long configuration file and reduces the space required in NVRAM to maintain address pools.

A DHCP database contains the mappings between a client IP address and the hardware address, which is referred to as a binding. There are two types of bindings: manual bindings that map a single hardware address to a single IP address, and automatic bindings that dynamically map a hardware address to an IP address from a pool of IP addresses. Manual (also known as static) bindings can be configured individually directly on the device or by using the DHCP Static Mapping feature. These static bindings can be read from a separate static mapping text file. The static mapping text files are read when a device reloads or the DHCP service restarts. These files are read-only.

The read static bindings are treated just like the manual bindings, in that they are:

- Retained across DHCPRELEASEs from the clients.
- Not timed out.
- Deleted only upon deletion of the pool.
- Provided appropriate exclusions for the contained addresses, which are created at the time of the read.

Just like automatic bindings, manual (or static) bindings from the static mapping text file are also displayed by using the **show ip dhcp binding** command.

Perform this task to create the static mapping text file. You will input your addresses in the text file, which is stored in the DHCP database for the DHCP server to read. There is no limit to the number of addresses that can be stored in the file. The file format has the following elements:

- Database version number
- End-of-file designator
- Hardware type
- Hardware address
- IP address
- Lease expiration
- Time the file was created

See the following table for more details about the format of the text file.

The following is a sample static mapping text file:

```
*time* Jan 21 2005 03:52 PM
*version* 2
!IP address      Type      Hardware address      Lease expiration
10.0.0.4 /24     1         0090.bff6.081e        Infinite
10.0.0.5 /28     id        00b7.0813.88f1.66     Infinite
10.0.0.2 /21     1         0090.bff6.081d        Infinite
*end*
```

**Table 1: Static Mapping Text File Field Descriptions**

Field	Description
*time*	Specifies the time the file was created. This field allows DHCP to differentiate between the new and old database versions when multiple agents are configured. The valid format of the time is mm dd yyyy hh:mm AM/PM.
*version* 2	Specifies the database version number.
IP address	Specifies the static IP address. If the subnet mask is not specified, a mask is automatically assigned depending on the IP address. The IP address and the mask is separated by a space.
Type	Specifies the hardware type. For example, type "1" indicates Ethernet. The type "id" indicates that the field is a DHCP client identifier. Legal values can be found online at <a href="http://www.iana.org/assignments/arp-parameters">http://www.iana.org/assignments/arp-parameters</a> in the "Number Hardware Type" list.
Hardware address	Specifies the hardware address.  When the type is numeric, the type refers to the hardware media. Legal values can be found online at <a href="http://www.iana.org/assignments/arp-parameters">http://www.iana.org/assignments/arp-parameters</a> in the "Number Hardware Type" list.  When the type is "id," the type refers to a match on the client identifier.  For more information about the client identifier, see RFC 2132, <i>DHCP Options and BOOTP Vendor Extensions</i> , section 9.14, located at <a href="http://www.ietf.org/rfc/rfc2132.txt">http://www.ietf.org/rfc/rfc2132.txt</a> , or the <b>client-identifier</b> command.  If you are unsure about the client identifier to match with the hardware type, use the <b>debug dhcp detail</b> command to display the client identifier being sent to the DHCP server from the client.
Lease expiration	Specifies the expiration of the lease. "Infinite" specifies that the duration of the lease is unlimited.
*end*	End of file. DHCP uses the *end* designator to detect file truncation.

## Configuring the DHCP Server to Read a Static Mapping Text File

### Before You Begin

The administrator must create the static mapping text file in the correct format and configure the address pools before performing this task.

Before editing the file, you must disable the DHCP server using the **no service dhcp** command.

**Note** The static bindings must not be deleted when a DHCPRELEASE is received or must not be timed out by the DHCP timer. The static bindings should be created by using the **ip dhcp pool** command.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *name*
4. **origin file** *url*
5. **end**
6. **show ip dhcp binding** [*address*]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp pool</b> <i>name</i>  <b>Example:</b> Device(config)# ip dhcp pool pool1	Assigns a name to a DHCP pool and enters DHCP configuration mode.  <b>Note</b> If you have already configured the IP DHCP pool name using the <b>ip dhcp pool</b> command and the static file URL using the <b>origin file</b> command, you must perform a fresh read using the <b>no service dhcp</b> command and the <b>service dhcp</b> command.
<b>Step 4</b>	<b>origin file</b> <i>url</i>  <b>Example:</b> Device(dhcp-config)# origin file tftp://10.1.0.1/static-bindings	Specifies the URL that the DHCP server can access to locate the text file.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(dhcp-config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 6</b>	<b>show ip dhcp binding</b> [ <i>address</i> ]  <b>Example:</b> Device# show ip dhcp binding	(Optional) Displays a list of all bindings created on a specific DHCP server.

