Configuring IP Multicast over ATM

Last Updated: December 5, 2012

This module describes how to configure IP multicast over ATM, including point-to-multipoint virtual circuits (VCs) and ATM bundle.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IP Multicast over ATM Point-to-Multipoint VCs

- You must have IP multicast routing and PIM sparse mode configured. This feature does not work with PIM dense mode.
- You must have ATM configured for multipoint signaling.
- You should understand the concepts in the “IP Multicast Technology Overview” module.
Information About IP Multicast over ATM

- PIM Nonbroadcast Multiaccess, page 2
- IP Multicast over ATM Point-to-Multipoint VCs, page 2
- Idling Policy for ATM VCs Created by PIM, page 4

PIM Nonbroadcast Multiaccess

Protocol Independent Multicast (PIM) nonbroadcast multiaccess (NBMA) mode allows the software to replicate packets for each neighbor on the NBMA network. Traditionally, the software replicates multicast and broadcast packets to all broadcast configured neighbors. This action might be inefficient when not all neighbors want packets for certain multicast groups. NBMA mode enables you to reduce bandwidth on links leading into the NBMA network, and to reduce the number of CPU cycles in switches and attached neighbors.

It is appropriate to configure PIM NBMA mode on ATM, Frame Relay, Switched Multimegabit Data Service (SMDS), PRI ISDN, or X.25 networks only, especially when these media do not have native multicast available. Do not use PIM NBMA mode on multicast-capable LANs (such as Ethernet or FDDI).

You should use PIM sparse mode with this feature. Therefore, when each Join message is received from NBMA neighbors, PIM stores each neighbor IP address and interface in the outgoing interface list for the group. When a packet is destined for the group, the software replicates the packet and unicasts (data-link unicasts) it to each neighbor that has joined the group.

Consider the following two factors before enabling PIM NBMA mode:

- If the number of neighbors grows, the outgoing interface list gets large, which costs memory and replication time.
- If the network (Frame Relay, SMDS, or ATM) supports multicast natively, you should use it so that replication is performed at optimal points in the network.

IP Multicast over ATM Point-to-Multipoint VCs

IP Multicast over ATM Point-to-Multipoint VCs is a feature that dynamically creates ATM point-to-multipoint switched virtual circuits (SVCs) to handle IP multicast traffic more efficiently.

This feature can enhance router performance and link utilization because packets are not replicated and sent multiple times over the ATM interface.

Traditionally, over NBMA networks, Cisco routers would perform a pseudobroadcast to get broadcast or multicast packets to all neighbors on a multaccess network. For example, assume in the figure that Routers A, B, C, D, and E were running the Open Shortest Path First (OSPF) protocol. Router A must deliver to Routers D and E. When Router A sends an OSPF Hello packet, the data link layer replicates the Hello
packet and sends one to each neighbor (this procedure is known as pseudobroadcast), which results in four copies being sent over the link from Router A to the multiaccess WAN.

**Figure 1  Environment for IP Multicast over ATM Point-to-Multipoint VCs**

With the advent of IP multicast, where high-rate multicast traffic can occur, the pseudobroadcast approach does not scale. Furthermore, in the preceding example, Routers B and C would get data traffic they do not need. To handle this problem, PIM can be configured in NBMA mode using the `ip pim nbma-mode` command. PIM in NBMA mode works only for sparse mode groups. Configuring PIM in NBMA mode would allow only Routers D and E to get the traffic without distributing to Routers B and C. However, two copies are still delivered over the link from Router A to the multiaccess WAN.

If the underlying network supported multicast capability, the routers could handle this situation more efficiently. If the multiaccess WAN were an ATM network, IP multicast could use multipoint VCs.

To configure IP multicast using multipoint VCs, Routers A, B, C, D, and E in the figure must run PIM sparse mode. If the Receiver directly connected to Router D joins a group and Router A is the PIM RP, the following sequence of events occurs:

1. Router D sends a PIM Join message to Router A.
2. When Router A receives the PIM join, it sets up a multipoint VC for the multicast group.
3. Later, when the Receiver directly connected to Router E joins the same group, Router E sends a PIM Join message to Router A.
4. Router A will see there is a multipoint VC already associated with the group, and will add Router E to the existing multipoint VC.
5. When the Source sends a data packet, Router A can send a single packet over its link that gets to both Router D and Router E. The replication occurs in the ATM switches at the topological diverging point from Router A to Router D and Router E.
If a host sends an IGMP report over an ATM interface to a router, the router adds the host to the multipoint VC for the group.

This feature can also be used over ATM subinterfaces.

**Idling Policy for ATM VCs Created by PIM**

An idling policy uses the `ip pim vc-count` command to limit the number of VCs created by PIM. When the router stays at or below the number configured, no idling policy is in effect. When the next VC to be opened will exceed the value, an idling policy is exercised. An idled VC does not mean that the multicast traffic is not forwarded; the traffic is switched to VC 0. VC 0 is the broadcast VC that is open to all neighbors listed in the map list. The name VC 0 is unique to PIM and the mroute table.

