iBGP Multipath Load Sharing

This feature module describes the iBGP Multipath Load Sharing feature. This feature enables the BGP speaking router to select multiple iBGP paths as the best paths to a destination. The best paths or multipaths are then installed in the IP routing table of the router.

- Finding Feature Information, on page 1
- iBGP Multipath Load Sharing Overview, on page 1
- How to Configure iBGP Multipath Load Sharing, on page 4
- Configuration Examples, on page 7
- Additional References, on page 8
- Feature Information for iBGP Multipath Load Sharing, on page 9

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

iBGP Multipath Load Sharing Overview

When a Border Gateway Protocol (BGP) speaking router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP (iBGP) for the same destination, the router will choose one iBGP path as the best path. The best path is then installed in the IP routing table of the router. For example, in the figure below, although there are three paths to autonomous system 200, Router 2 determines that one of the paths to autonomous system 200 is the best path and uses this path only to reach autonomous system 200.
The iBGP Multipath Load Sharing feature enables the BGP speaking router to select multiple iBGP paths as the best paths to a destination. The best paths or multipaths are then installed in the IP routing table of the router. For example, on router 2 in the figure below, the paths to routers 3, 4, and 5 are configured as multipaths and can be used to reach autonomous system 200, thereby equally sharing the load to autonomous system 200.

The iBGP Multipath Load Sharing feature functions similarly in a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) with a service provider backbone. For example, on router PE1 in the figure below, the paths to routers PE2, PE3, and PE4 can be selected as multipaths and can be used to equally share the load to site 2.
For multiple paths to the same destination to be considered as multipaths, the following criteria must be met:

- All attributes must be the same. The attributes include weight, local preference, autonomous system path (entire attribute and not just length), origin code, Multi Exit Discriminator (MED), and Interior Gateway Protocol (IGP) distance.
- The next hop router for each multipath must be different.

Even if the criteria are met and multiple paths are considered multipaths, the BGP speaking router will still designate one of the multipaths as the best path and advertise this best path to its neighbors.

**Benefits of iBGP Multipath Load Sharing**

Configuring multiple iBGP best paths enables a router to evenly share the traffic destined for a particular site.

**Restrictions on iBGP Multipath Load Sharing**

**Route Reflector Limitation**

With multiple iBGP paths installed in a routing table, a route reflector will advertise only one of the paths (one next hop).

**Memory Consumption Restriction**

Each IP routing table entry for a BGP prefix that has multiple iBGP paths uses approximately 350 bytes of additional memory. We recommend not using this feature on a router with a low amount of available memory and especially when the router is carrying a full Internet routing table.
How to Configure iBGP Multipath Load Sharing

Configuring iBGP Multipath Load Sharing

To configure the iBGP Multipath Load Sharing feature, use the following command in router configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-router)# maximum-paths ibgp maximum-number</code></td>
<td>Controls the maximum number of parallel iBGP routes that can be installed in a routing table.</td>
</tr>
</tbody>
</table>

Verifying iBGP Multipath Load Sharing

To verify that the iBGP Multipath Load Sharing feature is configured correctly, perform the following steps:

**SUMMARY STEPS**

1. Enter the `show ip bgp network-number` EXEC command to display attributes for a network in a non-MPLS topology, or the `show ip bgp vpnv4 all ip-prefix` EXEC command to display attributes for a network in an MPLS VPN:

   Example:
   
   ```
   Device# show ip bgp 10.22.22.0
   BGP routing table entry for 10.22.22.0/24, version 119
   Paths:(6 available, best #1)
   Multipath:iBGP
   Flag:0x820
   Advertised to non peer-group peers:
   10.1.12.12
   22
   10.2.3.8 (metric 11) from 10.1.3.4 (100.0.0.5)
   ```

2. In the display resulting from the `show ip bgp network-number` EXEC command or the `show ip bgp vpnv4 all ip-prefix` EXEC command, verify that the intended multipaths are marked as “multipaths.” Notice that one of the multipaths is marked as “best.”

3. Enter the `show ip route ip-address` EXEC command to display routing information for a network in a non-MPLS topology or the `show ip route vrf vrf-name ip-prefix` EXEC command to display routing information for a network in an MPLS VPN:

4. Verify that the paths marked as "multipath" in the display resulting from the `show ip bgp ip-prefix` EXEC command or the `show ip bgp vpnv4 all ip-prefix` EXEC command are included in the routing information. (The routing information is displayed after performing Step 3.)

**DETAILED STEPS**

**Step 1**

Enter the `show ip bgp network-number` EXEC command to display attributes for a network in a non-MPLS topology, or the `show ip bgp vpnv4 all ip-prefix` EXEC command to display attributes for a network in an MPLS VPN:

**Example:**

```
Origin IGP, metric 0, localpref 100, valid, internal, multipath, best
Originator:100.0.0.5, Cluster list:100.0.0.4
22
10.2.1.9 (metric 11) from 10.1.1.2 (100.0.0.9)
  Origin IGP, metric 0, localpref 100, valid, internal, multipath
  Originator:100.0.0.9, Cluster list:100.0.0.2
22
10.2.5.10 (metric 11) from 10.1.5.6 (100.0.0.10)
  Origin IGP, metric 0, localpref 100, valid, internal, multipath
  Originator:100.0.0.10, Cluster list:100.0.0.6
22
10.2.4.10 (metric 11) from 10.1.4.5 (100.0.0.10)
  Origin IGP, metric 0, localpref 100, valid, internal, multipath
  Originator:100.0.0.10, Cluster list:100.0.0.5
22
10.2.6.10 (metric 11) from 10.1.6.7 (100.0.0.10)
  Origin IGP, metric 0, localpref 100, valid, internal, multipath
  Originator:100.0.0.10, Cluster list:100.0.0.7

Device# show ip bgp vpnv4 all 10.22.22.0

BGP routing table entry for 100:1:10.22.22.0/24, version 50
Paths:(6 available, best #1)
Multipath:iBGP
  Advertised to non peer-group peers:
    200.1.12.12
22
  10.22.7.8 (metric 11) from 10.11.3.4 (100.0.0.8)
    Origin IGP, metric 0, localpref 100, valid, internal, multipath, best
    Extended Community:RT:100:1
    Originator:100.0.0.8, Cluster list:100.1.1.44
22
  10.22.1.9 (metric 11) from 10.11.1.2 (100.0.0.9)
    Origin IGP, metric 0, localpref 100, valid, internal, multipath
    Extended Community:RT:100:1
    Originator:100.0.0.9, Cluster list:100.1.1.22
22
  10.22.6.10 (metric 11) from 10.11.6.7 (100.0.0.10)
    Origin IGP, metric 0, localpref 100, valid, internal, multipath
    Extended Community:RT:100:1
    Originator:100.0.0.10, Cluster list:100.0.0.7
22
  10.22.4.10 (metric 11) from 10.11.4.5 (100.0.0.10)
    Origin IGP, metric 0, localpref 100, valid, internal, multipath
    Extended Community:RT:100:1
    Originator:100.0.0.10, Cluster list:100.0.0.5
22
  10.22.5.10 (metric 11) from 10.11.5.6 (100.0.0.10)
    Origin IGP, metric 0, localpref 100, valid, internal, multipath
    Extended Community:RT:100:1
    Originator:100.0.0.10, Cluster list:100.0.0.6

Step 2
In the display resulting from the show ip bgp network-number EXEC command or the show ip bgp vpnv4 all ip-prefix EXEC command, verify that the intended multipaths are marked as “multipaths.” Notice that one of the multipaths is marked as “best.”

Step 3
Enter the show ip route ip-address EXEC command to display routing information for a network in a non-MPLS topology or the show ip route vrf vrf-name ip-prefix EXEC command to display routing information for a network in an MPLS VPN:

Example:

Device# show ip route 10.22.22.0
Routing entry for 10.22.22.0/24
Known via "bgp 1", distance 200, metric 0
Tag 22, type internal
Last update from 10.2.6.10 00:00:03 ago
Routing Descriptor Blocks:
  * 10.2.3.8, from 10.1.3.4, 00:00:03 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.2.1.9, from 10.1.1.2, 00:00:03 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.2.5.10, from 10.1.5.6, 00:00:03 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.2.4.10, from 10.1.4.5, 00:00:03 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.2.6.10, from 10.1.6.7, 00:00:03 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1

Device# show ip route vrf PATH 10.22.22.0
Routing entry for 10.22.22.0/24
Known via "bgp 1", distance 200, metric 0
Tag 22, type internal
Last update from 10.22.5.10 00:01:07 ago
Routing Descriptor Blocks:
  * 10.22.7.8 (Default-IP-Routing-Table), from 10.11.3.4, 00:01:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.22.1.9 (Default-IP-Routing-Table), from 10.11.1.2, 00:01:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.22.6.10 (Default-IP-Routing-Table), from 10.11.6.7, 00:01:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.22.4.10 (Default-IP-Routing-Table), from 10.11.4.5, 00:01:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1
  10.22.5.10 (Default-IP-Routing-Table), from 10.11.5.6, 00:01:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1

Step 4 Verify that the paths marked as "multipath" in the display resulting from the show ip bgp ip-prefix EXEC command or the show ip bgp vpnv4 all ip-prefix EXEC command are included in the routing information. (The routing information is displayed after performing Step 3.)

Monitoring and Maintaining iBGP Multipath Load Sharing

To display iBGP Multipath Load Sharing information, use the following commands in EXEC mode, as needed:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Device# show ip bgp ip-prefix | Displays attributes and multipaths for a network in a non-MPLS topology.
Configuration Examples

Both examples assume that the appropriate attributes for each path are equal and that the next hop router for each multipath is different.

Example: iBGP Multipath Load Sharing in a Non-MPLS Topology

Both examples assume that the appropriate attributes for each path are equal and that the next hop router for each multipath is different.

The following example shows how to set up the iBGP Multipath Load Sharing feature in a non-MPLS topology (see the figure below).

Figure 4: Non-MPLS Topology Example

Router 2 Configuration

```
router bgp 100
maximum-paths ibgp 3
```

Example: iBGP Multipath Load Sharing in an MPLS VPN Topology

The following example shows how to set up the iBGP Multipath Load Sharing feature in an MPLS VPN topology (see the figure below).
Router PE1 Configuration

router bgp 100
address-family ipv4 unicast vrf site2
maximum-paths ibgp 3

### Feature Information for iBGP Multipath Load Sharing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