### Examples

The following sample output from the **show ip dhcp binding** command displays address bindings that are configured:

```
Device# show ip dhcp binding
```

```
00:05:14:%SYS-5-CONFIG_I: Configured from console by console
Bindings from all pools not associated with VRF:
IP address Client-ID/      Ls expir   Type      Hw address      User name
10.9.9.4/8 0063.7363.2d30.3036.  Infinite  Static 302e.3762.2e39.3634. 632d.4574.8892.
10.9.9.1/24 0063.6973.636f.2d30.  Infinite  Static 3036.302e.3437.3165. 2e64.6462.342d.
```

The following sample output displays each entry in the static mapping text file:

```
*time* Jan 21 2005 22:52 PM
!IP address      Type      Hardware address      Lease expiration
10.19.9.1 /24    id        0063.6973.636f.2d30.3036.302e.3437
10.9.9.4         id        0063.7363.2d30.3036.302e.3762.2e39.3634.632d  Infinite
*end*
```

The following sample debug output shows the reading of the static mapping text file from the TFTP server:

```
Device# debug ip dhcp server
```

```
Loading abc/static_pool from 10.19.192.33 (via Ethernet0):

*May 26 23:14:21.711: DHCPD: read static bindings from tftp://10.19.192.33/abccomp/static_pool.
```

## Customizing DHCP Server Operation

By default, the DHCP server pings a pool address twice before assigning a particular address to a requesting client. If the ping is unanswered, the DHCP server assumes (with a high probability) that the address is not in use and assigns the address to the requesting client.

By default, the DHCP server waits for 2 seconds before timing out a ping packet.

You can configure the DHCP server to ignore and not reply to any BOOTP requests that the server receives. This functionality is beneficial when there is a mix of BOOTP and DHCP clients in a network segment and there is a BOOTP server and a Cisco DHCP server servicing the network segment. The BOOTP server is configured with static bindings for the BOOTP clients and the BOOTP clients must obtain their addresses from the BOOTP server. However, DHCP servers can also respond to BOOTP requests and the DHCP server may offer an address that causes the BOOTP clients to boot with the address from the DHCP server, instead of the address from the BOOTP server. Configuring the DHCP server to ignore BOOTP requests ensures that the BOOTP clients will receive address information from the BOOTP server and will not accept an address from a DHCP server.

Cisco software can forward these ignored BOOTP request packets to another DHCP server if the **ip helper-address** command is configured on the incoming interface.

### Note

It is not recommended to use DHCP ping checks on Cisco Catalyst switches implemented in switch stack or VSS.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp ping packets** *number*
4. **ip dhcp ping timeout** *milliseconds*
5. **ip dhcp bootp ignore**
6. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<p><b>ip dhcp ping packets</b> <i>number</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip dhcp ping packets 5</pre>	<p>(Optional) Specifies the number of ping packets the DHCP server sends to a pool address before assigning the address to a requesting client.</p> <ul style="list-style-type: none"> <li>The default is two packets. Setting the <i>number</i> argument to a value of 0 disables the DHCP server ping operation.</li> </ul>
<b>Step 4</b>	<p><b>ip dhcp ping timeout</b> <i>milliseconds</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip dhcp ping timeout 850</pre>	<p>(Optional) Specifies the duration the DHCP server waits for a ping reply from an address pool.</p>
<b>Step 5</b>	<p><b>ip dhcp bootp ignore</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip dhcp bootp ignore</pre>	<p>(Optional) Allows the DHCP server to selectively ignore and not reply to received BOOTP requests.</p> <ul style="list-style-type: none"> <li>The <b>ip dhcp bootp ignore</b> command applies to all DHCP pools configured on the device. BOOTP requests cannot be selectively ignored on a per-DHCP pool basis.</li> </ul>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Configuring a Remote Device to Import DHCP Server Options from a Central DHCP Server

The Cisco DHCP server can dynamically configure options such as the Domain Name System (DNS) and Windows Internet Name Service (WINS) addresses to respond to DHCP requests from local clients behind the customer premises equipment (CPE). Earlier, network administrators configured the Cisco DHCP server on each device manually. Now, the Cisco DHCP server is enhanced to allow configuration information to be updated automatically. Network administrators can configure one or more centralized DHCP servers to update specific DHCP options within the DHCP pools. The remote servers can request or “import” these option parameters from centralized servers.

