Important Information about Cisco IOS XE 16

Effective Cisco IOS XE Release 3.7.0E (for Catalyst Switching) and Cisco IOS XE Release 3.17S (for Access and Edge Routing) the two releases evolve (merge) into a single version of converged release—the Cisco IOS XE 16—providing one release covering the extensive range of access and edge products in the Switching and Routing portfolio.

CHAPTER 2

Configuring Multicast VPN

The Multicast VPN (MVPN) feature provides the ability to support multicast over a Layer 3 VPN. As enterprises extend the reach of their multicast applications, service providers can accommodate these enterprises over their Multiprotocol Label Switching (MPLS) core network. IP multicast is used to stream video, voice, and data to an MPLS VPN network core.

Historically, point-to-point tunnels were the only way to connect through a service provider network. Although such tunneled networks tend to have scalability issues, they represented the only means of passing IP multicast traffic through a VPN.

Because Layer 3 VPNs support only unicast traffic connectivity, deploying MPLS in conjunction with a Layer 3 VPN allows service providers to offer both unicast and multicast connectivity to Layer 3 VPN customers.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
Prerequisites for Configuring Multicast VPN

Enable IP multicast and configure the PIM interfaces using the tasks described in the "Configuring Basic IP Multicast" module.

Restrictions for Configuring Multicast VPN

- The update source interface for the Border Gateway Protocol (BGP) peerings must be the same for all BGP peerings configured on the device in order for the default multicast distribution tree (MDT) to be configured properly. If you use a loopback address for BGP peering, PIM sparse mode must be enabled on the loopback address.
- The `ip mroute-cache` command must be enabled on the loopback interface used as the BGP peering interface in order for distributed multicast switching to function on the platforms that support it. The `no ip mroute-cache` command must not be present on these interfaces.
- MVPN does not support multiple BGP peering update sources.
- Data MDTs are not created for VPN routing and forwarding instance (VRF) PIM dense mode multicast streams because of the flood and prune nature of dense mode multicast flows and the resulting periodic bring-up and tear-down of such data MDTs.
- Multiple BGP update sources are not supported, and configuring them can break MVPN reverse path forwarding (RPF) checking. The source IP address of the MVPN tunnels is determined by the highest IP address used for the BGP peering update source. If this IP address is not the IP address used as the BGP peering address with the remote provider edge (PE) device, MVPN will not function properly.

Information About Configuring Multicast VPN

Multicast VPN Operation

MVPN IP allows a service provider to configure and support multicast traffic in an MPLS VPN environment. This feature supports routing and forwarding of multicast packets for each individual VRF instance, and it also provides a mechanism to transport VPN multicast packets across the service provider backbone.

A VPN is network connectivity across a shared infrastructure, such as an ISP. Its function is to provide the same policies and performance as a private network, at a reduced cost of ownership, thus creating many opportunities for cost savings through operations and infrastructure.

An MVPN allows an enterprise to transparently interconnect its private network across the network backbone of a service provider. The use of an MVPN to interconnect an enterprise network in this way does not change the way that enterprise network is administered, nor does it change general enterprise connectivity.

Benefits of Multicast VPN

- Provides a scalable method to dynamically send information to multiple locations.
• Provides high-speed information delivery.
• Provides connectivity through a shared infrastructure.

Multicast VPN Routing and Forwarding and Multicast Domains

MVPN introduces multicast routing information to the VPN routing and forwarding table. When a provider edge (PE) device receives multicast data or control packets from a customer edge (CE) router, forwarding is performed according to the information in the Multicast VPN routing and forwarding instance (MVRF). MVPN does not use label switching.

A set of MVRFs that can send multicast traffic to each other constitutes a multicast domain. For example, the multicast domain for a customer that wanted to send certain types of multicast traffic to all global employees would consist of all CE routers associated with that enterprise.

Multicast Distribution Trees

MVPN establishes a static default multicast distribution tree (MDT) for each multicast domain. The default MDT defines the path used by PE routers to send multicast data and control messages to every other PE router in the multicast domain.

If Source Specific Multicast (SSM) is used as the core multicast routing protocol, the multicast IP addresses used for the default and data MDT must be configured within the SSM range on all PE routers.

MVPN also supports the dynamic creation of MDTs for high-bandwidth transmission. Data MDTs are a feature unique to Cisco IOS software. Data MDTs are intended for high-bandwidth sources such as full-motion video inside the VPN to ensure optimal traffic forwarding in the MPLS VPN core. The threshold at which the data MDT is created can be configured on a per-router or a per-VRF basis. When the multicast transmission exceeds the defined threshold, the sending PE router creates the data MDT and sends a UDP message, which contains information about the data MDT, to all routers on the default MDT. The statistics to determine whether a multicast stream has exceeded the data MDT threshold are examined once every second. After a PE router sends the UDP message, it waits 3 more seconds before switching over; 13 seconds is the worst case switchover time, and 3 seconds is the best case.

Data MDTs are created only for (S, G) multicast route entries within the VRF multicast routing table. They are not created for (*, G) entries regardless of the value of the individual source data rate.

In the following example, a service provider has a multicast customer with offices in San Jose, New York, and Dallas. A one-way multicast presentation is occurring in San Jose. The service provider network supports all three sites associated with this customer, in addition to the Houston site of a different enterprise customer.
The default MDT for the enterprise customer consists of provider routers P1, P2, and P3 and their associated PE routers. PE4 is not part of the default MDT, because it is associated with a different customer. The figure shows that no data flows along the default MDT, because no one outside of San Jose has joined the multicast.

**Figure 1: Default Multicast Distribution Tree Overview**

An employee in New York joins the multicast session. The PE router associated with the New York site sends a join request that flows across the default MDT for the multicast domain of the customer. PE1, the PE router
associated with the multicast session source, receives the request. The figure depicts that the PE router forwards
the request to the CE router associated with the multicast source (CE1a).

**Figure 2: Initializing the Data MDT**

The CE router (CE1a) begins to send the multicast data to the associated PE router (PE1), which sends the
multicast data along the default MDT. Immediately sending the multicast data, PE1 recognizes that the multicast
data exceeds the bandwidth threshold for which a data MDT should be created. Therefore, PE1 creates a data
MDT, sends a message to all routers using the default MDT, which contains information about the data MDT,
and, three seconds later, begins sending the multicast data for that particular stream using the data MDT. Only
PE2 has interested receivers for this source, so only PE2 will join the data MDT and receive traffic on it.

PE routers maintain a PIM relationship with other PE routers over the default MDT and a PIM relationship
with directly attached PE routers.

**Multicast Tunnel Interface**

An MVRF, which is created per multicast domain, requires the device to create a tunnel interface from which
all MVRF traffic is sourced. A multicast tunnel interface is an interface that the MVRF uses to access the
multicast domain. It can be thought of as a conduit that connects an MVRF and the global MVRF. One tunnel
interface is created per MVRF.
Multicast Distributed Switching Support for Multicast VPN

Multicast distributed switching (MDS) is supported for MVPN. When MDS is configured, ensure that all interfaces enabled for IP multicast have MDS enabled correctly—verify that no interface has the `no ip mroute-cache` command configured (including loopback interfaces).

MDT Address Family in BGP for Multicast VPN

The `mdt` keyword has been added to the `address-family ipv4` command to configure an MDT address-family session. MDT address-family sessions are used to pass the source PE address and MDT group address to PIM using Border Gateway Protocol (BGP) MDT Subaddress Family Identifier (SAFI) updates.

BGP Advertisement Methods for Multicast VPN Support

In a single autonomous system, if the default MDT for an MVPN is using PIM sparse mode (PIM-SM) with a rendezvous point (RP), then PIM is able to establish adjacencies over the Multicast Tunnel Interface (MTI) because the source PE and receiver PE discover each other through the RP. In this scenario, the local PE (the source PE) sends register messages to the RP, which then builds a shortest-path tree (SPT) toward the source PE. The remote PE, which acts as a receiver for the MDT multicast group, then sends `(*, G)` joins toward the RP and joins the distribution tree for that group.

However, if the default MDT group is configured in a PIM Source Specific Multicast (PIM-SSM) environment rather than a PIM-SM environment, the receiver PE needs information about the source PE and the default MDT group. This information is used to send `(S, G)` joins toward the source PE to build a distribution tree from the source PE (without the need for an RP). The source PE address and default MDT group address are sent using BGP.

BGP Extended Community

When BGP extended communities are used, the PE loopback (source address) information is sent as a VPNv4 prefix using Route Distinguisher (RD) Type 2 (to distinguish it from unicast VPNv4 prefixes). The MDT group address is carried in a BGP extended community. Using a combination of the embedded source in the VPNv4 address and the group in the extended community, PE routers in the same MVRF instance can establish SSM trees to each other.

Note

Prior to the introduction of MDT SAFI support, the BGP extended community attribute was used as an interim solution to advertise the IP address of the source PE and default MDT group before IETF standardization. A BGP extended community attribute in an MVPN environment, however, has certain limitations: it cannot be used in inter-AS scenarios (because the attribute is nontransitive), and it uses RD Type 2, which is not a supported standard and not supported effective with Cisco IOS Release 15.5(1)T and Cisco IOS Release 15.4(3)S.
BGP MDT SAFI

Cisco software releases that support the MDT SAFI, the source PE address and the MDT group address are passed to PIM using BGP MDT SAFI updates. The RD type has changed to RD type 0, and BGP determines the best path for the MDT updates before passing the information to PIM.

Note

To prevent backward-compatibility issues, BGP allows the communication of the older style updates with peers that are unable to understand the MDT SAFI address family.

Cisco software releases that support the MDT SAFI, the MDT SAFI address family needs to be explicitly configured for BGP neighbors using the `address-family ipv4 mdt` command. Neighbors that do not support the MDT SAFI still need to be enabled for the MDT SAFI in the local BGP configuration. Prior to the introduction of the MDT SAFI, additional BGP configuration from the VPNv4 unicast configuration was not needed to support MVPN.

Because the new MDT SAFI does not use BGP route-target extended communities, the regular extended community methods to filter these updates no longer apply. As a result, the `match mdt-group` route-map configuration command has been added to filter on the MDT group address using access control lists (ACLs). These route maps can be applied—inbound or outbound—to the IPv4 MDT address-family neighbor configuration.

Automigration to the MDT SAFI

When migrating a Cisco IOS release to the MDT SAFI, existing VPNv4 neighbors will be automatically configured for the MDT SAFI upon bootup based on the presence of an existing default MDT configuration (that is, pre-MDT SAFI configurations will be automatically converted to an MDT SAFI configuration upon bootup). In addition, when a default MDT configuration exists and a VPNv4 neighbor in BGP is configured, a similar neighbor in the IPv4 MDT address family will be automatically configured.

Note

Because there is no VRF configuration on route reflectors (RRs), automigration to the MDT SAFI will not be triggered on RRs. The MDT SAFI configuration, thus, will need to be manually configured on RRs. Having a uniform MDT transmission method will reduce processing time on the routers (because MDT SAFI conversion is not necessary).

Guidelines for Configuring the MDT SAFI

• We recommend that you configure the MDT SAFI on all routers that participate in the MVPN. Even though the benefits of the MDT SAFI are for SSM tree building, the MDT SAFI must also be configured when using MVPN with the default MDT group for PIM-SM. From the multicast point of view, the MDT SAFI is not required for MVPN to work within a PIM-SM core. However, in certain scenarios, the new address family must be configured in order to create the MTI. Without this notification, the MTI would not be created and MVPN would not function (even with PIM-SM).

• For backward compatible sessions, extended communities must be enabled on all MDT SAFI peers. In a pure MDT SAFI environment, there is no need to configure extended communities explicitly for MVPN. However, extended communities will be needed for VPNv4 interior BGP (iBGP) sessions to relay the route-target. In a hybrid (MDT SAFI and pre-MDT SAFI) environment, extended communities
must be configured to send the embedded source in the VPNv4 address and the MDT group address to MDT SAFI neighbors.

Guidelines for Upgrading a Network to Support the MDT SAFI

When moving from a pre-MDT SAFI to an MDT SAFI environment, the utmost care should be taken to minimize the impact to the MVPN service. The unicast service will not be affected, other than the outage due to the reload and recovery. To upgrade a network to support the MDT SAFI, we recommend that you perform the following steps:

1. Upgrade the PEs in the MVPN to a Cisco IOS release that supports the MDT SAFI. Upon bootup, the PE configurations will be automigrated to the MDT SAFI. For more information about the automigration to the MDT SAFI functionality, see the Automigration to the MDT SAFI, on page 9 section.

2. After the PEs have been upgraded, upgrade the RRs and enable the MDT SAFI for all peers providing MVPN service. Enabling or disabling the MDT SAFI will reset the BGP peer relationship for all address families; thus, a loss of routing information may occur.

Note

In the case of a multihomed BGP RR scenario, one of the RRs must be upgraded and configured last. The upgraded PEs will use this RR to relay MDT advertisements while the other RRs are being upgraded.

Supported Policy

The following policy configuration parameters are supported under the MDT SAFI:

- Mandatory attributes and well-known attributes, such as the AS-path, multiexit discriminator (MED), BGP local-pref, and next-hop attributes.
- Standard communities, community lists, and route maps.

How to Configure Multicast VPN

Configuring a Default MDT Group for a VRF

Perform this task to configure a default MDT group for a VRF.

The default MDT group must be the same group configured on all devices that belong to the same VPN. The source IP address will be the address used to source the BGP sessions.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip multicast-routing distributed`
4. `ip multicast-routing vrf vrf-name distributed`
5. `ip vrf vrf-name`
6. `mdt default group-address`

### DETAILED STEPS

<table>
<thead>

</tr>
<tr>
<td><code>Device(config-vrf)# mdt default 232.0.0.1</code></td>
<td>• By default, the destination address of the tunnel header is the <code>group-address</code> value.</td>
</tr>
</tbody>
</table>
Configuring the MDT Address Family in BGP for Multicast VPN

Perform this task to configure an MDT address family session on PE devices to establish MDT peering sessions for MVPN.

**Before You Begin**

Before MVPN peering can be established through an MDT address family, MPLS and Cisco Express Forwarding (CEF) must be configured in the BGP network and multiprotocol BGP on PE devices that provide VPN services to CE devices.

**Note**

The following policy configuration parameters are not supported:

- Route-originator attribute
- Network Layer Reachability Information (NLRI) prefix filtering (prefix lists, distribute lists)
- Extended community attributes (route target and site of origin)

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `address-family ipv4 mdt`
5. `neighbor neighbor-address activate`
6. `neighbor neighbor-address send-community [both | extended | standard]`
7. `exit`
8. `address-family vpnv4`
9. `neighbor neighbor-address activate`
10. `neighbor neighbor-address send-community [both | extended | standard]`
11. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Example:**  
Device> enable | • Enter your password if prompted. |
| **Step 2**  
**configure terminal** | Enters global configuration mode. |
| **Example:**  
Router# configure terminal | |
| **Step 3**  
**router bgp as-number** | Enters router configuration mode and creates a BGP routing process. |
| **Example:**  
Device(config)# router bgp 65535 | |
| **Step 4**  
**address-family ipv4 mdt** | Enters address family configuration mode to create an IP MDT address family session. |
| **Example:**  
Device(config-router)# address-family ipv4 mdt | |
| **Step 5**  
**neighbor neighbor-address activate** | Enables the MDT address family for this neighbor. |
| **Example:**  
Device(config-router-af)# neighbor 192.168.1.1 activate | |
| **Step 6**  
**neighbor neighbor-address send-community [both | extended | standard]** | Enables community and (or) extended community exchange with the specified neighbor. |
| **Example:**  
Device(config-router-af)# neighbor 192.168.1.1 send-community extended | |
| **Step 7**  
**exit** | Exits address family configuration mode and returns to router configuration mode. |
| **Example:**  
Device(config-router-af)# exit | |
| **Step 8**  
**address-family vpnv4** | Enters address family configuration mode to create a VPNv4 address family session. |
| **Example:**  
Device(config-router)# address-family vpnv4 | |
### Step 9
**Command or Action:** `neighbor neighbor-address activate`  
**Purpose:** Enables the VPNv4 address family for this neighbor.  
**Example:**  
```
Device(config-router-af)# neighbor 192.168.1.1 activate
```

### Step 10
**Command or Action:** `neighbor neighbor-address send-community [both | extended | standard]`  
**Purpose:** Enables community and (or) extended community exchange with the specified neighbor.  
**Example:**  
```
Device(config-router-af)# neighbor 192.168.1.1 send-community extended
```

### Step 11
**Command or Action:** `end`  
**Purpose:** Exits address family configuration mode and enters privileged EXEC mode.  
**Example:**  
```
Device(config-router-af)# end
```

## Configuring the Data Multicast Group

A data MDT group can include a maximum of 256 multicast groups per VPN per VRF per PE device. Multicast groups used to create the data MDT group are dynamically chosen from a pool of configured IP addresses.