- How the Idling Policy Works, page 4
- Keeping VCs from Idling, page 4

**How the Idling Policy Works**

The idling policy works as follows:

- The only VCs eligible for idling are those with a current 1-second activity rate less than or equal to the value configured by the `ip pim minimum-vc-rate` interface configuration command on the ATM interface. Activity level is measured in packets per second (pps).
- The VC with the least amount of activity below the configured `ip pim minimum-vc-rate` pps rate is idled.
- If the `ip pim minimum-vc-rate` command is not configured, all VCs are eligible for idling.
- If other VCs are at the same activity level, the VC with the highest fanout (number of leaf routers on the multipoint VC) is idled.
- The activity level is rounded to three orders of magnitude (less than 10 pps, 10 to 100 pps, and 100 to 1000 pps). Therefore, a VC that has 40 pps activity and another that has 60 pps activity are considered to have the same rate, and the fanout count determines which one is idled. If the first VC has a fanout of 5 and the second has a fanout of 3, the first one is idled.
- Idling a VC means releasing the multipoint VC that is dedicated for the multicast group. The traffic of the group continues to be sent; it is moved to the static map VC. Packets will flow over a shared multipoint VC that delivers packets to all PIM neighbors.
- If all VCs have a 1-minute rate greater than the pps value, the new group (that exceeded the `ip pim vc-count number`) will use the shared multipoint VC.

**Keeping VCs from Idling**

By default, all VCs are eligible for idling. You can configure a minimum rate required to keep VCs from being idled.

**How to Configure IP Multicast over ATM**

- Configuring IP Multicast over ATM Point-to-Multipoint VCs, page 5
Configuring IP Multicast over ATM Point-to-Multipoint VCs

Perform this task to configure IP multicast over ATM point-to-multipoint VCs. All of the steps in the task can be used in an ATM network. This feature can also be used over ATM subinterfaces. PIM NBMA mode could be used in an ATM, Frame Relay, SMDS, PRI ISDN, or X.25 network.

• IP multicast routing and PIM sparse mode must be configured. This feature does not work with PIM dense mode.
• ATM must be configured for multipoint signaling.

SUMMARY STEPS
1. enable
2. configure terminal
3. interface atm number
4. ip pim nbma-mode
5. ip pim multipoint-signalling
6. atm multipoint-signalling
7. ip pim vc-count number
8. ip pim minimum-vc-rate pps
9. show ip pim

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface atm number</td>
<td>Configures an ATM interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface atm 0</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 4 ip pim nbma-mode</strong></td>
<td>(Optional) Enables NBMA mode on a serial link.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip pim nbma-mode</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5 ip pim multipoint-signalling</strong></td>
<td>Enables IP multicast over ATM point-to-multipoint VCs.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip pim multipoint-signalling</td>
<td>This command enables PIM to open ATM point-to-multipoint VCs for each multicast group that a receiver joins.</td>
</tr>
<tr>
<td><strong>Step 6 atm multipoint-signalling</strong></td>
<td>Enables point-to-multipoint signaling to the ATM switch.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# atm multipoint-signalling</td>
<td>This command is required so that static map multipoint VCs can be opened. The device uses existing static map entries that include the broadcast keyword to establish multipoint calls. The map list is needed because it acts like a static ARP table.</td>
</tr>
<tr>
<td><strong>Step 7 ip pim vc-count number</strong></td>
<td>(Optional) Changes the maximum number of VCs that PIM can open.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip pim vc-count 300</td>
<td>By default, PIM can open a maximum of 200 VCs. When the device reaches this number, it deletes inactive VCs so it can open VCs for new groups that might have activity.</td>
</tr>
<tr>
<td><strong>Step 8 ip pim minimum-vc-rate pps</strong></td>
<td>(Optional) Sets the minimum activity rate required to keep VCs from being idled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# ip pim minimum-vc-rate 1500</td>
<td>By default, all VCs are eligible for idling.</td>
</tr>
<tr>
<td><strong>Step 9 show ip pim vc</strong></td>
<td>(Optional) Displays ATM VC status information for multipoint VCs opened by PIM.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show ip pim vc</td>
<td></td>
</tr>
</tbody>
</table>

**Configuration Examples for IP Multicast over ATM**

- Example: IP Multicast over ATM Point-to-Multipoint VCs, page 7
Example: IP Multicast over ATM Point-to-Multipoint VCs

The following example shows how to enable IP multicast over ATM point-to-multipoint VCs:

```plaintext
interface ATM2/0
ip address 171.69.214.43 255.255.255.248
ip pim sparse-mode
ip pim multipoint-signalling

Feature Information for Configuring IP Multicast over ATM

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1 Feature Information for IP Multicast over ATM