This section contains the following tasks:

### Configuring the Central DHCP Server to Update DHCP Options

Perform the following task to configure the Central DHCP Server to update DHCP options:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool *name***
4. **network *network-number* [*mask* | */prefix-length*]**
5. **dns-server *address* [*address2* ... *address8*]**
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp pool <i>name</i></b>  <b>Example:</b> Device(config)# ip dhcp pool 1	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.
<b>Step 4</b>	<b>network <i>network-number</i> [<i>mask</i>   <i>/prefix-length</i>]</b>  <b>Example:</b> Device(dhcp-config)# network 172.16.0.0 /16	Specifies the subnet number and mask of the DHCP address pool.
<b>Step 5</b>	<b>dns-server <i>address</i> [<i>address2</i> ... <i>address8</i>]</b>  <b>Example:</b> Device(dhcp-config)# dns server 172.16.1.103 172.16.2.103	(Optional) Specifies the IP address of a DNS server that is available to a DHCP client.  • One IP address is required; however, you can specify up to eight IP addresses in one command line.  • Servers should be listed in the order of preference.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(dhcp-config)# end	Returns to privileged EXEC mode.

## Configuring the Remote Device to Import DHCP Options

Perform the following task to configure the remote device to import DHCP options:

### Note

When two servers provide DHCP addresses to a single device configured with **ip address dhcp** on two different interfaces, the imported information is merged and, for those options that take a single value, the last known option value will be used.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool** *pool-name*
4. **network** *network-number* [*mask* | */prefix-length*]
5. **import all**
6. **exit**
7. **interface** *type number*
8. **ip address dhcp**
9. **end**
10. **show ip dhcp import**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp pool</b> <i>pool-name</i>  <b>Example:</b> Device(config)# ip dhcp pool pool1	Creates a name for the DHCP server address pool and enters DHCP pool configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<b>network</b> <i>network-number</i> [ <i>mask</i>   <i>/prefix-length</i> ]  <b>Example:</b> Device(dhcp-config)# network 172.30.0.0 /16	Specifies the subnet network number and mask of the DHCP address pool.
<b>Step 5</b>	<b>import all</b>  <b>Example:</b> Device(dhcp-config)# import all	Imports DHCP option parameters into the DHCP server database.
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Device(dhcp-config)# exit	Exits DHCP pool configuration mode and enters global configuration mode.
<b>Step 7</b>	<b>interface</b> <i>type number</i>  <b>Example:</b> Device(config)# interface FastEthernet 0/0	Configures an interface and enters interface configuration mode.
<b>Step 8</b>	<b>ip address dhcp</b>  <b>Example:</b> Device(config-if)# ip address dhcp	Specifies that the interface acquires an IP address through DHCP.
<b>Step 9</b>	<b>end</b>  <b>Example:</b> Device(config-if)# end	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show ip dhcp import</b>  <b>Example:</b> Device# show ip dhcp import	Displays the options that are imported from the central DHCP server.

## Configuring DHCP Address Allocation Using Option 82

### Enabling Option 82 for DHCP Address Allocation

By default, the Cisco DHCP server uses information provided by option 82 to allocate IP addresses. If the DHCP address allocation is disabled, perform the task described in this section to reenable this capability.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp use class**
4. **end**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip dhcp use class</b>  <b>Example:</b> Device(config)# ip dhcp use class	Controls DHCP classes that are used for address allocation. <ul style="list-style-type: none"> <li>• This functionality is enabled by default.</li> <li>• Use the <b>no</b> form of this command to disable this functionality without deleting the DHCP class configuration.</li> </ul>
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Troubleshooting Tips

If DHCP classes are configured in the pool, but the DHCP server does not use the classes, verify if the **no ip dhcp use class** command was configured.