### Before You Begin
- Before configuring a default MDT group, the VPN must be configured for multicast routing as described in the "Configuring a Default MDT Group for a VRF" section.
- All access lists needed when using the tasks in this module should be configured prior to beginning the configuration task. For information about how to configure an access list, see the "Creating an IP Access List and Applying It to an Interface" module.

### SUMMARY STEPS
1. enable  
2. configure terminal  
3. ip vrf vrf-name  
4. mdt data group-address-range wildcard-bits [threshold kbps] [list access-list]  
5. mdt log-reuse  
6. end

<tr>
<td><strong>Step 4</strong> mdt data group-address-range wildcard-bits [threshold kbps] [list access-list]</td>
<td>Specifies a range of addresses to be used in the data MDT pool.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-vrf)# mdt data 239.192.20.32 0.0.0.15 threshold 1</td>
<td>- For the group-address-range and wildcard-bits arguments, specify a multicast group address range. The range is from 224.0.0.1 to 239.255.255.255. Because the range of addresses used in the data MDT pool are multicast group addresses (Class D addresses), there is no concept of a subnet; therefore, you can use all addresses in the mask (wildcard) range that you specify for the wildcard-bits argument.</td>
</tr>
<tr>
<td></td>
<td>- The threshold is in kbps. The range is from 1 through 4294967.</td>
</tr>
<tr>
<td></td>
<td>- Use the optional list keyword and access-list argument to define the (S, G) MVPN entries to be used in a data MDT pool, which would further limit the creation of a data MDT pool to the particular (S, G) MVPN entries defined in the access list specified for the access-list argument</td>
</tr>
<tr>
<td><strong>Step 5</strong> mdt log-reuse</td>
<td>(Optional) Enables the recording of data MDT reuse and generates a syslog message when a data MDT has been reused.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-vrf)# mdt log-reuse</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-vrf)# end</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring Multicast Routes and Information

Perform this task to limit the number of multicast routes that can be added in a device.

### Before You Begin

- Before configuring a default MDT group, the VPN must be configured for multicast routing as described in the “Configuring a Default MDT Group for a VRF” section.
- All access lists needed when using the tasks in this module should be configured prior to beginning the configuration task. For information about how to configure an access list, see the “Creating an IP Access List and Applying It to an Interface” module.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip multicast vrf vrf-name route-limit limit [threshold]`
4. `ip multicast mrinfo-filter access-list`

### DETAILED STEPS

<table>
<thead>

</table>
Verifying Information for the MDT Default Group

SUMMARY STEPS

1. enable
2. show ip pim mdt bgp
3. show ip pim vrf vrf-name mdt history interval \textit{minutes}

DETAILED STEPS

Step 1 enable

Example:
\texttt{Device> enable}

Enables privileged EXEC mode.

- Enter your password if prompted.

Step 2 show ip pim mdt bgp

Example:
\texttt{Device# show ip pim mdt bgp}

<table>
<thead>
<tr>
<th>MDT (Route Distinguisher + IPv4)</th>
<th>Router ID</th>
<th>Next Hop</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDT group 238.2.2.0 2:200:50.0.0.4</td>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
</tr>
<tr>
<td>MDT group 239.1.1.1 2:200:50.0.0.4</td>
<td>50.0.0.4</td>
<td>50.0.0.4</td>
</tr>
</tbody>
</table>

Displays information about the BGP advertisement of the RD for the MDT default group.

Step 3 show ip pim vrf vrf-name mdt history interval \textit{minutes}

Example:
\texttt{Device# show ip pim vrf vrf1 mdt history interval 20}

<table>
<thead>
<tr>
<th>MDT-data send history for VRF - vrf1 for the past 20 minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDT-data group</td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>10.9.9.8</td>
</tr>
<tr>
<td>10.9.9.9</td>
</tr>
</tbody>
</table>

Displays the data MDTs that have been reused during the past configured interval.
Configuration Examples for Multicast VPN

Example: Configuring MVPN and SSM

In the following example, PIM-SSM is configured in the backbone. Therefore, the default and data MDT groups are configured within the SSM range of IP addresses. Inside the VPN, PIM-SM is configured and only Auto-RP announcements are accepted.

```
ip vrf vrf1
  rd 1:1
  route-target export 1:1
  route-target import 1:1
  mdt default 232.0.0.1
  mdt data 232.0.1.0 0.0.0.255 threshold 500 list 101
  ip pim ssm default
  ip pim vrf vrf1 accept-rp auto-rp
```

Example: Enabling a VPN for Multicast Routing

In the following example, multicast routing is enabled with a VPN routing instance named vrf1:

```
ip multicast-routing vrf1
```

Example: Configuring the MDT Address Family in BGP for Multicast VPN

In the following example, an MDT address family session is configured on a PE router to establish MDT peering sessions for MVPN.

```
! ip vrf test
  rd 55:2222
  route-target export 55:2222
  route-target import 55:2222
  mdt default 232.0.0.1
  ip multicast-routing
  ip multicast-routing vrf test
  ! router bgp 55
  .
  .
  ! address-family vpnv4
  neighbor 192.168.1.1 activate
  neighbor 192.168.1.1 send-community both
  ! address-family ipv4 mdt
  neighbor 192.168.1.1 activate
  neighbor 192.168.1.1 send-community both
  !
```
Example: Configuring the Multicast Group Address Range for Data MDT Groups

In the following example, the VPN routing instance is assigned a VRF named VPN_A. The MDT default group for a VPN VRF is 239.1.1.1, and the multicast group address range for MDT groups is 239.2.2.0 with wildcard bits of 0.0.0.255:

```
ip vrf VPN_A
rd 2:200
route-target export 2:200
route-target import 2:200
mdt default 239.1.1.1
mdt data 239.2.2.0 0.0.0.255
```

The following is an alternate command to assign VRF to the VPN routing instance.

```
vrf definition VPN_A
rd 101:1
route-target export 101:1
route-target import 101:1
!
address-family ipv4
mdt default 232.1.1.1
mdt data 232.5.1.1 0.0.0.255 threshold 500 list 101
```

Example: Limiting the Number of Multicast Routes

In the following example, the number of multicast routes that can be added to a multicast routing table is set to 200,000 and the threshold value of the number of mroutes that will cause a warning message to occur is set to 20,000:

```
!
ip multicast-routing distributed
ip multicast-routing vrf cisco distributed
ip multicast cache-headers
ip multicast route-limit 200000 20000
ip multicast vrf cisco route-limit 200000 20000
no mpls traffic-eng auto-bw timers frequency 0
!
```

### Feature Information for Configuring Multicast VPN

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Configuring Multicast VPN Extranet Support

The Multicast VPN Extranet Support feature (sometimes referred to as the MVPN Extranet Support feature) enables service providers to distribute IP multicast content originated from one enterprise site to other enterprise sites. This feature enables service providers to offer the next generation of flexible extranet services, helping to enable business partnerships between different enterprise VPN customers.

This module describes the concepts and the tasks related to configuring Multicast VPN Extranet Support.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Multicast VPN Extranet Support

- You are familiar with IP multicast concepts and configuration tasks.
- You are familiar with Multicast VPN (MVPN) concepts and configuration tasks.
• You are familiar with Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Network (VPN) concepts and configuration tasks.

Restrictions for Configuring Multicast VPN Extranet Support

• The Multicast VPN Extranet Support feature supports only Protocol Independent Multicast (PIM) sparse mode (PIM-SM) and Source Specific Multicast (SSM) traffic; PIM dense mode (PIM-DM) and bidirectional PIM (bidir-PIM) traffic are not supported.

• When configuring extranet MVPNs in a PIM-SM environment, the source and the rendezvous point (RP) must reside in the same site of the MVPN behind the same provider edge (PE) router.

• It is required to configure either all the Receiver MVRF(s) in Source PE or Source MVRF in all the Receiver PE(s) to deliver the Extranet content.

• IPV6 based MVPN Extranet is not supported.

• Only Routed interfaces and Routed interfaces on Port channels are supported towards the core. BDI towards core is not supported.

• The scale data for MVPN extranet is as follows:
  - Maximum number of mVRFs supported is 20
  - Maximum number of mroutes supported (Intranet + extranet) is 1000 in case of default template and 2000 in case of Video template.

• PIM-SM and PIM-SSM are supported.

• PIM-DM and bidir-PIM are not supported.

• RP must be configured behind the PE router and the source is in the same intranet-MVPN and behind the CE router.

• Static mroute with fallback-lookup option is supported for RPF lookup².

• Configuring the Receiver mVRF on the Source PE only to implement MVPN Extranet support is not supported.

Information About Multicast VPN Extranet Support

Overview of MVPN Extranet Support

An extranet can be viewed as part of a company's intranet that is extended to users outside the company. It has also been described as a "state of mind" in which a VPN is used as a way to do business with other companies as well as to sell products and content to customers and companies. An extranet is a VPN connecting the corporate site or sites to external business partners or suppliers to securely share part of a business's information or operations among them.

MPLS VPNs inherently provide security, ensuring that users access only appropriate information. MPLS VPN extranet services offer extranet users unicast connectivity without compromising the integrity of their
corporate data. The Multicast VPN Extranet Support feature extends this offer to include multicast connectivity to the extranet community of interest.

The Multicast VPN Extranet Support feature enables service providers to distribute IP multicast content originated from one enterprise site to other enterprise sites. This feature enables service providers to offer the next generation of flexible extranet services, helping to enable business partnerships between different enterprise VPN customers. Using this feature, service providers can offer multicast extranet contracts to meet various business partnership requirements, including short-term, annual, and rolling contracts.

**Benefits of MVPN Extranet Support**

The Multicast VPN Extranet Support feature can be used to solve such business problems as:

- Efficient content distribution between enterprises
- Efficient content distribution from service providers or content providers to their different enterprise VPN customers

**Components of an Extranet MVPN**

The figure below illustrates the components that constitute an extranet MVPN.

- **MVRF** -- Multicast VPN routing and forwarding (VRF) instance. An MVRF is a multicast-enabled VRF. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a provider edge (PE) router.

- **Source MVRF** -- An MVRF that can reach the source through a directly connected customer edge (CE) router.

- **Receiver MVRF** -- An MVRF to which receivers are connected through one or more CE devices.

- **Source PE** -- A PE router that has a multicast source behind a directly connected CE router.
• **Receiver PE** -- A PE router that has one or more interested receivers behind a directly connected CE router.

*Figure 3: Components of an Extranet MVPN*

**Solution for MVPN Extranet Support**

For unicast, there is no difference between an intranet or extranet from a routing perspective; that is, when a VRF imports a prefix, that prefix is reachable through a label-switched path (LSP). If the enterprise owns the prefix, the prefix is considered a part of the corporate intranet; otherwise, the prefix is considered a part of an extranet. For multicast, however, the reachability of a prefix (especially through an LSP) is not sufficient to build a multicast distribution tree (MDT).

In order to provide support for extranet MVPN services, the same default MDT group must be configured in the source and receiver MVRF. Prior to the introduction of the Multicast VPN Extranet Support feature, there were challenges that prevented service providers from providing extranet MVPN services:

- The source MVRF may not have been configured with a default MDT group, or it may have been configured with a different MDT group as compared to the receiver MVRF. In the former case there was no way for the source MVRF to forward multicast streams to extranet sites, and in the latter case, there was no way for the separate MVRFs to be linked.

- It was not possible to maintain a forwarding table in cases where the RPF interface and outgoing interfaces belong to different VRFs.

The Multicast VPN Extranet Support feature solves these challenges as follows:

- The receiver and source MVRF multicast route (mroute) entries are linked.

- The Reverse Path Forwarding (RPF) check relies on unicast routing information to determine the interface through which the source is reachable. This interface is used as the RPF interface.
Configuration Guidelines for MVPN Extranet Support

Two configuration options are available to provide extranet MVPN services:

- Option 1--Configure the source MVRF on the receiver PE router.
- Option 2--Configure the receiver MVRF on the source PE router.

MVPN Extranet Support Configuration Guidelines for Option 1

To provide extranet MVPN services to enterprise VPN customers by configuring the receiver MVRF on the source PE router (Option 1), you would complete the following procedure:

- For each extranet site, you would configure an additional MVRF on the source PE router, that has the same default MDT group as the receiver MVRF, if the MVRF is not configured on the source PE.
- In the receiver MVRF configuration, you would configure the same unicast routing policy on the source and receiver PE routers to import routes from the source MVRF to the receiver MVRF.

The figure illustrates the flow of multicast traffic in an extranet MVPN topology where a receiver MVRF is configured on the source PE router (Option 1). In the topology, an MVRF is configured for VPN-Green and VPN-Red on PE1, the source PE router. A multicast source behind PE1 is sending out a multicast stream to the MVRF for VPN-Green, and there are interested receivers behind PE2 and PE3, the receiver PE routers for VPN-Red and VPN-Green, respectively. After PE1 receives the packets from the source in the MVRF for VPN-Green, it independently replicates and encapsulates the packets in the MVRF for VPN-Green and VPN-Red and forwards the packets. After receiving the packets from this source, PE2 and PE3 decapsulate and forward the packets to the respective MVRFs.

Figure 4: Packet Flow for MVPN Extranet Support Configuration Option 1
MVPN Extranet Support Configuration Guidelines for Option 2

To provide extranet MVPN services to enterprise VPN customers by configuring a source MVRF on a receiver PE router (Option 2), you would complete the following procedure:

- On a receiver PE router that has one or more interested receivers in an extranet site behind a directly connected CE router, configure an additional MVRF that has the same default MDT group as the site connected to the multicast source, if the MVRF is not configured.
- On the receiver PE router, you would configure the same unicast routing policy to import routes from the source MVRF to the receiver MVRF.

The figure illustrates the flow of multicast traffic in an extranet MVPN topology where the source MVRF is configured on a receiver PE router (Option 2). In the topology, an MVRF is configured for VPN-Green and VPN-Red on PE2, a receiver PE router. A multicast source behind PE1, the source PE router, is sending out a multicast stream to the MVRF for VPN-Green, and there are interested receivers behind PE2, the receiver PE router for VPN-Red, and behind PE3, the receiver PE router for VPN-Green. After PE1 receives the packets from the source in the MVRF for VPN-Green, it replicates and forwards the packets to PE2 and PE3, because both routers are connected to receivers in VPN-Green. The packets that originated from VPN-Green are then replicated on PE2 and forwarded to the interested receivers in VPN-Red and are replicated on PE3 and forwarded to the interested receivers in VPN-Green.

