DHCPv6 Individual Address Assignment

The Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Individual Address Assignment feature manages nonduplicate address assignment in the correct prefix based on the network where the host is connected.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring DHCPv6 Address Assignment

By default, no Dynamic Host Configuration Protocol for IPv6 (DHCPv6) features are configured on the device.

When you configure DHCPv6 address assignment, remember that the specified interface must be one of these Layer 3 interfaces:

- Switch virtual interface (SVI): a VLAN interface created when you enter the `interface vlan vlan-id` command.
Information About DHCPv6 Individual Address Assignment

DHCPv6 Address Assignment

Dynamic Host Configuration Protocol for IPv6 (DHCPv6) enables DHCP servers to pass configuration parameters, such as IPv6 network addresses, to IPv6 clients. The DHCPv6 Individual Address Assignment feature manages nonduplicate address assignment in the correct prefix based on the network where the host is connected. Assigned addresses can be from one or multiple prefix pools. Additional options, such as the default domain and Domain Name System (DNS) name-server address, can be passed back to the client. Address pools can be assigned for use on a specific interface or on multiple interfaces, or the server can automatically find the appropriate pool.

How to Configure DHCPv6 Individual Address Assignment

Enabling the DHCPv6 Server Function on an Interface

Perform this task to enable the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server function on an interface. Note that to delete a DHCPv6 pool, you must use the no ipv6 dhcp pool poolname global configuration command. Use the no form of the DHCP pool configuration mode commands to change the DHCPv6 pool characteristics. To disable the DHCPv6 server function on an interface, use the no ipv6 dhcp server interface configuration command.
SUMMARY STEPS

1. enable
2. configure terminal
3. ipv6 dhcp pool poolname
4. address prefix ipv6-prefix [lifetime {valid-lifetime preferred-lifetime | infinite}]
5. link-address ipv6-prefix
6. vendor-specific vendor-id
7. suboption number {address ipv6-address | ascii ascii-string | hex hex-string}
8. exit
9. exit
10. interface type number
11. ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]
12. end
13. Do one of the following:
   • show ipv6 dhcp pool
   • show ipv6 dhcp interface
14. copy running-config startup-config

DETAILED STEPS

<table>
<thead>

<tr>
<td>Device(config-if)# ipv6 dhcp server rapid-commit</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 12**

**end**

*Example:*

Device(config-if)# end

*Purpose:*
Returns to privileged EXEC mode.

**Step 13**

Do one of the following:

- `show ipv6 dhcp pool`
- `show ipv6 dhcp interface`

*Example:*

Device# show ipv6 dhcp pool

*Purpose:*
Verifies DHCPv6 pool configuration or verifies that the DHCPv6 server function is enabled on an interface.

**Step 14**

**copy running-config startup-config**

*Example:*

Device# copy running-config startup-config

*Purpose:*
(Optional) Saves your entries in the configuration file.

---

**Enabling the DHCPv6 Client Function on an Interface**

Perform this task to enable the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client function on an interface. To disable the DHCPv6 client function, use the `no ipv6 address dhcp` interface configuration command. To remove the DHCPv6 client request, use the `no ipv6 address dhcp client request vendor` interface configuration command.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface type number
4. ipv6 address dhcp [rapid-commit]
5. ipv6 address dhcp client request vendor
6. end
7. show ipv6 dhcp interface
**DETAILED STEPS**

<table>

| **Example:**  
  Device# show ipv6 dhcp interface | |
Configuration Examples for DHCPv6 Individual Address Assignment

Examples: Configuring the DHCPv6 Server Function

In the following example, Dynamic Host Configuration Protocol for IPv6 (DHCPv6) clients are connected to the DHCPv6 server on Ethernet interface 0/0. The server is configured to use parameters from the DHCP pool called dhcp-pool. This pool provides clients with the IPv6 address of a Domain Name System (DNS) server and the domain name to be used. It also specifies that prefixes can be delegated from the prefix pool called client-prefix-pool1. The prefixes delegated will have valid and preferred lifetimes of 1800 and 600 seconds, respectively. The prefix pool named client-prefix-pool1 has a prefix of length /40 from which it will delegate (sub) prefixes of length /48.

```
ipv6 dhcp pool dhcp-pool
  prefix-delegation pool client-prefix-pool1 lifetime 1800 600
  dns-server 2001:DB8:3000:3000::42
  domain-name example.com
! interface Ethernet 0/0
  description downlink to clients
  ipv6 address FEC0:240:104:2001::139/64
  ipv6 dhcp server dhcp-pool
! ipv6 local pool client-prefix-pool1 2001:DB8:1200::/40 48
```

The following example from the `show ipv6 dhcp` command shows the DHCP unique identifier (DUID) of the device:

```
Device# show ipv6 dhcp

This device's DHCPv6 unique identifier (DUID): 000300010002FCA5DC1C
```

In the following example, the `show ipv6 dhcp binding` command shows information about two clients, including their DUIDs, IAPDs, prefixes, and preferred and valid lifetimes:

```
Device# show ipv6 dhcp binding

Client: FE80::2:FCFF:FEA5:DC39 (Ethernet2/1)
  DUID: 000300010002FCA5DC1C
  IA PD: IA ID 0x00040001, T1 0, T2 0
  Prefix: 3FFE::C00:C18:11::/68
  preferred lifetime 180, valid lifetime 12345
  expires at Nov 08 2002 02:24 PM (12320 seconds)

Client: FE80::2:FCFF:FEA5:C039 (Ethernet2/1)
  DUID: 000300010002FCA5C01C
  IA PD: IA ID 0x00040001, T1 0, T2 0
  Prefix: 3FFE::C00:C18:33::/72
  preferred lifetime 240, valid lifetime 54321
  expires at Nov 09 2002 02:02 AM (54246 seconds)
```

In the following example, the `show ipv6 dhcp database` command provides information on the binding database agents TFTP, NVRAM, and flash:

```
Device# show ipv6 dhcp database

Database agent tftp://172.19.216.133/db.tftp:
  write delay: 69 seconds, transfer timeout: 300 seconds
  last written at Jan 09 2003 01:54 PM,
```
Example: Configuring the DHCPv6 Client Function

In the following example, this Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client has three interfaces. Ethernet interface 0/0 is the upstream link to a service provider, which has a DHCPv6 server function enabled. The Fast Ethernet interfaces 0/0 and 0/1 are links to local networks.

The upstream interface, Ethernet interface 0/0, has the DHCPv6 client function enabled. Prefixes delegated by the provider are stored in the general prefix called prefix-from-provider.

The local networks, Fast Ethernet interfaces 0/0 and 0/1, both assign interface addresses based on the general prefix called prefix-from-provider. The bits on the left of the addresses come from the general prefix, and the bits on the right of the addresses are specified statically.

```
interface Ethernet 0/0
description uplink to provider DHCP IPv6 server
ipv6 dhcp client pd prefix-from-provider
!
interface FastEthernet 0/0
description local network 0
ipv6 address prefix-from-provider ::5:0:0:0:100/64
!
interface FastEthernet 0/1
description local network 1
ipv6 address prefix-from-provider ::6:0:0:0:100/64
```

Feature Information for DHCPv6 Individual Address Assignment

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