## Defining the DHCP Class and Relay Agent Information Patterns

### Before You Begin

You must know the hexadecimal value of each byte location in option 82 to configure the **relay-information hex** command. The option 82 format may vary from product to product. Contact the relay agent vendor for this information.

Perform this task to define the DHCP class and relay agent information patterns:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp class *class-name***
4. **relay agent information**
5. **relay-information hex *pattern* [\*] [bitmask *mask*]**
6. Repeat Steps 3 through 5 for each DHCP class you need to configure.
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>ip dhcp class <i>class-name</i></b>  <b>Example:</b> Device(config)# ip dhcp class CLASS1	Defines a DHCP class and enters DHCP class configuration mode.
Step 4	<b>relay agent information</b>	Enters relay agent information option configuration mode.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(dhcp-class)# relay agent information</pre>	<ul style="list-style-type: none"> <li>If you omit this step, the DHCP class matches any relay agent information option, whether the relay agent information option value is available or not.</li> </ul>
<b>Step 5</b>	<p><b>relay-information hex <i>pattern</i> [*] [bitmask mask]</b></p> <p><b>Example:</b></p> <pre>Device(dhcp-class-relayinfo)# relay-information hex 01030a0b0c02050000000123</pre>	<p>(Optional) Specifies a hexadecimal value for full relay information option.</p> <ul style="list-style-type: none"> <li>The <i>pattern</i> argument creates a pattern that is used to match the DHCP class.</li> <li>If you omit this step, no pattern is configured and it is considered a match to any relay agent information option value, but the relay information option must be available in the DHCP packet.</li> <li>You can configure multiple <b>relay-information hex</b> commands in a DHCP class.</li> </ul>
<b>Step 6</b>	Repeat Steps 3 through 5 for each DHCP class you need to configure.	
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(dhcp-class-relayinfo)# end</pre>	Returns to privileged EXEC mode.

## Troubleshooting Tips

Use the **debug ip dhcp server class** command to display the class matching results.

## Defining the DHCP Address Pool

Perform this task to define the DHCP address pool:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp pool *name***
4. **network *network-number* [*mask* | */prefix-length*]**
5. **class *class-name***
6. **address range *start-ip end-ip***
7. Repeat Steps 5 and 6 for each DHCP class you need to associate with the DHCP pool.
8. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 3	<b>ip dhcp pool <i>name</i></b>  <b>Example:</b> Device# ip dhcp pool ABC	Configures a DHCP address pool on a Cisco IOS DHCP server and enters DHCP pool configuration mode. <ul style="list-style-type: none"> <li>• Multiple pools can be configured with the same class, eliminating the need to configure the same pattern in multiple pools.</li> </ul>
Step 4	<b>network <i>network-number</i> [<i>mask</i>   <i>/prefix-length</i>]</b>  <b>Example:</b> Device(dhcp-config)# network 10.0.20.0	Configures the subnet and mask for a DHCP address pool on a Cisco IOS DHCP server.
Step 5	<b>class <i>class-name</i></b>  <b>Example:</b> Device(dhcp-config)# class CLASS1	Associates a class with a pool and enters DHCP pool class configuration mode. <ul style="list-style-type: none"> <li>• This command also creates a DHCP class if the DHCP class is not yet defined.</li> </ul>

	Command or Action	Purpose
<b>Step 6</b>	<p><b>address range</b> <i>start-ip end-ip</i></p> <p><b>Example:</b></p> <pre>Device(dhcp-pool-class)# address range 10.0.20.1 10.0.20.100</pre>	<p>(Optional) Sets an address range for the DHCP class in a DHCP server address pool.</p> <ul style="list-style-type: none"> <li>If this command is not configured for a class, the default value is the entire subnet of the pool. Each class in the DHCP pool is examined for a match in the order configured.</li> </ul>
<b>Step 7</b>	Repeat Steps 5 and 6 for each DHCP class you need to associate with the DHCP pool.	
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(dhcp-pool-class)# end</pre>	Returns to privileged EXEC mode.

## Configuring a Static Route with the Next-Hop Dynamically Obtained Through DHCP

This task enables static routes to be assigned using a DHCP default gateway as the next-hop device. This behavior was not possible before the introduction of this feature because the gateway IP address is not known until after the DHCP address assignment. You cannot configure a static route with the CLI without knowing that DHCP-supplied address.