Figure 5: Packet Flow for MVPN Extranet Support Configuration Option 2

RPF for MVPN Extranet Support Using Imported Routes

You must configure either the receiver MVRF on the source PE router (Option 1) or the source MVRF on the receiver PE router (Option 2) for extranet links to be created. Once configured, RPF relies on unicast routing information to determine the interface through which the source is reachable. This interface is used as the RPF interface. No additional configuration is required for RPF resolution. The Multicast VPN Extranet
Support feature supports RPF from one VRF to another VRF, from a VRF to the global routing table, and from the global routing table to a VRF.

**RPF for MVPN Extranet Support Using Static Mroutes**

*Note*

This capability is not supported for MVPNv6 extranet.

By default, an extranet MVPN relies on unicast routing policies to determine the RPF interface. When the RPF lookup originates in a receiver MVRF, and it finds that the RPF interface does not lie in the same MVRF, the router uses the information in the Border Gateway Protocol (BGP) imported route to determine the source MVRF. The RPF lookup then continues and resolves in the source MVRF. In cases where the multicast and unicast topologies are incongruent, you can override the default behavior by configuring a static mroute in the receiver MVRF to explicitly specify the source MVRF using the `ip mroute` command with the `fallback-lookup` keyword and `vrf vrf-name` keyword and argument.

Static mroutes can also be configured to support RPF for extranet MVPN in the case where the source is present in an MVRF and the receiver is in the global table. In this case, because BGP does not allow VPNv4 routes to be imported into the IPv4 routing table, unicast cannot obtain the source MVRF information needed to resolve the RPF lookup. To enable the RPF lookup to be resolved in this case, a static mroute can be configured to explicitly specify the source MVRF using the `ip mroute` command with the `fallback-lookup` keyword and the `global` keyword.

**Multicast VPN Extranet VRF Select**

The Multicast VPN VRF Select feature is configured by creating group-based VRF selection policies. Group-based VRF selection policies are configured using the `ip multicast rpf select` command. The `ip multicast rpf select` command is used to configure RPF lookups originating in a receiver MVRF or in the global routing table to be resolved in a source MVRF or in the global routing table based on group address. Access Control Lists (ACLs) are used to define the groups to be applied to group-based VRF selection policies.

The figure illustrates an extranet MVPN topology with the Multicast VPN VRF Select feature configured. In this topology, (S, G1) and (S, G2) PIM joins originating from VPN-Green, the receiver VRF, are forwarded...
to PE1, the receiver PE. Based on the group-based VRF selection policies configured, PE1 sends the PIM joins to VPN-Red and VPN-Blue for groups G1 and G2, respectively.

**Figure 6: RPF Lookups Using Group-Based VRF Selection Policies**

**MVPNv6 Extranet**

IPv6 Multicast Virtual Private Network (MVPNv6) provides multiple VPN support that enables service providers to provide multicast-enabled private IPv6 networks to their customers using the existing IPv4 backbone. In the MVPNv6 implementation, the IPv6 multicast traffic is carried over the same IPv4-based core network and both the IPv4 and IPv6 VPN traffic are carried over the same tunnels simultaneously. MVPNv6 extranet forwards IPv6 multicast traffic across VRF boundaries on a PE device to connect the service provider to external business partners or suppliers for securely sharing information or operations among them.

**Hardware Acceleration for Multicast VPN Extranet Support on Catalyst 6500 Series Switches**

Beginning in Cisco IOS Release 12.2(33)SXH, when the Multicast VPN Extranet Support feature is configured on Catalyst 6500 series switches, forwarding entries for source and receiver MVRFs are linked in hardware (similar to how they are linked in software for this feature) and packets are replicated in hardware when being forwarded to extranet MVPN sites. This functionality is referred to as the Hardware Acceleration for Multicast VPN Extranet Support feature.
How to Configure Multicast VPN Extranet Support

Configuring MVVPN Support

Perform one of the following tasks to provide extranet MVVPN capabilities in an IPv4 core network:

**Configuring the Receiver MVRF on the Source PE - Option 1**

Perform this task to configure the receiver MVRF on the source PE router (Option 1) and provide support for extranet MVVPN services.

In the following figure, the source PE router is PE1. To provide extranet MVVPN services from one enterprise VPN site (VPN-Green) to another enterprise VPN site (VPN-Red) using Option 1, configure the receiver MVRF on the source PE router. In the receiver MVRF configuration, the default MDT group must be the same on both the source and receiver PE routers. In addition, you must configure the same unicast routing policy to import routes from the source MVRF (the MVRF for VPN-Green) to the receiver MVRF (the MVRF for VPN-Red).

**Before You Begin**

Intranet VPN in the source and receiver VPNs must be already configured.
SUMMARY STEPS

1. enable
2. configure terminal
3. ip vrf vrf-name
4. rd route-distinguisher
5. route-target import route-target-ext-community
6. mdt default group-address
7. end
8. show ip mroute [vrf vrf-name] group-address

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>

<td>Creates a route-target extended community for a VRF.</td>
</tr>
<tr>
<td></td>
<td>• The import keyword imports routing information from the target VPN extended community.</td>
</tr>
</tbody>
</table>
### Configuring the Source MVRF on the Receiver PE - Option 2

Perform this task to configure the source MVRF on the receiver PE router (Option 2) and provide support for extranet MVPN services.

In the following figure, the receiver PE router is PE2. To provide support for extranet MVPN services from one enterprise VPN site (VPN-Green) to another enterprise VPN site (VPN-Red) using Option 2, configure the source MVRF on the receiver PE router. The MDT group configuration of the source MVRF must be the same on both the source and receiver PE routers. In addition, you must configure the same unicast routing
policy to import routes from the source MVRF (the MVRF for VPN-Green) to the receiver MVRF (the MVRF for VPN-Red).

**Figure 8: Topology for MVPN Extranet Support Configuration Option 2**

Even though PE2 is not connected to any sites of VPN-Green, create an MVRF on PE2. Configure the same routing policy to import routes from VPN-Green to VPN-Red.

**Before You Begin**

Intranet VPN in the source and receiver VPNS must be already configured.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip vrf vrf-name
4. rd route-distinguisher
5. route-target import route-target-ext-community
6. mdt default group-address
7. end
8. show ip mroute [vrf vrf-name] group-address
9. show mls ip multicast group group-address

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Example:**
Router> enable | • Enter your password if prompted. |
| **Step 2**
configure terminal | Enters global configuration mode. |
| **Example:**
Router# configure terminal | |
| **Step 3**
ip vrf vrf-name | Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode.  
• The `vrf-name` argument is the name assigned to a VRF. |
| **Example:**
Router(config)# ip vrf VPN-Red | |
| **Step 4**
rd route-distinguisher | Creates routing and forwarding tables.  
• The `route-distinguisher` argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats:  
  • 16-bit autonomous system number: your 32-bit number, for example, 101:3  
  • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1 |
| **Example:**
Router(config-vrf)# rd 55:1111 | |
| **Step 5**
route-target import route-target-ext-community | Creates a route-target extended community for a VRF.  
• The `import` keyword exports routing information to the target VPN extended community.  
• The `route-target-ext-community` argument adds the route-target extended community attributes to the VRF’s list of import, export, or both (import and export) route-target extended communities.  
**Note** For content to be distributed from the source MVRF to the receiver MVRF, you must configure the same unicast routing policy on the source and receiver PE routers to import routes from the source VRF to the receiver VRF. |
| **Example:**
Router(config-vrf)# route-target import 55:1111 | |
| **Step 6**
mdt default group-address | Configures the multicast group address range for data MDT groups for a VRF.  
• A tunnel interface is created as a result of this command.  
• By default, the destination address of the tunnel header is the `group-address` argument. |
| **Example:**
Router(config-vrf)# mdt default 232.1.1.1 | |
### Purpose
Command or Action | Purpose
--- | ---
Step 7 | end

**Example:**

Router(config-vrf)# end

Step 8 | show ip mroute [vrf vrf-name] group-address

**Example:**

Router# show ip mroute 232.1.1.1

Step 9 | show mls ip multicast group group-address

**Example:**

Router# show mls ip multicast group 232.3.3.3

---

### Configuring RPF for MVPN Extranet Support Using Static Mroutes

**Note**

This task is not supported for MVPNv6 extranet.

**Before You Begin**

You must configure support for extranet MVPN services prior to performing this task.

### SUMMARY STEPS

1. enable
2. configure terminal
3. ip mroute vrf vrf-name source-address mask fallback-lookup {global | vrf vrf-name} [distance]
4. end
5. show ip mroute [vrf vrf-name] group-address

### DETAILED STEPS

<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
</tr>
</tbody>
</table>
### Configuring Group-Based VRF Selection Policies with MVPN

Perform this task to configure group-based VRF selection policies with MVPN.

This task enables RPF lookups to be performed to the same source address in different VRFs using the group address as the VRF selector. This feature enhances extranet MVPNs by enabling service providers to distribute content streams coming in from different MVPNs and redistributing them from there.

#### Before You Begin
- You must configure support for extranet MVPN services prior to performing this task.
- ACLs are used to define the groups to be applied to group-based VRF selection policies. This task assumes that you have configured the ACLs to be applied to group-based VRF selection policies.
SUMMARY STEPS

1. enable
2. configure terminal
3. Use the following commands:
   • ip multicast [vrf receiver-vrf-name] rpf select {global | vrf source-vrf-name} group-list access-list
4. Repeat step 3 to create additional group-based VRF selection policies.
5. end
6. Use the following commands:
   • show ip rpf [vrf vrf-name] select
7. Use one of the following commands:
   • show ip rpf [vrf vrf-name] source-address [group-address]

### Configuration Examples for Multicast VPN Extranet Support

#### Example Configuring the Receiver VRF on the Source PE Router - Option 1

The following example shows the configurations for PE1, the source PE router, and PE2, the receiver PE router, in the figure. In this example, extranet MVPN services are supported between VPN-Green and VPN-Red...
by configuring the receiver MVRF for VPN-Red on PE1, the source PE router. The MVRF configuration for VPN-Red is configured to import routes from the MVRF for VPN-Green to the MVRF for VPN-Red.

**Figure 9: Topology for MVPN Extranet Support Option 1 Configuration Example**

**PE1 Configuration**

```conf
ip cef
!

States in the Global Table on PE1 and PE2 for the MDT Default Group 232.3.3.3

The following are sample outputs from the `show ip mroute` command on PE1 and PE2. The sample outputs show the global table for the MDT default group 232.3.3.3 on PE1 and PE2.

**PE1# show ip mroute 232.3.3.3**

**IP Multicast Routing Table**

**Flags:** D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group
V - RD & Vector, v - Vector

**Outgoing interface flags:** H - Hardware switched, A - Assert winner

**Timers:** Uptime/Expires

**Interface state:** Interface, Next-Hop or VCD, State/Mode

```
(10.1.0.1, 232.3.3.3), 00:46:27/00:03:27, flags: st
Incoming interface: Loopback0, RPF nbr 0.0.0.0
Outgoing interface list:
    Ethernet0/0, Forward/Sparse-Dense, 00:45:17/00:02:44
```
States in the Global Table on PE1 and PE2 for the MDT Default Group 232.3.3.3 When PE1 and PE2 Are Catalyst 6500 Series Switches Configured for MVPN Extranet Support

The following are sample outputs from the `show ip mroute` on PE1 and PE2, when PE1 and PE2 are Catalyst 6500 series switches that have been configured to support extranet MVPN services. The sample output from the `show ip mroute` command shows the global table for the MDT default group 232.3.3.3 on PE1 and PE2. In the output, the “RPF-MFD” flag indicates that a multicast flow is completely hardware switched and “H” flag indicates that the flow is being hardware switched on an outgoing interface.

PE1# show ip mroute 232.3.3.3
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement, U - URD, I - Received Source Specific Host Report, Z - Multicast Tunnel, z - MDT-data group sender, Y - Joined MDT-data group, y - Sending to MDT-data group, V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner

Outgoing interface flags: H - Hardware switched, A - Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
(10.1.0.2, 232.3.3.3), 00:45:17/00:02:57, flags: sTIZ
Incoming interface: Ethernet0/0, RPF nbr 224.0.1.4
Outgoing interface list:
MVRF VPN-Red, Forward/Sparse-Dense, 00:45:17/00:01:09

Example Configuring the Receiver VRF on the Source PE Router - Option 1
States in the VRF Table for VPN-Green on PE1 After Receivers in VPN-Red Join Multicast Group 228.8.8.8

The following is sample output from the `show ip mroute` command on PE1. The sample output shows the state of the VRF table for VPN-Green on PE1 when receivers join the multicast group 228.8.8.8. The output indicates that extranet receivers in VPN-Red are receiving content from a source in VPN-Green that is sending to multicast group 228.8.8.8. The "E" flag in the output indicates that a (*, G) or (S, G) entry in the VRF routing table is a source VRF entry and has extranet receiver MVRF mroute entries linked to it.

```
PE1# show ip mroute vrf VPN-Green 228.8.8.8
IP Multicast Routing Table
  Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
  L - Local, P - Pruned, R - RP-bit set, F - Register flag,
  T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
  X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
  U - URD, I - Received Source Specific Host Report,
  Z - Multicast Tunnel, z - MDT-data group sender,
  Y - Joined MDT-data group, y - Sending to MDT-data group,
  V - RD & Vector, v - Vector
  Outgoing interface flags: H - Hardware switched, A - Assert winner
  Timers: Uptime/Expires
  Interface state: Interface, Next-Hop or VCD, State/Mode

(*) (228.8.8.8), 00:01:38/stopped, RP 10.100.0.5, flags: SE
  Incoming interface: Ethernet3/0, RPF nbr 10.1.1.5
  Outgoing interface list: Null
  Extranet receivers in vrf VPN-Red:

  (10.1.1.200, 228.8.8.8), 00:00:05/00:02:54, flags: TE
  Incoming interface: Ethernet3/0, RPF nbr 10.1.1.5
  Outgoing interface list: Null
  Extranet receivers in vrf VPN-Red:
  (10.1.1.200, 228.8.8.8), 00:00:05/stopped, OIF count: 1, flags:
```

States in the VRF Table for VPN-Green on PE1 After Receivers in VPN-Red Join Multicast Group 228.8.8.8 When PE1 Is a Catalyst 6500 Series Switch Configured for MVPN Extranet Support

The following are sample outputs from the `show ip mroute` command on PE1, when PE1 is a Catalyst 6500 series switch configured to support extranet MVPN services. The sample output from the `show ip mroute` command shows the state of the VRF table for VPN-Green on PE1 when receivers join the multicast group 228.8.8.8. The sample output indicates that extranet receivers in VPN-Red are receiving content from a source in VPN-Green that is sending to multicast group 228.8.8.8.

```
PE1# show ip mroute vrf VPN-Green 228.8.8.8
IP Multicast Routing Table
  Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
  L - Local, P - Pruned, R - RP-bit set, F - Register flag,
  T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
  X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
  U - URD, I - Received Source Specific Host Report,
  Z - Multicast Tunnel, z - MDT-data group sender,
  Y - Joined MDT-data group, y - Sending to MDT-data group,
  V - RD & Vector, v - Vector
  Outgoing interface flags: H - Hardware switched, A - Assert winner
  Timers: Uptime/Expires
  Interface state: Interface, Next-Hop or VCD, State/Mode
```
States in the VRF Table for VPN-Red on PE1 After Receivers in VPN-Red Join Multicast Group 228.8.8.8

The following is sample output from the `show ip mroute` command on PE1. The sample output shows the state of the VRF table for VPN-Red on PE1 when receivers join the multicast group 228.8.8.8. The "using vrf VPN-Green" field indicates that VPN-Red is using unicast routing information from VPN-Green to determine the RPF interface through which the source is reachable.

### PE1# show ip mroute vrf VPN-Red 228.8.8.8

| Flags: | D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet, X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement, U - URD, I - Received Source Specific Host Report, Y - Joined MDT-data group, y - Sending to MDT-data group, V - RD & Vector, v - Vector |

**Example Configuring the Source VRF on the Receiver PE - Option 2**

The following configuration example is based on the extranet MVPN topology illustrated in the figure. This example shows the configurations for PE2, the receiver PE router, and PE1, the source PE router. In this example, extranet MVPN services are supported between VPN-Green and VPN-Red by configuring the source.
MVRF for VPN-Green on PE2. The same unicast routing policy is configured to import routes from VPN-Green to VPN-Red.

Figure 10: Topology for MVPN Extranet Support Option 2 Configuration Example

PE2 Configuration

```conf
ip cef
ip vrf VPN-Red
 rd 55:2222
 route-target export 55:2222
 route-target import 55:2222
 route-target import 55:1111
 mdt default 232.3.3.3
!
ip vrf VPN-Green
 rd 55:1111
 route-target export 55:1111
 route-target import 55:1111
 mdt default 232.1.1.1

States in the Global Table on PE1 and PE2 for the MDT Default Group 232.1.1.1

The following are sample outputs from the `show ip mroute` command on PE1 and PE2. The sample outputs show the global table for the MDT default group 232.1.1.1 on PE1 and PE2.

