BGP-VRF-Aware Conditional Advertisement

The Border Gateway Protocol (BGP) VRF-Aware Conditional Advertisement feature provides additional control of the advertisement of routes and extends this control to within a virtual routing and forwarding (VRF) instance.

• Finding Feature Information, on page 1
• Information About BGP VRF-Aware Conditional Advertisement, on page 1
• How to Configure BGP VRF-Aware Conditional Advertisement, on page 3
• Configuration Examples for BGP VRF-Aware Conditional Advertisement, on page 5
• Additional References for BGP VRF-Aware Conditional Advertisement, on page 9
• Feature Information for BGP VRF-Aware Conditional Advertisement, on page 10

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About BGP VRF-Aware Conditional Advertisement

VRF-Aware Conditional Advertisement

The Border Gateway Protocol (BGP) VRF-Aware Conditional Advertisement feature provides additional control of the advertisement of routes and extends this control within a virtual routing and forwarding (VRF) instance.

BGP Conditional Advertisement

Normally, routes are propagated regardless of the existence of a different route. The BGP conditional advertisement feature uses the exist-map, non-exist-map, and the advertise-map keywords of the neighbor
command in order to track routes by the route prefix. If a route prefix is not present in output of the **non-exist-map** command, then the route specified by the **advertise-map** is announced. This feature is useful for multihomed networks, in which some prefixes are advertised to one of the providers only if information from the other provider is not present (this indicates a failure in the peering session or partial reachability). The conditional BGP announcements are sent in addition to the normal announcements that a BGP router sends to its peers.

**VRF-Aware Conditional Advertisement**

This feature extends support for BGP VRF-aware conditional advertisement to the following address families:

- IPv4 unicast
- IPv4 unicast VRF
- IPv6 unicast
- IPv6 unicast VRF

*Figure 1: VRF-Based Conditional Advertisement*

The figure above shows the IPv4 prefix 192.168.50.0/24 being advertised by a remote CE101 into VRF RED on PE1. The prefix flows as a MP-BGP VPN prefix and is imported into the VRF RED on PE4. On the PE4 the conditions configured by the **exist-map** command relating to this prefix in the BGP VRF RED table becomes the condition to advertise the prefix 203.0.113.0/24 to the CE104, that is, peer-activated under the VRF RED on the PE4. This scenario assumes that 203.0.113.0/24 is in the VRF RED BGP table. If 203.0.113.0/24 is not in the table, this policy is ignored.

- If 192.168.50.0/24 exists in PE4’s BGP table, then the 203.0.113.0/24 network is advertised to CE104.
- If 192.168.50.0/24 does not exist in PE4’s BGP table, then the 203.0.113.0/24 network is not advertised to CE104.
How to Configure BGP VRF-Aware Conditional Advertisement

Configuring BGP VRF-Aware Conditional Advertisement

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router bgp autonomous-system-number`
4. Enter one of the following:
   - `address-family ipv4 [unicast] [vrf vrf-name]`
   - `address-family ipv6 [unicast] [vrf vrf-name]`
5. `neighbor {ip-address | ipv6-address} remote-as autonomous-system-number`
6. `neighbor {ip-address | ipv6-address} activate`
7. `neighbor {ip-address | ipv6-address} advertise-map map-name {exist-map map-name | non-exist-map map-name}`
8. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**                 |                                 |
| Device# configure terminal   |                                 |

| **Step 3** router bgp autonomous-system-number | Enters router configuration mode for the specified routing process. |
| **Example:**                                  |                                                                     |
| Device(config)# router bgp 40000              |                                                                     |

<p>| <strong>Step 4</strong> Enter one of the following:         | Specifies the IPv4 or IPv6 address family and enters address family configuration mode. |
| • <code>address-family ipv4 [unicast] [vrf vrf-name]</code> | • The <code>unicast</code> keyword specifies the IPv4 or IPv6 unicast address family. |
| • <code>address-family ipv6 [unicast] [vrf vrf-name]</code> | • The <code>vrf</code> keyword and <code>vrf-name</code> argument specify the name of the virtual routing and forwarding (VRF) |
| <strong>Example:</strong>                                  |                                                                     |
| Device(config-router)# address-family ipv4 vrf |                                                                     |
| VRFRED                                        |                                                                     |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> `neighbor {ip-address</td>
<td>ipv6-address} remote-as autonomous-system-number`</td>
</tr>
<tr>
<td><strong>Step 6</strong> `neighbor {ip-address</td>
<td>ipv6-address} activate`</td>
</tr>
<tr>
<td><strong>Step 7</strong> `neighbor {ip-address</td>
<td>ipv6-address} advertise-map map-name {exist-map map-name</td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>end</code></td>
<td>Exits address family configuration mode and enters privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

- **Step 5**
  ```bash
  Device(config-router-af)# neighbor 192.0.2.1 remote-as 104
  ```

- **Step 6**
  ```bash
  Device(config-router-af)# neighbor 192.0.2.1 activate
  ```

- **Step 7**
  ```bash
  Device(config-router-af)# neighbor 192.0.2.1 advertise-map ADV-1 exist-map EXIST-1
  ```

- **Step 8**
  ```bash
  Device(config-router-af)# end
  ```
What to do next

To verify the configuration of the BGP VRF-Aware Conditional Advertisement feature, use the `show bgp ip neighbors` command.

Configuration Examples for BGP VRF-Aware Conditional Advertisement

Example: Configuring BGP VRF-Aware Conditional Advertisement

The following examples use the configuration in figure 1:

**CE 101: The source of the prefixes**

```
router bgp 101
  bgp log-neighbor-changes
timers bgp 0 0
neighbor 172.16.1.2 remote-as 65000
!  address-family ipv4
    network 21.21.21.0 mask 255.255.255.0
    network 22.22.22.22 mask 255.255.255.255
    network 31.0.0.0
    network 33.0.0.0
    network 44.0.0.0
    network 192.0.254 mask 255.255.255.0
    network 192.0.2.50
    neighbor 172.16.1.3 activate
  exit-address-family

PE 1