The static routes are updated in the routing table when the default gateway is assigned by the DHCP server. The routes remain in the routing table until the DHCP lease expires and then the routes are removed.

When a DHCP client releases an address, the corresponding static route (the route configured using the **ip route** command) is automatically removed from the routing table. If the DHCP router option (option 3 of the DHCP packet) changes during the client renewal, the DHCP default gateway changes to the new IP address supplied after the renewal.

This feature is particularly useful for VPN deployments such as Dynamic Multipoint VPNs (DMVPNs). This feature is useful when a nonphysical interface, such as a multipoint generic routing encapsulation (mGRE) tunnel, is configured on a device and certain traffic must be excluded from entering the tunnel interface.

### Before You Begin

Verify all DHCP client and server configuration steps. Ensure that the DHCP client and server are properly defined to supply a DHCP device option 3 of the DHCP packet.

**Note**

- If the DHCP client is not able to obtain an IP address or the default device IP address, the static route is not installed in the routing table.
- If the lease has expired and the DHCP client cannot renew the address, the DHCP IP address assigned to the client is released and any associated static routes are removed from the routing table.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip route** *prefix mask {ip-address | interface-type interface-number [ip-address]}* **dhcp** [*distance*]
4. **end**
5. **show ip route**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ip route</b> <i>prefix mask {ip-address   interface-type interface-number [ip-address]}</i> <b>dhcp</b> [ <i>distance</i> ]  <b>Example:</b> Device(config)# ip route 192.168.1.1 255.255.255.255 192.168.2.2 dhcp	Assigns a static route for the default next-hop device when the DHCP server is accessed for an IP address. <ul style="list-style-type: none"> <li>• If more than one interface is configured to obtain an IP address from a DHCP server, use the <b>ip route</b> <i>prefix mask interface-type interface-number dhcp</i> command for each interface. If the interface is not specified, the route is added to the routing table as soon as any of the interfaces obtain an IP address and a default device.</li> </ul>
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>show ip route</b>  <b>Example:</b> Device# show ip route	(Optional) Displays the current state of the routing table.

## Clearing DHCP Server Variables

Perform this task to clear DHCP server variables:

### SUMMARY STEPS

1. enable
2. clear ip dhcp binding {address | \*}
3. clear ip dhcp conflict {address | \*}
4. clear ip dhcp server statistics

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>clear ip dhcp binding {address   *}</b>  <b>Example:</b> Device# clear ip dhcp binding *	Deletes an automatic address binding from the DHCP database. <ul style="list-style-type: none"> <li>• Specifying the <i>address</i> argument clears the automatic binding for a specific (client) IP address, whereas specifying an asterisk (*) clears all automatic bindings.</li> </ul>
<b>Step 3</b>	<b>clear ip dhcp conflict {address   *}</b>  <b>Example:</b> Device# clear ip dhcp conflict 172.16.1.103	Clears an address conflict from the DHCP database. <ul style="list-style-type: none"> <li>• Specifying the <i>address</i> argument clears the conflict for a specific IP address, whereas specifying an asterisk (*) clears conflicts for all addresses.</li> </ul>
<b>Step 4</b>	<b>clear ip dhcp server statistics</b>  <b>Example:</b> Device# clear ip dhcp server statistics	Resets all DHCP server counters to 0.

# Configuration Examples for the Cisco IOS DHCP Server

## Example: Configuring the DHCP Database Agent

The following example shows how to store bindings on host 172.16.4.253. The file transfer protocol is FTP. The server waits for 2 minutes (120 seconds) before performing database changes.

```
ip dhcp database ftp://user:password@172.16.4.253/router-dhcp write-delay 120
```

## Example: Excluding IP Addresses

In the following example, server A and server B service the subnet 10.0.20.0/24. If the subnet is split equally between the two servers, server A is configured to allocate IP addresses 10.0.20.1 to 10.0.20.125 and server B is configured to allocate IP addresses 10.0.20.126 to 10.0.20.254.