PE1# `show ip mroute 232.1.1.1`

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group,
Outgoing interface flags: $H$ - Hardware switched, $A$ - Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
(10.2.0.2, 232.1.1.1), 00:01:19/00:02:42, flags: $sTIZ$
Incoming interface: Ethernet0/0, RPF nbr 10.0.1.4
Outgoing interface list:
  MRVF VPN-Green, Forward/Sparse-Dense, 00:01:19/00:02:07
(10.1.0.1, 232.1.1.1), 00:02:19/00:03:11, flags: $sT$
Incoming interface: Loopback0, RPF nbr 0.0.0.0
Outgoing interface list:
  Ethernet0/0, Forward/Sparse-Dense, 00:02:00/00:02:36

States in the VRF Table for VPN-Green on PE2 After Receivers in VPN-Red Join Multicast Group 228.8.8.8

The following is sample output from the `show ip mroute` command on PE2. The output shows the state of the VRF table for VPN-Green on PE1 when receivers join the multicast group 228.8.8.8. The output indicates that extranet receivers in VPN-Red are receiving content from the source in VPN-Green that is sending to...
multicast group 228.8.8.8. The "E" flag indicates that a (*, G) or (S, G) entry in the VRF routing table is a source VRF entry and has extranet receiver MVRF mroute entries linked to it.

PE2# show ip mroute vrf VPN-Green 228.8.8.8
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,

States in the VRF Table for VPN-Red on PE2 After Receivers in VPN-Red Join Multicast Group 228.8.8.8
The following is sample output from the show ip mroute command on PE2. The sample output shows the state of the VRF table for VPN-Red on PE2 when receivers join the multicast group 228.8.8.8. The "using vrf VPN-Green" field indicates that VPN-Red is using unicast routing information from VPN-Green to determine the RPF interface through which the source is reachable.

PE2# show ip mroute vrf VPN-Red 228.8.8.8
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
Example: Displaying Statistics for MVPN Extranet Support

This example is a stand alone example and does not refer to any other technologies. The MFIB-based implementation of IP multicast updates counters in source MVRF mroute entries for extranet MVPN. Counters in the source MVRF can be displayed using Cisco IOS commands. Counters in the receiver MVRF mroute entries will remain zero.

Use the `show ip mroute` command to determine the source and receiver MVRFs. The following sample output shows that VRF blue is the source MVRF and VRF red is the receiver MVRF:

```plaintext
PE1# show ip mroute vrf blue 228.1.1.1

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet, X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement, U - URD, I - Received Source Specific Host Report, Z - Multicast Tunnel, z - MDT-data group sender, Y - Joined MDT-data group, y - Sending to MDT-data group, V - RD & Vector, v - Vector
```

Outgoing interface flags: H - Hardware switched, A - Assert winner

Timers: Uptime/Expires

Interface state: Interface, Next-Hop or VCD, State/Mode

(*, 228.8.8.8), 00:02:00/stopped, RP 10.100.0.5, flags: S

Incoming interface: Tunnel10, RPF nbr 10.1.0.1, using vrf VPN-Green

Outgoing interface list:

- GigabitEthernet9/1, Forward/Sparse-Dense, 00:02:00/00:02:34, H

(10.1.1200, 228.8.8.8), 00:01:32/00:03:28, flags: S

Incoming interface: Tunnel10, RPF nbr 10.1.0.1, using vrf VPN-Green

Outgoing interface list:

- GigabitEthernet9/1, Forward/Sparse-Dense, 00:01:32/00:03:01, H
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
(*, 228.1.1.1), 00:05:48/stopped, RP 202.100.0.5, flags: SE
Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5
Outgoing interface list: Null
Extranet receivers in vrf red:
(*, 228.1.1.1), 00:05:48/stopped, RP 202.100.0.5, flags: S
Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5
Outgoing interface list: Null
Extranet receivers in vrf red:
(220.1.1.200, 228.1.1.1), 00:02:42/stopped, flags: TE
Incoming interface: Ethernet3/0, RPF nbr 228.1.1.1
Extranet receivers in vrf red:
(220.1.1.200, 228.1.1.1), 00:02:42/stopped, flags: T

PE1# show ip mroute vrf red 228.1.1.1

IP Multicast Routing Table
Flags: D = Dense, S = Sparse, B = Bidir Group, s = SSM Group, C = Connected, L = Local, P = Pruned, R = RP-bit set, F = Register flag, T = SPT-bit set, J = Join SPT, M = MSDP created entry, E = Extranet, X = Proxy Join Timer Running, A = Candidate for MSDP Advertisement, U = URD, I = Received Source Specific Host Report, Z = Multicast Tunnel, z = MDT-data group sender, Y = Joined MDT-data group, y = Sending to MDT-data group, V = RD & Vector, v = Vector
Outgoing interface flags: H = Hardware switched, A = Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
(*, 228.1.1.1), 00:05:55/stopped, RP 202.100.0.5, flags: S
Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5, using vrf blue
Outgoing interface list:
Tunnel16, Forward/Sparse-Dense, 00:05:55/00:03:26
(220.1.1.200, 228.1.1.1), 00:02:49/stopped, flags: T
Incoming interface: Ethernet3/0, RPF nbr 200.1.1.5, using vrf blue
Outgoing interface list:
Tunnel16, Forward/Sparse-Dense, 00:02:49/00:03:26

Use the show ip mfib vrf vrf-name command, with the source MVRF for the vrf-name argument, to display statistics.

The following example shows statistics for the source MVRF blue. Inspect the output to ensure that the forwarding statistics in the source MVRF MFIB are correct and that the A and F flags are set in the source MVRF. Notice that there is no indication of extranet forwarding in the MFIB.

PE1# show ip mfib vrf blue 228.1.1.1

Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag, ET - Data Rate Exceeds Threshold, K - Keepalive DDE - Data Driven Event, HW - Hardware Installed
I/O Item Flags: IC - Internal Copy, NP - Not platform switched, NS - Negate Signalling, SP - Signal Present, A - Accept, F - Forward, RA - MRIB Accept, RF - MRIB Forward, MA - MFIB Accept
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
I/O Item Counts: Total/Pkt Count/FS Pkt Count
VRF blue
(*, 228.1.1.1) Flags: C
SW Forwarding: 1/0/100/0, Other: 0/0/0
Ethernet3/0 Flags: A Tunnel16, MDT/239.3.3.3 Flags: F
Pkts: 1/0
(220.1.1.200, 228.1.1.1) Flags: SW Forwarding: 37/0/100/0, Other: 0/0/0 Ethernet3/0 Flags: A NS Tunnel16, MDT/239.3.3.3 Flags: F
Pkts: 37/0

The following example shows the following information for the receiver MVRF red:
- There are no forwarding statistics in the receiver MVRF MFIB because these statistics are collected in the source MVRF.
- The A and F flags are not set because these flags are only set in the source MVRF for MVPN extranet.
- There is no indication of extranet forwarding in the MFIB.

**Note**
The NS flag in the output is present for the purpose of receiving PIM control traffic in the receiver MVRF.

---

The following sample output from the `show ip mroute count` command shows statistics for the source MVRF blue:

```
PE1# show ip mroute vrf blue 228.1.1.1 count
```

Use "show ip mfib count" to get better response time for a large number of mroutes.

IP Multicast Statistics
3 routes using 1354 bytes of memory
2 groups, 0.50 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group: 228.1.1.1, Source count: 1, Packets forwarded: 38, Packets received: 38
  RP-tree: Forwarding: 1/0/100/0, Other: 1/0/0
  Source: 220.1.1.200/32, Forwarding: 37/0/100/0, Other: 37/0/0

The following sample output from the `show ip mroute count` command is for the receiver MVRF red:

```
PE1# show ip mroute vrf red 228.1.1.1 count
```

Use "show ip mfib count" to get better response time for a large number of mroutes.

IP Multicast Statistics
3 routes using 1672 bytes of memory
2 groups, 0.50 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group: 228.1.1.1, Source count: 1, Packets forwarded: 0, Packets received: 0
Example Configuring RPF for MVPN Extranet Support Using Static Mroutes

The following example shows how to configure the RPF lookup originating in VPN-Red to be resolved in VPN-Green using the static mroute 192.168.1.1:

```plaintext
ip mroute vrf VPN-Red 192.168.1.1.1 255.255.255.255 fallback-lookup vrf VPN-Green
```

Example Configuring Group-Based VRF Selection Policies with MVPN Extranet Support

The following example shows how to use group-based VRF selection policies to configure RPF lookups originating in VPN-Green to be performed in VPN-Red for group addresses that match ACL 1 and to be performed in VPN-Blue for group addresses that match ACL 2.

```plaintext
ip multicast vrf VPN-Green rpf select vrf VPN-Red group-list 1
ip multicast vrf VPN-Green rpf select vrf VPN-Blue group-list 2

! access-list 1 permit 239.0.0.0 0.255.255.255
access-list 2 permit 238.0.0.0 0.255.255.255
```

Example: Group-Based VRF Selection Policies with MVPNv6 Extranet

The following example shows how to use a group-based VRF selection policy to configure the RPF lookup for groups that match ACL 1 to be performed in VPN-blue:

```plaintext
ipv6 multicast vrf VPN-red rpf select vrf VPN-blue group-range 1

! access-list 1 permit ff02::00 00f0::00
```

Feature Information for Configuring Multicast VPN Extranet Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 4

Configuring Multicast VPN Inter-AS Support

The Multicast VPN Inter-AS Support feature enables Multicast Distribution Trees (MDTs) used for Multicast VPNs (MVPNs) to span multiple autonomous systems. Benefits include increased multicast coverage to customers that require multicast to span multiple service providers in a Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Network (VPN) service with the flexibility to support all options described in RFC 4364. Additionally, the Multicast VPN Inter-AS Support feature can be used to consolidate an existing MVPN service with another MVPN service, such as the case with a company merger or acquisition.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Multicast VPN Inter-AS Support

- You understand IP multicast concepts and configuration tasks.
• You understand MVPN concepts and configuration tasks.
• You understand Border Gateway Protocol (BGP) concepts and configuration tasks.
• You understand MPLS Layer 3 VPN concepts and configuration tasks.

Restrictions for Configuring Multicast VPN Inter-AS Support

The Multicast VPN Inter-AS Support feature requires that all routers in the core be configured for Protocol Independent Multicast (PIM) Source Specific Multicast (SSM). Protocol Independent Multicast sparse mode (PIM-SM) and bidirectional PIM (bidir-PIM) are not supported.

Information About Multicast VPN Inter-AS Support

MVPN Inter-AS Support Overview

As a general concept, MVPN inter-AS support enables service providers to provide multicast connectivity to VPN sites that span multiple autonomous systems. There are two types of MVPN inter-AS deployment scenarios:

• Single provider inter-AS--A service provider whose internal network consists of multiple autonomous systems.
• Intraprovider inter-AS--Multiple service providers that need to coordinate their networks to provide inter-AS support.

The extensions added to support the Multicast VPN Inter-AS Support feature enable MDTs used for MVPNs to span multiple autonomous systems.

Benefits of MVPN Inter-AS Support

The MVPN Inter-AS Support feature provides the following benefits to service providers:

• Increased multicast coverage to customers that require multicast to span multiple services providers in an MPLS Layer 3 VPN service with the flexibility to support all options described in RFC 4364.
• The ability to consolidate an existing MVPN service with another MVPN service, such as the case with a company merger or acquisition.

MVPN Inter-AS Support Implementation Requirements

The Multicast VPN Inter-AS Support feature was implemented in the software in accordance to the following requirements:

• To achieve parity with unicast inter-AS support, the software must support the following inter-AS options for MVPN (as defined in RFC 4364):
• Option A--Back-to-back VPN routing and forwarding (VRF) instances at the Autonomous System Border Router (ASBR) provider edge (PE) routers

The Option A model assumes direct connectivity between PE routers of different autonomous systems. The PE routers are attached by multiple physical or logical interfaces, each of which is associated with a given VPN (through a VRF instance). Each PE router, therefore, treats the adjacent PE router like a customer edge (CE) router, and the standard Layer 3 MPLS VPN mechanisms are used for route redistribution with each autonomous system; that is, the PEs use exterior BGP (eBGP) to distribute unlabeled IPv4 addresses to each other.

**Note** Option A allows service providers to isolate each autonomous system from the other, which provides better control over routing exchanges and security between the two networks. Option A, however, is considered the least scalable of all the inter-AS connectivity options.

• Option B--VPNv4 route exchange between ASBRs

In the Option B model, the PE routers use interior BGP (iBGP) to redistribute labeled VPNv4 routes either to an ASBR or to a route reflector of which an ASBR is a client. ASBRs then use multiprotocol eBGP (MP-eBGP) to advertise VPNv4 routes into the local autonomous system.

MP-eBGP provides the functionality to advertise VPNv4 prefix and label information across the service provider boundaries. The advertising ASBR router replaces the two-level label stack (which it uses to reach the originating PE router and VPN destination in the local autonomous system) with a locally allocated label before advertising the VPNv4 route. This replacement is necessary because the next-hop attribute of all routes advertised between the two service providers is reset to the ASBR router’s peering address, so the ASBR router becomes the termination point of the label-switched path (LSP) for the advertised routes. To preserve the LSP between ingress and egress PE routers, the ASBR router must allocate a local label that may be used to identify the label stack of the route within the local VPN network. This newly allocated label is set on packets sent toward the prefix from the adjacent service provider.

**Note** Option B enables service providers to isolate both autonomous systems with the added advantage that it scales to a higher degree than Option A.

• Option C--Exchange of VPNv4 routes between route reflectors (RRs) using multihop eBGP peering sessions

The Option C model combines MP-eBGP exchange of VPNv4 routes between RRs of different autonomous systems with the next hops for these routes exchanged between corresponding ASBR routers. In the Option C model, VPNv4 routes are neither maintained nor distributed by the ASBRs. ASBRs must maintain labeled IPv4 /32 routes to the PE routers within its autonomous system and use eBGP to distribute these routes to other autonomous systems. ASBRs in any transit autonomous systems will also have to use eBGP to pass along the labeled /32 routes. The result is the creation of a LSP from the ingress PE router to the egress PE router.

Because RRs of different autonomous systems will not be directly connected, multihop functionality is required to allow for the establishment of the MP-eBGP peering sessions. The exchange of next hops is necessary because the RRs do not reset the next-hop attribute of the VPNv4 routes when advertising them to adjacent
autonomous systems because they do not want to attract the traffic for the destinations that they advertise. They are not the original endpoint--just a relay station between the source and receiver PEs. The PE router next-hop addresses for the VPNv4 routes, thus, are exchanged between ASBR routers. The exchange of these addresses between autonomous systems can be accomplished by redistributing the PE router /32 addresses between the autonomous systems or by using BGP label distribution.