### Server A

```
ip dhcp excluded-address 10.0.20.126 10.0.20.255
!
ip dhcp pool A
 network 10.0.20.0 255.255.255.0
```

### Server B

```
ip dhcp excluded-address 10.0.20.0 10.0.20.125
!
ip dhcp pool B
 network 10.0.20.0 255.255.255.0
```

## Example: Configuring DHCP Address Pools

In the following example, three DHCP address pools are created: one in network 172.16.0.0, one in subnetwork 172.16.1.0, and one in subnetwork 172.16.2.0. Attributes from network 172.16.0.0—such as the domain name, Domain Name System (DNS) server, (Network Basic Input/Output System) NetBIOS name server, and NetBIOS node type—are inherited in subnetworks 172.16.1.0 and 172.16.2.0. In each pool, clients are granted 30-day leases and all addresses in each subnetwork, except the excluded addresses, are available to the DHCP server for assigning to clients. The table below lists the IP addresses for the devices in three DHCP address pools.

**Table 2: DHCP Address Pool Configuration**

Pool 0 (Network 172.16.0.0)	Pool 1 (Subnetwork 172.16.1.0)	Pool 2 (Subnetwork 172.16.2.0)			
Device	IP Address	Device	IP Address	Device	IP Address

## Example: Configuring a DHCP Address Pool with Multiple Disjoint Subnets

Pool 0 (Network 172.16.0.0)	Pool 1 (Subnetwork 172.16.1.0)	Pool 2 (Subnetwork 172.16.2.0)			
Default devices	—	Default devices	172.16.1.100 172.16.1.101	Default devices	172.16.2.100 172.16.2.101
DNS server	172.16.1.102 172.16.2.102	—	—	—	—
NetBIOS name server	172.16.1.103 172.16.2.103	—	—	—	—
NetBIOS node type	h-node	—	—	—	—

```

ip dhcp database ftp://user:password@172.16.4.253/router-dhcp write-delay 120
ip dhcp excluded-address 172.16.1.100 172.16.1.103
ip dhcp excluded-address 172.16.2.100 172.16.2.103
!
ip dhcp pool 0
 network 172.16.0.0 /16
 domain-name cisco.com
 dns-server 172.16.1.102 172.16.2.102
 netbios-name-server 172.16.1.103 172.16.2.103
 netbios-node-type h-node
!
ip dhcp pool 1
 network 172.16.1.0 /24
 default-router 172.16.1.100 172.16.1.101
 lease 30
!
ip dhcp pool 2
 network 172.16.2.0 /24
 default-router 172.16.2.100 172.16.2.101
 lease 30

```

## Example: Configuring a DHCP Address Pool with Multiple Disjoint Subnets

Multiple disjoint subnets in a DHCP pool can be used in any of the following network topologies:

- IP address pooling—The DHCP client and server reside on the same subnet.
- DHCP relay—The DHCP client and DHCP server communicate through a DHCP relay agent where the relay interface is configured with secondary IP addresses.
- Hierarchical DHCP—The DHCP server is configured as the DHCP subnet allocation server. The DHCP client and DHCP subnet allocation server communicate through an on-demand address pool (ODAP) router.

In the following example, one DHCP address pool named pool3 is created; the primary subnet is 172.16.0.0/16, one secondary subnet is 172.16.1.0/24, and the other secondary subnet is 172.16.2.0/24.

- When IP addresses in the primary subnet are exhausted, the DHCP server inspects the secondary subnets in the order in which the subnets were added to the pool.

- When the DHCP server allocates an IP address from the secondary subnet 172.16.1.0/24, the server uses the subnet-specific default device list that consists of IP addresses 172.16.1.100 and 172.16.1.101. However, when the DHCP server allocates an IP address from the subnet 172.16.2.0/24, the server uses the pool-wide list that consists of the four IP addresses from 172.16.0.100 to 172.16.0.103.
- Other attributes from the primary subnet 172.16.0.0/16—such as the domain name, DNS server, NetBIOS name server, and NetBIOS node type—are inherited in both the secondary subnets.
- DHCP clients are granted 30-day leases on IP addresses in the pool. All addresses in each subnet, except the excluded addresses, are available to the DHCP server for assigning to clients.

The table below lists the IP addresses for the devices in the DHCP address pool that consists of three disjoint subnets.

**Table 3: DHCP Address Pool Configuration with Multiple Disjoint Subnets**

Primary Subnet (172.16.0.0/16)	First Secondary Subnet (172.16.1.0/24)	Second Secondary Subnet (172.16.2.0/24)			
Device	IP Address	Device	IP Address	Device	IP Address
Default devices	172.16.0.100 172.16.0.101 172.16.0.102 172.16.0.103	Default devices	172.16.1.100 172.16.1.101	Default devices	172.16.0.100 172.16.0.101 172.16.0.102 172.16.0.103
DNS server	172.16.1.102 172.16.2.102	—	—	—	—
NetBIOS name server	172.16.1.103 172.16.2.103	—	—	—	—
NetBIOS node type	h-node	—	—	—	—

```
ip dhcp database ftp://user:password@172.16.4.253/router-dhcp write-delay 120
ip dhcp excluded-address 172.16.0.100 172.16.1.103
ip dhcp excluded-address 172.16.1.100 172.16.1.101
!
ip dhcp pool pool3
 network 172.16.0.0 /16
 default-router 172.16.0.100 172.16.2.101 172.16.0.102 172.16.0.103
 domain-name cisco.com
 dns-server 172.16.1.102 172.16.2.102
 netbios-name-server 172.16.1.103 172.16.2.103
 netbios-node-type h-node
 lease 30
!
 network 172.16.1.0 /24 secondary
  override default-router 172.16.1.100 172.16.1.101
 end
!
 network 172.16.2.0 /24 secondary
```

## Example: Configuring Manual Bindings

The following example shows how to create a manual binding for a client named example1.abc.com that sends a client identifier in the DHCP packet. The MAC address of the client is 02c7.f800.0422 and the IP address of the client is 172.16.2.254.

```
ip dhcp pool pool1
 host 172.16.2.254
 client-identifier 01b7.0813.8811.66
 client-name example1
```

The following example shows how to create a manual binding for a client named example2.abc.com that does not send a client identifier in the DHCP packet. The MAC address of the client is 02c7.f800.0422 and the IP address of the client is 172.16.2.253.

```
ip dhcp pool pool2
 host 172.16.2.253
 hardware-address 02c7.f800.0422 ethernet
 client-name example1
```

Because attributes are inherited, the two preceding configurations are equivalent to the following:

```
ip dhcp pool pool1
 host 172.16.2.254 255.255.255.0
 hardware-address 02c7.f800.0422 ieee802
 client-name client1
 default-router 172.16.2.100 172.16.2.101
 domain-name abc.com
 dns-server 172.16.1.102 172.16.2.102
 netbios-name-server 172.16.1.103 172.16.2.103
 netbios-node-type h-node
```

## Example: Configuring Static Mapping

The following example shows how to restart the DHCP server, configure the pool, and specify the URL where the static mapping text file is stored:

```
no service dhcp
 service dhcp
 ip dhcp pool abcpool
 origin file tftp://10.1.0.1/staticfilename
```

### Note

The static mapping text file can be copied to flash memory on the device and served by the TFTP process of the device. In this case, the IP address in the original file line must be an address owned by the device and one additional line of configuration is required on the device: **tftp-server flash static-filename**.

## Example: Configuring the Option to Ignore all BOOTP Requests

The following example shows two DHCP pools that are configured on the device and that the device's DHCP server is configured to ignore all received BOOTP requests. If a BOOTP request is received from subnet 10.0.18.0/24, the request will be dropped by the device (because the **ip helper-address** command is not

configured). If there is a BOOTP request from subnet 192.168.1.0/24, the request will be forwarded to 172.16.1.1 via the **ip helper-address** command.

## Example: Importing DHCP Options

The following example shows how to configure a remote and central server to support the importing of DHCP options. The central server is configured to automatically update DHCP options, such as DNS and WINS addresses, within the DHCP pools. In response to a DHCP request from a local client behind CPE equipment, the remote server can request or “import” these option parameters from the centralized server. See the figure below for a diagram of the network topology.

**Figure 1: DHCP Example Network Topology**

### Central Device

```
!do not assign this range to DHCP clients
ip dhcp-excluded address 10.0.0.1 10.0.0.5
!
ip dhcp pool central
! Specifies network number and mask for DHCP clients
network 10.0.0.0 255.255.255.0
! Specifies the domain name for the client
domain-name central
! Specifies DNS server that will respond to DHCP clients when they need to correlate host
! name to ip address
dns-server 10.0.0.2
! Specifies the NETBIOS WINS server
netbios-name-server 10.0.0.2
!
interface FastEthernet0/0
ip address 10.0.0.1 255.255.255.0
duplex auto
speed auto
```

### Remote Device

```
ip dhcp pool client
! Imports DHCP option parameters into DHCP server database
import all
network 172.16.2.254 255.255.255.0
!
interface FastEthernet0/0
ip address dhcp
duplex auto
speed auto
```

## Example: Configuring DHCP Address Allocation Using Option 82

This example shows how to configure two DHCP classes. CLASS1 defines the group of DHCP clients whose address requests contain the relay agent information option with the specified hexadecimal values. CLASS2 defines the group of DHCP clients whose address requests contain the configured relay agent information suboptions. CLASS3 has no pattern configured and is treated as a “match to any” class. This type of class is useful for specifying a “default” class.