**Note**

Option C normally is deployed only when each autonomous system belongs to the same overall authority, such as a global Layer 3 MPLS VPN service provider with autonomous systems in different regions of the world. Option B is equally suited for this purpose and is also deployed in networks where autonomy between different regions is desired.

- The Cisco software must support inter-AS MDTs. An inter-AS MDT is an MDT that extends across autonomous system boundaries. In the context of MVPN, because MVPN packets are encapsulated when being forwarded between ASBRs, an inter-AS MDT is needed (for Option B and Option C) to extend the MDT across the boundaries of the autonomous system.

**Limitations That Prevented Option B and Option C Support**

Prior to the extensions introduced in association with the Multicast VPN Inter-AS Support feature, limitations existed that prevented MVPN inter-AS support for Option B and Option C. These limitations were related to the following areas:

- Supporting reverse path forwarding (RPF) for inter-AS sources (applicable mainly to Option B)
  - When a PE router sends a PIM join (source PE address, MDT group address) for the default MDT, each P router in the path between the source and the destination PE routers must perform an RPF check on the source. Because Interior Gateway Protocol (IGP) routes (which would include the routes to source PE routers in remote autonomous systems) are not leaked across autonomous systems, the P routers in the receiving autonomous system were unable to perform an RPF check.
  - When a PIM join is received in an MVPN, an IP lookup is performed in the VRF to find the next hop toward the destination. This destination must be a PIM neighbor that can be reached through the MDT tunnel interface. However, because ASBRs change the next hop of the originating PE router for a given MDT group, the originating source address would be lost, and the RPF check at the PE router would fail.

**Note**

In typical Option C inter-AS deployments, the limitation related to supporting RPF for MVPN inter-AS support was not applicable because the RRs store all VPNv4 routes.

- Supporting an inter-AS MDT (applicable to Option B and Option C)
  - The default MDT relies on the ability of the PE routers to join the default multicast group. The source of the group is the originating PE router address used for MP-BGP peering. Prior to the extensions introduced in association with the Multicast VPN Inter-AS Support feature, this address could not be reached between autonomous systems because IGP routes could not be distributed across the autonomous systems. The default MDT for inter-AS MVPN, thus, could not be established.
MVPN Inter-AS Support for Option A

The limitations that prevented support for MVPN inter-AS support Options B and C have never applied to Option A for the following reasons:

- For Option A, native IP forwarding is used by the PE routers between autonomous systems; therefore, Option A does not require support for inter-AS MDTs.
- For Option A, the MDT is limited to one autonomous system; therefore, the issues associated with managing MDT group addresses between autonomous systems and RPF for inter-AS sources never applied to Option A.

Because Option A requires that one physical or logical interface be configured for each VRF, Option A is considered the least scalable MVPN inter-AS solution.

MVPN Inter-AS Support Solution for Options B and C

The following extensions introduced in association with the MVPN Inter-AS Support feature resolve the MVPN inter-AS protocol limitations related to supporting RPF and inter-AS MDTs in Option B and C deployments:

- BGP connector attribute in MP-BGP--This attribute helps preserve the identity of a PE router originating a VPNv4 prefix. This BGP extension helps solve the challenge of supporting RPF to sources in a remote autonomous system.
- BGP MDT Subaddress Family Identifier (SAFI)--This identifier helps ASBRs RPF to source PEs in a remote autonomous systems. The BGP MDT SAFI also helps ASBRs and receiver PEs insert the RPF Vector needed to build an inter-AS MDT to source PEs in remote autonomous systems.

BGP Connector Attribute

In an adjacent autonomous system, a PE router that wants to join a particular source of the default MDT for a given MVPN must know the originator’s address of the source PE router. This presents some challenges for Option B inter-AS deployments because the originator next hop for VPNv4 routes is rewritten at one or more points in the network. To solve this limitation, each VPNv4 route must carry a new attribute (the BGP connector attribute) that defines the route’s originator.

The BGP connector attribute is a transitive attribute that stores the PE router that originated a VPNv4 prefix. In a local autonomous system, the BGP connector attribute is the same as the next hop attribute. When advertised to other ASBRs in VPNv4 advertisements (as is the case in Option B), the value of the BGP connector attribute is preserved even after the next hop attribute is rewritten by ASBRs. The BGP connector attribute is a critical component of the MVPN inter-AS solution, helping to enable RPF to sources in remote autonomous systems.
The BGP connector attribute also helps ASBRs and receiver PEs insert the RPF Vector needed to build the inter-AS MDT for source PEs in remote autonomous systems. For more information about RPF Vectors, see the PIM RPF Vector, on page 65 section.

The format of the BGP connector attribute is shown in the figure.

**Figure 11: BGP Connector Attribute**

<table>
<thead>
<tr>
<th>Type (2 Octets)</th>

Type is the Type of the data contained in this TLV.
Length is the Length of the Value portion in the TLV.
Value is a variable length field defined by the AFI/SAFI carried in this tuple, which would be used by the AFI/SAFI in this tuple.

---

**BGP MDT SAFI Updates for MVPN Inter-AS Support**

The BGP MDT SAFI is specifically designed to carry the address of the source PE router to which a PIM join should be sent for the MDT group contained in the PIM join. The format of the Network Layer Reachability Information (NLRRI) carried in this SAFI is \{RD:PE-IP-address\}. The BGP MDT SAFI is capable of being advertised across autonomous system boundaries. Each MDT group is carried in the MP_REACH attribute using the format shown in the figure.

**Figure 12: MDT SAFI Format**

<table>
<thead>
<tr>
<th>RD:IPv4 Address (12 Octets)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDT Group Address (4 Octets)</td>
</tr>
</tbody>
</table>

RD: Route distinguisher of the VRF to which the MDT attribute belongs.
IPv4 Address: IPv4 address of the originating PE router.
MDT Group Address: Group address of the MDT group that a given VRF is associated with.

When RRs and MP-eBGP peerings are used, the advertisement of the BGP MDT SAFI is independent of the advertisement of VPNv4 routes. BGP MDT SAFI advertisements, however, are processed and filtered like VPNv4 advertisements.

ASBRs store the path advertised in BGP MDT SAFI updates in a separate table. How the BGP MDT SAFI is advertised determines the RPF path to the PE router that originated the advertisement.
PEs also store the BGP MDT SAFI update in a separate table. PE routers use the information contained in the BGP MDT SAFI to determine the ASBR that is the exit router to the source PE router in an adjacent autonomous system.

**PIM RPF Vector**

Normally, in an MVPN environment, PIM sends join messages containing the IP address of upstream PE routers that are sources of a given MDT group. To be able to perform RPF checks, however, P routers must have IPv4 reachability to source PE routers in remote autonomous systems. This behavior is not the case with inter-AS Options B and C because the autonomous systems do not exchange any of their IGP routes, including those of their local PE routers. However, P routers do have reachability to the BGP next hop of the BGP MDT update received with the BGP MDT SAFI updates at the PE routers. Therefore, if the PE routers add the remote PE router IP address (as received within the BGP MDT SAFI) and the BGP next-hop address of this address within the PIM join, the P routers can perform an RPF check on the BGP next-hop address rather than the original PE router address, which, in turn, allows the P router to forward the join toward the ASBR that injected the MDT SAFI updates for a remote autonomous system. This functionality is generally referred to as the **PIM RPF Vector**; the actual vector that is inserted into PIM joins is referred to as the **RPF Vector** or the **Proxy Vector**. The PIM RPF Vector, therefore, enables P routers to determine the exit ASBR to a source PE router in a remote autonomous system. Having received the join that contains a RPF Vector, an ASBR can then determine that the next-hop address is in fact itself and can perform an RPF check based on the originating PE router address carried in the PIM join.

When configured on PE routers using the `ip multicast rpf proxy vector` command, the RPF Vector is encoded as a part of the source address in PIM join and prune messages. The RPF Vector is the IGP next hop for PIM RPF neighbor in PIM join and prune messages, which is typically the exit ASBR router to a prefix in a remote autonomous system.

The format of this PIM RPF Vector encoding in PIM join and prune messages is shown in the figure.

*Figure 13: PIM RPF Vector Encoded in PIM Join and Prune Messages*

**Note**

RPF Vectors can be used natively in an IP environment (that is, in a non-VPN environment). For more information about the use of RPF Vectors in a native environment, see RFC 5496, *The Reverse Path Forwarding (RPF) Vector TLV*.

**Originators of an RPF Vector**

Whether or not a PE router originates an RPF Vector is determined by configuration; that is, the `ip multicast rpf proxy vector` command must be configured on all PE routers in order for an RPF Vector to be originated. The PE router that originates an RPF Vector always performs an RPF lookup on the source. When a PE router
performs an RPF lookup on a source, the PE router learns the origin of an RPF Vector in one of the following ways:

- In an MVPN network environment, the RPF Vector is learned from BGP MDT SAFI updates.
- In a native IP network environment, the RPF Vector is learned from either IP unicast routing (AFI=1, SAFI=1) or IP multicast reverse-path information (AFI=1, SAFI=2).

**Note**

For more information about the use of RPF Vectors in a native environment, see RFC 5496, *The Reverse Path Forwarding (RPF) Vector TLV*.

**Note**

Routers that understand the RPF Vector format advertise the RPF Vector in PIM hello messages.

---

**Recipients of an RPF Vector**

When a router receives a PIM join that contains an RPF Vector, that router stores the RPF Vector so that it can generate a PIM join to the exit ASBR router. P routers, thus, learn the RPF Vector from PIM joins. The RPF Vector is advertised to all P routers in the core. If multiple RPF Vectors are received by a router, the RPF Vector with the lower originator address is used. When the RPF Vector is present, it takes priority; as a result, RPF checks are triggered periodically to readvertise RPF Vectors upstream. If a router receives an RPF Vector that references a local interface (typically an ASBR), the RPF Vector is discarded and a normal RPF lookup is performed.

**ASBR Receipt of an RPF Vector**

When an ASBR receives an RPF Vector, it typically references a local interface (most likely a loopback interface); in which case, the RPF Vector is discarded and a normal RPF lookup is performed. If the RD type is 2, the ASBR performs an RPF lookup in the BGP MDT table that is built from the BGP MDT SAFI updates; this type of RPF lookup uses both the RD and the source PE address contained in the PIM join.

**Interoperability with RPF Vector**

A new PIM hello option is introduced along with the PIM RPF Vector extension to determine if the upstream router is capable of parsing the new encoding. An RPF Vector is included in PIM messages only when all PIM neighbors on an RPF interface support it.

**MDT Address Family in BGP for Multicast VPN Inter-AS Support**

The `mdt` keyword has been added to the `address-family ipv4` command to configure an MDT address-family session.

**Supported Policy**

The following policy configuration parameters are supported under the BGP MDT SAFI:
- Mandatory attributes and well-known attributes, such as the AS-path, multi-exit discriminator MED, BGP local-preference, and next hop attributes.

Guidelines for Configuring MDT Address Family Sessions on PE Routers for MVPN Inter-AS Support

When configuring routers for MVPN inter-AS support, follow these guidelines:

- For MVPN inter-AS Option A, BGP MDT address-family peering sessions are not required between the PE routers because native IP forwarding is used by the PE routers. For option A, BGP MDT peering sessions are only required for intra-AS VPN peering sessions.
- For MVPN inter-AS Option B, BGP MDT address-family peering sessions are only required between the PEs and ASBRs. In the Option B inter-AS case where PE routers use iBGP to redistribute labeled VPNv4 routes to RRs of which ASBRs are clients, then BGP MDT address-family peering sessions are required between the PEs, ASBRs, and RRs.
- For MVPN inter-AS Option C, BGP MDT address-family peering sessions are only required between the PEs and RRs.

**MVPN Inter-AS MDT Establishment for Option B**

This section describes the sequence of events that lead to the establishment of an inter-AS MDT between the autonomous systems in the sample inter-AS Option B topology illustrated in the following figure. For this topology, assume that all the routers have been configured properly to support all extensions associated with the Multicast VPN Inter-AS Support feature.

**Figure 14: MVPN Inter-AS Support Option B Sample Topology**

The following sequence of events occur to establish an MDT default tree rooted at PE1B in this inter-AS MVPN Option B topology:
As illustrated in the following figure, PE1B advertises the default MDT information for VPN blue using the BGP MDT SAFI with itself (PE1B) as the next hop.

**Figure 15: BGP Updates from PE1B to ASBR1B**

As illustrated in the following figure, ASBR1B receives the MDT SAFI information and, in turn, advertises this information to ASBR1A with itself (ASBR1B) as the next hop.

**Figure 16: BGP Updates from ASBR1B to ASBR1A**
1 As illustrated in the following figure, ASBR1A advertises the MDT SAFI to PE1A with itself (ASBR1A) as the next hop.

**Figure 17: BGP Updates from ASBR1A to PE1A**

<table>
<thead>
<tr>
<th>BGP VPNv4 Update</th>
<th>RD 55:1111, PREFIX 172.16.0.0/24, NEXTHOP ASBR1A, CONN PE1B</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP MDT SAFI Update</td>
<td>RD 55:1111, PREFIX PE1B, MDT 232.1.1.1, NEXTHOP ASBR1A</td>
</tr>
</tbody>
</table>

1 As illustrated in the following figure, PE1A learns the source PE router, the RD, and the default MDT group address from BGP MDT SAFI updates. In addition, from the same BGP MDT SAFI updates, PE1A learns that the RPF Vector, ASBR1A, is the exit router to source PE1B RD 55:1111. PE1A learns that
P1A is an RPF neighbor through an IGP. PE1A then inserts the RPF Vector into the PIM join and sends the PIM join that is destined for source PE1B to P1A.

Figure 18: SSM Default PIM Join from PE1A to P1A
As illustrated in the following figure, source PE1B is not reachable on P1A, but the RPF Vector ASBR1A is reachable, and the next hop is ASBR1A, as learned from the IGP running in the core. P1A then forwards the PIM join to ASBR1A.

Figure 19: SSM Default MDT PIM Join from P1A to ASBR1A

As illustrated in the following figure, the RPF Vector, ASBR1A, is contained in the PIM join sent from P1A to ASBR1A. When ASBR1A receives the RPF Vector, it learns that it is the exit router for source PE1B with RD 55:1111. Source PE1B is not reachable on ASBR1A, but source PE1B, RD 55:1111, and group 232.1.1.1 are known from the BGP MDT SAFI updates. The RPF neighbor P1A is learned from...
the IGP running in the core as the next hop to reach ASBR1A, which is inserted as the RPF Vector. ASBR1A then forwards the PIM join for source PE1B to ASBR1B.

Figure 20: SSM Default MDT PIM Join from ASBR1A to ASBR1B

As illustrated in the following figure, source PE1B is reachable on ASBR1B through the IGP running in AS65. ASBR1B forwards the PIM join to source PE1B, using PE1B as the next hop. At this point, the setup of the SSM tree for MDT default group 232.1.1.1 rooted at PE1B is complete. The SSM MDT default
group rooted at PE1B, thus, has been established. The SSM trees for the MDT default groups rooted at PE1A and PE2A follow the same procedures.

Figure 21: SSM Default MDT PIM Join from ASBR1B to PE1B

This section describes the sequence of events that lead to the establishment of an inter-AS MDT between the autonomous systems in the sample inter-AS Option C topology illustrated in the following figure. For this topology, assume that all the routers have been configured properly to support all features associated with the Multicast VPN Inter-AS Support feature.

Figure 22: MVPN Inter-AS Support Option C Sample Topology

MVPN Inter-AS MDT Establishment for Option C

This section describes the sequence of eventsthata lead to the establishment of an inter-AS MDT between the autonomous systems in the sample inter-AS Option C topology illustrated in the following figure. For this topology, assume that all the routers have been configured properly to support all features associated with the Multicast VPN Inter-AS Support feature.
The following sequence of events occur to establish an MDT default tree rooted at PE1B in this inter-AS MVPN Option C topology:

1. As illustrated in the following figure, PE1B advertises the default MDT information for VPN blue to RR1B within the BGP MDT SAFI.