The subnet of pool ABC has been divided into three ranges without further subnetting the 10.0.20.0/24 subnet. If there is a DHCP Discover message from the 10.0.20.0/24 subnet with option 82 matching that of class CLASS1, an available address in the range from 10.0.20.1 to 10.0.20.100 will be allocated. If there is no free address in CLASS1’s address range, the DHCP Discover message will be matched against CLASS2, and so on.

Therefore, each class in the DHCP pool will be examined for a match in the order configured by the user. In pool ABC, the order of matching is CLASS1, CLASS2, and finally CLASS3. In pool DEF, class CLASS2 does not have any address range configured. By default, the address range for a particular class is the pool’s entire subnets. Therefore, clients matching CLASS2 may be allocated addresses from 10.0.20.1 to 10.0.20.254.

Multiple pools can be configured with the same class, eliminating the need to configure the same patterns in multiple pools. For example, there may be a need to specify that one or more pools must be used only to service a particular class of devices (for example, cable modems and IP phones).

```
! Defines the DHCP classes and relay information patterns
ip dhcp class CLASS1
  relay agent information
    relay-information hex 01030a0b0c020500000000123
    relay-information hex 01030a0b0c02*
    relay-information hex 01030a0b0c0205000000000000 bitmask 000000000000000000000000FF
ip dhcp class CLASS2
  relay agent information
    relay-information hex 01040102030402020102
    relay-information hex 01040101030402020102
ip dhcp class CLASS3
  relay agent information
! Associates the DHCP pool with DHCP classes
ip dhcp pool ABC
  network 10.0.20.0 255.255.255.0
  class CLASS1
    address range 10.0.20.1 10.0.20.100
  class CLASS2
    address range 10.0.20.101 10.0.20.200
  class CLASS3
    address range 10.0.20.201 10.0.20.254
ip dhcp pool DEF
  network 172.64.2.2 255.255.255.0
  class CLASS1
    address range 172.64.2.3 172.64.2.10
  class CLASS2
```

## Example: Configuring a Static Route with the Next-Hop Dynamically Obtained Through DHCP

The following example shows how to configure two Ethernet interfaces to obtain the next-hop device IP address from the DHCP server:

```
ip route 10.10.10.0 255.255.255.0 dhcp 200
ip route 10.10.20.1 255.255.255.255 ethernet 1 dhcp
```

## Feature Information for the Cisco IOS DHCP Server

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 4: Feature Information for the Cisco IOS DHCP Server**

Feature Name	Releases	Feature Configuration Information
DHCP Server Import All Enhancement	Cisco IOS XE Release 3.2SE	The DHCP Server Import All Enhancement feature is an enhancement to the <b>import all</b> command. Prior to this feature, the options imported through the <b>import all</b> command were overwritten by those imported by another subsystem. Through this feature, options imported by multiple subsystems can coexist in the DHCP address pool. When the session is terminated or the lease is released, the imported options are cleared.

Feature Name	Releases	Feature Configuration Information
DHCP Server Multiple Subnet	Cisco IOS XE Release 3.2SE	<p>The DHCP Server Multiple Subnet feature enables multiple subnets to be configured under the same DHCP address pool.</p> <p>The following commands were introduced or modified: <b>network(DHCP)</b>, <b>override default-router</b>.</p>
DHCP Server Option to Ignore all BOOTP Requests	Cisco IOS XE Release 3.2SE	<p>The DHCP Server Option to Ignore all BOOTP Requests feature allows the Cisco IOS DHCP server to selectively ignore and not reply to received Bootstrap Protocol (BOOTP) request packets.</p> <p>The following command was introduced or modified: <b>ip dhcp bootp ignore</b>.</p>