Figure 23: BGP MDT SAFI Update from PE1B to RR1B

1. As illustrated in the following figure, RR1B receives the MDT SAFI information, and, in turn, advertises this information to RR1A.

Figure 24: BGP MDT SAFI Update from RR1B to RR1A
As illustrated in the following figure, RR1A receives the MDT SAFI information, and, in turn, advertises this information to PE1A.

**Figure 25: BGP MDT SAFI Update from RR1A to PE1A**

As illustrated in the following figure, PE1A sends a PIM join with the Proxy Vector that identifies ASBR1A as the exit router to reach source PE1B with RD 55:1111 and Default MDT 232.1.1.1. The Proxy Vector provides P1A and P2A a hint on how to reach PE1B in the absence of a route to reach PE1B. Source PE1B is reachable through RPF neighbor P1A through BGP IPv4 learned updates on PE1A.

**Figure 26: PIM SSM Join for Default MDT with Proxy Vector from PE1A to P1A**

As illustrated in the following figure, P1A does not know how to reach PE1B. However, the PIM join with the Proxy Vector sent from PE1A identifies ASBR1A as being the exit router to reach source PE1B.
with RD 55:1111 and Default MDT 232.1.1.1. P1A uses the Proxy Vector to reach PE1B. The RPF neighbor to reach ASBR1A is through P2A. P1A, thus, forwards the PIM SSM join to P2A.

**Figure 27: PIM SSM Join for Default MDT with Proxy Vector from P1A to P2A**

As illustrated in the following figure, P2A does not know how to reach PE1B. However, the PIM join with the Proxy Vector sent from P1A identifies ASBR1A as being the exit router to reach source PE1B with RD 55:1111 and Default MDT 232.1.1.1. P2A uses the Proxy Vector, ASBR1A, to reach PE1B. The RPF neighbor to reach ASBR1B is through ASBR1A (that is, itself).

**Figure 28: PIM SSM Join for Default MDT with Proxy Vector from P2A to ASBR1A**
As illustrated in the following figure, ASBR1A receives a PIM join with Proxy Vector from P2A. ASBR1A realizes that the Proxy Vector is itself and sends a regular PIM join towards PE1B with an RPF neighbor of ASBR1B. The PIM joins continue hop-by-hop building the SSM Default MDT until PE1B is finally reached following standard PIM procedures.

Figure 29: PIM SSM Join for Default MDT with Proxy Vector from ASBR1A to PE1B

How to Configure Multicast VPN Inter-AS Support

Configuring the MDT Address Family in BGP for Multicast VPN Inter-AS Support

Perform this task to configure an MDT address family session on PE routers to to establish MDT peering sessions for MVPN. The **mdt** keyword has been added to the **address-family ipv4** command to configure an MDT address-family session.

Supported Policy

The following policy configuration parameters are supported under the BGP MDT SAFI:

- Mandatory attributes and well-known attributes, such as the AS-path, multiexit discriminator (MED), BGP local preference, and next hop attributes.
- Standard communities, community lists, and route maps.
Guidelines for Configuring MDT Address Family Sessions on PE Routers for MVPN Inter-AS Support

When configuring routers for MVPN inter-AS support, follow these guidelines:

- For MVPN inter-AS Option A, BGP MDT address-family peering sessions are not required between the PE routers because native IP forwarding is used by the PE routers. For option A, BGP MDT peering sessions are only required for intra-AS VPN peering sessions.

- For MVPN inter-AS Option B, BGP MDT address-family peering sessions are only required between the PEs and ASBRs. In the Option B inter-AS case where PE routers use iBGP to redistribute labeled VPNv4 routes to RRs of which ASBRs are clients, then BGP MDT address-family peering sessions are required between the PEs, ASBRs, and RRs.

- For MVPN inter-AS Option C, BGP MDT address-family peering sessions are only required between the PEs and RRs.

Before You Begin

Before inter-AS VPN peering can be established through an MDT address family, MPLS and Cisco Express Forwarding (CEF) must be configured in the BGP network and multiprotocol BGP on PE routers that provide VPN services to CE routers.

Note

The following policy configuration parameters are not supported:

- Route-originator attribute
- NLRI prefix filtering (prefix lists, distribute lists)
- Extended community attributes (route target and site of origin)

SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp as-number
4. address-family ipv4 mdt
5. neighbor neighbor-address activate
6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> neighbor neighbor-address activate</td>
<td>Enables the MDT address family for this neighbor.</td>
</tr>
<tr>
<td>Example: Router(config-router-af)# neighbor 192.168.1.1 activate</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Exits address family configuration mode and enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router(config-router-af)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Displaying Information About IPv4 MDT Sessions in BGP

Perform this optional task to display information about IPv4 MDT sessions in BGP.

**SUMMARY STEPS**

1. enable
2. show ip bgp ipv4 mdt {all | rd | vrf vrf-name}
DETAILED STEPS

Step 1  enable
Use this command to enable privileged EXEC mode.
  • Enter your password if prompted.

Example:

Router> enable

Step 2  show ip bgp ipv4 mdt {all | rd | vrf vrf-name}
Use this command to display IPv4 MDT sessions in the IPv4 BGP routing table.

The following is sample output from the show ip bgp ipv4 mdt command with the all keyword:

Example:

Router# show ip bgp ipv4 mdt all

BGP table version is 2, local router ID is 10.1.0.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network Next Hop Metric LocPrf Weight Path
Route Distinguisher: 55:1111 (default for vrf blue)
*> 10.5.5.5/32 10.1.0.1 55 0 23 24 25 54 ?
* 10.9.9.9/32 0.0.0.0 0 ?

Clearing IPv4 MDT Peering Sessions in BGP

Perform this optional task to reset IPv4 MDT address-family sessions using the mdt keyword in one of the various forms of the clear ip bgp command. Due to the complexity of some of the keywords available for the clear ip bgp command, some of the keywords are documented as separate commands.

SUMMARY STEPS

1. enable
2. Do one of the following:
   • clear ip bgp ipv4 mdt as-number [in[prefix-filter]] [out] [soft [in[prefix-filter] | out]]
   • clear ip bgp ipv4 mdt peer-group peer-group-name [in [prefix-filter]] [out] [soft [in[prefix-filter] | out]]
   • clear ip bgp ipv4 mdt update-group [index-group | neighbor-address]
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Router&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Step 2</strong> Do one of the following:</th>
<th>(Optional) Resets IPv4 MDT address-family sessions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• clear ip bgp ipv4 mdt as-number [in</td>
<td>prefix-filter]] [out] [soft [in</td>
</tr>
<tr>
<td>• clear ip bgp ipv4 mdt peer-group peer-group-name [in</td>
<td>prefix-filter]] [out] [soft / in</td>
</tr>
<tr>
<td>• clear ip bgp ipv4 mdt update-group [index-group</td>
<td>neighbor-address]</td>
</tr>
<tr>
<td>Example: Router# clear ip bgp ipv4 mdt 65700</td>
<td>• Specifying the clear ip bgp ipv4 mdt command with the peer-group keyword resets IPv4 MDT address-family sessions for all members of a BGP peer group.</td>
</tr>
<tr>
<td>Example: Router# clear ip bgp ipv4 mdt peer-group test soft in</td>
<td>• The example for this form of the clear ip bgp ipv4 mdt command shows how to initiate a soft reset for inbound MDT address-family sessions with members of the peer group test. Outbound sessions are unaffected.</td>
</tr>
<tr>
<td>Example: Router# clear ip bgp ipv4 mdt update-group 3</td>
<td>or</td>
</tr>
<tr>
<td>Example: Router# clear ip bgp ipv4 mdt update-group 3</td>
<td>• Specifying the clear ip bgp ipv4 mdt command with the update-group keyword resets IPv4 MDT address-family sessions for all the members of a BGP update group.</td>
</tr>
<tr>
<td>Example: Router# clear ip bgp ipv4 mdt update-group 3</td>
<td>• The example for this form of the clear ip bgp ipv4 mdt command shows how to reset for all members of the update group 3.</td>
</tr>
</tbody>
</table>
Perform this task to configure PE routers in an Option B deployment to support the extensions necessary (BGP connector attribute, BGP MDT SAFI, and RPF Vector) to send BGP MDT updates to build the default MDT for MVPN inter-AS support.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `neighbor ip-address remote-as as-number`
5. `address-family ipv4 mdt`
6. `neighbor neighbor-address activate`
7. `neighbor neighbor-address next-hop-self`
8. `exit`
9. `address-family vpnv4`
10. `neighbor neighbor-address activate`
11. `neighbor neighbor-address send-community extended`
12. `end`

Configuring Multicast VPN Inter-AS Support

## Configuring a PE Router to Send BGP MDT Updates to Build the Default MDT for MVPN Inter-AS Support - Option C

Perform this task to configure PE routers in an Option B deployment to support the extensions necessary (BGP connector attribute, BGP MDT SAFI, and RPF Vector) to send BGP MDT updates to build the default MDT for MVPN inter-AS support.

### SUMMARY STEPS

1. enable
2. configure terminal
3. router bgp as-number
4. neighbor ip-address remote-as as-number
5. address-family ipv4 mdt
6. neighbor neighbor-address activate
7. neighbor neighbor-address send-community extended
8. exit
9. address-family vpnv4
10. neighbor neighbor-address activate
11. neighbor neighbor-address send-community extended
12. end

### DETAILED STEPS

</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-router)# address-family vpnv4</td>
<td></td>
</tr>
</tbody>
</table>
### Step 10

**Command or Action:**

- `neighbor neighbor-address activate`

**Example:**

Router(config-router-af)# neighbor 192.168.1.1 activate

**Purpose:** Enables the VPNv4 address family for this neighbor.

### Step 11

**Command or Action:**

- `neighbor neighbor-address send-community extended`

**Example:**

Router(config-router-af)# neighbor 192.168.1.1 send-community extended

**Purpose:** Enables the standard and extended community attributes to be sent to this neighbor.

### Step 12

**Command or Action:**

- `end`

**Example:**

Router(config-router-af)# end

**Purpose:** Exits address family configuration mode and returns to privileged EXEC mode.

---

### Verifying the Establishment of Inter-AS MDTs in Option B and Option C Deployments

Perform this optional task to verify the establishment of Inter-AS MDTs in Option B and Option C MVPN inter-AS deployments.

#### Note

The steps in this optional task can be performed in any order. All steps in this task are optional.

**SUMMARY STEPS**

1. enable
2. show ip mroute proxy
3. show ip pim [vrf vrf-name] neighbor [interface-type interface-number]
4. show ip rpf [vrf vrf-name] {route-distinguisher | source-address [group-address] [rd route-distinguisher]} [metric]
5. show ip pim [vrf vrf-name] mdt bgp

**DETAILED STEPS**

**Step 1**

enable
Use this command to enable privileged EXEC mode.

- Enter your password if prompted.

**Example:**

Router> enable

**Step 2** `show ip mroute proxy`

Use this command to display information about RPF Vectors received on a multicast router.

- The information displayed in the output of this command can be used to determine if an RPF Vector proxy is received on a core router.

The following is sample output from the `show ip mroute proxy` command:

**Example:**

```markdown
Router# show ip mroute proxy

(192.168.0.8, 232.1.1.1)
Proxy Assinger Origin Uptime/Expire
55:1111/192.168.0.4 10.0.3.1 PIM 00:03:29/00:02:06
55:1111/192.168.0.4 10.0.3.2 PIM 00:17:47/00:02:06
```

**Step 3** `show ip pim [vrf vrf-name] neighbor [interface-type interface-number]`

Use this command to display the PIM neighbors discovered by PIMv1 router query messages or PIMv2 hello messages.

The P flag indicates that the neighbor has announced (through PIM hello messages) its capability to handle RPF Vectors in PIM join messages. All software versions that support the PIM PIM Vector feature announce this PIM hello option. An RPF Vector is only included in PIM messages when all PIM neighbors on an RPF interface support it.

The following is sample output from the `show ip pim neighbor` command:

**Example:**

```markdown
Router# show ip pim neighbor

PIM Neighbor Table
Mode: B - Bidir Capable, DR - Designated Router, N - Default DR Priority,
S - State Refresh Capable
Neighbor Interface Uptime/Expires Ver DR
Address Prio/Mode
10.0.0.1 GigabitEthernet10/2 00:01:29/00:01:15 v2 1 / S
10.0.0.3 GigabitEthernet10/3 00:01:15/00:01:28 v2 1 / DR S P
```

**Step 4** `show ip rpf [vrf vrf-name] [route-distinguisher | source-address [group-address] [rd route-distinguisher]] [metric]`

Use this command to display information about how IP multicast routing does RPF.

The following is sample output from the `show ip rpf` command:

**Example:**

```markdown
Router# show ip rpf 10.7.0.7 232.1.1.1 rd 55:1111

RPF information for ? (10.7.0.7)
RPF interface: GigabitEthernet2/2
RPF neighbor: ? (10.0.1.3)
RPF route/mask: 10.5.0.5/32
```
Step 5  

```plaintext
show ip pim [vrf vrf-name] mdt bgp
```

Use this command to display information about the BGP advertisement of RDs for the MDT default group.

The following is sample output from the `show ip pim mdt bgp` command:

<table>
<thead>
<tr>
<th>MDT (Route Distinguisher + IPv4)</th>
<th>Router ID</th>
<th>Next Hop</th>
</tr>
</thead>
<tbody>
<tr>
<td>55:1111:192.168.0.2</td>
<td>192.168.0.2</td>
<td>192.168.0.2</td>
</tr>
<tr>
<td>55:1111:192.168.0.8</td>
<td>192.168.0.4</td>
<td>192.168.0.4</td>
</tr>
</tbody>
</table>
```

---

**Configuration Examples for Multicast VPN Inter-AS Support**

**Configuring an IPv4 MDT Address-Family Session for Multicast VPN Inter-AS Support Example**

The following examples show how to configure a router to support an IPv4 MDT address-family session with the BGP neighbor at 10.1.1.2:

```plaintext
router bgp 1
  address-family ipv4 mdt
  neighbor 10.1.1.2 activate
```

**Configuring a PE Router to Send BGP MDT Updates to Build the Default MDT for MVPN Inter-AS Support**

The following example shows how to configure a PE router to support the extensions necessary (BGP connector attribute, BGP MDT SAFI, and RPF Vector) to send BGP MDT updates to build the default MDT for MVPN inter-AS support in an Option B deployment. Only the relevant configuration is shown in this example.

```plaintext
! ip multicast-routing
ip multicast-routing vrf blue
ip multicast vrf blue rpf proxy rd vector
! .
.
.
router bgp 55
.
.
```
Configuring a PE Router to Send BGP MDT Updates to Build the Default MDT for MVPN Inter-AS Support

The following example shows how to configure a PE router to support the extensions necessary (BGP connector attribute, BGP MDT SAFI, and RPF Vector) to send BGP MDT updates to build the default MDT for MVPN inter-AS support in an Option B deployment. Only the relevant configuration is shown in this example.
Configuring Back-to-Back ASBR PEs - Option A Example

The following example shows how to configure support for MVPN inter-AS support Option A. This configuration example is based on the sample inter-AS network Option A topology illustrated in the figure.

In this configuration example, PE3A in AS1 is attached directly to PE3B in AS2. The two PE routers are attached by physical interfaces, one physical interface for each of the VPNs (VPN blue and VPN green) whose routes need to be passed from AS1 to AS2, and vice versa. Each PE will treat the other as if it were a CE router; that is, the PEs associate each interface with a VRF and use eBGP to distribute unlabeled IPv4 addresses to each other. Intermediate System-to-Intermediate System (IS-IS) is being used for the BGP peerings in both autonomous systems, and Routing Information Protocol (RIP) is being used on the PE routers that face the CE routers to dynamically learn the routes from the VRFs and advertise them as VPNv4 routes to the remote PE routers. RIP is also being used between the ASBRs to set up the eBGP peerings between PE3A and PE3B.

For Option A, any IGP can be used to exchange the IPv4 routes for the loopback interfaces.

The table provides information about the topology used for the Option A configuration example presented in this section.

Table 3: Topology Information for MVPN Inter-AS Option A Configuration Example

<table>
<thead>

**Configuring the Exchange of VPNv4 Routes Directly Between ASBRs - Option B Example**

The following example shows how to configure MVPN inter-AS support in an Option B deployment. This configuration is based on the sample inter-AS topology illustrated in the figure.

In this configuration example, PE1A and PE2A are configured to use iBGP to redistribute labeled VPNv4 routes to each other and to ASBR1A, and PE1B is configured to redistribute labeled VPNv4 routes to ASBR1B. ASBR1A and ASBR1B are configured to use eBGP to exchange those labeled VPNv4 routes to each other.

*Figure 31: Topology for MVPN Inter-AS Support Option B Configuration Example*
The table provides information about the topology used for this particular Option B configuration example.

**Table 4: Topology Information for MVPN Inter-AS Support Option B Configuration Example**

The following is sample output from the `show ip pim mdt bgp` command for PE1A, PE2A, and PE1B. The sample output displays information about the BGP advertisement of RDs for the MDT default group 232.1.1.1. The output displays the MDT default groups advertised, the RDs and source addresses of sources sending to the MDT default groups, the BGP router ID of the advertising routers, and the BGP next hop address contained in the advertisements.

PE1A# show ip pim mdt bgp
MDT (Route Distinguisher + IPv4) Router ID Next Hop
MDT group 232.1.1.1 192.168.0.2 192.168.0.2
  55:1111:192.168.0.2 192.168.0.4 192.168.0.4
PE2A# show ip pim mdt bgp
MDT (Route Distinguisher + IPv4) Router ID Next Hop
MDT group 232.1.1.1 192.168.0.1 192.168.0.1
  55:1111:192.168.0.4 192.168.0.4 192.168.0.4
PE1B# show ip pim mdt bgp
MDT (Route Distinguisher + IPv4) Router ID Next Hop
MDT group 232.1.1.1 192.168.0.9 192.168.0.9
  55:1111:192.168.0.9 192.168.0.9 192.168.0.9

The following are sample outputs from the `show ip mroute proxy` command for PE1A, PE2A, and PE1B. The output displays information about the RPF Vectors learned by each PE router in this configuration example. The RPF Vector is the exit address of the ASBR router through which PIM messages are sent to reach inter-AS sources. The "Proxy" field displays the RPF Vectors learned by the PE routers. Each RPF Vector listed under the "Proxy" field is prepended by the RD associated with the RPF Vector. Because the PE routers are the assigners of the RPF Vector (that is, the PE routers insert the RPF Vector into PIM joins), 0.0.0.0 is the address displayed under the "Assigner" field in all the sample outputs. Finally, because PE routers learn the RPF Vector from BGP MDT SAFI updates, BGP MDT is displayed as the origin under the "Origin" field in all the outputs.

PE1A# show ip mroute proxy
(192.168.0.8, 232.1.1.1) Proxy Assigner Origin Uptime/Expire
  55:1111/192.168.0.4 0.0.0.0 BGP MDT 00:13:07/stopped
PE2A# show ip mroute proxy
(192.168.0.8, 232.1.1.1) Proxy Assigner Origin Uptime/Expire
  55:1111/192.168.0.4 0.0.0.0 BGP MDT 00:14:28/stopped
PE1B# show ip mroute proxy
(192.168.0.8, 232.1.1.1) Proxy Assigner Origin Uptime/Expire
  55:1111/192.168.0.4 0.0.0.0 BGP MDT 00:35:19/stopped

The following is sample output from the `show ip mroute proxy` command from P1A. Because P routers learn the RPF Vector from the PIM joins sent from PE routers, the IP addresses of PE1A (10.0.3.1) and PE2A (10.0.3.2) are displayed under the "Assigner" field in the output for P1A. Because P1A learns the RPF Vector from encodings in the PIM join message, PIM is displayed as the origin under the "Origin" field.

P1A# show ip mroute proxy
(192.168.0.8, 232.1.1.1) Proxy Assigner Origin Uptime/Expire
  55:1111/192.168.0.4 10.0.3.1 PIM 00:03:29/00:02:06
  55:1111/192.168.0.4 10.0.3.2 PIM 00:17:47/00:02:06

The following is sample output from the `show ip mroute proxy` command for ASBR1A and ASBR1B. If a router receives an RPF Vector that references a local interface (which occurs in an Option B deployment when
an ASBR receives a RPF Vector owned by a local interface, the router discards the RPF Vector and performs a normal RPF lookup using information that the router learned from BGP MDT SAFI updates. In the output for all ASBR routers, under the "Proxy" field, the word "local" is displayed instead of the RPF Vector because ASBR1A and ASBR1B are using local interfaces to perform RPF lookups for PIM joins with RPF Vectors that reference one of their local interfaces. The "Assigner" field displays the RPF address that sent the PIM join to the ASBR. Because the ASBRs learn the RPF Vectors from the PIM joins (the RPF Vectors that are subsequently discarded), PIM is displayed as the origin under the "Origin" field.

The following is sample output from the `show ip mroute` command for PE1A, PE2A, P1A, ASBR1A, ASBR1B, and PE1B. The sample outputs show the global table for the MDT default group 232.1.1.1. The output from this command confirms that all three PE routers (PE1A, PE2A, and PE1B) have joined the default MDT.

Configuring the Exchange of VPNv4 Routes Between RRs Using Multihop MP-EBGP

The following example shows how to configure support for MVPN inter-AS option C. This configuration is based on the sample inter-AS topology illustrated in the figure.

In the configuration example, MP-eBGP is used to exchange VPNv4 routes between RRs of different autonomous systems with the next hops for these routes exchanged between corresponding ASBR routers. Because the RRs in the two autonomous systems are not directly connected, multihop functionality is required to allow them to establish MP-eBGP peering sessions. The PE router next-hop addresses for the VPNv4 routes are exchanged between ASBR routers. In this configuration example, the exchange of these addresses between autonomous systems is established using IPv4 BGP label distribution, which enables the ASBRs to distribute IPv4 routes with MPLS labels.

![Figure 32: Topology for MVPN Inter-AS Support Option C Configuration Example](image)

The table provides information about the topology used for this inter-AS MVPN Option C configuration example.

The following is sample output from the `show ip pim mdt bgp` command for PE1A and PE2A. The sample output displays information about the BGP advertisement of RDs for MDT default groups. The output displays the MDT default groups advertised, the RDs and source addresses of sources sending to the MDT default groups, the BGP router ID of the advertising routers, and the BGP next hop address contained in the advertisements.

```
PE1A# show ip pim mdt bgp
MDT (Route Distinguisher + IPv4) Router ID Next Hop
MDT group 232.1.1.1 10.252.252.4 10.254.254.8

PE1B# show ip pim mdt bgp
MDT (Route Distinguisher + IPv4) Router ID Next Hop
MDT group 232.1.1.1 10.252.252.10 10.254.254.2
```

The following is sample output from the `show ip mroute proxy` command from P1A, P2A, P1B, and P2B. Because P routers learn the RPF Vector from encodings in the PIM join message, PIM is displayed as the origin under the "Origin" field.

```
P1A# show ip mroute proxy
(10.254.254.8, 232.1.1.1)  Assigner Origin Uptime/Expire
Proxy 10.254.254.6 10.0.2.2 PIM 00:15:37/00:02:57

P2A# show ip mroute proxy
(10.254.254.8, 232.1.1.1)  Assigner Origin Uptime/Expire
Proxy 10.254.254.6 10.0.4.3 PIM 00:20:41/00:02:46

P1B# show ip mroute proxy
(10.254.254.2, 232.1.1.1)  Assigner Origin Uptime/Expire
Proxy 10.254.254.12 10.0.10.9 PIM 00:29:38/00:02:16

P2B# show ip mroute proxy
(10.254.254.2, 232.1.1.1)  Assigner Origin Uptime/Expire
Proxy 10.254.254.12 10.0.12.8 PIM 00:29:58/00:02:09
```

The following is sample output from the `show ip mroute` command for PE1A, P1A, P2A, ASBR1A, ASBR1B, P1B, P2B, and PE1B. The sample outputs show the global table for the MDT default group 232.1.1.1. The output from this command confirms that all three PE routers (PE1A, PE2A, and PE1B) have joined the default MDT.

```

MVPN mLDP Partitioned MDT

The MVPN mLDP partitioned MDT feature uses Upstream Multicast Hop-Provider Multicast Service Interface (UMS-PMSI), a subset of provider edge routers (PEs) to transmit data to other PEs; similar to the usage of multiple selective-PMSI (S-PMSI) by data multicast distribution tree (MDT). In the partitioned MDT approach, egress PE routers that have interested receivers for traffic from a particular ingress PE joins a point-to-point (P2P) connection rooted at that ingress PE. This makes the number of ingress PE routers in a network to be low resulting in a limited number of trees in the core.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MVPN mLDP Partitioned MDT

MVPN BGP auto discovery should be configured.
Restrictions for MVPN mLDP Partitioned MDT

- PIM Dense mode (except for Auto-RP) and PIM-Bidir in the VRF are not supported.
- BGP multicast signaling is supported and PIM signaling is not supported.
- Only point-to-multipoint (P2MP) mLDP label switch path is supported.
- Same VRF (for which mLDP in-band signaling is configured) needs to be configured on IPv4.
- Rosen mLDP recursive FEC is not supported. Partitioned MDT is applicable to inter-AS VPN (Inter AS option B and option C are not supported).
- mLDP filtering is not supported.
- Only interface-based strict RPF is supported with partitioned MDT.

Information About MVPN mLDP Partitioned MDT

Overview of MVPN mLDP Partitioned MDT

MVPN allows a service provider to configure and support multicast traffic in an MPLS VPN environment. This type supports routing and forwarding of multicast packets for each individual VPN routing and forwarding (VRF) instance, and it also provides a mechanism to transport VPN multicast packets across the service provider backbone. In the MLDP case, the regular label switch path forwarding is used, so core does not need to run PIM protocol. In this scenario, the c-packets are encapsulated in the MPLS labels and forwarding is based on the MPLS Label Switched Paths (LSPs).

The MVPN mLDP service allows you to build a Protocol Independent Multicast (PIM) domain that has sources and receivers located in different sites.

To provide Layer 3 multicast services to customers with multiple distributed sites, service providers look for a secure and scalable mechanism to transmit customer multicast traffic across the provider network. Multicast VPN (MVPN) provides such services over a shared service provider backbone, using native multicast technology similar to BGP/MPLS VPN.

MVPN emulates MPLS VPN technology in its adoption of the multicast domain (MD) concept, in which provider edge (PE) routers establish virtual PIM neighbor connections with other PE routers that are connected to the same customer VPN. These PE routers thereby form a secure, virtual multicast domain over the provider network. Multicast traffic is then transmitted across the core network from one site to another, as if the traffic were going through a dedicated provider network.

Separate multicast routing and forwarding tables are maintained for each VPN routing and forwarding (VRF) instance, with traffic being sent through VPN tunnels across the service provider backbone.

In the Rosen MVPN mLDP solution, a multipoint-to-multipoint (MP2MP) default MDT is setup to carry control plane and data traffic. A disadvantage with this solution is that all PE routers that are part of the MVPN need to join this default MDT tree. Setting up a MP2MP tree between all PE routers of a MVPN is equivalent to creating N P2MP trees rooted at each PE (Where N is the number of PE routers). In an Inter-AS (Option A) solution this problem is exacerbated since all PE routers across all AS’es need to join the default MDT.
Another disadvantage of this solution is that any packet sent through a default MDT reaches all the PE routers even if there is no requirement.

In the partitioned MDT approach, only those egress PE routers that receive traffic requests from a particular ingress PE join the PMSI configured at that ingress PE. This makes the number of ingress PE routers in a network to be low resulting in a limited number of trees in the core.

# How to Configure MVPN mLDP Partitioned MDT

## Configuring MVPN mLDP Partitioned MDT

### SUMMARY STEPS

1. enable
2. configure terminal
3. ip multicast-routing vrf *vrf-name*
4. ip vrf *vrf-name*
5. rd *route-distinguisher*
6. route target export *route-target-ext-community*
7. route target import *route-target-ext-community*
8. mdt partitioned mldp p2mp
9. mdt auto-discovery mldp [inter-as]
10. exit
11. show ip pim mdt
12. show ip pim vrf mdt [send | receive]
13. show ip multicast mpls vif

### DETAILED STEPS

<table>

| show ip multicast mpls vif | Example: Device# end |

### Configuration Examples for MVPN mLDP Partitioned MDT

#### Example: MVPN mLDP Partitioned MDT

```plaintext
ip multicast-routing vrf VRF
  ip vrf VRF
  rd 50:11
  route target export 100:100
  route target import 100:100
  mdt strict-rpf interface
  mdt partitioned mldp p2mp
  mdt auto-discovery mldp inter-as
  !
```

Nextgen MVPN BGP C-Route Signaling

The Next-generation MVPN BGP C-Route Signaling feature provides a simpler solution to configure multicast over Layer 3 VPNs using BGP for C-multicast signaling. The MVPN BGP C-Route Full SM Support option uses BGP to signal the customer multicast routes. Sending the multicast routes over BGP avoids the need for the periodic refresh of the routes since BGP uses a reliable transport. This module provides information for configuring the Next-generation MVPN BGP C-Route Signaling feature with the MVPN BGP C-Route Full SM Support option.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To
find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Nextgen MVPN BGP C-Route Signaling

The following multicast features are not supported by MVPN BGP C-route signaling:

• BGP signaling with mLDP Transport
• Inter-AS scenarios with BGP signaling
• Dense mode in the VRF
• Extranets with BGP Signaling
• Full ASM Mode (SM and Bidir) in the VRF
• IPv6 in the VRF with mLDP Transport
• BGP Non Stop Routing (NSR)
• Inter-AD for GRE and IP-IP MVPN transport
• Migration/Hybrid solution between PIM Signaling and BGP Signaling
• Static mroutes used in conjunction with BGP signaling

Information About Nextgen MPVN BGP C-Route Signaling

Overview of MVPN BGP C-Route Full SM Support

A service provider determines whether a particular VPN is multicast-enabled. If it is, it corresponds to a "multicast domain". A PE that attaches to a particular multicast-enabled VPN is said to belong to the corresponding multicast domain. For each multicast domain, there is a default "Multicast Distribution Tree (MDT)" through the backbone, connecting all of the PEs that belong to that multicast domain. A given PE may be in as many multicast domains as there are VPNs attached to that PE. However, each multicast domain has its own MDT. The MDTs are created by running PIM in the backbone, and in general an MDT also includes P routers on the paths between the PE routers.

The default MDT for a multicast domain is constructed automatically as the PEs in the domain come up. Construction of the default MDT does not depend on the existence of multicast traffic in the domain; it will exist before any such multicast traffic is seen. Default MDTs correspond to the "MI-PMSIs" of MVPN.

In MVPNs, each CE router is a unicast routing adjacency of a PE router, but CE routers at different sites do not become unicast routing adjacencies of each other. This important characteristic is retained for multicast routing—a CE router becomes a PIM adjacency of a PE router, but CE routers at different sites do not become PIM adjacencies of each other. Multicast packets from within a VPN are received from a CE router by an ingress PE router. The ingress PE encapsulates the multicast packets and forwards them along the default MDT tree to all the PE routers connected to sites of the given VPN. Every PE router attached to a site of the
given VPN thus receives all multicast packets from within that VPN. If a particular PE routers is not on the path to any receiver of that multicast group, the PE simply discards that packet.

If a large amount of traffic is being sent to a particular multicast group, but that group does not have receivers at all the VPN sites, it may not be needed to forward that group's traffic along the default MDT. Therefore, a method is specified for establishing individual MDTs for specific multicast groups called as "Data MDTs". A data MDT delivers VPN data traffic for a particular multicast group only to those PE routers that are on the path to receivers of that multicast group. Using a data MDT has the benefit of reducing the amount of multicast traffic on the backbone, as well reducing the load on some of the PEs; it has the disadvantage of increasing the amount of state that must be maintained by the P routers. The service provider has complete control over this tradeoff. Data MDTs correspond to the S-PMSIs of MVPN.

An enterprise that uses PIM-based multicasting in its network can migrate from a private network to a BGP/MPLS IP VPN service, while continuing to use whatever multicast router configurations it was previously using; no changes need be made to CE routers or to other routers at customer sites. For instance, any dynamic RP-discovery procedures that are already in use may be left in place.

The BGP MVPN signaling mechanism does not use the MDT tunnel for signaling. The BGP signaling separates the control-plane and the data-plane for MVPN multicast c-route exchange. The MVPN BGP C-Route Full SM Support feature helps the service providers to leverage the existing BGP operation experience for deploying MVPN services.

For more details see Cisco Systems' Solution for Multicast in MPLS/BGP IP VPNs.

**How to Configure Nextgen MVPN BGP C-Route Signaling**

**Configuring the MVPN BGP C-Route Signaling**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router bgp autonomous-system-number
4. address-family {ipv4 | ipv6} mvpn
5. mvpn single-forwarder-selection highest-ip-address single-forwarder-selection highest-ip-address
6. mdt overlay use-bgp
7. end
8. configure terminal
9. ip multicast-routing vrf vrf-name
10. ip vrfvrf-name
11. mdt auto-discovery [pim | mldp [inter-as]] [ pim-tlv-announce]
12. mdt overlay bgp shared-tree-prune-delay seconds
13. mdt overlay bgp source-tree-prune-delay seconds
14. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| Example: Device> enable | |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal | |
| **Step 3** router bgp autonomous-system-number | Enters BGP router configuration mode and creates a BGP routing process. |
| Example: Device(config)# router bgp 65538 | |
| **Step 4** address-family {ipv4 | ipv6} mvpn | Enters address family configuration mode and enables C-route signaling. |
| Example: Device(config-router)# address-family ipv4 mvpn | |
| **Step 5** mvpn single-forwarder-selection highest-ip-address  
  single-forwarder-selection highest-ip-address | Configures the BGP MVPN Upstream Multicast Hop (UMH) via the highest IP address. |
<p>| Example: Device(config-router-af)# mvpn single-forwarder-selection highest-ip-address | |
| <strong>Step 6</strong> mdt overlay use-bgp | Specifies BGP as the overlay protocol. |
| Example: Device(config-router-af)# mdt overlay use-bgp | |
| <strong>Step 7</strong> end | Exits address family configuration mode and returns to privileged EXEC mode. |
| Example: Device(config-router-af)# end | |
| <strong>Step 8</strong> configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal | |</p>

Feature Information for Nextgen MVPN BGP C-Route Signaling

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

BGP MVPN PE-PE Ingress Replication

The BGP-mVPN PE-PE Ingress Replication feature enables creating a Point-to-Multipoint (P2MP) tree where ingress devices replicate the multicast packets, encapsulate the packets in a unicast tunnel and send the packets to egress devices.

- Finding Feature Information, page 135

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for BGP MVPN PE-PE Ingress Replication

- Label switched paths (LSPs) are assumed to exist between PE routers ("PEs").
- Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) and unicast routing must be enabled.
Restrictions for BGP MVPN PE-PE Ingress Replication

- For Cisco IOS XE Denali 16.3.1 the PE to PE Ingress Replication (PE-PE IR) is only supported on the Cisco CSR 1000v Series Cloud Services Router.
- The Partitioned MDT IR profile only supports MVPN BGP C-Route Signaling.
- Inter-AS option C is only supported.
- High Availability is not supported.
- BGP Auto Discovery (AD) must be used for PE-PE IR.
- The Partitioned-MDT profile supports only BGP C-multicast route signaling. The Default-MDT profile supports both BGP and PIM C-multicast signaling. The Data-MDT profile is also supported.
- Only PIM ASM and SSM are supported for deployments of multicast control plane protocols. PIM BIDIR and PIM Dense-mode are not supported.

Information about BGP MVPN PE-PE Ingress Replication

In Multicast VPN (MVPN) using Multipoint to Multipoint LDP (MLDP), multicast traffic received by an ingress provider edge (PE) router is replicated/copied and passes through the core to egress PE routers. State is maintained in the core and this may lead to some dynamic fluctuation of state in the service provider core routers.

In PE to PE IR, multicast traffic from an ingress PE router is replicated/copied and tunneled over multiple LSPs directly from the ingress PE to egress PE. State is not maintained as the traffic passes through the core.

The primary advantage of using PE to PE Ingress Replication (IR) is not having to maintain state in the core as mentioned above. A potential disadvantage to using PE-PE IR, is that the bandwidth utilization in the core increases in some parts of the core; For example, at the point in the network shown in the figure below, at callout 3, there are multiple copies of traffic going from the Ingress PE in a path towards the egress PEs.
BGP MVPN AD is the control plane that is used between PEs for PE-PE IR.

Figure 33: PE-PE Ingress Replication Topology

<table>
<thead>
<tr>
<th>Callout</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Red-dashed line, which shows the route taken by one copy or replication of traffic from an Ingress PE to an Egress PE.</td>
</tr>
<tr>
<td>2</td>
<td>Cloud showing the network core.</td>
</tr>
<tr>
<td>3</td>
<td>On this route, a multicast packet is replicated four times by PE-PE Ingress Replication.</td>
</tr>
</tbody>
</table>

In the figure above, when the Ingress PE router receives multicast traffic, it sends a copy of the traffic to each of the egress PE routers: Egress PE 1, Egress PE 2, Egress PE 3 and Egress PE 4. The egress PE routers inform the ingress PE routers of their interest in receiving multicast traffic by originating BGP Leaf Auto-Discovery routes.

Each replication is sent over a MPLS Label Switched Path (LSP) to the specific destination PE router. MVPN sites that are connected to a particular egress PE are allowed to send multicast traffic to other sites in the same MVPN.

LSPs are assumed to exist before PE-PE IR is configured. LSPs can be setup using a variety of types of LSP, e.g. BGP labeled unicast SAFI LSPs can be used with PE-PE IR but it is better to use P2P (TE) LDP LSPs, which are verified and tested.

**Ingress Replication MVPN Profiles**

For Ingress Replication, the MVPN Profile may be one of the following two profiles. Data MDT is supported within either of the following two profiles:

- Partitioned MDT Profile
• Default MDT Profile

Partitioned MDT Profile

In a partitioned MDT profile, only those egress PE routers that receive traffic requests from a particular ingress PE are associated with that ingress PE. This results in a low number of ingress PE routers in the network and a limited number of trees in the core.

When a Partitioned MDT profile is used in PE-PE IR, egress PEs may need to identify traffic from ingress PEs, which uses an internal RPF-ID. A strict RPF check is done using the RPF-ID.

Note

Interface-based strict RPF check is not supported. If the PE-PE IR MVPN is configured to include both IPv4 and IPv6 address-families of a VRF, the default or partitioned MDT profile must be the same in both the IPv4 and the IPv6 address-families.

Default MDT Profile

In a default MDT Profile, the MDT carries control plane and data traffic. All PE routers in the MVPN need to join the default MDT tree. The number of MDT trees that are set up for every PE equals the number of PEs in the MVPN.

Note

If the PE-PE IR MVPN is configured to include both IPv4 and IPv6 address-families of a VRF, the default or partitioned MDT profile must be the same in both the IPv4 and the IPv6 address-families.

PE-PE IR profile must be same in IPv4. mLDP and PE-PE IR cannot exist together

Similar to the Partitioned MDT profile, PE-PE IR cannot exist alongside an mLDP MVPN profile under the same address family of the same VRF. Also, a PE-PE IR cannot exist with mLDP inband signaling in the same address family of a VRF.

Data MDT

By default, the number of data MDTs that can be used in either a partitioned or default MDT profile for PE-PE IR is unlimited. However, each data MDT consumes system resources; therefore, optionally, the number of data MDTs can be limited between 1 and 20000.

An ACL can be optionally configured, via the list keyword, to control the multicast flows that can use a data MDT. When the data MDT threshold is 0, a PIM-SSM (multicast) state is assigned to a data MDT as soon as it is instantiated. Using the immediate-switch keyword, the first packet of the (multicast) flow switches onto the data MDT. Without this immediate-switch keyword, a three second delay occurs before flow packets transition to the data MDT.

Receiver-only Sites

BGP auto-discovery (AD) control plane states are reduced by not announcing certain BGP AD routes. Note that receiver-only sites are not specific to PE-PE IR but also apply to mLDP. In a PE-PE IR configuration, each egress PE must be connected to a receiver-only site. The PE-PE IR C-multicast protocol is BGP C-routes.
How to Configure BGP MVPN PE-PE Ingress Replication

Configuring BGP MVPN PE-PE Ingress Replication

In the following configuration, partitioned MDT is set up in two address families. To configure BGP MVPN PE-PE Ingress Replication:

```
enable
configure terminal
vrf definition vrf2
rd 100:2
route-target export 100:2
route-target import 100:2
!
address-family ipv4
mdt auto-discovery ingress-replication
mdt strict-rpf interface
mdt partitioned ingress-replication
mdt overlay use-bgp
exit-address-family
!
address-family ipv6
mdt auto-discovery ingress-replication
mdt strict-rpf interface
mdt partitioned ingress-replication
mdt overlay use-bgp
exit-address-family
!
router bgp 1009
address-family ipv4 MVPN
neighbor 13.3.3.3 activate
neighbor 13.3.3.3 send-community extended
exit-address-family
!
address-family ipv6 MVPN
neighbor 13.3.3.3 activate
neighbor 13.3.3.3 send-community extended
exit-address-family
```

Displaying and Verifying BGP MVPN PE-PE Ingress Replication

Use the `show MVPN ipv4 vrf red auto-discovery` command to display a summary of the MVPN IPv4 VRF auto-discovery routes. Some parts of the following output is removed for brevity:

```
Device# show MVPN ipv4 vrf red auto-discovery
Orig: L - Local, R - Remote
Route-Type: I - PMSI - Intra-AS Inclusive-PMSI, S - PMSI - Selective-PMSI

Feature Information for BGP MVPN PE-PE Ingress Replication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

CHAPTER 8

Multicast VPN MIB

The Multicast VPN MIB feature introduces the capability for Simple Network Management Protocol (SNMP) monitoring of a Multicast VPN (MVPN) using the MVPN MIB (CISCO-MVPN-MIB).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Multicast VPN MIB

- Before performing the tasks in this module, you must configure MVPN.
- You must configure SNMP on the routers on which the MVPN MIB is to be used.
Restrictions for Multicast VPN MIB

- Currently only IPv4 is supported.
- For all MIB objects with "read-create" access privileges, currently only "read-only" access is supported.

Information About Multicast VPN MIB

Overview of the MVPN MIB

In an MVPN network, a provider edge (PE) router has a multicast routing table and a Protocol Independent Multicast (PIM) instance associated with every VPN routing and forwarding (VRF) table that is used to define the VPN membership of customer sites attached to the router. There is one global multicast routing table and a table per multicast VRF (MVRF) used to route multicast packets received from a customer edge (CE) router. A set of MVRFs form a multicast domain (MD) when they are connected to potential sources and receivers of multicast traffic. A distinct group address, also known as the Multicast Distribution Tree (MDT) group address, obtained from an administrative pool, is assigned to each multicast domain. MDT groups are used by PE routers to encapsulate and transport multicast traffic within an MD through multicast tunnel interfaces (MTIs).

Initially all multicast data is forwarded using preconfigured MDT default groups. When certain multicast streams exceed a configured bandwidth threshold on the PE router, the multicast data is moved to an MDT data group that is dynamically chosen from an available pool of multicast addresses.

Using the MVPN MIB, network administrators can access MVRF information from PE routers for VPN traffic across multiple CE sites in real time. SNMP operations can be performed to monitor the MVRFs on the PE routers using get and set commands entered on the network management system (NMS) workstation for which SNMP has been implemented. The NMS workstations is also known as the SNMP manager.

MVPN Information Retrieval Using SNMP and the MVPN MIB

SNMP has historically been used to collect network information. SNMP permits retrieval of critical information from network elements such as routers, switches, and workstations. The MVPN MIB uses SNMP to configure MVRF trap notifications and to gather useful MVPN information in real time.

The MVPN MIB allows MVPN data for the managed devices on your system to be retrieved by SNMP. You can specify the retrieval of MVPN information from a managed device (for example, a router) either by entering commands on that managed device or by entering SNMP commands from the NMS workstation to gather MVPN information. MVPN MIB requests for information are sent from an NMS workstation to the router using SNMP and are retrieved from the router. This information can then be stored or viewed, thus allowing MVPN information to be easily accessed and transported across a multivendor programming environment.
**MVPN MIB Objects**

The MVPN MIB defines managed objects that enable a network administrator to remotely monitor the following MVPN information:

- The state of the MVRFs including the name of the MVRF, whether they are active, and the number of active multicast-enabled interfaces
- MDT default group address and encapsulation information
- Next hop information used to receive Border Gateway Protocol (BGP) MDT updates for Source Specific Multicast (SSM) mode
- Traffic threshold that determines switchover to an MDT data group
- Type of MDT group being used for a given (S, G) multicast route entry that exists on each configured MVRF, source address, and group address of the multicast route entry
- Source and group address used for encapsulation
- Information on MDT data groups currently joined
- Information on MVPN-specific MDT tunnels present in the device
- Trap notifications enabled on the router

---

**Note**

For a complete description of the objects supported by the MVPN MIB, see the CISCO_MVPN_MIB.my file, available on Cisco.com at [http://www.cisco.com/go/mibs](http://www.cisco.com/go/mibs).

**MVPN Trap Notifications**

An MVPN router can be configured to send MVRF (ciscoMvpnMvrfChange) trap notifications. A ciscoMvpnMvrfChange trap notification signifies a change about an MVRF in the device. The change event can be the creation of an MVRF, the deletion of an MVRF, or an update on the default or data multicast distribution tree (MDT) configuration of an MVRF. The change event is indicated by the ciscoMvpnGenOperStatusChange object embedded in the trap notification.

**How to Configure Multicast VPN MIB**

**Configuring the Router to Send MVRF Trap Notifications**

Perform this task to configure the router to use SNMP to send MVRF trap notifications.
Before the MVPN MIB can be used, the SNMP server for the router must be configured. To enable the SNMP server on the router, perform Steps 3 and 4. If an SNMP server is already available, omit Steps 3 and 4 and proceed to Step 5.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - `snmp-server community string ro`
   - `snmp-server community string rw`
4. `snmp-server host { hostname | ip - address } version 2c community - string`
5. `snmp-server enable traps mvpn`
6. **end**

**DETAILED STEPS**

</table>

**Configuration Examples for Multicast VPN MIB**

**Configuring the Router to Send MVRF Trap Notifications Example**

The following example shows how to configure a router to use SNMP to send MVRF trap notifications:

```
!
snmp-server community public rw
snmp-server enable traps mvpn
snmp-server host 10.3.32.154 version 2c public
!
```
